GOTTSCHALL, RUDOLF VON. A German novelist, poet and critic, died on March 21, 1909. He was born at Breslau in 1823, and studied at Königsberg, Breslau and Berlin. His first poems, published anonymously in 1842, were *Lieder der Gegenwart*. His earliest plays were *Ulrich von Hutton* and *Maximilian Robespierre* (1848), and these were followed by *Lambertine, von Mericourt* (1850) and *Ferdinand von Schill* (1851). These were followed by many other plays, novels, and volumes of criticism. Gottschall was one of the most voluminous writers of his generation, and many of his productions were widely read.

GREAT BRITAIN. The United Kingdom of Great Britain (England, Scotland and Wales) and Ireland is a constitutional monarchy. Capital, London.

AREA AND POPULATION. The area in square miles and the population, according to the census of April 1, 1901, and the estimate of June 30, 1909, are stated as follows:

	Area	Population 1901	Population 1909
England and Wales ..	58,324	32,527,843	35,756,615
Scotland	30,405	4,472,103	4,877,648
Ireland	32,360	4,458,775	4,374,153
Isle of Man	227	64,752
Channel Islands	75	95,618
Army, navy and merchant seamen abroad		367,736
Total	121,391	41,976,927	45,208,421

The 1909 estimate is exclusive of army, navy, and merchant seamen abroad, but includes the Isle of Man and the Channel Islands. The decennial rate of increase, as shown by the 1901 census, is: England, 12.1 per cent.; Wales, 13.3; Scotland, 11.1; the Islands, 1.9; Ireland, a decrease of 5.2. The movement of the population was as follows in 1908:

	England and Wales	Scotland	Ireland
Births	942,611	131,337	102,426
Deaths	521,644	77,839	77,151
Marriages	264,647	81,583	22,831

In 1907 the birth-rate, death-rate, and marriage-rate per 1000 inhabitants were 26.3, 15, and 15.8 respectively in England and Wales; 27, 16.2, and 13.9 in Scotland; 23.2, 17.7, and 10.1 in Ireland. Births, deaths, and marriages for the United Kingdom of Great Britain and Ireland are reported as follows:

Births			Rate
Year	Number		
1895	1,154,898		29.4
1906	1,170,622		26.8
1907	1,148,573		26.0
1908	1,176,374		26.4
Marriages			Rate
Year	Number		
1895	279,746		14.3
1906	325,842		14.9
1907	332,190		15.1
1908	319,061		14.3
Deaths			Rate
Year	Number		
1895	735,244		18.7
1906	681,343		15.6
1907	678,822		15.4
1908	676,634		15.2

The following shows the immigration:

Year	British and Irish	Foreigners	Not dis- tinguished	Total
1906	130,446	95,264	4,435	230,165
1907	160,588	129,183	3,862	293,633
1908	172,043	170,879	342,922

Emigration (British and Irish) has been: 1906, 325,137; 1907, 395,680; 1908, 263,199. The principal destinations of British and Irish emigrants have been:

Brit. No. America	United States	Austral- asia	South Africa
1906....	114,859	144,817	19,331
1907....	151,216	170,264	24,767
1908....	81,321	96,869	33,569

In 1908 English emigrants numbered 176,986; Scotch, 42,273; Irish, 38,352; British colonials, 5588; total, 203,199; foreigners, 123,212; grand total, 386,411. In 1907 the grand total was 634,949.

The estimated population of the larger cities at the middle of 1908 was: London, 4,795,757; Glasgow, 859,715; Liverpool, 753,203; Manchester, 649,251; Birmingham, 558,357; Leeds, 477,107; Sheffield, 463,222; Dublin (with suburbs), 394,525; Belfast, 380,344; Bristol, 372,785;

Edinburgh, 350,524; West Ham, 315,000; Bradford, 292,136; Newcastle-on-Tyne, 277,257; Hull, 271,137; Nottingham, 260,449; Leicester, 240,172; Salford, 239,294; Portsmouth, 211,493; Cardiff, 191,446; Bolton, 185,358; Aberdeen, 178,210; Dundee, 168,616; Croydon, 157,698; Sunderland, 157,693; Willesden, 154,792; Oldham, 142,507; Blackburn, 135,961; Rhondda, 133,137; Brighton, 129,967; Gateshead, 128,-393.

EDUCATION. Illiteracy has decreased remarkably. In 1843, 32.7 per cent. of males and 49 per cent. of females signing the marriage registers in England and Wales signed by mark; in 1907, 1.4 per cent. males and 1.7 per cent. females. In Ireland, in 1907, 8 per cent. of the males and 6 per cent. of the females signed by mark; in Scotland, in 1906, 1.45 per cent. males and 1.97 per cent. females. Elementary instruction is compulsory in England, Scotland, and Wales.

In 1908 the number of public elementary schools in England was 18,766, with accommodation for 6,650,087 pupils, an enrollment of 5,984,130, and an average attendance of 4,908,-880. Of the schools, 6318 were Council schools (maintained at public expense), with accommodation of 3,338,031 pupils and an average attendance of 2,655,585; and 12,448 were voluntary schools (maintained by religious denominations), with accommodation for 3,171,056 and an average attendance of 2,259,296. In Wales the elementary schools numbered 1794, with accommodation for 511,931 pupils and an average attendance of 373,575; 1090 of the schools were Council, with accommodation for 378,993 and average attendance of 268,897, and 704 were voluntary, with accommodation for 133,138 and average attendance of 86,678. In England (1908) certificated teachers numbered 28,585 men and 56,931 women; in Wales, 2519 men and 2896 women. There is a steady increase in the number of certificated teachers. In 1908 there were also in England and Wales 39 higher elementary schools, with 446 teachers, accommodation for 12,471 pupils, and an average attendance of 9909. In 1908 there were in England and Wales 840 public secondary schools, 6874 evening (continuation) schools, 193 day technical classes, 37 technical institutions, 225 schools of art, and 40 art classes, besides schools for the blind, deaf, etc. For the training of teachers there were in 1908 72 training colleges and 23 hostels in England, and 7 and 4 in Wales.

In Scotland there were in 1908 3143 elementary schools, with an enrollment, 792,418 pupils, and 169 higher grade schools, with 19,-928 pupils; in addition there were 930 evening schools, with 87,599 pupils, 754 continuation classes, with 101,664 pupils.

In Ireland there were in 1908 8468 elementary schools, with 12,731 teachers and 689,001 pupils enrolled. Seven training colleges for teachers had 521 men and 663 women students.

In 1907 the total payments for public elementary education in England and Wales amounted to £21,194,003, of which Parliamentary grants represented £11,380,784 and local rates £9,491,703; in Scotland the sums expended from Parliamentary grants in 1907 and 1908 amounted to £1,866,711 and £1,941,918 respectively; in Ireland, from Parliamentary grants and rates, £1,454,185 in 1907 and £1,470,-347 in 1908.

Besides the public schools there are many private institutions of all grades, for which statistics are not available. The institutions for higher education include the universities of Oxford (1249 A.D.), Cambridge (1257), Durham (1831), London (1836), Manchester (1850), Birmingham (1900), Liverpool (1903), Leeds (1904), Sheffield (1905), and Bristol (1909); the University of Wales; the universities of St. Andrews (1411 A.D.), Glasgow (1450), Aberdeen (1494), and Edinburgh (1582); and Dublin University.

AGRICULTURE. Coincident with the extension of public instruction in Great Britain, and the development of great manufacturing industries, the area of land under cultivation has grown smaller from year to year. In 1909 the cultivated area was nearly 1,500,000 acres less than ten years before; in 1861 about 4,000,000 acres were sown to wheat, and in 1909 about 1,823,000 acres. The decrease has been chiefly in England and Wales, there being practically no change in Scotland. There has also been a conspicuous shrinkage in the number of small holdings—that is, farms of 50 acres or less—and it is contended that only through a large increase of such farms can any real betterment of English agriculture be brought about. See AGRICULTURE.

Of Great Britain's total land area—56,211,830 acres—14,795,517 acres were under crop and 17,415,869 acres under uncultivated grass in 1908; in 1909, 14,730,668 and 17,452,405 respectively (figures for 1909 provisional). The acreage and production of the principal crops in Great Britain are reported as follows:

Crop	Area		Production	
	1908	1909	1908	1909
	Acres.	Acres.	Bushels.*	Bushels.*
Wheat.....	36,677	43,606	1,394,000	1,754,000
Barley.....	154,596	163,100	7,134,000	8,340,000
Oats.....	1,060,301	1,035,735	63,839,000	67,894,000

* Bushels of weight: Wheat, beans, peas, and potatoes, 60 pounds; rye, 56 pounds; barley, 48 pounds; oats, 32 pounds. † Yield of sound tubers.

MINING AND METALS. In 1908 the number of persons in the United Kingdom engaged in mineral production was: At 3211 coal mines, 972,232 (including 5070 females); at 848 metalliferous mines, 45,508 (including 255 females); at quarries, 85,475. The value of the principal mineral produce of the United Kingdom in 1907 is reported at £135,279,088, as against £105,842,992 in 1906. Of the 1907 total, minerals valued at £80,710,565 were produced in England, £25,341,479 in Wales, £19,955,974 in Scotland, £215,660 in Ireland, and £55,410 in the Isle of Man. Metallic minerals were valued at £5,773,487 and non-metallic at £129,505,601. The value of the metals produced from British ores in 1907 is reported at £20,528,417, as against £19,166,644 in 1906. The principal metallic minerals raised in 1907 included the following: Iron ore, 15,731,604 tons, valued at £4,433,418, and contain-

* Preliminary estimates. † Winchester bushels, except for potatoes; potatoes, bushels of 60 pounds.

In 1908 and 1909 hops were grown on 38,921 acres respectively in Great Britain; vetches or tares, 126,083 and 136,245; rape, 86,495 and 87,443; cabbage, 69,120 and 66,854; alfalfa, 65,156 and 65,327; small fruits, 84,880 and 87,116; under orchard were 250,297 acres in 1908 and 257,336 acres in 1909.

The number of live-stock in Great Britain in 1908 and 1909 is reported as follows: Horses used for agricultural purposes, 1,119,324 and 1,132,014 respectively; unbroken horses, 426,347 and 420,979; cattle, 6,905,134 and 7,020,982; sheep, 27,119,730 and 27,618,419; swine, 2,823,482 and 2,380,887. In Ireland in 1908: Horses, 604,629; mules, 30,351; asses, 241,133; cattle, 4,792,458; sheep, 4,126,106; swine, 1,217,840; goats, 246,286; poultry, 24,031,095.

In Ireland the acreage and production of the principal crops in 1908 and 1909 are stated as follows (1909 figures provisional):

ing 5,126,949 tons of metal, valued at £19,004,413; lead ore, 32,533 tons, £419,247, containing 24,460 tons of metal, £479,722; tin ore, 7080 tons, £706,700, containing 4407 tons of metal, £769,438; zinc ore, 20,082 tons, £100,533, containing 7600 tons of metal, £183,612; copper ore, 6525 tons, £21,253, containing 666 tons of ore, £62,673. The principal non-metallic minerals raised in 1907 were: Coal, 267,830,962 tons, valued at £120,527,378; clays, £1,850,387; sandstone, 5,012,053 tons, £1,397,285; limestone, 12,509,142 tons, £1,323,624; slate, 443,554 tons, £1,178,609; granite, etc., 5,674,470 tons, £1,158,951. Of the coal output in 1907, 187,386,517 tons were raised in England, 40,252,193 in Wales, 40,092,542 in Scotland, and 99,704 in Ireland. In 1907, in 369 blast furnaces, 25,123,759 tons of iron ore were smelted, producing 10,114,281 tons of pig iron.

FISHERIES. The catch in 1908 was valued at

£10,897,841, against £11,686,674 in 1907. In 1909 there was less industrial confusion by 1908 the value of the catch credited to England reason of strikes, boycotts, and lockouts than in and Wales was £8,032,984 (including shellfish, 1908. £293,650); Scotland, £2,585,731 (shell-fish, £74,- COMMERCE. Imports and exports of merchandise have been valued as follows:

Year	Total imports	Exports		Total exports
		Domestic	Foreign and colonial	
1905.....	£565,019,917	£329,816,614	£77,779,913	£407,596,527
1906.....	607,888,500	375,575,338	85,102,480	460,677,818
1907.....	646,807,942	426,035,083	91,942,084	517,977,167
1908.....	592,953,487	377,103,824	79,623,697	456,727,521

Figures for the total trade for three years, including reexports of merchandise and showing the values of specie and bullion are as follows:

	1906	1907	1908
Imports:			
Merchandise	£607,888,500	£645,807,942	£592,953,487
Specie and bullion	63,306,653	73,072,439	56,472,203
Total	£671,195,153	£718,880,381	£649,425,690
Exports:			
Merchandise	£460,677,818	£517,977,167	£456,727,521
Specie and bullion	61,482,552	67,786,858	63,252,987
Total	£522,160,370	£585,764,025	£519,980,508

MANUFACTURES. The textile industry of the United Kingdom employs a capital estimated at £250,000,000. On March 1, 1909, the number of cotton spindles in operation was placed at 53,471,897 (United States second with 27,846,000), with 1,467,388 in construction. For 1908 the mill consumption of cotton is reported at 1,726,000,000 pounds; wool, 652,000,000 pounds; flax and tow, 228,000,000 pounds.

Great Britain, and especially England, is pre-eminently a manufacturing country. Textiles constitute the leading production, but in virtually all branches of manufacture large amounts of capital are invested. Recent statistics, definite and comprehensive, of the various manu-

including reexports of merchandise and showing importance of British manufactures may be seen in the section on Commerce, which shows the export values.

INDUSTRIAL DEPRESSION. From 1904 to 1907 wages manifested an upward tendency. Statistics covering the period from April 1, 1908, to July 1, 1909, show a steady fall in wages, with an increasing number of workers out of employment, and toward the end of the year the tendency appeared to be still downward. In the calendar year 1908 the wages of 464,000 industrial workers were reduced, while only 119,000 received an increase. Of the persons receiving an increase, 57,000 were government or municipal employees. 12,000 were textile workers, 11,000 were employed in the printing and allied trades, and 9000 in the building trades. Of those receiving diminished wages, 83,500 were employed in the engineering and shipbuilding trades, 69,000 in the manufacture of pig iron and iron and steel, and 283,000 in coal mining. In the first six months of 1909, 1,081,273 persons (846,750 employed in coal mines) suffered a decline in wages, against 6439 who received an increase. With a few exceptions, as employees in the printing and clothing trades and government and municipal employees, British industrial wage-earners were receiving smaller compensation on July 1, 1909, than on the same date in 1908. It should be noted that

The share of each division of the United Kingdom in total imports and domestic exports has been as follows, in thousands of pounds sterling:

Year	England and Wales	
	Imports	Exports
1905.....	£511,294	£292,834
1906.....	550,024	334,805
1907.....	585,721	377,230

Year	Scotland	
	Imports	Exports
1905.....	£41,332	£36,099
1906.....	44,941	39,987
1907.....	44,976	47,419

Year	Ireland	
	Imports	Exports
1905.....	£12,394	£ 884
1906.....	12,924	783
1907.....	15,110	1,385

The imports and domestic exports of merchandise in 1907 and 1908 are classified on page 312.

Reexports of merchandise (that is, exports of foreign and colonial produce), classified according to this table, showed the following totals in 1908: Class I., £10,879,356; class II., £45,310,088; class III., £25,254,963; class IV., £179,290; total £79,623,697. The principal articles of import and of domestic export, not specified in the foregoing trade, were valued as follows in 1908: Imports: Wheat, £38,295,327; butter, £24,080,912; oil (exclusive of petroleum), £21,852,256; sugar, £20,003,427 (refined £12,985,787; unrefined, £7,817,640); bacon and hams, £17,565,248; fruits, £14,071,833 (fresh, £10,955,829; dried, etc., £3,116,004); silk manufactures, £11,621,609; tea, £10,734,415; copper, £10,427,547; corn, £10,388,061; fresh beef, £10,276,957; rubber, £8,370,905; fresh mutton, £8,140,029; iron and steel, £7,681,512; eggs, £7,183,112; wheat flour, £7,075,231; cheese, £6,684,203; petroleum, £6,662,711; barley, £6,113,945. Exports: Cotton piece goods, £70,227,516 (unbleached, £19,970,594; bleached,

Of the total trade in merchandise, imports from foreign countries in 1907 and 1908 were valued at £488,670,888 and £463,125,429 respectively, and imports from British possessions £157,137,054 and £129,828,058 respectively; exports (including reexports) to foreign countries, £370,523,086 and £321,060,854 respectively, and exports to British possessions £147,454,081 and £135,066,067 respectively. The relative importance of the trade by countries in 1907 and 1908 is shown in the table in the next column; the figures indicate millions of pounds sterling and represent total imports and total exports of merchandise.

SIPPING. The total net tonnage, with cargo and in ballast, entered and cleared (exclusive of the coasting trade) at ports of the United Kingdom in 1907 and 1908 was as follows:

Entered	British	Foreign	Total
1907.....	40,415,618	25,825,295	66,240,913
1908.....	38,889,588	26,579,469	65,469,057

The foreign shipping is principally German, Norwegian, Danish, Swedish, Dutch, and French. Of the total tonnage entered in 1908, 63,210,390 represented steamers; cleared, 63,765,357. The tonnage entire in the coasting trade in 1908 was 58,779,484 (54,742,454 British); cleared, 58,096,812 (54,222,986 British). On December 31, 1908, the merchant marine consisted of 11,026 steamers, of 10,139,000 tons, and 9542 sailing

vessels, of 1,403,000 tons; total, 21,168 vessels, of 11,542,000 tons. On the same date the total merchant marine of the British colonies consisted of 17,440 vessels, of 1,722,000 tons (17,440,000 steam).

COMMUNICATIONS. On December 31, 1907, there were open to traffic 15,897 miles of railway in England and Wales, 3849 in Scotland, and 3362 in Ireland. The total length in the United Kingdom on December 31, 1908, was 23,205 miles, representing an aggregate paid-up capital of £1,310,533,212. The following figures, for the year 1908, relate to all the railways of the United Kingdom: Passengers carried (exclusive of season-ticket holders), 1,278,115,488; total traffic receipts, £110,552,833; working expenses, £76,407,801; net traffic receipts, £43,486,526. Length of state telegraph lines in 1908, 57,193 miles; of wire, 462,463 miles; offices, 10,862; other telegraph offices, 2487; post-offices, 27,728.

JOINT-STOCK COMPANIES AND BANKS. On April 30, 1900, there were on the register in the United Kingdom 46,474 joint-stock companies, with a paid-up capital of £2,163,132,789. At the end of 1908 post-office savings banks had 11,618,251 accounts open and £160,648,212 deposited; and trustees' savings banks, 1,788,033 accounts open, and £51,715,950 deposits. The amount passing through the Bankers' Clearing-House, London, in 1908, was £12,120,362,000, against £12,730,393 in 1907.

FINANCE. The unit of value is the sovereign, or pound sterling, worth \$4.8665. Ordinary revenue and expenditure for fiscal years ending March 31 have been as follows:

	1907	1908	1909
Revenue....	£144,814,073	£156,537,689	£151,578,295
Expenditure	139,415,251	151,812,094	152,292,395

For the fiscal year 1910, the estimated ordinary revenue and expenditure were £162,840,000 and £162,469,000 respectively. In the fiscal year 1909, the sources of ordinary revenue were as follows: Customs, £29,200,000; excise, £33,650,000; estate, etc., duties, £18,370,000; stamps, £7,770,000; land tax, £730,000; house duty, £1,900,000; property and income tax, £33,930,000; total Exchequer receipts from taxes, £125,550,000; post-office, £17,770,000; telegraph service, £3,020,000; telephone service, £1,510,000; crown lands, £530,000; receipts from Suez Canal shares and sundry loans, £1,171,476; miscellaneous, £2,026,829; total Exchequer receipts of non-tax revenue, £26,028,000;—total Exchequer revenue, £151,578,295. The classification of ordinary expenditures was: National debt, £28,000,000 (interest, etc., £18,011,000; repayment of capital, £9,989,000); civil list, £470,000; annuities and pensions, £271,790; salaries and allowances, £77,736; courts of justice, £519,293; miscellaneous services, £331,288; payments to local taxation accounts, £9,824,286; total consolidated fund services, £39,493,394;—Army, £26,840,000; navy, £32,188,000; civil services, £30,228,000; old-age pensions, £2,110,000; customs and inland revenue, £3,320,000; post-office revenues, £18,113,000; total supply services, £112,799,000;—total expenditure, £152,292,395. Including bank balances and various receipts and payments not classified as ordinary, the receipts and issues of the Exchequer in the fiscal year 1909 balanced at £205,137,275.

On March 31, 1909, the gross debt stood at £754,121,309, against £759,826,051 the year before. Against the gross debt must be set assets (including £32,667,000 in Suez Canal shares) and Exchequer balances amounting, March 31, 1909, to £43,510,589; so that the net debt on that date stood at £710,610,720. The net debt on March 31, 1910, is computed to stand at about £702,688,000.

NAVY. The larger vessels of the effective navy were as follows in 1909:—First-class battleships: 2 of 11,800 tons each; 6 of 12,950 tons; 5 of 14,000 tons; 9 of 14,900 tons; 8 of 15,000 tons; 8 of 16,350 tons; 2 of 16,500 tons; 1 of 17,900 tons (*Dreadnought*); 3 of 18,600 tons;—second-class battleships: 2 of 10,500 tons each; 2 of 11,940 tons; 1 of 12,350 tons; 8 of 14,150 tons;—first-class armored cruisers: 10 of 9800 tons each; 6 of 10,850 tons; 6 of 12,000 tons; 6 of 13,550 tons; 4 of 14,100 tons; 3 of 14,600 tons; 3 of 17,250 tons. In 1909 there were building 3 first-class battleships of 19,250 tons each, one of 20,250 tons, 2 of 21,000 tons, and there was authorized one of 21,000 tons. The number and displacement of effective warships, built and building, of 1000 or more tons, and of torpedo craft of 50 or more tons, were as follows in 1909: Battleships of 10,000 tons and over: 60, of 41,450 tons; armored cruisers, 40, of 506,350 tons; cruisers over 6000 tons, 18, of 176,250 tons; cruisers 6000 to 3000 tons, 48 of 214,700 tons; cruisers 3000 to 1000 tons, 24, of 51,675 tons; torpedo-boat destroyers, 168, of 81,356 tons; torpedo-boats, 69, of 15,014 tons; submarines, 67, of 19,078 tons; total, 494 war vessels, aggregating 2,005,873 tons, giving to the British navy first place among the navies of the world. (See NAVAL PROGRESS.) The naval expenditure during the ten-year period ending March 31, 1910, is stated at \$1,595,505,000.

ARMY. The British army, as a result of the reorganization following the passage of the "Territorial and Reserve Forces Act" in 1908, is organized in two lines: A Regular Army with its Reserve and Special Reserve, the latter corresponding to the old militia; and the Territorial Forces formed from the Yeomanry and Volunteers as they existed when the reorganization took place. The first line furnishes the garrisons for India, Egypt, South Africa, and other places, and maintains at home sufficient troops to supply drafts for those serving abroad. Furthermore in the first line are always maintained at home sufficient troops to constitute an Expeditionary Force which would be brought up to war strength by the Reserve. The Special Reserve is designed to make good the war losses in this first line. The Second Line is concerned chiefly with home defense, but it is expected that in case of hostilities trained men will volunteer for foreign service. Service in the Regular Army is by voluntary enlistment for a term of 12 years, part of which, as specified below, is served with the colors and the remainder with the Reserve. The prescribed terms of active service are: Cavalry, 7 years; Royal Horse Artillery and Royal Field Artillery, 6 years (5000 for 3 years); Royal Garrison Artillery, 8 years; Foot Guards and Line Infantry, 7 years; Royal Engineers, 7 years. On completing these periods of service a soldier serving abroad is liable to be retained with the colors for a period not exceeding one year. According to the Army estimates of 1909-10, the strength of the establishment of the Regular Army, including

India, as compared with the previous year was as follows:

	1909-10	1908-9
Cavalry	20,110	20,192
Royal Artillery	48,659	49,019
Royal Engineers	9,793	9,561
Infantry	149,797	151,534
Army Service Corps	6,806	6,811
Army Medical Corps	4,963	4,969
Colonial and Native Indian Corps	8,604	8,451
Departmental Corps	2,982	2,984
Excess Numbers	1,300	1,700
Total	253,004	255,221

In addition there were: Permanent Staff of the Territorial force, 2813; Staff and Departments, 1926; and miscellaneous establishments, 1466, making the grand total voted 183,200, exclusive of the army in India. The army estimates for 1909-10 gave the distribution of the total establishments as follows: Home, 133,259; Colonies, Egypt, etc., 45,057; India, 76,009; Total, 254,325.

The expeditionary force mentioned would consist of 5065 officers and 161,630 men, which could be readily mobilized for any service. Of this, 4992 officers and 61,977 men would be drawn from the regular peace establishment, including reserve officers, while the reserve would furnish 85,023 men. From the special reserve and from the Territorial force would be drawn a non-regular contingent amounting to 757 officers and 7360 men and 7272 men respectively.

The recruitment of the Territorial force was very active in 1909 and much enthusiasm was manifested, a recruiting march through the city of London on May 15 leading directly to the enlistment of 600 men. Training camps were held at many places and considerable progress was reported. The army estimates for 1909-10 gave the establishment of the Territorial force as below, to which are appended figures for the strength on January 1, 1909:

	Establishment	Strength
Cavalry	26,545	23,347
Artillery	47,073	31,773
Engineers	15,607	11,075
Infantry	201,807	128,584
Army Service Corps	9,013	5,731
Medical Corps	15,485	9,413
Veterinary Service	210	77
Total	315,740	210,000

On October 1, 1909, the establishment of the Territorial force was given as 11,267 officers and 302,047 men, while the strength on the same date was 9650 officers and 260,404 men. The Territorial force may be compared with the former Volunteer force, which in the three years previous to its disbandment in 1908, had enrolled the following strength: 1905, 249,611; 1906, 255,854; and 1907, 250,786.

The general staff was further reorganized by an order in council of September 20, 1909, and was divided into two main groups or divisions, the first concerned with general staff duties at the War Office and the second consisting of officers distributed in commands and districts to assist in every way in promoting general military efficiency as well as with certain prescribed duties. By Royal warrant of October 29, 1909, a reorganization of the financial system of the

army was arranged to take place on January 1, 1910, and the pay services and cash accounting of the army commands were taken over by the Army Pay Corps, the Army Accounts Department losing some of its importance.

During 1909 a number of important steps attending the reorganization of the previous years were taken. In order to solidify the mobilization and administration of the expeditionary force, as well as its training in time of peace, a gradual redistribution of peace stations was made. Improvements were made in the scheme of small arms practice and a new bayonet, as well as improved accoutrements, was issued. A more powerful field howitzer was issued to the artillery and a reorganization of the system of cavalry depots and remounts was brought about, so that not only would there be six cavalry depots for the reception and instruction of recruits, but these would be the bases of the formation of fourteen reserve cavalry regiments. A remount system somewhat similar to that of Germany was introduced and a number of changes were effected in the artillery as regards its organization. The expeditionary force was of course the main object in these various phases of reorganization, as it was designed to represent a complete and fully organized army in readiness for action, not the maximum organization towards which the nation was aiming. Therefore attention was also paid to the Special Reserve, in large part favored by the militiamen, who during 1908 and 1909 took transfer to the new branch. This branch was designed to make good the wastage of the first six months of a war. Progress was made in the development of the Territorial force, though naturally there was considerable crudeness in the organization and in the personnel, but a marked improvement over the previous year was to be noted, the various county associations and the officers and recruits manifesting considerable interest in the work. The staff and divisional organization was in progress of organization, with regular or ex-regular officers as commanders and principal staff officers. Maneuvres were held during the summer at Salisbury Plain and Aldershot, two yeomanry brigades being assembled at the former place, and a Territorial division at the latter. The formation of various reserves of officers was also prosecuted during the year, the General Reserve and the Special Reserve being formally organized and provision made for small allowances to them. An officers' training corps, though not forming a part of the army, was evolved out of the cadet corps and university corps, and was arranged to be officially supervised by the general staff at the War Office.

The army estimates gave the following total strength of officers and men in the regimental establishment of the Army, Army Reserve, Special Reserves, and Territorial Forces, all ranks. (See next page).

The army estimates for 1909-10 amounted to £27,435,000, or a decrease of £24,000 as compared with 1908-9 (£27,459,000).

GOVERNMENT. The executive authority is vested in the King, acting through his ministers. The legislative power devolves upon the Parliament, a body of two chambers, the House of Lords and the House of Commons. The latter consists of 670 elected members. The King in 1909 was Edward VII., who was born November 9, 1841, and ascended the throne

January 22, 1901. The heir apparent is George, Prince of Wales, born June 3, 1865. At the end of 1909 those of the King's ministers who form the Cabinet (formed April, 1908) were as follows: Prime Minister and First Lord of the Treasury, Herbert Henry Asquith; Lord High Chancellor, Lord Loreburn; Lord President of the Council, Viscount Wolverhampton; Lord Privy Seal, Earl of Crewe; First Lord of the Admiralty, Reginald M'Kenna;—Secretaries of State: for Home Affairs, Herbert John Gladstone; Foreign Affairs, Sir Edward Grey; Colonies, Earl of Crewe; War, Richard Burdon Haldane; India, Viscount Morley of Blackburn;—Chancellor of the Exchequer, David Lloyd-George; Secretary for Scotland, Lord Pentland; Chief Secretary to the Lord Lieutenant of Ireland, Augustine Birrell; Postmaster-General, Sydney Buxton;—Presidents of committees of the Council: Board of Trade, Winston Spencer Churchill; Local Government Board, John Burns; Board of Agriculture, Earl Carrington; Board of Education, Walter Runciman;—Chancellor of the Duchy of Lancaster, Herbert Samuel; First Commissioner of Works, Lewis Vernon Harcourt.

HISTORY

INTRODUCTION. The Parliamentary crisis at the close of the year 1909 marked the end of four years of Liberal rule. In January, 1906, the Liberals for the first time in twenty years came into power with an effective majority, for, although there was a Liberal government from 1892 to 1895, its majority was precarious, depending wholly on the Irish vote. The programme on which it assumed power in 1906 comprised the following policies: The exclusion of Chinese labor from the Transvaal, the amendment of the Licensing and Education acts, the maintenance of free trade, and the carrying out of a thorough-going plan of industrial and social legislation. In the last-named field it achieved in 1906 the passage of the Trades Disputes act, which established the principle that any act lawful for an individual was also lawful for a combination and which legalized picketing and gave immunity to trade union funds; the passage of the Workmen's Compensation act, amending the existing law and extending compensation for injuries to many new classes; and the passage of measures for improving the system of reporting accidents in the industries, securing the better treatment of crews on board ships, etc. In 1907 was passed the Small Holdings act, designed for the purpose of facilitating the purchase or lease of

lands for small holdings and allotments, which went into effect on January 1, 1908. Another achievement of the Liberal government in 1907 was the settlement at the close of that year of the impending strike on the British railways through the efforts of Mr. Lloyd-George, then president of the Board of Trade. He established conciliation boards to decide on questions of wages, hours, etc., between the masters and the men. The plan was adopted by many of the railroads and worked successfully. In 1908 the Port of London act created a port authority which should purchase and henceforth manage the London docks. Among other measures of that year were the law establishing an eight-hour day in the coal mines, and the Children's act, creating a juvenile court and containing many other clauses, all looking to the prevention of cruelty to children and the better provision for their health and safety; but the chief measure in the field of social and industrial legislation was the Old Age Pensions act of 1908, by which all persons of 70 and over, with the exception of lunatics, criminals, aliens and those benefiting under the Poor Law Relief, are entitled to a pension of 5 s. (\$1.25) a week if their incomes do not exceed \$157.50 a year. (See OLD AGE PENSIONS.) In 1909 legislation of this same class comprised a Labor Exchanges act, a Trade Boards act Housing and Town-Planning act, Development act, and other measures, which will be noted in the following paragraphs. As to the exclusion of the Chinese labor from South Africa, the Liberal policy was successfully carried out, and by the close of 1909 very few of the Chinese laborers were left in the Rand.

On the other hand, the Liberals failed to carry through the two leading features of their programme. The Education bills of 1906 and 1908 were alike unsuccessful, and the Licensing bill of 1908 was also rejected. A large part of the Liberal energies had been concentrated on these unsuccessful measures, which, down to the beginning of 1909, were the chief matters of Parliamentary discussion. In education the Liberals aimed at popular control of rate-aided schools and the abolition of religious tests for teachers. As to the liquor traffic they sought to assert the principle of State supremacy. The rejection by the House of Lords of these and other measures of social and industrial reform led to much sharp discussion and to Liberal demands for curtailment of the powers of the Upper House. Such in brief was the record of the first three years of Liberal rule. In the account that follows, the budget dispute, lead-

ing as it did to the dissolution of Parliament and the great political contest at the close of 1900 on the eve of the general election, will be treated first, and the other events of the year will be given in succeeding paragraphs.

THE BUDGET. By far the most important issues in internal politics during the year were raised by the Budget. The Chancellor of the Exchequer, Mr. Lloyd-George, introduced the Budget with a speech on April 29. The deficit amounted to about £16,500,000. This was due first to the cost of the social legislation which had gone into effect or would be proposed. The Old Age Pension law, which had passed in 1908 and had brought relief to a great majority of the indigent persons over 70 years of age, had introduced a serious item of expense, which had to be met out of ordinary revenue, for it was a permanent charge; and it would involve heavier expense after two years, when the persons assisted under the Poor Law would be eligible to pensions. Other social legislation contemplated by the government included a trade boards bill, designed to put an end to the abuses in the sweated industries; a bill for the creation of labor exchanges to bring employers and employees together; a plan for workmen's insurance; a measure for afforestation and for the encouragement of agriculture. The Opposition in general did not attack these expenditures, although a number of economists were opposed to old age pensions and to certain of the Budget measures. The point at issue was the means of raising the revenue. In the opinion of the Conservatives the basis of the new taxation should be tariff reform, especially a protective system, or at least one that afforded the groundwork for a new fiscal policy. Their chief argument hitherto had been that the maximum returns had been reached under the present free trade system, and that any further increase of revenue could be secured only by means of import duties. Mr. Lloyd-George's taxation scheme was a defiance of this protectionist argument. Without departing from the system of free trade, it found new sources of revenue either by new taxes or by an increase in the present taxes. It would block the protectionist programme effectually if, without unduly burdening the taxpayers, revenues could be raised to meet the deficit without recourse to customs duties. Much of the bitterness in the discussion of the Budget was due to this cause, as well as to the fact that the proposals seemed socialistic and in certain cases to discriminate against classes. The essential point, according to Liberal interpretation, was the removal of social injustice. On the Conservative side the principle of indirect taxation was upheld and the tendency toward state socialism in the Liberal proposals was condemned. The means of raising revenue proposed by Mr. Lloyd-George may be summarized as follows: First, as to the matter of debt reduction. During the last three years the Liberal government had succeeded in reducing the public debt with great rapidity, and it was feared that this reduction, in view of the present deficit, would be suspended, but the Chancellor of the Exchequer's plan withdrew only a small portion from the funds that were to be applied to debt reduction, namely, £3,000,000 (subsequently £3,500,000). This would reduce the amount to be made good by a new taxation from £16,-

500,000 to £13,500,000. The revenues for meeting this balance of the deficit were to be obtained from three sources of taxation: The luxuries of the masses, excess of wealth, and monopoly. These included increased duties on spirits and tobacco, the former being expected to raise £1,800,000 and the latter £1,900,000. The dealers immediately put up the price on spirits and tobacco sufficiently not only to equal the tax but to yield a profit. As to the taxation of property, the income tax on all unearned incomes and on all incomes over £3000 was increased and a super-tax was levied on all incomes of more than £5000. The estimated increase from the income tax for 1909-10 was £3,000,000, and from the super-tax £500,000. Increased succession duties were levied on great fortunes. The existing duties brought in £18,600,000; those proposed were estimated to yield £2,850,000; in addition, estates of £5000 or less were to pay no more than before, but a more rapidly progressive tax was imposed on estates between £5000 and £1,000,000, reaching the maximum figure of 15 per cent. for the latter. As to monopolies the government proposed to increase greatly the price for liquor licences, raising their yield by £2,600,000. The principle of this increase was the same as that underlying the Licensing bill which was rejected by the House of Lords in 1908, that is to say, the principle that the license to sell liquor is not a permanent property right, but a privilege that can be taken away at will by the state. By inserting this clause in the Budget it became a fiscal measure and could not be rejected by the Lords without raising a constitutional question.

Another very important and critical point was the tax on land values. Here, too, the Lords had shown hostility. There was proposed first a valuation of the selling price of all lands, and on this basis four taxes were planned: First, a tax on increment value, that is, the increase in the site value which the land has acquired; second, a tax on the site value of undeveloped land; third, a reversion tax on benefits accruing to the lessor on the termination of a lease; fourth, a tax on mineral rights, which was substituted for the government's earlier proposal of a tax on "ungotten minerals." The revised estimate of the yield from these four sources was only £600,000, but it was evident that the increment taxes would grow more productive as time went on. These were the chief objects of the Opposition's attack. The Government was accused of discriminating against the land, and the Opposition, representing largely the wealthy classes, saw in this plan a design to shift the burdens of taxation from the producing classes to the possessors of wealth. Mr. Lloyd-George's proposals were fully supported by the Government. The above items were the chief ones, but the proposals also included increased stamp duties. The following table recapitulates these items and the amounts which they were expected to yield, according to the revised estimates of October:

From the debt reduction fund.....	£3,500,000
Increased duty on spirits.....	800,000
Increased duty on tobacco.....	1,900,000
Super-tax and increased income tax.....	3,200,000
Increased succession duty.....	4,150,000
Increased price of liquor licenses.....	2,100,000
Land duties	600,000
Increased stamp duty	900,000

In the debate that immediately followed the presentation of the Budget on May 3 and 4 the Opposition denounced the abolition of the sinking fund, saying that it would lead to extravagance. They declared that the tax on vacant lands would harass the people who wished to sell them, that the principle of the unearned increment was unsound, that the new taxes imposed on the rich were likely to drive capital out of England, that the new income tax would be evaded and was inquisitorial; that the government was laying a heavy burden on English beer, but not on foreign beer. As to the charge that it was attacking landed property and inclining to socialism, the Government replied that it was idle to call a tax on the unearned increment revolutionary, for the policy was actually applied in many Continental centres and with success, and that the Conservatives, if they came to power, would be sure to adopt the new taxes to which they were now objecting. Moreover, if capital should be driven out the government asked to what country could it fly, for all countries at the present time were hard pressed in the matter of raising revenues and were levying heavy taxes.

In the Commons the resolution authorizing the new license duties in the Finance bill was carried on May 10. By this brewers would pay only two and three-fourths d. per barrel. The Government in reply to criticism that this bore heavily on industry said that already liquor dealers were preparing to charge £20,000,000 to meet a levy of only £4,000,000. The duties on imported beer were allowed on May 11, and at the same time the excise duty of 3d. on the pound for liquor sold in clubs. Among the specific objections advanced against the details of the Finance bill, the following may be mentioned: The land tax was criticised as invidious. It was said that there was no reason for taxing land differently from any other kind of property. The tax on "ungotten minerals" was mercilessly ridiculed, and after a time this was withdrawn by the government. The increase of the income tax on incomes of over £5000 was condemned as preparing the way for an intolerable extension. To questions raised in regard to stamp duties the Government replied that the charge was less than in any other country in Europe. It had been said against them that they doubled the duties on transfer of property. The estate duty, the increased settlement duty and the other death duties were carried in the House of Commons on May 20, and a few days later the customs duty and additional excise on spirits, the increased excise on tobacco, the duty on motor spirits, the increased duties on licenses, and the provisions as to land valuation were also carried. In the debate on June 7 the Budget was attacked for introducing oppressive confiscation, raising more money than was needed, violating the principle of taxation for revenue only, distributing the burden unfairly between Ireland and Scotland, imperiling the interests of certain classes and trades, for example hotel keepers, restaurant keepers, distillers, landowners, small cultivators, insurance companies, friendly societies which had invested in mortgages and ground rents, tradesmen and working people who had invested in small house properties, men interested in land development near towns, etc. The measure was condemned as socialistic and the real authors were said to

be Mr. Snowden and the Labor party. The general defense was that it found money without adding to the duties on the necessities of life and that it taxed superfluities. It was denied that capital would leave the country on account of these impositions. It was admitted that it was a blow at fiscal form and it was frankly approved as a triumph of free trade. The Opposition's amendment for the rejection of the measure was lost by 368 to 209. In place of the clause taxing "ungotten minerals," the Premier announced on August 11 that the Government offered a duty of five per cent. on mineral rents. The objections to the death duties were brought out in a debate in September. The chief complaint was that they were paid out of capital and would greatly complicate settlements. The super-tax of 6d. per pound on incomes of over £5000 was condemned by some for its discrimination against a small class, but Mr. Balfour declared that by comparison with the other features of the Government programme it was not objectionable. This at least came out of income, he said, whereas the death duties came out of capital. The only proper measure was a tax on imports, but as the Government would not consent to this, he did not think the super-tax a bad alternative. The Government was also criticised for its inroad on the sinking fund, and this criticism was renewed when Mr. Asquith on October 29 moved a further reduction of £500,000 beyond the £3,000,000 already demanded. When criticised for not judging the amount more nearly in the first place, he said that he had expected from the beginning that he might require even a million in addition, but that less was necessary owing to the greater yield from the death duties than had been expected. From whiskey, on the contrary, less was returned than had been anticipated. This was due to the fact that people were curtailing their consumption. In general the Government was blamed for extravagance. Despite their promises of economy they had raised expenses in four years from £151,750,000 to £162,500,000.

DEBATES ON THE FINANCE BILL. The bill was in the committee stage from June 21 to October 6. A great many important modifications were then introduced by the Government. The debates on this important measure during the month of November down to the day when Lord Lansdowne moved its rejection in the Lords, thus raising one of the most serious issues in the Parliamentary history of the country for many years, may be briefly summarized. On November 4, Mr. Redmond, as spokesman for the Nationalist party, announced that although the members of his party favored the land taxes, they were strongly opposed to the license duties and the increase of the whiskey duty. They intended therefore to abstain from voting in the coming election. They would not, however, support the action of the Lords in the impending constitutional crisis. Much as they objected to these measures, they considered the Budget a less serious evil than the threatened disruption of the constitution through the action of the Lords. The Chancellor of the Exchequer made a temperate speech on this occasion in which he congratulated the House on having put through to its present stage so complex a measure and without having had recourse to closure. The main

point, he said, was that the Government faced a deficit of over £16,000,000 this year and would need more money next year. The Opposition had objected to every tax that would bring in money. They favored, he believed, a tax on the foreigner, but that was the most foolish of all suggestions that had been made. He declared that in the present Budget his party had provided revenue for objects that would insure the security of the State and the well-being of the people and by means that would remove the burdens from industry and promote the prosperity of every class. Mr. Balfour declared that this was not the proper time for the discussion of tariff reform, but that he wished to make one point clear: The Opposition firmly believed that the great difference between the Government proposals and tariff reform was that while the former was mischievous, the latter would benefit the whole community, and especially the working classes. He denied the charge that tariff reform would throw upon the working classes burdens which would otherwise be borne by the rich. The main objection to the Budget was not the taxes which it levied on the rich, but the arbitrary selection of the kind of property to be taxed. The Chancellor declared in effect to one man that although he had £5000 a year he would be let off, but to another man having exactly the same income, but drawn from a different kind of property, that he must pay a special contribution. This was an indefensible system. The Budget was socialistic, said Mr. Balfour, inasmuch as it struck at the security of property. "We hold that for an industrial community with numerous rivals around us it is madness to tamper, as the present Government are doing, with the rights of property. The Government are destroying confidence, and with confidence they are destroying enterprise and initiative. . . . They are making it more difficult for this country to engage with success in the great industrial fight which is going to be the great question of modern national politics." Mr. Asquith, the Premier, declared that the Opposition were "battling with ghosts and fighting shadows of their own creation." He made light of the familiar bugbear that the taxes would drive out capital. The Opposition desired a tariff which would place the burden upon the necessities of life. The Government scheme taxed values which came from monopolies and were not the fruit of individual exertions. The bill would be carried by an overwhelming majority of the House of Commons, which was the sole constitutional authority in matters of national finance. The greater issue would then arise as to the continued supremacy of that House in view of the threatened action of the House of Lords. It was known at this time that the bill would be rejected by the upper House on the ground that they ought not to pass a measure of this nature until the country had been consulted. On November 16, Lord Lansdowne gave notice in the upper House that he would introduce a motion to this effect when the bill came up for a second reading. As the crisis approached, important speeches were made outside Parliament by the leading men of both parties, including Lord Rosebery, Mr. Balfour, Mr. Asquith, Mr. Churchill, Mr. Lloyd-George, and many others. The final debate began in the House of Lords on Monday, No-

vember 22, when the motion for the rejection of the Budget was introduced.

This day's session is the most important in the history of Parliament since the rejection of the Home Rule bill of 1893; and there were but two other Parliamentary crises to be compared with it in a period of nearly eighty years, namely, the Reform bill of 1831 and the Representation of the People bill of 1884. The House was crowded and there was every sign that the importance of the issue was fully appreciated. There was, however, little excitement and the proceedings went on with a deliberation and dignity that contrasted with the bustle which characterized the lower House on similar occasions. Lord Crewe, on behalf of the government, merely moved that the bill be read a second time. Lord Lansdowne thereupon introduced the motion, "That this House is not justified in giving its consent to the bill until it has been submitted to the judgment of the country." In his speech on behalf of the motion he advanced the following arguments: The attitude of the House of Lords was that they could not undertake the responsibility of consenting to the bill until they knew that it was the wish of the people that it should become a law. Apparently the government supporters wished the bill to be put through without debate, as if it were a non-contentious matter of ordinary departmental routine. He was not aware of any authority that prevented the House of Lords from amending or rejecting the bill, and he challenged its supporters to cite any such authority. The course of the House of Lords was unusual, but this was an unusual Budget. It was not to be expected that the House of Lords would dispense with their constitutional privilege. The right of the House of Lords to reject a finance bill was recognized in the resolution passed by the House of Commons in 1889 and it existed to-day. The House of Commons itself was guilty of a new departure in its practice of tacking to finance bills all sorts of measures for the purpose of forcing them through. The present bill was a jumble of financial proposals and the House of Lords was told that it could not change a single word in it. It was told that it could not deal with the question of land valuation because it was included in a finance bill. Yet the competence of the House of Lords in this matter was shown by their rejecting the Scottish Land Valuation bill of 1907. In 1908 the Lords rejected the Licensing bill. The present bill cynically put forth proposals based on the very principle which the Lords had denied. If the House of Commons could graft on the Finance bill a Licensing bill and a Valuation bill, what would prevent their grafting also a Home Rule bill? Under the circumstances it was the clear duty of the Lords not to decide on the final overthrow of the bill, but to insist that before it became a law the opinion of the voters should be taken upon it. In regard to the income tax he wished to know what had become of the reserve upon which the Chancellor of the Exchequer relied for national needs, and in regard to the death duties, he said that they went far beyond the point at which they endangered the home and family fortunes. He condemned the licensing proposals as bad finance, as well as bad temperance policy. Interminable litigation would result from the land tax and

valuation clauses and the State would be involved in wholesale land-jobbing transactions. He characterized the land taxes as unjust and unproductive, as taxing the people on what they did not have, as taxing the same people over and over again, as discriminating against a particular class, as obstructing the land market, and as based on a socialistic fallacy. As to the traditional policy of free imports, he declared that the country was falling behind other countries every day and that this isolation was increasing. He concluded by reminding the House that they were not rendering a final verdict on the bill, bad as it was.

In the Lord Chancellor's reply he made a distinction between the legal and constitutional aspect of the question, saying that while the House could reject the Finance bill under the law, it could not do so constitutionally. Such action had not been taken for centuries. In important matters the country was governed by precedent more than by law. He denied that there was anything wrong in the so-called tacking of certain measures to the Finance bill. The fact that the government had brought in a Licensing bill in 1908 was no reason why they should not increase existing laws. That was a bill dealing with a particular subject. This was a bill providing revenues for the year. Although small bills dealing with money matters might have been rejected by the Lords, they had never taken such a course in regard to bills providing for the year. Such a bill had never been touched. The Crown addressed the House of Commons alone in asking for supplies and never the House of Lords. The House of Commons always passed the money resolutions and without the authority of the Lords. The House of Commons had the power of the purse. Never before in the history of that House had they been confronted with a question resulting from the stoppage of supplies. At the present crisis the Lords were directly invading the prerogative of the Crown and the privileges of the Commons. The latter were asked to surrender the power of the purse. Such a course would transfer enormous power to the House of Lords which would hold the Government of the day in the hollow of its hands. On the one hand there had been a vast increase in wealth, on the other hand a vast increase of pauperism, unemployment, crime, and physical deterioration. The Government had done all that it could to remedy these evils. The taxes proposed tended in that direction. Other taxes would fall on the necessities of life and to these the Government was unalterably opposed. The land tax did not proceed on any new principle. Lord St. Aldwyn in 1904 had advocated a tax on land values near towns. This principle had long been recognized, not only by the Liberals, but by many of the Conservatives. If the Budget did not work well the new tax might be repealed. An appeal to the country would certainly raise a constitutional question and an issue between the two Houses. No Liberal Government would bear for another four years the sort of treatment that the present government had undergone. If the coming election failed, the struggle would only be begun and it could end only in one way.

Lord Cromer made a noteworthy speech, in which he condemned the Budget, but declared that in the present circumstances he felt con-

strained to vote against Lord Lansdowne. It was better to accept the Budget than to precipitate this constitutional issue, nor did he believe that protection was the best weapon to be used against Socialism. Other notable speeches were those of Lord Rosebery and Lord Milner on November 24. Lord Rosebery repeated the opinions which he had previously expressed and which prevented his voting for Lord Lansdowne's motion. As to the distinction which the Lord Chancellor drew between the law and the constitution, the practice of centuries in the matter of letting money pass through had not been quite unbroken. The Budget of 1894, though objectionable, passed through without opposition, but he thought that the House of Lords at that time might have had in view the particular position of the lower House. The House might reject the bill on the ground that it did not serve the interests of the country. There was one unquestionable principle of the constitution, namely, no taxation without representation. The Lords were accused of holding enormous quantities of land. This land was taxed abundantly and without a word or a vote. It was an indispensable condition to the exercise of any dormant power that the circumstances must be exceptional and that the nation must be behind it. He believed that the Budget was of vital importance and that it poisoned the sources of national supremacy, but the strength, efficiency, and power of the second Chamber was more vital. The measure before the House was exceedingly dangerous. It seemed both crude and vindictive. The Chancellor of the Exchequer had brought forward 250 amendments to it on the report stage. It had already done great damage and destroyed confidence. Vast sums formerly invested in this country were seeking investment elsewhere. Every kind of commercial enterprise was blocked. If the Lansdowne motion could refer the subject to the nation without danger of their mixing it up with other issues he would rejoice, but in a general election the question of an unreformed second Chamber would certainly be associated with all the Budget questions. This was not the best battlefield on which to risk the powers and perhaps the existence of the House. The value of the House of Lords was never greater than at present, when measures of this nature were thrust upon them. He warned the House against taking any action that would weaken its power. In rejecting the Budget they were doing what their enemies wished them to do. He was sorry with all his heart that he could not give a vote against the Budget. He would have the bill passed and then judged by its effects.

Lord Milner referred to the difficult task before the Chancellor, saying it was impossible to complete it within a single year. The accumulative wealth of the nation was not progressive; it was alarmingly stationary. It was dangerous to attack any source of revenue that had ceased to expand. The death duties were the worst feature of the Budget, but all its taxes were bad. The right method was to levy import duties. Effective speeches were also made by Lord Morley, Lord Curzon, and others. On November 30 the Lansdowne motion was carried by 350 to 75. On December 2 Mr. Asquith in the House of Commons moved: "That the action of the House of

Lords in refusing to pass into law the financial provision made by this House for the service of the year is a breach of the Constitution and a usurpation of the House of Commons." The motion was carried by 349 to 134. On the following day Parliament was prorogued. The date of dissolution was fixed on January 8, to be followed by the general elections. The leading issues in the campaign were the Budget, the veto power of the House of Lords, and, later, Home Rule, Mr. Asquith in a public declaration having committed his party to the granting to Ireland a measure of Home Rule. The contest, which was going on at the close of the year, was the most spirited as well as the most important as regards the principles at stake of all the political campaigns of recent years.

THE OPENING OF PARLIAMENT. Parliament was opened on February 16. As to foreign relations, the King's speech referred to his recent visit to Germany and the friendly feeling displayed on that occasion; to the progress toward the settlement of questions pending between the United States and Great Britain, the Newfoundland fisheries dispute, and the question of waterways (See CANADA, paragraphs on *History*); to the renewal of the arbitration agreements with France, Spain, and Italy; to the course of the government in relation to Persia, where the disturbed conditions caused anxiety and prompted the government, while observing strictly a policy of non-intervention, to interchange views with Russia as to a measure that might tend to the establishment of representative institutions and orderly government in Persia, the economic and commercial interests of Great Britain and Russia being imperiled by the present state of affairs; to the Italian earthquake and the sympathy and aid offered by British subjects to the sufferers; to the international conference in London for an agreement on questions of maritime law, whose decisions were to be submitted to Parliament for the necessary legislation to ratify the International Prize Court Convention; to the prospects of a satisfactory settlement of the Balkan question. In Imperial affairs the speech referred to the favorable reception of the Indian reform proposals and of the constitution drafted by the South African Union Convention. As to the measures that would be submitted to Parliament, these would comprise a bill embodying the Indian reform proposals, the Irish Land bill, and the Housing and Town-Planning bills; bills for establishing trade boards in sweated industries; for altering the law of elections and registration in London; for prohibiting the landing and selling of fish caught in prohibited waters adjoining Scotland; for amendments of the laws as to inebriates, the milk supply, and the hours of labor in shops, and such amendments to the Old Age Pension act as should remove inequalities of treatment.

The Report of the Poor Law Commission was announced and measures were promised for the organization of a labor market through a system of labor exchanges, and perhaps in connection with that measure other means of relieving unemployment. In the discussion that followed the Speech from the Throne the Opposition referred to the disorders in Ireland, noted in a subsequent paragraph. It attacked the government for its folly in rejecting every com-

promise in tariff matters which might secure preference for British products and characterized its course toward voluntary schools as vindictive and designed to avenge on them the failure of its education bills. Premier Asquith in reply admitted that the condition of Ireland was bad, but denied that the Government was remiss in the execution of the laws. He repudiated also the charges of financial folly and extravagance. The Labor members in the course of the discussion of unemployment held that the government plans were inadequate. The government in reply pointed to the heavy expenses that they had incurred and would incur on this account.

IRELAND. In the early part of the year the newspapers teemed with items about the "terrorism" that prevailed in Ireland, and there was sharp criticism of the Birrell administration for permitting these abuses. "Cattle driving" was still frequently reported and a number of murders and outrages occurred. Some of the newspapers went so far as to call it virtually anarchy. The "terrorism" was attributed to the "United Irish League" and its instruments, but owing to the laxity of the government, it was said, the most flagrant violations of the law went on with impunity. The government was blamed for not employing the powers conferred upon it by the act of 1887, or even properly enforcing the ordinary law. It was publicly charged in the newspapers that parts of Ireland were more dangerous to live in and in fact more barbarous than other parts of the empire, and that the government knew this, but took no measures to improve conditions. Lord Lansdowne in discussing the Speech from the Throne asked how long the reign of terror in Ireland would endure and censured the government for relying upon the ordinary law, which it knew to be inadequate. In a subsequent debate in the House of Lords boycotting was said to be so dangerous that one insurance company had refused risks to any persons against whom a boycott had been declared. No civilized country, said the Opposition, permitted such terrorism.

Mr. Birrell replied to these accusations, saying in the first place that they were greatly exaggerated. He read a detailed report on each Irish county, which indicated, as he said, that the bad conditions were merely local and not typical of the whole country. "Cattle driving" was, he said, on the decrease. The government had done all it could against it, but most of the outrages were committed by individuals and it was impossible to get evidence. Where there was unlawful assembly evidence could be had, but out of 681 cases unlawful assembly was a feature in only 100. The government was not negligent in the matter and did not palliate the crime of "cattle driving" or of boycotting. But the Crimes act of 1887 was useless for the suppression of the boycott. The difficulty lay in the detection of the criminals. Revolvers were illegally carried, but so they were in England. He favored legislation against the carrying of weapons if it applied to the whole country. As to the firing into dwelling houses, the difficulty was to catch the criminals. The government did not feel warranted in asking for exceptional powers or in enforcing the Crimes act. The trouble arose from the efforts of the

landless men, encouraged by the Land Purchase act of 1903, to get possession of untenanted lands. The Government had already retorted to the Opposition that present conditions resulted from a measure which they themselves had passed, namely, the Land Purchase act, and that the reason why they did not enforce the Crimes act was that they regarded it as a useless weapon. The Opposition continued its criticisms and in general ridiculed the Government for trying, as they said, to put down "cattle driving" under a statute of Edward III., as a result of which they could merely bind the offenders over to keep the peace. At the Irish National Convention held at Dublin on February 9, a resolution was passed declaring in favor of Home Rule and expressing confidence in the Irish party. It also resolved that the Irish language ought to be included as a necessary subject for matriculation in the Irish National University. See paragraph below, *Irish Land Bill*.

POOR LAW COMMISSION REPORT. The report of the Royal Commission on Poor Laws and the Relief of Distress, which had been sitting for a little over three years, was published on February 17. The majority report proposed the following measures of improvement: The reorganization of the administrative system by abolishing the Guardians, substituting for the union area a larger area and for the workhouse a system of classified institutions, replacing the term "Poor Law" by the term "Public Assistance," and establishing as the new responsible authority a Statutory Committee of the county or a County Borough Council, which should be helped and advised by the local Public Assistance Committee, and which was to make more effective the co-operation between voluntary and legal charities. As to existing evils and their cause and remedy, it noted among other points the following: The present educational system was defective and resulted in sending out into the community pupils who preferred clerical to manual labor, although the market for the former was already overcrowded. The schools failed to look after children over 14 years of age when they left the schools, or to do anything to prevent their swelling the numbers of the unemployed or casual workers. The problem of vagrancy was serious. Able-bodied loafers and tramps drifted in and out of the workhouse. "Detention colonies" were recommended for these idlers and for vicious persons whose families became chargeable. Although there was a decrease of three and nine-tenths per cent. in the total number of paupers between the period 1871-80 and the period 1896-1906, this was due solely to the large decrease in the number of children, and a slight reduction in the number of women, while male pauperism largely increased. Expenses rose from £8,000,000 in the former period to £14,000,000 in the latter. The administration of relief was defective.

The Report declared that workhouses tended to the deterioration of their inmates, especially children, and recommended specialization of treatment, that is, special institutions for special classes, so that the aged might have especially humane treatment, loafers might be disciplined, etc. This principle of specialization, together with individual treatment of each case and each

class of cases, were the main features of the reform proposals. The problem of unemployment was assuming more menacing proportions as the young and middle-aged tended steadily to drift into the ranks of casual labor, although skilled labor was at a premium. The workhouses have increased inefficiency; giving money without work has demoralized and employment relief has, in general, been unsuccessful. The Report commanded the Salvation Army and Church Army for their work in the lower grades of the unemployed and the practically hopeless cases, and it urged that they should be so organized as to be free to give attention to individual cases. The Report declared that the Unemployed Workingmen's act had failed of its object and should be discontinued. In addition to the Public Assistance authorities the Commission proposed councils of voluntary aid and committees of voluntary aid which should be recommended by the local authorities; also a great increase in the powers of the Local Government Board; also the increase of the Exchequer grant to £5,000,000, the Local Government Board to have the power to withhold the grants if the new Public Assistance authorities are inefficient. The remedies proposed included: First, Education and training; the keeping of boys at school until 15 years of age, putting them back in school if not properly employed; better means of technical education; physical drill; special means of information to boys, parents, and teachers as to opportunities of employment to be organized in connection with the labor exchange; the substitution for the present unduly literary system of elementary education a more practical one better suited to industrial life. Second, Labor exchanges: A national system was proposed. It was to be organized under the Local Government Board and maintained by it for the purpose of promoting the mobility of labor and supplying data as to employment. Third, The central government, as well as local and public authorities, should be required, so far as possible, to regularize employment and reduce casual labor. Fourth, Insurance against unemployment was recommended through the subsidization by the Government of the unemployed funds in the hands of trade organizations. The minority report, while accepting in the main the above criticisms of the present system, made certain reservations and recommended especially the establishment of a new Minister of Labor, to be responsible to the government, the "regularizing," so far as possible, of the national demand for labor by arranging a part of the ordinary work of each government department on a ten years' programme, and the adoption of new laws for compulsory reduction of hours of labor.

THE NAVAL QUESTION. One of the most discussed topics of recent years has been the subject of Imperial defense. Great alarm has been expressed from time to time over the alleged lack of readiness for war. The subject was frequently before the public in 1908 and in certain quarters the agitation assumed a somewhat hysterical form. The general public appeared not to be disturbed. Early in 1909, however, there were signs of a popular awakening on this subject. The slow recruiting of the Territorial force had often been remarked. It occasioned many warnings as to the country's military status. A great sensation was caused by the

production of Major Du Maurier's play, *An Englishman's Home*, showing the consequences of an imaginary invasion of the country by a foreign Power, presumably Germany, and public interest was also aroused by a campaign of one of the newspapers. The apathy of the public was partly dispelled. Recruiting began to go on more rapidly in February and a number of great parades aided in drawing public attention. But the main cause of alarm and the chief subject of discussion in relation to Imperial defense was the slow increase of the British navy as compared with Germany's supposed rate of naval construction. For three years the Government had tried to keep down the Naval Budget and it had hoped to do so during 1909, but in view of Germany's very extensive naval programme this was impossible. Her general plan included the laying down of a number of large vessels and three of them, which were planned for 1909, were actually laid down in the autumn of 1908. It was necessary to increase the British naval programme if it were to keep ahead of Germany. This meant of course a heavy addition to the Naval Budget. A debate on the increased navy estimates began in the House of Commons on March 16. The Government declared that the increased burden was absolutely necessary to insure Imperial safety. The total strength of the British navy in *Dreadnoughts* and *Invincibles* in 1911 would be 12 *Dreadnoughts* and 4 *Invincibles* against the 13 German battleships of the same class provided for, but the German programme, it was said, called for the laying down of four more in 1911 and thus Germany would have 17 by April, 1912; so Great Britain if it were to hold its lead must have four more ready by that date, thus making the ratio 20 to 17. Although the vessels of the other types, such as the *Lord Nelson*, *King Edward*, *Formidable*, etc., were not now obsolete, they would be in the future, and although Great Britain's armored cruisers of other types than the *Invincible* were superior to those of other navies they could not be called into the home waters in case of war. The amount that Great Britain would spend—£35,000,000—greatly exceeded the German outlay according to the German Naval Budget, but in reality the civil expenditures under the German system included important contributions to the navy. The Opposition condemned the Government's plan as inadequate. Mr. Balfour declared that the basis now was evidently a one-Power and not a two-Power standard, that it was possible for Germany to have 25 *Dreadnoughts* by April, 1912, and that she might at least have 21 on that date. The Premier, Mr. Asquith, declared that Germany should have only 16 in March, 1912, and that even if she increased her rate of building would have only 17, whereas Great Britain would at that time have 20. He emphasized the friendly relations with Germany but admitted the need of self-defense and of making the British rate of construction turn upon the German rate.

Naval estimates for 1909-10 were £35,142,700 or £2,823,200 more than the year before. The Opposition persisted in an alarmist view of the situation, declaring that while naval supremacy was safe for the present it would be hazarded in 1910 and still more so in 1911. The Government, on the other hand, continued to deprecate this alarmist spirit, declaring that there was an unpatriotic tendency to misrepresent the situation and undervalue the strength of Great Britain's navy. It dwelt upon the friendly re-

lations between the two countries, the improbability that Germany would increase her rate of building and the great preponderance of Great Britain under present conditions. The Opposition continued to press the question and finally moved a vote of censure which declared that the Government did not sufficiently provide for the safety of the empire in its naval programme. The motion was introduced on March 29. The Opposition declared that the Government ought not to be influenced by the self-interested statements of Germany as to her naval programme, and that it ought at once to provide for 8 ships of the latest *Dreadnought* type (*Neptunes*) so that there should be 16 *Dreadnoughts* by August, 1911, and 20 by December, 1911, as compared with the 13 and 17 of Germany on those respective dates. Sir Edward Grey made a moderate speech on behalf of the government which was much commented upon at the time. He said that the government should not pledge herself to the building of 8 *Neptunes*, as it was not clear that they would be necessary and moreover if they were ordered now they would reach completion no sooner than if they were ordered in July. At that time the shipbuilding vote would come up and it would be early enough to consider the matter if the Opposition saw fit to make it a party question. He said the Opposition really presented the very maximum of improbabilities. The situation was sufficiently grave without this exaggeration, for Germany would have when her navy was completed a fleet of 33 *Dreadnoughts*, the most powerful navy that the world had seen, and Great Britain to exceed that pace must rebuild her entire fleet, but the period within which this great work must be completed was uncertain. The orders must not exceed the capacities for building. Great Britain was superior to Germany in her capacity for building hulls and for manufacturing the machinery and the big guns. Her weak point was in gun-mountings, but here the Admiralty had already taken steps to secure advantage and the government felt safe. As to the relations with Germany they had begun to improve after the Algeciras Conference and this improvement was enhanced by the recent interchange of visits on the part of the King and Kaiser. The chance of peace was good and although there would be a menace in any British attempt to isolate Germany or any counter-attempt of Germany against Great Britain, he saw no risk of either. The government held that British naval construction must depend on the German rate of increase and that it must maintain the superiority of the British navy. While Great Britain would like to come to some agreement as to a naval programme with Germany, there was no denial of the fact that the British Empire's continued existence would be imperiled by German naval superiority. He declared that he accepted in good faith Germany's assurance that she should have no more than 13 *Dreadnoughts* till 1912. Germany was not bound by this declaration, but he did believe that it proved that she would not have 13 *Dreadnoughts* in December, 1910, as had been contended.

Another consideration that was very important to bear in mind was that Germany might not build vessels of the *Dreadnought* type. It enhanced the danger of ordering new vessels now. This point should be considered in connection with the four hypothetical British ships that were to be laid down later. If there were

any change in the programme Germany might hurry also. At present Great Britain had 5 *Dreadnoughts* in commission and 7 building. Four were to be laid down in 1909, thus making 16 in all. Four more might be ordered in advance without detriment to the government's next year's programme. There was no sign that the Admiralty had underestimated the seriousness of the situation, and the Government could not withdraw from the competition with Germany if Great Britain was still to count among the great nations. The vote of censure was lost by 353 against 135. Another naval debate took place on July 26, when Mr. M'Kenna declared that the four hypothetical ships would be laid down at the end of the fiscal year and completed by March, 1912. This had been resolved he said after careful study of the construction plans on the part of foreign powers. Of the first four vessels one was already laid down and another would be within a few days. During the last three years Great Britain had laid down 8 ships and Germany 11 and if the same comparative progress was made there would be an end to British sea supremacy in 10 or 15 years. There was no present danger, but if there were no agreement upon disarmament, for which Great Britain was always ready, British sea power would fall behind, unless the Government took some action. It would not be necessary to lay down the keels of the new vessels till April, 1910. The Opposition condemned this plan as a compromise. Mr. Balfour said that it might crowd the construction of 12 *Dreadnoughts* into the next year and that in the latter part of 1911 Great Britain would have only one more than Germany.

There was considerable discussion as to the precise meaning of the two-Power standard as employed by the Government and on May 26 Mr. Asquith defined it. He said that it did not mean strength in *Dreadnoughts* and *Invincibles* alone, but in total effective defense strength. In these respects the British navy was to be superior to any two other Powers. It was not a precise rule but a convenient one as representing the aim of British naval policy. Mr. Churchill in an address to his constituents had declared that the United States was not to be reckoned as one of the Powers in making comparison because it was not to be supposed that the United States would be found in any combination against Great Britain. In reply to a question on this point, however, Mr. Asquith said that the United States was not excluded, but referred to what he had already said as to nations so geographically situated that they could not be reckoned on the same footing in this matter as France and Germany. Among such nations were the United States and China.

REPORT OF DEFENSE COMMITTEE. In consequence of the criticism referred to in a previous paragraph of the country's lack of readiness for war a Committee on Imperial Defense was appointed in the House of Commons. The results of its deliberations were announced on July 29, by the Premier. Among the subjects discussed were the defense of India, the question of transit across the Channel, aerial navigation, the Forth and Clyde Canal and a plan for the various garrisons throughout the empire. The question of a possible invasion and its results, which had been the subject of much alarmist discussion in 1908 and was more vividly present in the public mind after the production of Du Maurier's play, was especially investigated.

The Committee reached the conclusion that even though an invasion took place when the regular forces were away it was doomed to failure so long as British naval supremacy was maintained. On the other hand the army for home defense should be of sufficient strength to repel any raids and the War Office should aim at keeping in readiness a force that could cope with an invading army of 70,000 men. A sub-committee was appointed to consider the serious criticism of the naval administration contained in a letter from Lord Charles Beresford to the Prime Minister on April 2. Lord Charles, who had completed his two years' service as commander-in-chief of the Channel Fleet on March 24, declared that the Admiralty's provisions were inadequate for the country's safety in the event of war and that the fleets in home waters were not kept in readiness for war, the deficiency in small craft and destroyers being a serious weakness, and that he could not obtain any strategical plan as to the disposal of the forces of war. The sub-committee reported that these complaints rested on no substantial ground.

IMPERIAL DEFENSE CONFERENCE. An invitation to a Conference on Imperial Defense was issued on April 30 to Australia, New Zealand, Canada, Newfoundland, Cape Colony, Natal, the Transvaal, and the Orange River Colony. It held its first meeting on July 28 and remained in session during the following month. Its official title was A Conference with the Representatives of the Self-Governing Dominions of the Naval and Military Defense of the empire. Its chief purpose in naval matters was to "determine the form in which the various dominion governments can best participate in the burden of Imperial Defense with due regard to varying political and geographical conditions." The general principle laid down by the Admiralty and accepted by the Conference was "that a dominion wishing a navy should aim to form a distinct fleet unit." The regulations concerning the training of the personnel should be similar to those of the Royal navy, and the standard of vessels and armament should be uniform to admit of interchange and union between the British and dominion services. Canada and Australia would found fleets of their own, while New Zealand would adhere for the present to the policy of contribution. As to military defense the main principle agreed upon was "that each part of the empire is willing to make its preparations on such lines as will enable it should it so desire to take its place in the general defense of the empire." Another important object sought was the interchangeability of forces between the different parts of the empire. A sub-conference on military defense recommended specifically the form that the organization and direction of the new dominion forces should assume. It declared that the war establishment of the home regular army should be the model for each dominion to follow as closely as possible. The Premier announced to the House of Commons on August 26 the plans which the Defense Conference had recommended.

THE INDIAN COUNCILS BILL. When the Indian Councils bill reached its second reading in the House of Lords on February 23, Lord Morley defined its objects as follows: It was designed to amend and extend the acts of 1861 and 1872 so as to enlarge the Governor-General's Legislative Council and the Provincial

Legislative Councils; to provide for the election by popular vote of a certain portion of the members of these Councils and for greater freedom of discussion and question, especially in financial matters; to establish executive councils in the Provinces in which they did not now exist and to reform the Councils of Madras and Bombay; and to provide for the appointment of the vice-presidents of the Councils. Lord Morley declared that he was willing to accept two of the demands of the Mohammedan element, namely, a separate electorate and a representation in the legislative councils in excess of their numerical proportion, but that he would not accept the third demand for the presence in the Viceroy's Executive Council of two natives, of whom one was to be a Mohammedan. The general tenor of such criticism as the bill encountered in the House of Lords was that it gave India parliamentary institutions before she was ready for them. After some discussion the Lords struck out clause 3 of the measure, which provided for Provincial Executive Councils (March 4), but this was restored when the measure came before the Commons. The bill was read in the Commons for the third time on April 27, and finally passed the Lords as amended in the House of Commons, after Lord Morley had offered a compromise confining the Viceroy's power to form Executive Councils in the first place to the Bengal province of the Presidency of Fort William, and requiring that, if Executive Councils were proposed for the other provinces, the proclamation creating them should be first laid on the table of both Houses for sixty days and should not go into effect if any address were made against them. The bill received the Royal assent and in November the government of India issued the orders for carrying it into effect. See INDIA, paragraphs on *History*.

TRADE BOARDS BILL. The object of the Trade Boards bill, which was to go into effect on January 1, 1910, was to put an end to the sweating system, and for this purpose it created commissions consisting equally of workingmen and employers, which were to decide in connection with an arbiter upon a minimum wage for certain trades. It also contained provisions as to piece work and prescribed the penalties for not paying the required rate. The system would be extended to other trades in which the same abuses existed. The minimum wage principle was recognized in certain Australian laws which had on the whole worked out well. The bill reached its second reading in the House of Commons at the close of August, and passed both Houses in the autumn.

LABOR EXCHANGE BILL. The Government's plan for Labor Exchanges was explained on May 19. Its object was to promote mobility of labor by bringing together employers who needed workingmen and workingmen who needed employment. It contemplated the creation of Labor Exchange Offices in all towns. The country was formed into ten divisions, each with a clearing house, and there was also to be a central clearing house in London. Each large centre was to have a joint advisory committee, consisting of representatives of both employers and employed, under the chairmanship of an independent permanent officer. Mr. Churchill, who was the author of the plan, estimated that the cost of constructing the necessary buildings would be at first £200,000 a year and later

£170,000. He expected it to be in working order during the early months of 1910. He hoped that it would receive the support and co-operation of the trade unions. It reached its second reading in the House of Commons in June, and was soon afterwards passed by both Houses. It received the Royal assent on September 20.

PLAN FOR UNEMPLOYMENT INSURANCE. The proposals for workingmen's insurance were explained to the House of Commons by Mr. Churchill on May 19. The principle involved was compulsory contribution from employers, employees and the state. It was to apply first to the three great national industries of building, engineering, and naval construction, including about 2,500,000 workingmen, that is, about one-third of the workingmen in the United Kingdom. Mr. Churchill estimated that in these trades occurred half and the worst half of the cases of unemployment. The trades included house-builders, ship-builders, tool-makers, vehicle-makers, sawyers, and in general those engaged in works of construction and engineering. The scale of benefit was on the whole lower than in the trade unions. The plan contemplated weekly payments, a little more than sixpence a week per capita being raised from the employers, workingmen, and state subvention. All engaged in the trade were to contribute. The plan was generally well received and was especially pleasing to the Labor members.

HOUSING AND DEVELOPMENT BILLS. The Development and Road Improvement Funds Act was designed in general for the promotion of the economic development of the United Kingdom. It authorized the treasury to make loans and to apply the money to afforestation, the reclamation of land, agricultural improvement, rural industries, harbor improvements, canals, rural transportation, the development of fisheries, etc. It provided also for a Road Board to carry out improvements in facilities for motor traffic. The forests in England were neglected. The Crown did not possess large forests, as was the case in Germany and France, but only scattered patches. The forests were ill-cared for and kept merely for game. It was urged that certain waste tracts might readily be re-forested if the state would bear the initial expense. Another important measure that passed was Mr. Burns's Housing and Town-Planning act, which aimed to improve the conditions of workingmen's dwellings. It required the local authorities to provide new means of housing when necessary, and establish a thorough system of sanitary inspection. It empowered them to purchase land compulsorily. As to town-planning, it gave the Local Government Board authority to permit the local administrations to draw up plans for the extension of towns, laying out the land or adopting the schemes proposed by the land-owners. The execution of the plans, however, required the Board's approval. See SANITATION.

WELSH DISESTABLISHMENT. The plan for disestablishment of the Welsh church had been under contemplation for some time and was promised by the government. It received the united support of the Welsh representatives. The argument for it was found in the comparatively small number of communicants in the Established Church. In 1905 the Non-Conformists numbered 554,000, and provide chapel room for 1,500,000, while the Estab-

lished Church had only 193,000 communicants, and provided chapel room for 450,000. It was proposed that on January 1, 1911, the four Welsh dioceses should be disestablished and thenceforth no Welsh bishops should sit in the House of Lords. The purposes of the Church, though no longer enforced by law, would be carried out by agreement, former members having the power to form synods and conventions for the purpose of dealing with the Church property after disestablishment. Commissioners were to be appointed to have charge of the re-arrangement of church matters under the new dispensation. Such were the leading features of the plan, but owing to the pressure of other considerations the Prime Minister announced on June 15 that the measure would be deferred to a later session.

IRISH LAND BILL. This was practically the same measure as had been brought in in the session of 1908. The Opposition had declared that a moderate measure would have their support. Mr. Birrell explained its provisions in the discussion that followed its second reading on March 20, 1909. The financial provisions for land purchase under the Act of 1903 had proved inadequate. Mr. Wyndham in framing the purchase measure had supposed that £100,000,000 would suffice, but a large part of that was already involved in pending transactions, and the outlay would probably run to not less than £183,000,000. There would probably be considerable loss on the flotation of land stock. It would not be safe to assume within the next decade that the price of issue would exceed 85. If the law were not amended an annual burden could be thrown on the rate-payer that could not be endured, and the purchase scheme would fail unless the law were amended. Under the Act of 1903 landlords received a bonus of 12 per cent. of the price. The new measure provided that the bonus should vary inversely with the number of years purchase paid. By his bill the Exchequer would assume a total capital liability of £30,000,000; landlords would be paid partly in cash and partly in stock at 92. The work of the Estates Commission was being hastened. Advances at the present time were £8,000,000 a year, and they were not likely to exceed in the future £10,000,000. It introduced the feature of compulsory sales under the Estates Commissioners and the Congested Districts Board. The Opposition objected to this compulsory feature of the measure, which they complained had been introduced in spite of the fact that the voluntary system of the Act of 1903 had been successful. Progress on the bill was slow, the details being highly technical and requiring much discussion. It was the subject of prolonged debate. It passed through its committee stage in the House of Commons on August 27 and passed the House of Lords on November 26.

LONDON ELECTIONS BILL. On November 8 the House of Lords rejected one of the government's chief measures, namely the London Elections bill, the purpose of which was to give the London electorates the same rights as those of Manchester, Liverpool, Glasgow, and other great cities, and to do away with the present system by which a man lost his vote sometimes for nearly two years by change of residence. It turned the present London constituencies into a single Parliamentary borough, in which,

however, each constituency would retain its present name and boundaries and return one member, except the City of London, which would return two members. The voting would take place on the same day and no man could vote in the same election for more than one division. It was criticised in the House of Lords as aimed against the plural voter in London alone, and as applying to London a principle which had been rejected for the country as a whole.

OTHER PARLIAMENTARY BUSINESS. A debate on tariff reform occurred in the House of Commons on February 18 and 19, when the Opposition moved a fiscal reform amendment which expressed alarm as to the present condition of trade and as to employment, and deplored the failure of the government to recognize the seriousness of the situation, and urged that measures be taken for enlarging the British market, increasing the demand for labor, lessening the rigors of foreign tariffs and developing over-sea trade between different parts of the Empire on the basis of mutual preference. On behalf of a customs tariff, it was argued that it would serve as a remedy for unemployment, that it was necessary to consolidate the trade policy of the Empire and establish an adequate preferential system with the colonies, that protection would give access to foreign markets and insure greater commercial stability. The amendment was lost by 276 to 107. The Daylight Saving bill, which had been the subject of Parliamentary discussion in 1908, was read for the second time in the House of Commons on March 5 and referred to a committee, which reported on August 24 that if enforced by law it would cause too great confusion in certain industries, but it was hoped that it might be voluntarily accepted. The report was unanimously carried. On May 2 a bill for removing what was left of the Roman Catholic disabilities was read for the second time in the House of Commons. It removed from the declaration of accession the expressions that were invidious to Catholics, remitted the penal disabilities for Roman Catholic religious orders, and opened to the Roman Catholics the offices of Chancellor of Great Britain and Lord Lieutenant of Ireland. The bill was subsequently dropped. On May 19 Lord Roberts brought in his National Service bill, which required all British subjects in the United Kingdom between the ages of 18 and 30 to serve in the Territorial Force, the period of training being four years, but the principle of compulsory service had always been opposed in Great Britain, and its outlook at the present time is not favorable. The bill was defeated in the House of Lords by a vote of 123 to 103. The South African bill (see SOUTH AFRICA, BRITISH), creating a constitution for South Africa on the basis of the Act of Union passed by the South African Union Parliament, was passed by both Houses, and on September 20 received the Royal assent. By August 20 fifteen bills had been passed, including the three already mentioned, namely, the Labor Exchange bill, the Indian Councils bill, and the South African bill, and on September 20 they received the Royal assent. The Welsh Disestablishment and certain other bills were deferred.

WOMAN SUFFRAGE. The agitation of the woman suffragists continued throughout 1909

as in 1908, and resulted in many scenes of disorder. On February 18 the woman suffragists made an attempt to enter the Downing Street offices, but were prevented by the police, and on the same night and on the following day attempts were also made to force a way into Parliament. A large number were arrested on these occasions. The attitude of the Government continued to be the same as it was in 1908. Early in February Mr. Herbert Gladstone announced to a deputation of suffragists that the Government would not introduce a separate measure for woman suffrage, but would make it a feature of the reform which it had under contemplation. On March 30 a number of women attempted to enter the House of Commons to present a petition, but were stopped by the police and eleven of them were arrested. On March 26 an anti-suffrage meeting was held under the chairmanship of Mrs. Humphry Ward, who announced that a league with about 100 branches had been formed and that a petition against woman suffrage had been presented to Parliament containing about 243,000 signatures. The Annual Congress of the International Woman's Suffrage Alliance was opened in London on April 27, representing seventeen countries. Telegrams were received from foreign countries describing the gains of the suffragists under their governments. The report from Sweden referred to the unanimous passage in the Swedish lower house of the bill for Parliamentary franchise for women, which, however, was rejected in the upper house. The report from Australia referred to the fact that 1,000,000 women there were not only qualified to vote, but for holding the highest offices, including the Premiership.

FOREIGN RELATIONS. A debate on foreign affairs occurred on July 22, in the course of which the government's policy was criticised for its over-emphasis of the sanctity of the Berlin treaty at the time of the annexation of Bosnia and Herzegovina and for its weakness in dealing with the Congo abuses. The Labor members also criticised the official welcome accorded to the Czar, referring to the barbarous methods that still prevailed in Russia, namely, the cruelties inflicted upon political prisoners and the great number of exiles sent to Siberia. Sir Edward Grey replied in general as follows: Had Great Britain taken a less decisive course at the time of the annexation it might, he said, have delayed the peaceful settlement of the issue, especially as between Turkey and the Powers which had violated the Treaty of Berlin. Although feeling ran high at one time against Great Britain in Austria, he said that now Austria had a clearer understanding of the British attitude. He explained the government's course toward Crete by its unwillingness to do anything that would embarrass the new Turkish régime. As to Belgium and the Congo he denied that the policy of the Government had weakened, but said that Belgium ought to have more time in which to make her intentions clear. The government must await the return of the Belgian Colonial Minister, who was now in the Congo, for if it pressed the matter at this time its action would seem provocative, but he declared that the government would not definitely recognize the annexation so long as forced labor was continued, and that if the same status existed at the close

of the year it would consider the means of enforcing its treaty rights. As to the Czar, the proper principle for a country to observe was non-interference in the internal affairs of another. He pointed to the fact that a constitution had been established and that the members of the Duma themselves had said during their visit to England that the people who took part in a demonstration against the Czar were wrong in thinking that it would aid the cause of liberty. The Czar's reign would after all go down in history as the period in which constitutionalism began. The House would not do anything that would divide the two countries. The Labor members, however, continued to refer bitterly to the Czar as a "monster," and they made light of the Anglo-Russian Alliance. The Czar's visit took place on August 2 and was made the occasion of many congratulatory speeches. It was thought to have had a very marked effect in strengthening the Anglo-Russian accord. King Manuel of Portugal visited England in November (see PORTUGAL, paragraph on *History*). For an account of King Edward's visit to Germany, see GERMANY, paragraphs on *History*. For other references to the relations of Great Britain with foreign countries see articles on foreign countries, especially BALKAN QUESTION, CRETE and TURKEY.

IMPERIAL PRESS CONFERENCE. Representatives from the press in the different parts of the empire met in a conference on June 5. The chief subjects of discussion were cable news, inter-press communications, naval defense, military problems, etc. Its sessions closed on June 26 and were generally regarded as having done much to strengthen Imperial unity and to advance the cause of Imperial defense. One reform which resulted from it was the reduction of the Pacific Cable rates. See TARIFF AND TRADE UNIONS.

GREECE. A constitutional monarchy in southeastern Europe. Capital, Athens.

AREA AND POPULATION. Area, 24,973 square miles. Population in 1896, 2,433,806; in 1907, 2,631,952. Of late there has been a considerable emigration, especially to the United States. The leading cities, with population in 1907, are: Athens, 167,479; Piraeus, 71,505; Patras, 37,724; Corfu, 27,397; Volo, 23,563; Larissa, 18,001; Trikkala, 17,800; Hermoupolis, 17,773; Pyrgos, 13,690; Zante, 13,580; Calamai, 13,123. Most of the inhabitants are adherents of the Greek Orthodox Church. Primary instruction is nominally compulsory between the ages of five and twelve. Illiteracy is common, 30 per cent. of the army recruits being unable to read and write. The Greek Orthodox is the State Church, but entire religious toleration prevails.

PRODUCTION. The area under cultivation is given as about 5,563,100 acres (1,112,000 under cereals, 1,200,000 fallow, 2,025,400 under forests). There are in addition 5,000,000 acres under pasture. The principal crop is currants, with an annual average yield of 150,000 tons, which far exceeds the export; the surplus is utilized in the manufacture of denatured alcohol. In 1907 the crop was estimated at 150,000 tons; the 1908 yield exceeded 170,000 tons. The olive oil yield in 1907 was 3,200,000 gallons; wine (Ionian Islands), 2,160,000 gallons. Fruits tobacco, valonea, and silk are also produced. There are 2,900,000 sheep, 360,000 cattle, and 100,000 horses.

The mineral products are various. The output in metric tons for 1907 is given as follows: Iron, 768,883; manganese iron, 92,770; magnetite, 60,248; zinc, 30,340; argentiferous lead, 13,814; chrome, 11,730; sulphur, 11,719; manganese, 11,139; gypsum, 10,580.

COMMERCE. The trade for three successive years is given in drachmas (1 drachma=19.3 cents) as follows:

	1906	1907	1908
Imports....	144,636,000	148,393,000	152,635,000
Exports....	123,526,000	116,049,000	109,244,000

The principal articles of commerce and their value in drachmas are given as follows:

Imports	Drachmas
Cereals	39,933,000
Yarns and textiles	20,499,000
Timber	9,807,000
Minerals and wrought metals	8,161,000
Oil	7,914,000
Chemical products	6,745,000
Fish	5,883,000
Live-stock	4,276,000
Paper	3,759,000
Hides	3,429,000
Coffee	2,910,000
Iron	2,613,000
Exports	Drachmas
Currants	44,553,000
Tobacco	8,647,000
Iron	8,149,000
Olive oil	7,402,000
Wine	7,299,000
Argentiferous lead	6,702,000
Zinc	5,753,000
Figs	4,178,000
Silk and cocoons	3,990,000
Olives	3,405,000
Valonea	1,915,000
Cognac	1,644,000

Great Britain furnished imports to the value of 31,056,000 drachmas, and received exports to the value of 32,606,000; Russia, 24,708,000 and 1,915,000; Austria-Hungary, 19,261,000 and 11,414,000; Germany, 13,792,000 and 10,813,000; Turkey, 12,784,000 and 6,168,000.

COMMUNICATIONS. The total length of railways in operation in 1906 was about 845 miles. The line from Piraeus to Larissa (218 miles) is completed and open to traffic; its extension to Keralik is under construction, and if the consent of the Porte can be obtained it will continue to Gida, on the Salonika-Monastir line. There are 4951 miles of telegraph line, and 852 offices. There were 852 post-offices in 1907. The length of highways is about 3000 miles. There is a canal across the Isthmus of Corinth, but it is rarely used by foreign vessels. The vessels entering at the ports in 1907 numbered 6412 of 4,812,834 tons; cleared, 6253 of 4,814,549 tons. The merchant marine (1906) consisted of 1092 sailing vessels of 154,912 tons and 282 steamers of 276,147 tons.

FINANCE. The monetary unit is the drachma, worth one franc, or 19.3 cents. The estimated ordinary revenue and expenditure for 1908 were 136,642,784 drachmas and 134,042,556 drachmas respectively; for 1909, 129,719,358 and 126,708,010 respectively. The principal sources of revenue were estimated for 1909 as follows: Duties and excise, 54,580,000 drachmas; stamps and dues, 25,582,000; direct taxes, 22,325,000; monopolies (salt, petroleum, matches, and playing-cards), 13,085,000. The largest items of esti-

mated expenditure were: Public debt, 31,581,932 drachmas; Interior Department, 18,870,668; War Department, 18,905,260; Navy Department, 8,921,952; administration, 8,501,044; pensions, 7,508,412; worship and instruction, 7,080,808. The outstanding external gold debt on June 30, 1908, amounted to 720,361,424 drachmas; the currency debt, in December, 1907, 166,891,073 drachmas.

NAVY. The effective navy includes 3 coast-defense vessels, of 5000 tons each, and 10 torpedo boats.

ARMY. Military service is compulsory and universal between the ages of 21 and 51 in accordance with the terms of the law of 1904. About 15,000 are annually conscripted, of whom a certain number were exempted upon payment of a tax. The service is 14 months with the colors, 10 years and 10 months in the reserve, 8 years in the National Guard or Territorial Army and 10 years in its reserve. The peace organization, amounting in 1909 to 1875 officers and 20,187 men, was virtually a skeleton whose strength is fixed annually by the Chamber. The regulations provided an army of 120,000 to 130,000 on a war footing, but the officers available would not have sufficed for more than 75,000. Both organization and training were considered defective and a number of reforms were proposed. One of these eliminating princes from military commands was rendered unnecessary by their resignations. The proposed measures (see *History* below) to increase and recognize the army involved the beginning of compulsory service at the close of the 19th year instead of the 21st and permitted no exemptions. The service proposed was for active army, 2 years; first reserve 12 years; second reserve 9 years; National Guard 7 years; National Guard reserve 7 years. In this way a first reserve of over 2000 men would be formed, while the second reserve and National Guard would supply 250,000 more. The estimated annual cost was £920,000, as compared with £720,000, and a national defense fund of £140,000.

GOVERNMENT. The executive authority is vested in a king, assisted by a responsible ministry of seven members. The King in 1909 was George I., second son of the late Christian IX., of Denmark; he was born in December, 1845, and was elected King of the Hellenes by the National Assembly at Athens in March, 1863. The constitution vests the legislative power in a single chamber, the National Assembly, or Boulé, consisting of 235 members elected by manhood suffrage. The Ministry as composed August 28, 1909, was as follows: Premier and Minister of Foreign Affairs, K. Mavromichalis; Interior, N. Triantaphyllakos; Finance, A. Eutaxias; Justice, Mr. Tofalos; Education, etc., P. Zaïmis; War, Col. L. Lapathiotis; Marine, L. Damianos.

HISTORY

CABINET CRISIS. In March the government was sharply attacked by the Opposition on the ground that it was responsible for the prevailing distress of the people. On March 31 the Premier, Theotoki, announced his resignation, but the Opposition leader, M. Ralli, was unable to form a ministry and the former Cabinet remained in force until July 17. On that date Theotoki resigned on account of the opposition to his Cretan policy and M. Ralli agreed to form a ministry on condition that the Chamber

be dissolved. This was accepted by the King but on the understanding that the elections were to be deferred till March. His programme was thorough economic and military reform. (For an account of the Cretan question, see CRETE and TURKEY, paragraphs on *History*.) Under the Ralli Ministry the government in July announced its submission to the decisions of the protecting Powers in regard to Crete and the Premier gave orders that the frontier be strictly watched in order to prevent the passage of arms and ammunition and of guerrillas into Turkey.

CRISIS IN THE ARMY. For a long time there had been discontent among the officers of the army with the military administration. A Military League was formed and presented its demands to the government. These included a demand that no command in the army should be held by the Crown Prince or any of the royal princes, that a council should be appointed to protect the interests of the army, consisting of the chiefs of the three divisions, the eldest being the president, and that the two war ministries should be composed of the best fitted officers of the army and not of civilians. Premier Ralli refused these demands, and when he decided to order the arrest of five mutinous officers in the garrison, and refused, on August 27, to receive representatives of the League who wished to hand him a memorandum, the officers of the League, five hundred in number, at the head of a force of two thousand men including artillery, cavalry and marines, withdrew to a hill outside of Athens as a warning of revolt unless their demands were met. Thereupon M. Ralli tendered his resignation. The King summoned M. Mavromichalis, who formed a new cabinet. One of the main demands of the officers of the League was for amnesty. This was granted by royal decree and at about the same time the new Premier announced his agreement to almost all the other demands. In foreign countries there was little sympathy with the programme of the League. It was believed that the military administration of the princes had been altogether for the good of the service, and the programme of the League was thought to be distinctly aimed against the royal family. Sympathy with the King and princes was shown in Greece on the occasion of the Crown Prince's journey to Germany. He was met by crowds who demanded that he should retain his command in the army. While on his way to Germany, he refused to meet the officers of one of the garrisons who were members of the Military League. Partisans of the League were angered by these demonstrations and by speeches the Crown Prince made at the time. A mass meeting held on the Field of Mars on September 27, at which 50,000 people were said to be present, carried a resolution expressing satisfaction with the Military League's opposition to the injurious influence of political parties in affairs of state and to the maladministration of the army and navy and declaring that the people would insist on their demands. They sent a deputation to the King, who received them cordially, congratulated them on having kept good order and declared that he would do all that the constitution permitted to do to insure the welfare of the state. The deputation then went to the Premier, who said that this action of the people had strengthened the hands of the government in the present emergency. When the Chamber opened in the first week of October, the

Ministry prepared to lay before it a mass of hastily considered legislation embodying the reforms. The King sanctioned these measures in principle. They comprised the following points: The cancellation of all powers on the part of the royal princes over promotions, the princes, though retaining their present rank, to have no executive duties either in the army or the navy; the abolition of the Crown Prince's command-in-chief; the abolition of the present General Staff; the authorization of the government to engage a foreign organizer to rehabilitate the army. In addition to these measures which were submitted by the Minister of War, the Minister of the Interior presented at the same time (October 11) certain rules for the purpose of defeating obstructive tactics in the Chamber. The attitude of the Chamber toward these reforms was not satisfactory to the leaders of the Military League, whose course throughout had been exceedingly high-handed. The Chamber having shown a spirit of independence on the question of removing the royal princes, the Military League was greatly incensed and was even said to be planning a *coup d'état*, that is to say, the temporary seizure of the government and the establishment of a provisional dictatorship. The government having learned of this immediately took steps to placate the League. The King announced that the princes would resign and the Premier told the Chamber that the military reforms must be voted at once. On October 15 both the military reforms and the rules proposed by the Minister of the Interior were passed by the Chamber. The other measures, 23 in all, were hurried through within an hour. The arbitrary spirit of the Military League was illustrated by dissatisfaction even with this display of docility. It was said that the League, fearing that the silent voting upon laws would be taken as a sign of compulsion, commanded the members to talk. Accordingly discussion was resumed in the Chamber on October 16.

Later in the month of October a new bill was brought in to provide for summoning the reserves and for the preparatory instruction of the young. The War Minister declared that the active army could be raised to 216,000, which, with the reserves, would make 450,000. At present there were 48,000 men still untrained who were available for service. The new law authorized the calling of these to the colors, the period of training not to exceed three months. By this time the Military League seemed to show a more acquiescent temper, but in the following month, through its official newspaper organ, it resumed its threatening attitude, declaring that it would insist on the overhauling of the diplomatic service and certain other departments and would publish a list of proscribed persons. The spirit of insubordination, which the League had done so much to foster, began to show itself in its own ranks at the close of November, when the junior members, contending that the present leaders showed little regard for their interests, demanded the appointment of a new committee. On December 20 Colonel Lapathiotis, the new War Minister, who was a representative of the Military League, brought in the army reorganization bill. In the discussion that followed he spoke slightly of the powers of Parliament. This caused much indignation among the Deputies and he was soon afterwards dismissed.

THE NAVAL CRISIS. Meanwhile trouble had arisen among the junior officers of the navy, who preferred certain demands to the government, some of which the government accepted. One of the changes demanded was the reduction of the age of retirement for the senior officers. The government brought in a bill reducing the age for captains from the sixty-fourth to the fifty-eighth year, and for commanders from the sixty-second to the fifty-fifth. This concession was not sufficient and there arose at the end of October a mutiny among the junior officers. Commander Typaldos, the representative of the latter, demanded the immediate removal of a number of officers and the reinstatement of a subaltern officer who had been cashiered during the war with Turkey. Upon the Minister of War's refusal, Typaldos became threatening, saying that, unless the request was granted within twenty-four hours, he would attack the Salamis fleet with his torpedo flotilla. He appealed for support to the Military League, of which he was a member, but the League having learned that a good many of the junior officers were not in sympathy with Typaldos, that the crews of the fleet were either indifferent or hostile to him and that he could not even count on the officers of his own flotilla, decided to expel him and to stand by the government. The mutiny which occurred at the end of October turned out to be a trivial affair. A force of about three hundred men and twenty officers attacked three battleships with destroyers. Shots were fired by one destroyer and the fire was returned. A boiler pipe on board the destroyer was burst, scalding five men to death. One man was killed on a battleship. These were the only casualties. The crews of the destroyers refused to obey the command of Typaldos to continue fighting and soon the force of mutineers was in confusion. About fifty arrests were made. Typaldos and his officers escaped into the interior, but he was arrested during the first week of November. Most of the men and officers of the fleet remained loyal, and throughout the navy generally the feeling ran very high against the mutineers. It was decided that the mutineers should be tried by the Assize Court and not by court martial. On November 4 the law embodying the reduction of the age of retirement according to the promise made to the junior officers was introduced in the Chamber. It occasioned much discontent among the senior officers. The cause of the mutiny as distinct from its immediate occasion was the demoralization that had resulted from the course taken by the Military League.

FINANCIAL PROPOSALS. On October 13 the government submitted proposals for meeting the deficit of eight million drachmas by more economical administration of the army and navy and for raising besides from new revenues and by means of further economies the sum of twenty million drachmas in order to provide for the proposed reorganization of the army and navy. The new sources of revenue included, first, an increase in the duties on gunpowder, dynamite, spirits and other articles that could not be classed as necessities of life; a succession duty, an income tax, and a tax on movables. At the same time the government proposed a reduction of duties on petroleum, rice and other necessities, and the remission of the tax on plowing animals and vineyards. On behalf of the government plan it was urged that it re-

moved the burdens from the poor and placed them on the classes able to bear them. On the other hand the industries affected by them raised a protest and the United Guilds urged against them that they were inconsistent with a principle which had been asserted at the mass meeting of September 27 and accepted by the government, namely, that articles of consumption should not be taxed. Toward the end of November there were signs of opposition to the new financial measures in the provinces and some of their features were objectionable also to foreign governments. On November 23 the law reducing the age of retirement among the senior officers in the navy reached its third reading. On December 7 the fiscal measures preliminary to the presentation of the budget were introduced, including a tax on alcohol, a duty on imported iron ware, a new duty on malt imported for the manufacture of beer, the abolition of the tax on plowing animals, the regulation of the exportation of wine, and the establishment of a sugar monopoly. It was also proposed to abolish the tax on vineyards.

OTHER EVENTS. In March preparations were made for the celebration of the centenary of Lord Byron's visit. The British excavations at Sparta were going on during the summer (see ARCHAEOLOGY). Early in June the military authority condemned to varying terms of imprisonment 217 non-commissioned officers on the charge of insubordination for having petitioned the Chamber against the passage of a law which tended to restrict the promotion of non-commissioned officers to the commissioned ranks. In July an earthquake occurred in Elis accompanied by volcanic eruptions near Paphiote. The loss of life was estimated at thirty and four hundred houses were said to have been destroyed.

GREEK CATHOLIC CHURCH or GREEK CHURCH. A religious body which comprises in its widest sense all those members following the Greek or Greco-Slavonic rite. Its official designation is the Holy Orthodox Catholic Apostolic Church. The membership throughout the world is in the neighborhood of 100,000,000. There are in the United States four branches: Russian Orthodox, with a membership of about 50,000, about 100 churches and 75 ministers; Greek Orthodox, with about 100,000 members, 42 churches and 43 ministers; Syrian Orthodox, with about 4000 members, 8 churches and 9 ministers, and the Servian Orthodox, with about 15,000 communicants, 10 churches and 9 ministers. The archbishop in charge of the Russian Orthodox Church formerly had a seat in Alaska and now resides in New York City. The Greek Church has no bishop in the United States. The Syrian Church belongs to the Synod of Antioch. They have a bishop concentrated by the Russian Archbishop.

GREEN, JAMES GILCHRIST. An American rear-admiral, retired, died February 16, 1909. He was born in 1841, and entered the volunteer naval service as acting ensign in May, 1861, and was transferred to the regular service at the close of the Civil War. He was made commander in 1887, and captain in 1900. In that year he was commandant at the Havana naval station. He was retired in 1901 at his own request, as rear-admiral, after 40 years of service.

GREEN BUG. See ENTOMOLOGY.

GREENLAND. A Danish colony, and, after Australia, the largest island in the world. The area is variously estimated at from about 500,000 to over 800,000 square miles. The colonized area, extending along the west coast from about 60° to about 72° north latitude, is estimated at 46,740 square miles and its population (1901) at 11,895. The trade is a government monopoly. The total imports from Denmark, 1907, amounted to 1,119,000 kroner (1 krone=26.8 cents); and the exports to Denmark, to 492,000 kroner.

GREENWOOD, FREDERICK. An English author, journalist and publicist, died December 16, 1909. He was the originator and first editor of the *Pall Mall Gazette*, and when this journal was purchased by Yates Thompson and made a Liberal organ, Greenwood founded the *St. James Gazette*, which he edited for several years. He was the author of histories of Napoleon Bonaparte and Napoleon III., and also wrote two novels, *The Lovers' Lexicon* and *Imaginations in Dreams and their Study*.

GREGORY, EDWARD JOHN. An English painter, died June 22, 1909. He was born in Southampton in 1850 and studied at the art school in his native town and at South Kensington. His first pictures were exhibited at the Royal Academy in 1875. He was made academician in 1898. Among the best known of his works are "Saint George" (1876); "The Signal"; "A Rehearsal" (1882); "Sir Galahad," and "Is It a Mouse?" He was known especially as a skilful painter of domestic genre subjects.

GRENADE. The largest of the Windward Islands (q. v.) and the residence of the Governor; a British possession. Area, 133 square miles; population (including some of the Grenadines), in 1906, 70,505; in 1908, 72,088. St. George's is the chief town. The Grenadines are a chain of small islands lying between Grenada and St. Vincent, within whose governments they are included. The soil is fertile; cacao, spices, rubber, cotton, coffee, and fruits are grown, and the forests are rich in valuable timbers. The total imports and exports in 1908 were £303,783 and £359,245 respectively, against £288,665 and £417,299 in 1907. The revenue and expenditure were (1908-9) £73,182 and £72,661 respectively, against £79,871 and £68,383 in 1907-8. The public debt stood (1909) at £123,670.

GROSS, CHARLES. An American scholar and educator, died December 3, 1909. He was born at Troy, N. Y., in 1857, and graduated at Williams College in 1878. From 1884 to 1888 he was engaged in literary work in England, and in the latter year became instructor in Harvard University. He was later made professor of history in that institution. Among his writings, which are numerous, are: *Gilda Mercatoria* (1883); *The Gild Merchant* (1890); *Bibliography of British Municipal History* (1897); *Sources and Literature of English History* (1900). He also translated Lavisé's *Political History of Europe* (1891) and Kayserling's *Christopher Columbus* (1893). He was a contributor to American and English historical reviews and was a corresponding member of the Royal Historical Society of England and the Royal Society of Göttingen.

GROUSSET, PASCHAL. A French journalist and communist, died April 10, 1909. He was

born at Corte in the island of Corsica in 1844. For a short time he studied medicine in Paris, but soon abandoned this for journalism. He wrote scientific articles for *L'Etendard* and *Le Figaro*, under the pen-name of "Docteur Blasius." He began also to write fiction under the name of "Leopold Virey." In 1869 he joined Henry de Rochefort in the management of the journal *La Marseillaise*. He quarreled in 1870 with Prince Pierre Bonaparte and sent two seconds to answer the challenge sent by the latter. One of these, Victor Noire, was killed by the Prince. This aroused in Grousset bitter opposition to the empire and he attacked it savagely in *La Marseillaise*. For this he was condemned to a heavy fine and repeated imprisonments. In 1871 he took part in the insurrection and was elected a member of the Commune, taking charge of foreign affairs, but in an attempt to leave Paris in June he was arrested and deported to New Caledonia. Escaping in 1874 with Rochefort and others, he went to England, where he acted as the London correspondent of *Le Temps* under the name of "Philippe Daryl." He returned to Paris in 1881 and in the same year was defeated in the elections. He was chosen Deputy in 1893 and was reelected in 1898, 1902 and 1906. He wrote much and among his published works are the political sketches, *Le bilan de l'année 1868* (1869); *Les origines d'une dynastie, le coup d'état de Brumaire an VIII.* (1869). His *Les condamnés politiques en Nouvelle Calédonie* (written with Jourde, 1876) is autobiographical. He wrote also many works of travel and life abroad and translated the works of several English authors, including Stevenson and Mayne Reid.

GRUYER, FRANCOIS. A French chemist and writer on art, died in November, 1909. He was born in 1824 and studied at the Ecole des Arts et Manufactures. He was appointed lecturer in chemistry at the Institut Agronomique of Versailles, but he later abandoned science for the fine arts, and from 1857 to 1868 published seven volumes on Raphael's frescoes of the Vatican, and on his Virgins. In 1874 he published *Raphael as a Portrait Painter*. He wrote other works in the field of art criticism and of the history of art, and many essays and periodicals. He was appointed in 1872 inspector-general and later a member of the Superior Council for the Fine Arts. He was finally elected Conservateur de la peinture at the Louvre. He was elected a member of the Académie des Beaux-Arts in 1875. He was also curator of the Musée Condé.

GUADELOUPE. A French colony composed of several islands of the Lesser Antilles; total area, 687 square miles; population (1906), 190,273. The principal islands are Guadeloupe proper, or Basse-Terre on the west and Grande-Terre on the east of a narrow channel separating the two. The five smaller islands, Marie Galante, Les Saintes, Désirade, St. Barthélemy, and St. Martin, are dependencies of the colony proper. Capital, Point-à-Pitre (population 14,861). There are 113 public and private elementary schools, with 12,182 pupils, and two secondary establishments, with 728 pupils. The country is fertile; 27,632 hectares are devoted to sugar, employing 28,800 persons; 5138 to coffee, employing 7935 persons; 2540 to cacao, and 6926 to manioc. Valuable timber is con-

tained in the forests, which cover 71,256 hectares. The imports in 1907 amounted to 13,420,555 francs (France, 8,163,000); exports, 16,269,156 (France, 15,675,000). Sugar, rum, and cacao are the principal exports. There is direct steamship communication with France. The budget for 1908 balanced at 4,692,322 francs; expenditure of France (budget of 1908), 400,000 francs. Debt outstanding January 1, 1907, reported at 10,575,000 francs. The Bank of Guadeloupe has capital, 3,000,000 francs; reserve funds, 843,746. The colony is administered by a governor and an elected council, and is represented in the French Parliament by one senator and two deputies.

GAULEGNAY RIVER BRIDGE. See BRIDGES.

GUARANTEE OF DEPOSITS. See BANKS AND BANKING.

GUATEMALA. The most northern and western republic of Central America. The capital is Guatemala City.

AREA AND POPULATION. The estimated area of the 22 departments comprising the republic is 48,300 square miles. The population in 1903 was 1,842,134; at the end of 1906, 1,882,992 (estimated). About 60 per cent. of the inhabitants are Indians, and most of the remainder mestizos. The principal towns, with population, are: Guatemala City, 125,000; Coban, 30,770; Quezaltenango, 28,940; Totonicapan, 28,310; San Pedro, 10,190. Immigration is small, but is being encouraged by the government; a law promulgated April 30, 1909, makes provisions for the care of colonists. Primary instruction is free and nominally compulsory. In 1908 there were 1330 public primary schools, with 51,280 pupils. In 1909 the study of English was made compulsory in the primary schools. Secondary schools are established at Guatemala City, Quezaltenango, and Chiquimula. At the capital and at Quezaltenango are institutions for higher and professional education.

INDUSTRIES. Agriculture is the principal industry, and the leading crops are coffee (controlled largely by German capital), sugar, corn, bananas, tobacco, and cacao. A presidential decree of July, 1908, made the cultivation of a minimum of cotton compulsory on suitably conditioned lands, and the encouragement of agriculture in all its branches is the subject of governmental aid. The average coffee crop amounts to about 70,000,000 pounds; that of 1909 was estimated at 81,000,000 pounds. Cattle raising is of considerable importance. The exploitation of the timber reserves of the country is a valuable industry and receives considerable official attention; valuable concessions were recently granted for the cutting and export of cabinet (especially mahogany) and dye woods, the extraction of chicle and other gums, and the development of rubber culture. There are mines of gold, silver, copper, lead, zinc, antimony, and salt, but hitherto they have been only slightly exploited. Manufacturing has not yet attained importance, although some cotton textiles are produced, and a few breweries, sugar mills, and tanneries are profitably conducted. A factory near Quezaltenango consumes about 2,500,000 pounds of cotton annually.

FOREIGN COMMERCE. The values of imports and exports have been as follows:

	1906	1907	1908
Imports.....	\$7,220,760	\$7,316,574	\$5,811,546
Exports.....	7,136,280	10,174,486	6,756,143

In 1908 the decrease in imports was attributable largely to the falling off in receipts of railway material; and the principal cause of the export decline was the small coffee crop. The leading imports include: Cotton goods (\$1,389,570 in 1908), ironware, provisions, wines and liquors, chemicals, and machinery. The chief exports were, in 1908: Coffee, 60,722,000 pounds, valued at \$5,697,183; hides and skins, \$291,283; bananas, \$200,474 (668,246 bunches, all shipped to the United States); sugar, \$168,788; rubber, 158,573; woods, \$144,349. Of the imports to and exports from Guatemala, the share of the United States in 1908 was \$1,718,660 and \$1,776,876; Germany, \$1,258,193 and \$3,939,207; Great Britain, \$1,061,843 and \$713,449; France, \$209,947 and \$713,765. Of the 1908 coffee export, Germany received 35,725,100 pounds, the United States 13,965,900, and Great Britain 5,903,100.

COMMUNICATIONS. There were about 480 miles of railway in 1909. A line is under construction between Quezaltenango and Guatemala City. New lines and extensions are projected; notable among them are: A line from Zacapa to the frontier, connecting with Santa Ana in Salvador, and forming a link in the Pan-American Railway; a line from Caballo Blanco to Pajapita, connecting the Guatamalan Western and Ocos railways; a line from Pajapita to the frontier, connecting with the Mexican railways. At the end of 1908 there were 3897 miles of telegraph and 384 miles of telephone lines.

FINANCE. For 1907 revenue and expenditure in paper pesos were reported at 35,297,823 and 44,560,221 respectively; for 1908, the reported revenue was 37,335,958 pesos paper. In the former year the paper peso was worth about 8 cents; in the latter, about 6½ cents. Over one-half the revenue is derived from customs, and one-third from taxes on spirits, tobacco, etc. About one-half the expenditure is for the public debt. At the end of 1908 the external gold debt, including arrears of interest, amounted to \$10,102,465; the currency (paper) debt stood at 71,884,744 pesos.

ARMY. The regular army numbers about 7000 officers and men and the militia about 57,000. All citizens not exempted are liable for service from the 18th to 25th year in the active army and from the 26th to 50th in the militia.

GOVERNMENT. The executive authority is vested in a president, who is elected for a term of six years and is assisted by a cabinet of six members. The legislative power devolves upon the representative National Assembly (69 members) and the Council of State (15 members—5 elected by the Assembly and 10 appointed by the President, 6 being the cabinet ministers). The President in 1909 was Manuel Estrada Cabrera, who, as Vice-President, succeeded to the executive office in March, 1898, and subsequently was elected for the term ending March 15, 1905, and again for the term ending March 15, 1911. See ARBITRATION, INTERNATIONAL.

GUIANA. See BRITISH GUIANA; DUTCH GUIANA; FRENCH GUIANA.

GUINEA, FRENCH. See FRENCH GUINEA.

GUNPOWDER. See MILITARY PROGRESS.

GYMNASISTICS. The eleventh annual inter-collegiate gymnastic meet was won by Columbia, whose team scored 17 points. Princeton, the 1908 champion, finished second with 13 points and New York University third with 9 points. Other colleges to score were: Pennsylvania, 7 points; Yale, 5 points, and Rutgers 3 points. The individual championship went to Schoonmaker of Columbia, who made 320 points. Dowd of Princeton was second with a total of 315 and Melitzer of Columbia third with 205. The all-around national championship of the Amateur Athletic Union was again won by Fred Steffens, who contested under the colors of the Turn Verein Vorwaerts. Steffens's total score was 144.55 points, Frank Jirasek of the Bohemian Gymnasium Sokol finished second with 143.65 points and Charles Downs of the Alsace-Lorraine Turn Verein, third, with 136.51 points. The club championship went to the Bohemian Gymnasium Sokol. The West Side Y. M. C. A., which won the event in 1908, took second place.

GYROSCOPE. The application of the principle of the gyrostat to transportation scored a further advance in 1909 when Louis Brennan, the inventor of the Brennan torpedo, exhibited before the Royal Society of England on November 14 a car 14 feet in length running on a mono-rail and carrying 40 passengers. It will be recalled that in the spring of 1907 Mr. Brennan exhibited before the Royal Society a model car 6 feet in length which, running along a single rail or a cableway, was able to maintain its position and equilibrium despite the shifting of the load and which indicated the possibility of the gyroscopic principle being applied to larger cars working on a single line of track and capable of operating. This principle of the gyroscope may be stated as the use of rapidly rotating masses in the form of fly wheels to preserve a desired position of the axis of the car and to resist forces tending to displace it. The car was supported on its single track by a bearing wheel, so that the problem was simple to keep the gyroscope wheels in rotation and communicate motion to the driving wheels. In the model originally shown electricity was employed as the motive power and the fly wheels revolved at a speed of 7500 revolutions per minute. The gyroscopic apparatus amounted to but 5 per cent. of the total weight of the locomotive. For the 1909 experiments a car was used 14 feet in length, 13 feet high and 10 feet wide, which weighed 22 tons, a gasoline engine supplying the motive power both for the gyroscopes and the driving wheels. The gyroscopes were two in number, weighed three-quarters of a ton each, and revolved at a speed of 3000 revolutions per minute. Care was taken to cut down friction losses at the bearings as much as possible and the wheels were incased and ran in a vacuum. The car was operated on a circular track 220 yards in circumference and despite the efforts of the passengers to destroy the balance by shifting their positions suddenly the gyroscopes maintained its proper position.

While the Brennan experiments were in progress in Great Britain, Herr Scherl, a German capitalist, was showing in Berlin a gyroscopic car which was later brought to the United States. While independently devised it was in many respects similar to that of the English inventor. It was invented by Paul Froelich and

the model tested was 18 feet long and 4 feet wide, carried on two 2-wheeled trucks, on each of which was a $\frac{1}{2}$ horse-power motor. The two gyroscopes controlling the equilibrium of the car were mounted in the frame, so that the fly wheels normally would rotate in a horizontal plane on vertical axes. The fly wheels weighed only 125 pounds each, but they were operated by electric motors at the high speed of 8000 revolutions per minute. The motors were at the lower ends of the shaft and motor; fly wheels and shafts were mounted in air-tight casings from which the air had been exhausted. The casings are mounted on transverse axes journaled into the frame of the car so that they can move fore and aft in a vertical plane. The motors are arranged to revolve in opposite directions and they are connected by bell-crank levers and toothed quadrants, for the working of the gyroscopes is always in opposite directions. A peculiar feature in which the Scherl car differs from the Brennan is in having a so-called "precession motor" carried at the rear of the gyroscopes and operated by hydraulic pressure produced by an electrically-driven oil pump. This tends to increase the resistance of the gyroscope to any action working to displace its axis and thus automatically ends in restoring the car to a position of equilibrium.

HÆMOGLOBIN. The red coloring matter of the blood, has been isolated for therapeutic use. It occurs as a brownish-red powder, soluble in water. It is given internally for the same purpose as organic iron.

HAGUE CONFERENCE. See ARBITRATION, INTERNATIONAL.

HAINES, SIR FREDERICK PAUL. A British Field Marshal, died June 11, 1909. He was born in 1819, and served as military secretary in 1845 in India, where he distinguished himself for gallantry. He served as regimental officer in the Crimean War, and in 1856 returned to India as military secretary to the government of Madras, serving throughout the Indian Mutiny. After a series of home appointments, he was sent again to India in 1865 to command a division of the Bengal army. After another interval at home, he was made commander-in-chief at Madras, and in 1875 was nominated to the chief command in India, which he held until 1881.

HAITI. A West Indian republic, occupying the western and smaller portion of the island of Haiti. The capital is Port-au-Prince.

AREA AND POPULATION. The area is estimated at about 10,200 square miles. The population, according to an ecclesiastical estimate based on parish registers, was 1,500,000 in 1906; an estimate in 1908 puts it at 1,800,000. About nine-tenths of the inhabitants are negroes and the rest mulattos, the number of whites being negligible. The principal towns, with estimated population, are: Port-au-Prince, 75,000; Cape Haiti, 29,000; Les Cayes, 25,000; Gonaives, 18,000. The official language is French, of which the vernacular is a dialect. Besides some private schools and five public lyceums, there are about 400 public primary schools. The educational system is very imperfect. The prevailing religion is Roman Catholicism.

INDUSTRIES. The industries are mainly agricultural. The most important product is coffee, but the export duty thereon has greatly hin-

THE BRENNAN MONORAIL CAR RUNNING ON A CURVED TRACK
MONORAIL EXPERIMENTS OF 1909

dered its development. At present coffee shipments average only a little more than half the former annual export of 100,000,000 pounds. Cacao is an important product, the 1908 crop amounting to about 6,000,000 pounds. Cotton culture is increasing, and that of sisal hemp has recently declined. There are numerous sugar plantations. Of the many valuable woods cut for export, logwood is the most important. The mineral resources include gold, silver, copper, iron, antimony, tin, sulphur, etc., but they are almost wholly undeveloped. Manufacturing establishments are few and their output small. Manufactured products include soap, candles, and matches, and rum and other spirits are distilled.

COMMERCE. For the fiscal year ending September 30, 1908, imports and exports were reported at \$4,701,160 and \$3,478,848 respectively. Reported exports for the preceding year amounted to \$14,330,887. The exports of coffee during the fiscal years 1906 and 1907 amounted to 56,395,076 pounds and 59,824,869 pounds respectively; cacao, 4,582,403 and 4,839,737; logwood, 87,790,000 and 114,458,880; logwood roots, 48,779,276 and 44,076,320; cotton, 3,865,216 and 4,501,578; cotton seed, 6,208,289 and 7,909,000. Other exports were honey, wax, fustic, cowhides, goatskins, orange peel, and mahogany. Imports of textiles, provisions, and household articles come principally from the United States. The total imports therefrom in 1907 amounted to \$3,145,853, and the exports to the United States, \$1,220,420; in 1908, \$3,500,775 and \$447,186 respectively. Almost the entire coffee export goes to Europe. Of the total exports, France receives about two-thirds, Germany taking second place.

COMMUNICATIONS. A fifteen-mile railway connects Cape Haiti with Grande Rivière. A light railway is in operation from Port-au-Prince to Lake Assouï (twenty-eight miles), being intended ultimately to connect the capitals of Haiti and the Dominican Republic. Another line, projected from Gonaïves to Hinche, is open as far as Passerelle, and one from Les Cayes to Perrin has been contracted for. A regular line of steamboats plies between Grande Saline, at the mouth of the Artibonite River, and the interior. The principal towns are connected by government telegraph. There are thirty-one post-offices.

FINANCE. Revenue is derived chiefly from customs; the largest item of expenditure is service of the debt. In the fiscal year ending September 30, 1906, the revenue amounted to \$2,731,761 and 5,135,250 gourdes (1 paper gourde is worth about 20 cents); in 1907, \$2,547,664 and 7,718,291 gourdes. For the fiscal year 1908, the expenditure was estimated at \$2,651,249 and 6,885,660 gourdes; for the fiscal year 1909, the estimated revenue was \$3,235,201 and 5,415,300 gourdes, and the estimated expenditure \$2,777,688 and 7,283,953 gourdes; for the fiscal year 1910, \$2,094,107 and 6,684,656 gourdes. The public debt on March 31, 1909, amounted to \$25,096,997 and 17,309,590 gourdes.

ARMY AND NAVY. The navy includes three small gunboats. The Haitian army varies greatly in strength from time to time with political circumstances. Returns for 1909 gave for the troops of the guard: 1 regiment of artillery (300 men), 4 regiments of infantry (1300 men); 2 battalions of chasseurs (300

men), 1 regiment of cavalry (187 men), and two battalions of riflemen; in the line there were 38 companies of infantry (9361 men), 2 regiments of artillery (300 men), and 50 companies of gendarmes (2000 men), or a grand total of 14,060 men.

GOVERNMENT. The executive authority is vested in a president, who is elected (by the National Assembly) for a term of seven years and is assisted by a cabinet of four members. The legislative power devolves upon the National Assembly, which consists of the Senate (39 members) and the Chamber of Representatives (95 members chosen by direct vote). The President in 1909 was General Antoine F. C. Simon, who was elected December 17, 1908, after the deposition of General Alexis Nord.

HALE, EDWARD EVERETT. An American clergyman, author and philanthropist, died June 10, 1909. He was born in Boston in 1822, the son of Nathan Hale, editor and proprietor of the *Boston Daily Advertiser*. At twelve years of age he had learned to set type in his father's office. He was educated at the Boston Latin School and at Harvard College, where he graduated in 1839, when only seventeen years of age. In 1842 he was licensed to preach, and undertook his first pastorate at the Church of the Unity in Worcester, Mass., in 1846. Here he remained for ten years, going from there to the South Congregational Church (Unitarian) of Boston. Of this church he continued pastor during the remainder of his life. Dr. Hale was a writer from his earliest youth, but his famous story, *The Man Without a Country*, written just before the outbreak of the Civil War, brought him instant fame, and it is as the author of this little book that he was, perhaps, most widely known. This story, written for the purpose of stimulating national patriotism, wonderfully achieved this purpose, and became, in the lifetime of its author, almost a classic. Dr. Hale wrote much that, in point of literary value, probably exceeds *The Man Without a Country*. Throughout his long life he never ceased writing, and his works include novels, biographies, histories, essays and religious and ethical productions. He wrote, also, a charming volume of reminiscences entitled *Memories of a Hundred Years*. His authorship was, however, but a part of his daily life. He made no pretensions as a literary artist, and wrote only because writing was his natural method of expression. His stories are marked by a kindly humor and a robust and inspiring enthusiasm.

Dr. Hale was identified with nearly all the forward movements that arose in the country during his lifetime. He was the organizer of the Lend a Hand Club, and a promoter of Chautauqua. He was intimately engaged in the provision for the great immigration which began with the Irish famine of 1845 and 1846, and he was closely connected with the work of the New England Emigration Aid Society in colonizing Kansas after 1854.

In spite of his activity in literary and philanthropic lines, Dr. Hale insisted that he wished first to be thought of as a minister of the gospel. He said: "My vocation, first, second and last, is that of a minister of the gospel. My avocation has been literature." With characteristic courage, Dr. Hale, in 1900, substituted water for wine at the communion table of his church. He was not a great

preacher, in the oratorical sense, but his earnestness and simplicity gave him effectiveness in the pulpit.

It is probable that Edward Everett Hale will be longest remembered for what he was, rather than for what he did. Throughout his whole career he was an example of optimistic, aggressive patriotism. The purity, simplicity and beauty of his life made him beloved by those who knew nothing of his writings or of his other achievements. His outlook on life is best summed up by the motto of his *Ten Times One is Ten*, adopted also as the motto of the Lend a Hand Club,

"Look up and not down,
Look forward and not back;
Look out and not in, and
Lend a hand."

In 1903 Dr. Hale was appointed chaplain of the United States Senate, and he served in that position until his death. He was connected editorially with several literary journals and newspapers. Among his writings, in addition to those mentioned above, are: *In His Name*; *Mr. Tangier's Vacations*; *What Career? The Story of Massachusetts*; *A New England Boyhood*; *Chautauquan History of the United States*; *Ralph Waldo Emerson* (1902); *We, the People* (1903); *New England Ballads* (1903); *Progress in the United States Senate* (1904); *Foundation of the Republic* (1906). He also edited *Modern Achievements*, in ten volumes (1905).

HALL, JOHN DENNIN. An American architect and inventor, died April 20, 1909. He was born in Salisbury, N. Y., in 1828, and graduated from Union College in 1854. Previously he had gone to California with the Argonauts of '49, and while there had invented a machine for separating gold from dirt. Returning to the East he began the practice of architecture, but after a few years gave his time wholly to invention. Some of his better known inventions are a folding sewing table, a car coupler, a typewriter for the use of the blind, and a machine for the cheap manufacture of thermometers. In all, Mr. Hall secured over 200 patents on his inventions. At the time of his death he was at work on a propeller for aëroplanes.

HALLE, ERNST VON. A German naval writer and official, died June 27, 1909. He was born at Hamburg in 1868, and attended the universities of Munich, Bonn, Berlin and Leipzig. He traveled extensively and in 1895 published a monograph on *Trusts in the United States*. His work on the *Sea Interests of Germany* was published in 1897, and was followed yearly by a series of works on shipping affairs and political economy. He bitterly attacked Joseph Chamberlain's naval policy in 1904, and in 1905 published *Amerika*. His later works related chiefly to war. Von Halle was for some time an official of the Ministry of Marine.

HALLEY'S COMET. See ASTRONOMY.

HAMILTON, DAVID JAMES. A Scotch pathologist, died February 19, 1909. He was born in 1849 and studied in Edinburgh, Vienna and Strassburg. He was professor of pathology in Aberdeen University, and was one of the most eminent pathologists of his time. He wrote *Pathology of Bronchitis* (1883); *Text*

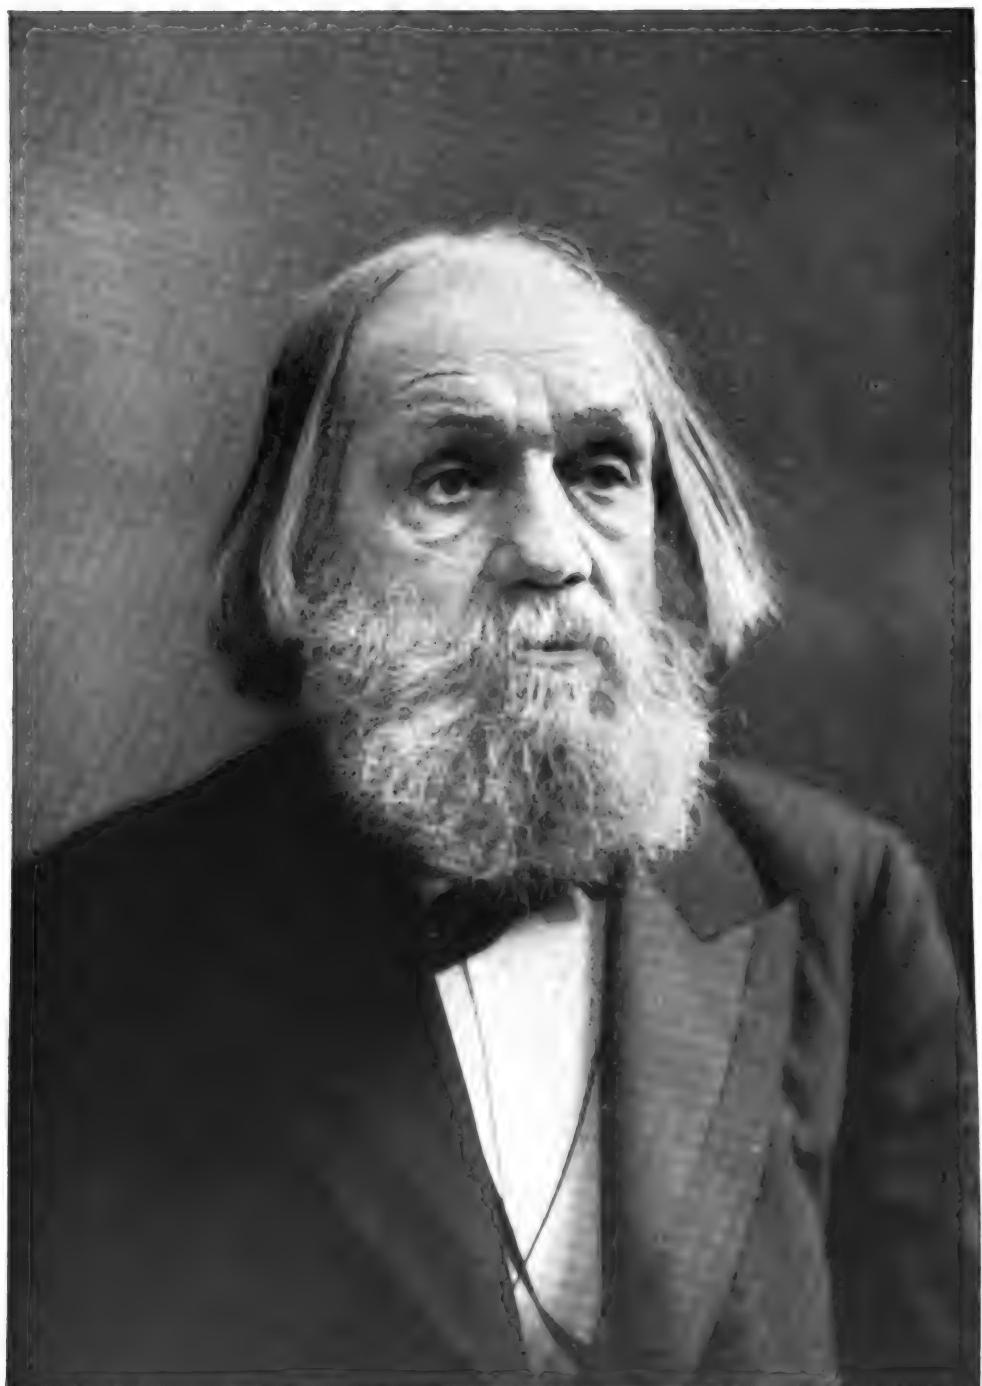

Book of Pathology (1889), and many pathological essays.

HAMILTON COLLEGE. An institution of higher learning at Clinton, N. Y., founded in 1812. There were in 1909, 185 students and 19 members of the faculty. The endowment was increased during the year by \$300,000. The library contains 49,200 volumes. The productive funds amount to about \$600,000 and the total income to about \$50,000. The president is M. W. Stryker, D.D., LL.D.

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE. An institution at Hampton, Va., founded in 1868 by General Chapman Armstrong under the auspices of the American Association for the practical education of the children of ex-slaves. In 1870 it was chartered by a special act of the General Assembly of Virginia, and thus became independent of any church organization. It is a private corporation controlled by a Board of Trustees, who come from various parts of the country and belong to different religious denominations. In 1878 the Institute opened its doors to Indian pupils. The aim of the school as expressed by General Armstrong is: "To train selected youth who shall go out and teach and lead their people, first by example by getting land and homes; to give them not a dollar that they can earn for themselves; to teach respect for labor; to replace stupid drudgery with skilled hands; and to these ends to build up an industrial system for the sake, not only of self-support and intelligent labor, but also for the sake of character." The enrollment for the year 1909-10 was 1356, of which 841 were in the boarding department, and 515 were in the Whittier school. There were 615 negro girls, 30 Indian girls, 678 negro boys and 33 Indian boys. There were 97 men and women on the teaching staff of the various departments, of which 48 were in the academic department, 11 at the Whittier school, which is the elementary department used as a training school for teachers, 12 in the agricultural department, 4 in the domestic arts, 3 in the domestic science departments, and 21 in the trade schools. The officers of the school in 1909 were: Principal, Hollis B. Frissell; Vice-Principal, George B. Phenix; Chaplain, Herbert B. Turner; Treasurer, Frank K. Rogers, and Secretary, William H. Scoville. The President of the Board of Trustees is Robert C. Ogden.

HANKIN, ST. JOHN ÉMILE CLAVERING. An English author and dramatist, died, supposedly by his own hand, on June 19, 1909. He was born at Southampton in 1869 and was educated at Malvern College and Oxford University. He contributed to various journals, including *Punch*, the *Times*, the *Saturday Review* and the *Indian Daily News*. His first acted play was *The Two Miss Wetherbys* (1903), and his best known play is *The Return of the Prodigal* (1905). *The Charity that Began at Home* was produced in 1906. He wrote, also, *Mr. Punch's Dramatic Sequels* (1901) and *Lost Masterpieces* (1904).

HANSEN, ÉMILE CHRISTIAN. A Danish botanist, died August 27, 1909. He was born in Ribe, Jutland, in 1842. He started in life as a house painter, but his ambition led him to study art at Copenhagen. He soon turned from this, however, to the natural sciences. For three years he supported himself by tutor-

EDWARD EVERETT HALE

ing, but in 1866 he obtained a scholarship which enabled him to study mathematics and science at the Copenhagen University. He became an instructor in the gymnasium there, and devoted himself to the study of chemistry and botany, especially with regard to the physiology of plants. In the latter science he came to be one of the recognized authorities. He also made special studies in the lower orders of plants, especially of the fungi. He was later appointed head of the physiological laboratory at Carlsberg. His studies in alcoholic fermenting yeasts and other microorganisms influencing them led to a wide study of the fungi which established a new epoch in botany. He gave practical value to his discoveries by evolving a plan to place the utilization of yeast cultures on a new basis, and in 1887, with Professor Kühle, he devised an apparatus for producing a new ferment which is now in use in many breweries in Europe. He wrote a work on microorganisms found in the atmosphere, and other papers of kindred nature.

HARBORS. An important development of the harbor improvements at the port of New York which have been in progress for many years was the opening of the new Ambrose Channel. This important work involved the deepening of an old channel with a depth of but 16 feet at mean low water, which was available for use only by tow-boats, scows and very light draft vessels. The project called for en-

nual value of foreign commerce in 1908. During 1908, 124 different ships drawing 27 feet or more made 484 trips outward and 137 trips inward. Prior to the improvement none of these ships could have crossed the bar to enter or leave the harbor except at extreme high tide or after lightering.

The most important work in harbor construction was the completion of the great artificial port of Dover, which was done by an elaborate system of breakwater construction and is more fully described elsewhere. (See BREAKWATERS.) The harbor thus formed furnishes protection for an entire fleet of the largest battleships and includes over a square mile of area. The cost of the work had amounted to about \$20,000,000. Southampton is another instance of a British port where developments were in progress. The London and South-Western Railway Co. obtained from Parliament sanction for the construction of a dry-dock which will be 1000 feet in length, with an entrance 115 feet wide, and 37½ feet of water over the sill, in other words it was to be capable of taking the largest ocean liners. A new basin amounting to 16 acres was under construction and the quay accommodation was extended 2500 feet, with a depth alongside of 35 feet, capable of further deepening to 42 feet if necessary.

The port improvements at Havre continued during the year and not only was it determined

(From *Engineering Magazine*.)

CROSS SECTION OF QUAY WALL AT PARA

larging this channel to a depth of 40 feet at mean low water and a width of 2000 feet, the estimated excavation being about 42,500,000 cubic yards of material for the length of seven miles. The work was done by powerful dredges during 1909, four of these being employed, and at the close of the government fiscal year 42,911,791 cubic yards of sand, mud, and stones had been excavated, at an expense of \$4,197,932.47. In the fiscal year 1909, 10,786,638 cubic yards of sand and mud and 6889 cubic yards of stone mixed with sand were excavated. In 1909 the work was about three-quarters completed and a channel with a depth of 40 feet at mean low water and a width of 1000 feet was secured easily navigable at mean low tide by ships of 37 feet draft. It was first buoyed for navigation in September, 1907, and its use was restricted to daylight navigation by ships of 29 feet draft or over, or more than 600 feet in length. Under authority of the Act of Congress of March 3, 1909, regulations were issued permitting use of the channel by day or night by all steamships or passenger steamers not having tugs regardless of size; and straightway the channel was used by practically all of the transatlantic lines and many of the others. The entire cost of the improvement of New York Harbor up to 1909 was less than 1 per cent. of the increase in valuation of foreign commerce alone for the port since the improvement began, and less than one-half of 1 per cent. of the an-

to improve the channel through the Seine estuary at an expense of about \$2,500,000, but plans were approved for the construction of a tidal basin and graving dock.

The port of Antwerp was undergoing considerable improvement in 1909. The Rogers lock, which affords access to the more important basins, is 580½ feet in length, 79 feet in width, and has 33½ feet of water over the sill. During the year a contract was let for dock works in the first part of the great scheme of harbor improvements adopted in 1907, involving the sum of \$3,400,000, and the excavation for two of the docks was commenced. The rivers in connection with the Belgian harbors require great attention and this has been found especially true at the port for large vessels at Zeebrugge, where a depth of 26 feet is maintained only by considerable dredging. This port, which is connected with Bruges by a maritime canal, has increased its business within three years from 441 vessels of 258,951 tons to 839 vessels of 500,154 tons in 1908.

During the year active progress was being made with the extensive improvements of the port of Pará, Brazil, which are designed to afford ample commercial facilities for this important seat of the export rubber trade. Pará, being on the only navigable mouth of the Amazon, the third seaport of Brazil in point of commerce, is situated on an estuary 65 miles from the open sea, but the deep water navigable

for ocean steamships does not come nearer to the city than three or four miles, so that at the old quay there was only 19.7 feet of water at mean low tide. Accordingly the commerce involving annually between \$40,000,000 and \$50,000,000 of exports and imports often had to be lightered and handled more than once. The work was under the direction of M. L. Quellenece, chief engineer of Ponts et Chaussées of France, and consulting engineer of the Suez Canal, with E. L. Corthell, the American engineer, as consulting engineer. The general plan of work involved the construction of a quay wall 3280 feet long with a depth of water in front of it of 30 $\frac{1}{2}$ feet for deep-sea ships and a quay wall 1640 feet in length with a depth of water of 10 feet for Amazon river boats, and 3875 feet of shallow walls for small boats and for the general improvement of the city. The foundation of the quay wall was laid in hard clay in which a trench had been excavated. On this was placed riprap stone and above massive concrete blocks. Between the quay wall and the shore the space was filled with the sand excavated by the suction dredges from the channel and the deep-water basin in front. On the quay walls will be traveling cranes, and behind warehouses and railroad tracks, it being the intention to erect fireproof warehouses the entire length of the port. The work is being undertaken by an American corporation known as the Port of Pará Company, which is guaranteed 6 per cent. interest on the capital invested and a concession extending until 1973, and to 1996 in case the second division of the port is built, with a proviso for the purchase of the work by the government.

In addition to Pará further important harbor works in South America were undertaken at Buenos Ayres to accommodate the rapidly growing trade of this port. Bids were invited during the spring of 1909 for the construction of a new wet or tidal dock which will cover 200 acres and have a depth of 30 feet at low water. The depth of the approach channel was increased from 21 to 26 feet.

During the year extensive harbor works were in progress at Madras with the aim of making the harbor one of the best in India. This involved the construction of a breakwater 1500 feet in length to protect a new entrance and the pierhead of this breakwater formed a difficult engineering problem on account of its exposure. Accordingly a large square iron caisson was constructed and towed to the site and after being loaded was sunk in place. The caisson was filled with concrete so as to possess the greatest strength and on it was placed a superstructure of masonry.

HARE, WILLIAM HOBART. An American Bishop of the Protestant Episcopal Church, died October 23, 1909. He was born at Princeton, N. J., in 1838, and received his early education in the Protestant Episcopal Academy in Philadelphia. He entered the University of Pennsylvania, but remained in college only two years, leaving to take up the preparation for the ministry. During his years of study he taught school. In 1859 he received his deacon's orders and was ordained a priest in 1862. He was made assistant in St. Luke's Church in Philadelphia, and soon thereafter became rector of St. Paul's, and subsequently of Chestnut Hill, both in Philadelphia. He became in 1870 secretary and general agent of the foreign committee

of the Domestic and Foreign Missionary Society. In 1873 he was consecrated Bishop of Niobrara, which diocese in 1883 was enlarged and made coterminous with the newly-created Territory of South Dakota, the name of which it assumed.

HARRIMAN, EDWARD HENBY. An American financier and railroad builder, died September 9, 1909. He was born at Hempstead, L. I., February 25, 1848, the son of the Rev. Orlando Harriman, at that time rector of St. George's Episcopal Church in Hempstead. He was one of six children, four boys and two girls. The circumstances of his father precluded any attempt at collegiate education, and all the formal instruction that he obtained was two years in a church school to supplement a course in the public schools. Mr. Harriman's business training began while he was still a youth, when he obtained the position of a clerk in the office of a Wall Street broker. At about the same time his mother fell into a considerable legacy, but this did not change the young man's habits of industry. So great was his ability and diligence that in the year of his majority he was able to purchase a seat in the New York Stock Exchange. This was in 1870. Mr. Harriman did not begin his Stock Exchange career, as is customary, as a junior partner in an exchange house, but engaged in the much more difficult business of floor trader. This was during the period of the most daring operations of Jay Gould, Commodore Vanderbilt, Daniel Drew and their contemporaries. Mr. Harriman thrived in business while men of greater experience failed. It was early demonstrated that not one of his generation was a better reader of the stock market than he, and none quicker to see and grasp an opportunity. During this period Mr. Harriman made many fortunate acquaintances. Among these was Stuyvesant Fish, who began his career in the financial district at about the same time.

In a few years Mr. Harriman organized the Stock Exchange firm of Harriman and Co., which still exists, although Mr. Harriman long before his death retired from it. He remained a member of the Stock Exchange, however, as long as he lived. In 1883 Mr. Fish was made vice-president of the Illinois Central Railway, and as soon as it was possible he used his influence to secure the election of Mr. Harriman to the Board of Directors. The latter at once turned his genius for analysis to mastering all the business of conducting and maintaining railroads. He was soon familiar with all the departments of the railway business, including costs of supplies and operation and all the details of administration. He soon became known as an expert in railroad matters and before he had long been connected with the Illinois Central he had convinced the great financial house of Kuhn, Loeb and Co. that he had a genius for railway management, and they were willing to accept his judgment on many railroad propositions.

Mr. Harriman's vision was of vast range and he cherished the dream of a railroad empire. The opportunity for realizing this came in that period of the first administration of President McKinley when the financiers of Wall Street were engaged in restoring the wrecks of suspended railroads. One of these was the Union Pacific, which seemed to most reorganizers beyond the possibility of resuscitation. Mr. Har-

Courtesy of "Engineering Magazine"

riman had studied the situation in connection with this road closely, and he succeeded in persuading Kuhn, Loeb and Co. to agree to his plans in connection with it. When the road was sold at auction by the government on account of its failure to pay its liabilities, these bankers had a syndicate organized and made the successful bid. Among the members of this syndicate were the Vanderbilts, Goulds, James Stillman of the City Bank, and Mr. Harriman. At that time he was little known, and those who were lacking in intimate knowledge of his ability considered him the least important member. The syndicate paid the government about \$60,200,000 for the 1800 miles of poor track and worn-out equipment then owned by the company, and paid an additional sum to bondholders and for the purchase of minor tributary lines. The company was then reorganized. It was Mr. Harriman's plan to merge this railroad with the Chicago and Northwestern. The Vanderbilt interests, however, would not undertake this, and Mr. Harriman and Kuhn, Loeb and Co. undertook to finance the operation alone. They secured the influence of James Hazen Hyde, vice-president of the Equitable Life Insurance Company, whom Mr. Harriman had placed on the Board of Directors. Mr. Hyde took a large block of the preferred stock for the Equitable Company and subscribed also individually. This operation later became famous in the insurance investigations of 1907. Under Mr. Harriman's management the Union Pacific Railroad became prosperous. Largely through his efforts enough credit was obtained to float another issue of securities and acquire the Oregon Short Line and the Oregon Railway and Navigation Company. The Oregon Short Line had a great value apart from its usefulness as a railroad on account of its broad, comprehensive charter. This permitted Mr. Harriman to accomplish what came to be considered some of his most extraordinary feats in "high finance." This line became the favorite "holding company" for the Union Pacific system and permitted it to make acquisitions of other lines that otherwise would have been impossible. In 1901 the controlling interest in the Southern Pacific was turned over to the Oregon Short Line. This line was immensely superior to the Union Pacific in mileage and resources, and with it came the Central Pacific, which it controlled. This gave Mr. Harriman a direct central line to the Pacific coast at San Francisco. In the meantime Mr. Harriman had become interested in the Kansas City Southern, a railroad extending from Kansas City to the Gulf at Galveston, and he had also, with the assistance of Kuhn, Loeb and Co., acquired control of the Chicago and Alton.

After having secured the Union Pacific, Southern Pacific, and Chicago and Alton by the spring of 1901, Mr. Harriman and his associates in that year took objection to the purchase of the Chicago, Burlington and Quincy by James J. Hill and his associates. They insisted that this acquisition threatened the community of interest among roads in the West and Northwest, and retaliated on Mr. Hill by endeavoring to wrest the Northern Pacific from his control. This contest led to the famous Northern Pacific corner, which culminated on May 9, 1901, when the price of Northern Pacific went to \$1000 and the entire stock market went to pieces. When the contest ended the Hill party had a majority of the common stock and was in control of the

road. All interests finally combined their holdings of Northern Pacific, Great Northern and Burlington in a new holding company, called the Northern Securities Company. This company was subsequently dissolved by the courts under the Sherman Anti-Trust Law. This outcome left the Harriman party in control of none of these three roads, and in this respect was a defeat for Mr. Harriman. On the other hand, the subsequent appreciation of the Great Northern and Northern Pacific enriched the Union Pacific treasury by an amount estimated at more than \$100,000,000. The bulk of these stocks sold at a handsome profit in 1906 and Mr. Harriman reinvested the proceeds in stocks of other roads. Most of the money used by Mr. Harriman and his associates for this fight with the Hill interests had been obtained by an authorized issue of \$100,000,000 Union Pacific convertible bonds, but shortly before the contest Mr. Harriman had been elected a trustee of the Equitable Life Insurance Society and had borrowed \$2,700,000 from that institution, presumably to pay in part his share of the contest. From that time until the life insurance investigation in 1905 he increased his influence in the Equitable Company and when the difficulties between James Hazen Hyde and President Alexander came to a head, Mr. Harriman endeavored to secure the control of the company. He was thwarted in this endeavor by Thomas F. Ryan, who bought up the control unknown to Mr. Harriman. Neither the defeat in the Northern Pacific corner nor in the Equitable affair apparently discouraged Mr. Harriman.

In 1903 he came into conflict with James R. Keene, at that time counted the most redoubtable market operator of his time. Mr. Keene and his son-in-law, Talbot J. Taylor, had a pool in Southern Pacific and were endeavoring to force the management to declare a dividend on the stock. Mr. Harriman's party controlled about half of the Southern Pacific stock through the Union Pacific and they released \$30,000,000 of this stock from the Union Pacific treasury. As a result the Keene pool was smashed.

The transaction of the Chicago and Alton Railroad referred to above was perhaps the most notable with which Mr. Harriman was connected. It was proved in the investigation of the Interstate Commerce Commission noted below that a syndicate organized by Harriman paid \$40,000,000 for the road, and in the course of reorganization converted \$8,000,000 of old bonds and \$22,000,000 of old stock into \$54,000,000 of new bonds and \$40,000,000 of new stock. It was shown that the syndicate had received or voted itself a 30 per cent. dividend soon after the reorganization and had taken the new company's 3 per cent. bonds at 65 per cent. and sold them to life insurance companies, among others, at 96. The defense of Mr. Harriman was that the new capitalization was justified by the back earnings put into the property in capital expenditure but never capitalized and in the new money spent on the road in improvements and extensions.

In 1906 the Interstate Commerce Commission instituted a rigid investigation into the Harriman lines. Mr. Harriman and others testified on the stand early in 1907. In this investigation it came out for the first time how broad had been the scope of Mr. Harriman's ambition in the railroad field and how successful he had been in spreading his influence across the con-

tinent. By the sale of the Great Northern and Northern Pacific stock and the reinvestment of the proceeds, the Union Pacific and its controlling companies had secured, at an expenditure of about \$150,000,000, \$28,000,000 worth of Illinois Central, \$39,500,000 worth of Baltimore and Ohio, \$14,000,000 worth of New York Central, \$10,000,000 worth of Atchison, and smaller blocks of other railroads. It appeared also that Mr. Harriman's power as president of the Union Pacific and Southern Pacific was practically supreme. He was shown to be in absolute control of the system, the directors having deputized the entire power to the executive committee and that committee having by resolution turned it over to Mr. Harriman.

The last of the great contests carried on by Mr. Harriman was the successful attempt to oust Stuyvesant Fish, his former friend, from the presidency of the Illinois Central. This was accomplished in 1907 after a bitter fight. Following this, Mr. Harriman's relations with his rivals were more amicable. Harmonious relations were established in the railroad and banking fields during the troubled times of the panic of 1907. The most important of his operations was perhaps the settlement of the old strife with the Gould interests dating from the inception of the Gould scheme for a transcontinental line. Three of the Gould Eastern and one of the Western lines were unable to weather the panic of 1907, and Mr. Harriman and Kuhn, Loeb and Co. were applied to for help. This was given on terms that were satisfactory to the Harriman party. Following the panic, Mr. Harriman coöperated in measures for the improvement of the Erie Railroad, turned the Central of Georgia over to the Illinois Central and became a director in the New York Central. He also made a close traffic connection between the Union Pacific and Kansas City Southern.

In politics Mr. Harriman was counted very influential in California during the last ten years of his life. He had also close relations with the leading politicians of New York State and up to 1904 was on friendly terms with President Roosevelt. In 1907 a letter written in 1904 by Mr. Harriman to Sidney Webster, in which Mr. Harriman complained of his treatment at the hands of the Roosevelt administration after he had raised \$225,000 for the Roosevelt campaign fund in 1904, was stolen and made public by a discharged stenographer, who had kept his notes. This drew from President Roosevelt an angry reply in which he referred to Mr. Harriman as "an undesirable citizen." Several sharp retorts followed between them and a letter written by President Roosevelt to Mr. Harriman on October 14, 1904, was made public. In this President Roosevelt asked for Mr. Harriman's help as a "practical man" in the campaign then in progress. In the same correspondence it also came out that in 1906 Mr. Harriman had refused to contribute to the Republican Congressional campaign fund.

At the time of his death Mr. Harriman controlled, by the ownership of a majority of the stocks and bonds, the following railroads: The Union Pacific, the Southern Pacific, the Southern Pacific and Mexico, the San F. L. A. and St. L., the St. Joseph and Grand Island, Illinois Central and Central of Georgia. He had a dominant interest in the Baltimore and Ohio and the Delaware and Hudson. He had also important interests in the Erie, New York Central, and W. and L. E. P. T. He held lesser in-

terests in the Atchison, Chicago and Northwestern, and St. Paul. Besides these, he was interested in many financial institutions, including the Equitable Trust Co., the Guaranty Trust Co., National City Bank, Night and Day Bank, Railroad Securities Co., and Western Union Telegraph Co. Of transportation companies other than railroad companies he was in control of the Pacific Mail Steamship Company, the Portland and Asiatic Steamship Co., and the Wells Fargo and Co. Express. A week prior to his death Mr. Harriman made public plans for new construction and development of railroads and other transportation companies, which contemplated the expenditure of \$300,000,000. The most important of these plans was the completion of the road of the Southern Pacific Company to Mexico, and other Mexican projects.

Mr. Harriman was a man of slight physique and in the last two years of his life was almost constantly in poor health. Only his marvelous vitality permitted him to persevere in the execution of his great plans. He made several tours of the world in search of health and had returned from a visit to baths in Austria just previous to his death. He had considerable interest in scientific matters, and at his expense was equipped and carried out the Harriman Expedition to Alaska in 1899. He also gave away large sums of money, but so unostentatiously that little was known of this by the public. He purchased a great estate at Arden, near New York City, and had under construction what will probably be the finest country house in America. His entire estate was left to his wife.

HARRIS, WILLIAM ALEXANDER. An American public official, from 1897 to 1903 United States Senator from Kansas, died December 20, 1909. He was born in Loudoun County, Va., in 1841 and graduated from Columbian College in 1859 and from the Virginia Military Institute in 1863. He served in the Civil War, being for three years assistant adjutant-general and an ordnance officer. Following the war he removed to Kansas and was construction engineer for the Union Pacific Railway Co. He became interested in politics and was a member of Congress from 1893 to 1895. In 1897 he was chosen United States Senator, serving until 1903. In 1907 he was Democratic candidate for Governor of Kansas.

HARRIS, WILLIAM TORBEY. An American educator and public official, died November 5, 1909. He was born at Killingly, Conn., in 1835. He attended Yale College for two and a half years but did not graduate. That institution, however, conferred on him in 1869 the degree of A. M., and in 1895 the degree of LL. D. From 1857 to 1867 he was assistant superintendent in the St. Louis public schools and three years following was superintendent, resigning on account of ill health. He settled at Concord, Mass., where he became a lecturer at the School of Philosophy. In 1867 he established in St. Louis the *Journal of Speculative Philosophy*, of which he was conductor up to the time of his death. In 1880 he represented the United States Bureau of Education at the International Congress of Educators at Brussels, and also at the Paris Exposition in 1889. In 1889 he was appointed United States Commissioner of Education, which office he held until 1906. He was chief editor of the "Appleton School Readers," and also later edited an educational series for D. Appleton & Co. He was editor also of the De-

Copyright by Underwood & Underwood, New York

E. H. HARRIMAN

partment of Philosophy in *Johnson's Encyclopædia* and wrote many important articles for that work. He was in addition editor-in-chief of *Webster's New International Dictionary*, which was published just prior to his death. Dr. Harris wrote much on philosophical and educational subjects. Among his published works are: *Introduction to the Study of Philosophy* (1889); *The Spiritual Sense of Dante's Divina Commedia* (1889); *Hegel's Logic, a Book on the Genesis of the Categories of the Mind* (1890); and *Psychologic Foundation of Education* (1898).

HARVARD UNIVERSITY. An institution of higher learning at Cambridge, Mass., founded 1636. The attendance in 1908-09 was 4915; in the fall of 1909, 5100. In Harvard College, the Graduate School of Applied Science, the Graduate School of Arts and Sciences, the Graduate School of Business Administration, the Divinity School, the Law School, and the Dental School there was an increase in attendance. The Lawrence Scientific School and the Medical School showed a decrease. In December, 1909, the Governing Boards of the University adopted the following scheme for modifying the choice of electives in Harvard College:

A standing committee of nine is to be appointed from the Faculty of Arts and Sciences with power to associate with itself a large number of advisers for students; this committee is to prepare general rules for the choice of electives to be approved by the Faculty, based upon the principle that the student must take a considerable amount of work in some one field, and that the rest of his course must be well distributed. At the end of his first year in college each student is to be required to present to his adviser a plan of study for the remainder of his college course, this plan to conform to the general principles laid down by the committee, unless the committee is satisfied that the student has sufficient grounds for departing from those principles; the student's plan can be subsequently changed only for a course satisfactory to the committee.

In 1909, 1017 degrees were conferred in all departments of the University. Among the gifts to the University in the year 1908-09 may be mentioned the following:

One million dollars from the estate of Gordon McKay to promote applied science; \$100,000, as the 25th anniversary fund of the Class of 1884; \$50,000, bequest of Charles F. Farrington to advance the knowledge of infectious or communicable diseases; \$260,000 for the Germanic Museum; \$150,000 for the maintenance of religious services at the University; \$30,000 from Henry L. Higginson; \$5000, bequest of Robert Henry Harlow for assisting poor young men of excellent moral character in the academic department.

George Foote Moore, Professor of the History of Religion, was chosen by the German Department as Visiting Professor at the University of Berlin. Professor Eduard Meyer, lecturing on Ancient History, was Exchange Professor at Harvard.

Professor Bliss Perry, of the Department of English, was appointed lecturer at the University of Paris and other French universities, on the Hyde Foundation for the year 1909-10.

The Cercle Français lecturer for the year 1909-10 was M. Émile Boutroux.

The resignation of President Charles W. Eliot

took effect on May 19, 1909. At this time Abbott Lawrence Lowell, Eaton Professor of the Science of Government, became president of the University. The inaugural ceremonies took place October 6 and 7, 1909.

The endowment of the University in July, 1909, was \$22,716,759.24.

HAUSRATH, ADOLF. A German Protestant theologian, died in August, 1909. He was born in Karlsruhe in 1837, and was educated at the universities of Jena, Göttingen, Berlin and Heidelberg. In 1867 he was appointed professor of ecclesiastical history at Heidelberg. His most important published works include *Der Apostel Paulus* (second ed. 1872); *Martin Luthers Romfahrt* (1894); *Alte Bekannte* (1899-1901). Under the name of George Taylor he wrote a number of historical novels, among them *Antinous* (1880); *Klytia* (1883); *Jetta* (1884); *Elfriede* (1885); and *Peter Maternus* (1898).

HAVERHILL, MASSACHUSETTS. See ELECTORAL REFORM.

HAWAII or HAWAIIAN ISLANDS (formerly SANDWICH ISLANDS). A Territory of the United States comprising a chain of islands in the Pacific Ocean, forming the extreme northern group of Polynesia. The capital is Honolulu on the Island of Oahu, 2100 miles from San Francisco, 4803 miles from Manila, and 3850 miles from Salina Cruz, the Mexican Pacific terminus of the Tehuantepec Railway.

AREA AND POPULATION. The total area of the Hawaiian Islands is 6,449 square miles, and the area of the inhabited islands is as follows: Hawaii, 4015 square miles; Maui, 728 square miles; Kahulawae, 69; Molokai, 261; Lanai, 133; Oahu, 600; Kauai, 544; and Niihau, 97. The last official census of the islands was taken in 1900, when the total population was 154,000. Conditions since that time make it difficult to estimate the present population. It is probably 170,000, divided about as follows: Orientals, 95,000, including 72,000 Japanese, 18,000 Chinese, and 5000 Koreans; Latins, 27,000, including 23,000 Portuguese, 2000 Spanish, and 2000 Porto Ricans; Polynesians, practically all Hawaiians and part Hawaiians, 35,000; Teutons, practically all of American, British, German and Norwegian descent, 12,000; others, 1000.

AGRICULTURE. Hawaii is mainly an agricultural country, but the conditions are such, owing to lack of knowledge of tropical agriculture, distance from the world's markets, tariffs, and other causes, that thus far only few products have been produced on a sufficient scale for export in appreciable quantities. Much enterprise is being shown, however, in experimentation and a growing disposition toward the adoption of scientific methods. Marked progress has been made in knowledge of possible crops and methods of cultivation. Especially is this true of the sugar industry, in which the scientific cultivation has resulted in an enormous product. The sugar industry far exceeds all others combined in the value of its output. It is conducted mainly on a large scale, although there are a number of planters who raise cane and sell it to the large producers. The greater portion, however, even of that raised under the general supervision of the large producers, is raised under contracts, more or less of the

nature of profit-sharing agreements, under which the planters perform certain functions varying with local conditions, and the laborers do most of the work and sell the cane to the planters at agreed prices, which vary with the price of sugar and the amount of cane required to produce a given quantity of sugar. There were employed in the enterprise on January 1, 1909, 44,348 persons comprising 570 Americans, 3,202 Portuguese, 685 Spanish, 370 other Europeans, 1,080 Hawaiians, 1,917 Porto Ricans, 118 Filipinos, 31,207 Japanese, 2,942 Chinese, 1,743 Koreans, and 96 others. Since the beginning of 1909, the percentage of non-Asiatics further increased, owing to the recent strikes among the Japanese. More than \$70,000,000 is invested in the sugar industry, and 215,000 acres in the island are cultivated in cane. About half the land is irrigated. The annual value of the crop is over \$40,000,000, and the crop of 1909 yielded about 530,000 tons, which was a slight increase over the crop of 1907, which was 521,123 tons. The value of the sugar, including refined and brown, exported to the United States in the fiscal year ending June 30, 1909, was \$37,632,821, as compared with \$39,816,082 in 1908. Rice is produced in considerable quantities in the islands, mainly by the Chinese, on small plantations and usually upon land leased at high rentals. About 11,000 acres are cultivated, yielding as a rule two crops a year, the entire crop being valued at \$2,500,000, most of which is consumed in the Territory. The value of the export of rice to the United States for the fiscal year ending June 30, 1909, was \$255,210, a marked increase over the value of the export product of 1908, which was \$140,768.

The coffee industry is one of the oldest on the islands, and was at one time conducted largely by Americans. Owing to low prices, it has fallen largely into the hands of Japanese. The output is variable. About 4500 acres are cultivated, averaging 600 to 700 pounds per acre. The value of the coffee exported to the United States in 1909 was \$211,535, from 1,753,119 pounds, compared with the export of 1,310,432 pounds valued at \$157,137 in 1908. The pineapple industry is the most advanced of the newer minor industries of Hawaii. It has large promise and is especially suitable for American settlers. Its growth has been rapid since the extension of the American protective tariff to these islands, when territorial government was established. The pineapple schedule in the tariff bill of 1909 was most gratifying to the people of Hawaii. The export of fresh fruits has not grown much, but it is expected to grow with the increase of transportation facilities, and of knowledge as to methods of packing, shipping and marketing. In the year ending May 31, 1909, 411,000 cases were exported, which was more than double the pack of the preceding year. The area planted is about 5500 acres, an increase of about 1000 acres during the year. The rubber industry is still in an experimental state in the islands, although the experiments of 1908 in tapping and in the use of temporary fertilizers during the tapping period have been most promising. One of the most marked and hopeful industrial features of the past year was the increase of the tobacco and cotton industries. Both these are results, in large measure, of the work of the Federal Experiment Station, and bid fair to play an important part in the diversification

of industries and the encouragement of small proprietors (see AGRICULTURAL EXPERIMENT STATIONS). Two tobacco companies have been incorporated with a stock of \$50,000 and \$100,000 respectively, and have begun operations on the Island of Hawaii. It is expected that the crop of 1909 will amount to 750 bales. The sisal industry is important. Five companies are in operation, and about 3000 acres are under cultivation. The output in 1908 was 100 tons, and the output of 1909 is expected to be 300 tons. The honey industry, which is comparatively new, is steadily growing, and it now represents an investment of \$200,000, and yields annually about \$70,000 worth of honey and wax. Bananas are exported to some extent. The cultivation of cocoanut for purposes of exportation has been begun on a more extensive scale.

The cattle on the islands number about 130,000 head, valued at about \$1,700,000. The cattle ranches suffered from the prolonged drought in 1908, which continued in 1909, and resulted in the loss of 15,000 head of cattle. In consequence it was found necessary for the first time in many years to import beef in the early part of the year. There are about 100,000 sheep valued at \$130,000 in the islands. The exports of wool amount to about \$50,000 annually.

MANUFACTURING. The principal manufactures of the islands are incidental to agricultural industries. The principal manufactory of the islands is that of the Honolulu Iron Works Company at Honolulu, of which sugar machinery is its specialty. On the sugar plantations there are numerous pumping plants and there are about ten pineapple canning factories, a number of coffee mills, rice mills, and sisal and manioc mills. There are also several saw mills for lumber and railroad ties and several planing mills.

COMMERCE. The aggregate imports and exports for the year ended June 30, 1909, amounted to \$61,946,484, an apparent slight decrease of \$277,695 from the amount \$62,224,179 for the previous year, which was by far the largest up to that time. The amount in 1908, however, includes, while that for 1909 excludes, specie shipped from the mainland. Omitting such specie from both, the decrease is only \$143,572. The table given on the following page shows the imports and exports by countries for the fiscal years 1908-9.

The principal exports to the United States in 1909 were as follows: Sugar, raw, 983,092,127 pounds, valued at \$35,487,912; refined, 39,773,800 pounds, valued at \$2,144,830; coffee, 1,763,110 pounds, valued at \$211,535; rice, 5,823,585 pounds, valued at \$255,210; fruits and nuts, valued at \$1,446,792.

The steady increase for some years past in the tonnage of vessels entered and cleared, continued during the fiscal year 1909, when the amount was the largest thus far, or 1,159,118 tons entered and 1,159,749 cleared, exclusive of vessels engaged in inter-island traffic, which is nearly as much additional.

TRANSPORTATION. The matter of transportation facilities is of the greatest importance. There is need of more railroads upon the several islands, at least one good harbor in each island and two on the largest, the reduction of freight and passenger rates, and especially an increase in available accommodations for passengers and

IMPORTS AND EXPORTS, BY COUNTRIES, FISCAL YEARS 1908 AND 1909.

Country.	Imports		Exports

perishable goods, particularly fresh fruits, between the Territory and the mainland. Considerable progress was made in this direction during 1909. A number of steamers were added in the trans-Pacific traffic, and traffic between the Territory and the mainland, with increased accommodations for fruit, and, to some extent, for perishable goods. The passenger accommodations, however, are still very inadequate. The harbor of Honolulu has undergone enlargement and improvement, and the conditions there are, on the whole, excellent. Inter-island traffic is conducted almost exclusively by the Inter-island Steam Navigation Company. Five steamers regularly visit all ports of consequence in the territories. This company has fifteen steamers. Five steamship companies are engaged in traffic between the Territory, the mainland and Mexico. A few American sailing vessels continue to carry sugar around Cape Horn. The most extensive railroad is on the Island of Oahu, with nearly 100 miles of main line and branches. On the Island of Hawaii, the Hilo Railroad Company has 40.35 miles of main line and branches. There was only one street railway, that of the Honolulu Rapid Transit and Land Company, Honolulu, with just 24 miles of line. This company carries nearly 8,000,000 passengers yearly.

PUBLIC LANDS. The public lands of the islands comprise about 1,700,000 acres, and of this, much is so high, or so precipitous, or so recently formed by volcanic action, or so dry and rocky or otherwise unsuitable to marketable crops, that comparatively little is arable in its natural condition, and in the present state of knowledge. The Governor in his annual report recommends the amendment of the present land laws. They were enacted in 1895 and were modeled largely from the New Zealand laws, and conditions which made them suitable at that time have since changed. The last legislature provided that the entire proceeds of land sold for settlement purposes might be used for the construction of roads, opening up and land for such purposes. Four tracts, aggregating 101,614 acres, have been set apart during the year as forest reserves, making the total present area of such reserves in the islands, 545,746 acres.

FINANCE. The bonded debt of the Territory at the beginning of the fiscal year 1909 was \$3,979,000, which was reduced during the year by the payment of \$20,000 in 5 per cent. bonds, leaving a total bonded indebtedness of \$3,959,000 at the close of the year. The receipts for

the year were \$3,051,526, an increase of \$381,778 over the amount for the previous year. The expenditures were \$2,934,084, an increase of \$117,605 over the amount for the previous year. The receipts exceeded the expenditures during the last year by \$116,542. The principal sources of revenue were as follows: Licenses, \$217,058; real property tax, \$668,721; personal property tax, \$678,886; income tax, \$389,500; water works, \$147,140; land revenue, \$185,268. The chief expenditures were for departmental expenses, \$1,474,052; payments to the city and county of Honolulu, \$534,168; payments to the county of Hawaii, \$233,740.

EDUCATION. The public schools are under the Department of Public Instruction, consisting of the superintendent and six commissioners. The enrollment in all schools for the school year 1909 was 24,889, an increase of 1444 for the year. Of these, 10,507 were in public schools and 5382 in private schools. Teachers numbered 493 in the public schools and 269 in private schools. The actual attendance at the public schools was 91 per cent. of the enrollment. The largest increase in all schools, 902, was in Japanese pupils, the next in Chinese, the next in Portuguese, and the next in part Hawaiian. The expenditures for public school purposes for the fiscal year 1909 amounted to \$532,908. The principal nationalities of the scholars in the schools are as follows: Japanese, 6415; Portuguese, 4606; Hawaiians, 3681; Chinese, 2830; Americans, 972; Porto Ricans, 438. The College of Agriculture and Mechanic Arts, although established a little more than a year, has made much progress. Negotiations are practically completed for obtaining an additional 30,000 acres of land for a permanent site, which, with the land already obtained, will make 73,000 acres of a value of nearly \$100,000. The College is becoming well equipped with the best apparatus and machinery. The faculty has been increased to twelve members, all of whom are specialists in their several lines of work. During the year there were 102 students in prescribed courses. These courses include general science, agriculture, engineering and household economics.

LABOR AND IMMIGRATION. The departures of Japanese during the year 1909 far exceeded the arrivals, which are now confined mostly to returning Japanese, or relatives of Japanese already ready in the Territory. The decrease of the Chinese population, due to the departures and non-arrivals, is largely offset by births, and also by the arrival of Chinese children for the

purpose of attending school. The Portuguese are increasing rapidly; the pure Hawaiians are slowly decreasing, and part Hawaiians are increasing.

The principal feature in immigration and labor matters during 1909 was the provision by the legislature for a special fund to be raised by an additional tax of 2 per cent. upon incomes of over \$4000, three-fourths of which is to be used for immigration purposes and the other one-fourth for conservation purposes. The entire proceeds are expected to amount to from \$300,000 to \$400,000 a year. With this fund the Territorial Board of Immigration has dispatched a special agent to arrange for the transportation of such Portuguese and other European immigrants of desirable classes as desire to go to Hawaii. A serious strike occurred on a number of plantations on the island of Oahu in May and lasted about three months. About 7000 laborers, chiefly Japanese, were involved. The strike was settled on the 1st of August. During its progress there were serious riots on several of the plantations, and on June 17 indictments were found against several rioting Japanese laborers. The government of Japan declined to intervene in the trouble.

POLITICS AND GOVERNMENT. During the year the regular biennial election was held for the election of a Delegate to Congress, members of the Territorial legislature, and city and county officials. Among the notable features of the election was the steady and rapid increase of Portuguese voters, the steady, though comparatively slow increase of Chinese voters, and the small number of Japanese voters, notwithstanding the large Japanese population. At the election four Portuguese were elected to the House of Representatives. The total vote cast for Delegate to Congress was 12,316, of which the Republicans cast 5698, the Democrats 3824, and the Home Rule Party 2794.

The fifth legislature of the Territory began its regular biennial session on February 17, 1909, and was in session the allotted period of sixty days. The number of bills passed, 152, was the largest passed by any legislature in Hawaii. Much attention was paid to the subject of finance, and measures were taken which went far toward establishing a satisfactory status for both territorial and county finances. Measures were passed also inaugurating a new policy in regard to the handling of leprosy, which it is believed will within a reasonably short period result in a practical eradication of that disease, if it can be accomplished at all. Provision was also made for inaugurating a campaign by the Territorial Board of Health against tuberculosis. The other bills included one of an advanced character in regard to juvenile courts, one providing for indeterminate sentence, and one for the establishment of a territorial library. Some of the best work of the legislature was done in defeating undesirable bills, notably a strenuously pressed amendatory bill, which would have greatly impaired the efficiency of an excellent liquor bill, passed by the previous legislature.

On February 18, the United States War Department decided to establish a large military station at Hawaii, and make it second in the Department of the Philippines in importance. The construction of a naval station at Pearl Harbor is proceeding under the Navy Department. Rapid progress was made during the

year under a contract entered into in December, 1908, for the extensive work of widening, deepening and straightening the long entrance channel. A contract was made during the year for the construction of the dry dock.

HAY. The hay crop of 1909 in the United States was very satisfactory, and was generally harvested under conditions insuring good quality. In the Southwest and in parts of the East, the crop was short as a result of drouth. The total production was about 65 million tons, the acreage approximately 45,750,000 and the total farm value on December 1 about \$670,000,000. The yield of hay had been greater a number of times than it was this year, but the 5-year average for 1903 to 1907 was only 60,671,000 tons. Iowa, as in 1908, was the leading hay State in 1909, producing 5,983,000 tons on 3,648,000 acres. New York, where dry weather reduced the crop, yielded 5,002,000 tons on 4,764,000 acres, and ranked second, being followed by Illinois with 4,135,000 tons on 2,852,000 acres, Ohio with 4,033,000 tons on 2,820,000 acres, Pennsylvania with 3,742,000 tons on 3,118,000 acres, and Missouri with 3,719,000 tons on 2,755,000 acres.

HAZELTINE, MAYO WILLIAMSON. An American literary critic and writer, died September 14, 1909. He was born in Boston in 1841, and graduated from Harvard College in 1862. He studied at Oxford and spent some years in Continental Europe. Returning, he studied law and was admitted to the bar. In 1878, at the invitation of Charles A. Dana, he became an editorial writer for the *New York Sun*. Up to the time of his death he was connected with that paper as leading book reviewer, and editorial writer. He contributed also to the *North American Review* and other periodicals, particularly on foreign topics. His published books include *Chats About Books*, *British and American Education*, and *The American Woman in Europe*.

HEART, REANIMATION OF. Several methods of reestablishing the heart action after that organ has stopped beating were tried experimentally during 1909. Mocquot, in a resumé of the subject, says that the best method was by massage of the heart below the diaphragm through an abdominal incision. Massage through openings in the chest was tried in 21 cases, with 2 complete and 5 partial successes, whereas in 22 cases of massage in which the heart was manipulated from below the diaphragm, success was complete in 9 and partial in 6. Mocquot found that it was not necessary to grasp the heart during massage, but it is more effectual merely to compress the ventricle against the chest wall by means of the hand introduced flat behind the heart. Butruille succeeded in massaging the heart in an asphyxiated new born infant without any incision, merely working two fingers under the false ribs and seizing the heart between the two fingers and the thumb placed on the precordial region. The rhythm of the compression of the heart should approximate the normal rate, that is, about 60 a minute. Cyon revived the heart merely by irrigating the nerve centres with oxygenated blood. Adrenalin was found valuable in stimulating the heart to contract, and may be used alone or associated with massage. These methods are applicable to cases of chloroform syncope, asphyxia, traumatism of the heart,

embolism or diphtheria, and were actually used in 53 cases in the human subject.

DR. LOUISE G. ROBINOVITCH. Of New York and Paris, repeated in New York and Boston experiments first made by her in Magnan's laboratory, Paris, in which resuscitation of animals apparently dead from chloroform poisoning was accomplished by the application of a current of low tension and frequent interruption (6000 to 12,000 per minute), passed through electrodes applied to dorsal and lumbar points, avoiding allowing the current to pass through the head. An induction current furnished by a coil the diameter of whose wire is not under 0.6 mm. may be substituted. Similar resuscitation was obtained by Robinovitch in the case of animals apparently killed by an industrial electric current, the minimal voltage being employed which will start heart beats, after artificial respiration is excited by the current (10 to 75 volts). In man, she used 20 to 90 volts, and the electrodes were placed as follows: cathode on the dorsal region (measuring 25 by 30 cts.), anode on the lumbar region (12 by 25 cts.). She suggests that a special coil be placed in power houses, with capacity of sufficient power to give a strong current for practicing rhythmic ex-citations.

HELPER, HINTON ROWAN. An American writer and public official, died by his own hand March 9, 1909. He was born in 1829, in North Carolina. He was an early anti-slavery agitator, and his *Impending Crisis of the South*, which was a bitter arraignment of slavery, and an attempt to convince the South that it would be economically better without it, created a great sensation and had enormous sales throughout the country. Helper was Consul at Buenos Ayres, 1862-6. He gave many years of his life to a project to connect North and South America by a railroad. He wrote, in addition to the work mentioned above, *The Three Americas Railway*, *The Negroes in Negroland*, *The Land of Gold*, and *Oddments of Andean Diplomacy*.

HENDERSON, ETTIE (LEWIS). An American actress and playwright, died October 7, 1909. She was born in London in 1835, and was brought to the United States at the age of four by her father, Henry Lewis, who was a famous English actor. At the age of ten she appeared in *The Stranger*. She was educated at the Notre Dame Convent in Cincinnati, and married William Henderson in 1855. She appeared successfully in many engagements in the United States and in 1863 toured England as the star in *Fanchon*. Several years later she gave up acting to devote her time to writing plays. Her first production was *Marriage*, which was very successful. She wrote also *Claire* and *The Forge Master*, which were also successful, and dramatized Gaboriau's novel *Within an Inch of His Life*. From 1889, when her husband died, until 1899 she owned and managed the Academy of Music in Jersey City, N. J.

HENDRICK, THOMAS AUGUSTINE. An American bishop of the Roman Catholic Church, died November 30, 1909. He was born in Penn Yan, N. Y., in 1849. He was educated at the public schools and in St. John's College at Fordham, and at St. Joseph's Provincial Seminary in Troy, N. Y. He was ordained as a priest in 1873. The year following he served as assistant pastor of St. Mary's Church, Rochester, N. Y., for a year and was then appointed

rector of the Holy Cross Church, at Charlotte, N. Y. He served later as pastor at Union Springs, N. Y., and in 1891 took charge of St. Bridget's Church in Rochester. Here his work was remarkably successful. While acting as pastor of St. Bridget's he was summoned to Rome by Pope Leo XIII., to prepare for consecration as the first American Bishop of Cebu, Philippine Islands. The Pope died while Father Hendrick was on his way to Rome and he was consecrated by Cardinal Satolli. He took up his work in Cebu in March, 1904, and continued it until the time of his death. As a parish priest in Rochester Father Hendrick took a keen interest in public affairs. He served at one time as a regent of the University of the State of New York and was also a vice-president of the New York and National Associations for the Prevention of Cruelty to Animals, and a delegate from the National Association to the World's Conference in London in 1902.

HEY, JULIUS. A German musician and teacher of music, died May 15, 1909. He was born at Irmelshausen in 1832 and studied music under F. Schmitt and F. Lachner. He was introduced to Wagner by King Louis II. of Bavaria, and attempted in connection with the Munich School of Music to bring about a revolution in the national system of singing. His attempt failed and on Wagner's death in 1883 he retired from public life to complete his work on singing, *Deutscher Gesangsunterricht* (1886). Although unsuccessful in his efforts to bring about changes in the existing methods of voice culture, Hey exercised a powerful influence on the contemporary schools of singing.

HIGH PRESSURE FIRE SYSTEM. See FIRE PROTECTION.

HIMALAYA MOUNTAINS. See EXPLORATION.

HISTORICAL ASSOCIATION, AMERICAN. A society for the promotion of historical studies, organized at Saratoga, New York, in 1884. The Association was incorporated in 1889 by Act of Congress. Its principal office is fixed at Washington, and it is required to make an annual report to the Secretary of the Smithsonian Institution. The object of the Association is the promotion of historical studies and its activities have steadily increased in number and widened in scope. Its annual meeting, held in New York December 27-30, was the celebration of its 25th anniversary. In conjunction with this the American Economic Association, the American Political Science Association and the American Sociological Society held meetings at the same time and place. Addresses of welcome were made by Governor Hughes of New York, Mayor McClellan of New York City and President Butler of Columbia University. Many foreign visitors of distinction were present. A novel feature of the programme was a series of historical tablaux illustrating scenes and events in the political history of New York. In the presidential address, President Albert Bushnell Hart discussed "The Use and Abuse of Imagination in History." Particular interest attached to the session held with the American Political Science Association, which discussed "British Constitutional and Political Development with special reference to the Centenary of Gladstone." Edward Porritt and Ambassador Bryce spoke upon various aspects of Gladstone's career. Professor George W. Wrong of the University of Toronto,

sketched the growth of nationalism in Canada. Herbert L. Fisher of New College, Oxford, spoke of the achievement of political union in South Africa. Among the foreign visitors in attendance beside those mentioned above, were Professor G. W. Prothero, Professor Eduard Meyer of Berlin, Professor Camille Enlart of Paris, Professor H. T. Colenbrander of Verboog, Holland, and Professor R. Altamira of Oviedo, Spain. A special session was devoted to a discussion of the work of historical societies in Europe. Ten conferences with other societies were held, including one with the American Society of Church History, and two with the New York State Teachers' Association. Conferences were also held on ancient history and on the contribution of the Romance nations to the history of America. A conference on modern European history considered the political situation in Bosnia and Herzegovina, Bismarck as a historiographer, and a proposed course in contemporaneous history. The conference of State and local historical societies showed gratifying progress in the unification of work and the improvement of society publications. Plans are well under way for a bibliography of English history to be carried out jointly by a committee of the Association and a similar committee of English scholars. A committee has also been created to make a preliminary investigation of historical sites and buildings. The Association meets in 1910 at Indianapolis. Professor Frederick J. Turner was chosen president. The Society numbered in 1909 about 2500 members.

HITCHCOCK, ETHAN ALLEN. An American public official, died April 9, 1909. He was born in Mobile, Alabama, in 1835, and was a great-grandson of Ethan Allen of Revolutionary War fame. He was educated at a military school in New Haven, Connecticut, and went to St. Louis, where he engaged in business with his father. Following a stay of several years in China, he became interested in railroad and mining enterprises in Missouri, where he became one of the leading business men. In 1897 he was appointed by President McKinley, Minister to Russia, and in 1899 he was asked by the latter to succeed Cornelius N. Bliss as Secretary of the Interior. At the very outset of his assumption of this office, the attention of Mr. Hitchcock was called to the wholesale frauds by which government lands were being stolen in the Northwest. He set himself to the discovery and punishment of the perpetrators of these crimes, and by the end of his term he had secured the conviction of 89 persons and the indictment of 402 others, whose cases were untried. Among those convicted were a United States Senator, a Representative to Congress, and several high officials of the Land Office. Great pressure was brought to bear upon Presidents McKinley and Roosevelt to procure the removal of Mr. Hitchcock as the result of his zeal in these prosecutions, but he had the firm support of both these executives. Mr. Hitchcock was responsible, also, for starting government suits to cancel patents to millions of acres of valuable oil lands secured by railroads through alleged false entries in Utah, Colorado, Wyoming and Idaho. Among his last official acts was his refusal to approve the purchase and assignment of valuable oil lands in Oklahoma to the Standard Oil Co. In 1907 Mr. Hitchcock resigned his portfolio, and was succeeded by James R. Garfield.

HITCHCOCK, FRANK HARRIS. An Ameri-

can public official, Postmaster-General in President Taft's cabinet. He was born at Amherst, Ohio, in 1867, and graduated from Harvard University in 1891. After having graduated from the Columbia University Law School in 1894, he was admitted to the bar. From 1891 he was almost exclusively engaged in government work. He was Chief of the Division of Foreign Markets in the United States Department of Agriculture, Chief Clerk in the Department of Commerce and Labor, Assistant Secretary of the Republican National Committee, a member of the Keep Commission, and First Assistant Postmaster-General. He had charge of President Taft's campaign for nomination and election and his work in that capacity was considered remarkably efficient. He is the author of many bulletins, reports and circulars on foreign trade and the customs tariff. See UNITED STATES, paragraphs *Cabinet*, *Administration*, and *Post-office*.

HOE, ROBERT. An American printing press manufacturer, inventor and art collector, died September 22, 1909. He was born in New York City in 1839, the grandson of Robert Hoe, who came to the United States in 1803, and established a press building business with two of his brothers-in-law, Matthew and Peter Smith, as partners. The subject of this sketch went to school in New York and studied abroad. As a young man he entered the printing press factory of which his father, Robert Hoe, and his uncles, Richard March Hoe, the inventor, and Peter Hoe, were the heads. His father died in 1884, and his uncle shortly after, and the management of the business was then left to Robert Hoe. His devotion to the work was unflagging, and the inventive genius which had descended to him from his grandfather enabled him to make a long series of improvements in printing presses.

Among these the most noteworthy was the invention of the rotary, multi-color press, which enabled the printing of illustrations in 11 and 12 colors. Mr. Hoe paid great attention to the training of his employees, and developed a large apprentices' school with an elaborate curriculum. He was one of the best known collectors of objects of art and rare books in the United States. He was one of the founders and first president of the Grolier Club, and one of the founders of the Metropolitan Museum in New York City. He wrote several books, dealing, for the most part with printing. Among them was a history of the development of the printing press from the time of Gutenberg to the present day.

HOFFMANN, HANS. A German novelist and poet, died in July, 1909. He was born in 1848 at Stettin and studied at the universities of Bonn, Berlin, and Halle. Thereafter he made a long visit in Italy, and Greece. Hoffmann was considered one of the most gifted of modern German novelists. He had a particular talent for vivid descriptions of landscapes and a delightful humor. Among his best known works are *Iwan der Schreckliche und sein Hund* (1889); *Von Frühling zu Frühling* (1889; 1898); *Irrande Mutterliebe* (1900), *Von Hoff zu Haff* (1903).

HOFFMAN, RICHARD. An American pianist composer and teacher of music, died August 17, 1909. He was born in Manchester, England, in 1831, and at the age of 16 removed to New York City. He received his earliest instruction from his father and subsequently was a student of many famous musicians, including Pleyel,

Moscheles, Rubinstein and Liszt. Following his return to America he made a tour of the country and later was an accompanist of Jenny Lind on her tours in the United States. He was popular as a concert pianist and played with Gottschalk and von Bülow. His later years were devoted to teaching and he became one of the most important factors in American musical life. His compositions include piano-forte music, part songs and ballads, anthems, and church music generally.

HOFMEYR, J. H. A British colonial official, died October 16, 1909. He was born in 1845 in Cape Town, South Africa, and was educated in the South African College in that city. For some years he was editor of several papers in Cape Town, including the *Volksvriend*, the *Zuid Afrikaan*, and the *Zuid Afrikaan Tyd-schrift*. He represented Cape Colony at the London Conference with Sir Thomas Upington and Sir Charles Mills, and proposed the scheme of the Imperial Customs Federation. In 1888-9 he was a member of the South African Customs Union Conference, and negotiated the Swaziland Convention of the Transvaal in 1890. He was deputed by the Cape Town government to Bloemfontein and Pretoria in July, 1890, and obtained franchises and other concessions to prevent hostilities between the South African republics and England. He was a member of the executive council of Cape Colony. His death occurred in London while he was attending the Colonial Conference as the delegate.

HOLDER, SIR FREDERICK WILLIAM. An Australian public official, died July 22, 1909. He was born in Happy Valley, South Australia, in 1850. He was educated in the public schools and at St. Peter's College. After some years in school teaching and journalism, he was chosen in 1887 member of the House of Assembly of South Australia. In 1892 he was Premier and Treasurer of South Australia; in 1893-4 Commissioner of Public Works; Treasurer 1894-9; Premier, Treasurer and Minister of Industry 1899-1901. In the latter year he resigned to enter the Federal Parliament. He took a prominent part in the movement for Australian federal union, and was a member of the convention which framed the constitution in 1897-8. He was returned to the first House of Representatives, and was Speaker, 1901-9.

HOLLAND. See NETHERLANDS.

HOLLE, LUDWIG VON. A German scholar and public official, died December 13, 1909. He was born in 1855 in Westphalia. He early entered the public service and his entire career was spent there. He served at one time as Prussian Ambassador to Japan. He was identified with the arrangements between the United States and Germany for exchange professors.

HOLSTEIN, FRIEDRICH VON. A German diplomat and public official, died May 8, 1909. He was born in 1837, and for over 30 years was head of the political department of the German foreign office. Von Holstein, on account of his retiring disposition, was little heard of in discussion of public affairs, but he exercised great influence on the foreign policy of the German Empire. He held office under Bismarck, and when the Emperor William, in 1890, dismissed Bismarck, von Holstein chose to remain in the foreign office in order that his services might be employed by Count Caprivi.

To von Holstein's influence is attributed the German seizure of Kiao-chau in China, and he is generally believed to have been the real author of the policy pursued by Germany in regard to Morocco. On the failure of this policy he retired from office. It was said that, following the retirement of Bismarck, he was the real director of Germany's foreign policy.

HOMER, LOUISE DILWORTH (BEATTY). An American contralto prima donna singer who has achieved great success in recent years in concert, and on the operatic stage. She was born in Pittsburgh, Pa., and began the development of her voice in Philadelphia. She studied later in Boston, where she married Mr. Sidney Homer, a well-known song composer (see below). After her marriage, Mme. Homer studied in Europe, and after two years in Paris made her début as an opera singer. She achieved an emphatic success and was engaged for the following season for Covent Garden, London, where she made her début as Amneris in *Aida* in May, 1899. In September of the same year she was called to the Royal Opera at Brussels, where she remained for eight months. She returned to Covent Garden, London, in the spring of the same season. Following her success in London she was engaged at the Metropolitan Opera House in New York, where she has sung for ten successive seasons. Mme. Homer's successes have been achieved in the greatest contralto rôles, such as Amneris in *Aida*, Laura in *La Gioconda*, Azucena in *Il Trovatore*, Otrud in *Lohengrin*, Fricka in *Walküre*, and others. Among her more recent successes are the rôles of Dame Quickly in Verdi's *Falstaff* and of Orpheus in Gluck's opera of the same name.

HOMER, SIDNEY. An American composer and song writer, who in recent years has won a high place among American composers. He was born in Boston in 1864. His first musical studies were made under George W. Chadwick. He went thereafter to Germany and spent five years, three of them at the Royal Conservatory of Munich under Josef Rheinberger. Returning to Boston, he taught harmony and counterpoint for eight years, at the same time conducting lectures and classes in the study of symphonies and the Wagnerian music dramas. In 1895 he married Miss Louise Dilworth Beatty (see above). Mr. Homer's songs have been sung by the leading singers in the United States and elsewhere. Among the best known of them are: Two poems by Tennyson, "Sweet and Low," and "Thy Voice Is Heard"; two songs by Robert Browning, "A Woman's Last Word," and "Prosprise"; "The Last Leaf"; three songs from Stevenson's *Underwoods*, "Sing Me a Song of a Lad that Is Gone," "Requiem," and "The Stormy Evening"; and "Dearest," a poem from Henley's *Hawthorn and Lavender*.

HONDURAS. A Central American republic, bordering on the Caribbean Sea and touching the Pacific at the Gulf of Conchagua. The capital is Tegucigalpa.

AREA, POPULATION, ETC. The estimated area of the sixteen departments and one territory constituting the republic is 44,274 square miles. At the end of 1905 the population, according to official figures, was 500,136, mostly of Indian blood. The estimated population in 1907 was 543,741. The principal towns, with estimated population, are: Tegucigalpa, 35,000; Juti-cala, 17,800; Nacaome, 12,040; La Esperanza,

11,500; Santa Rosa, 10,900; Choluteca, 10,820; San Pedro Sula, 10,000. Primary instruction is free, secular, and nominally compulsory. At the end of 1908 primary schools numbered 648. In May, 1907, there were 775 schools (of which 720 were public schools), with 912 teachers and an average attendance of 47,000 pupils. In 1908 children of school age (7 to 15) numbered 109,353. There are several institutions for secondary, higher, and professional education.

INDUSTRIES. Agriculture is the leading industry, and cattle raising and mining are important. The chief crop is bananas, and other products include tobacco, sugar, corn, coffee, rubber, sarsaparilla, cocoanuts, oranges, and lemons. Banana production in 1908 amounted to 4,310,538 bunches. Increasing activity is to be noted in both banana and tobacco culture. The sugar output is used largely in the manufacture of rum. There is some exploitation of the forests, which are rich in valuable woods, including mahogany and cedar. In 1909 an American company (capital, \$1,000,000) undertook the exploitation of a large tract of mahogany territory and began the construction of an 18-mile railway from Armenia (near Ceiba); besides tapping the mahogany district, the railway will pass through productive banana lands. The mineral resources of the country are remarkable in richness and extent, but they have not been greatly developed. Mining, as well as industries in general, is hampered by inadequate means of transportation, lack of capital, and scarcity of labor. The metals and minerals include gold, silver, platinum, copper, mercury, lead, zinc, tin, nickel, iron, antimony, bismuth, cinnabar, opals, salt, sulphur, petroleum, and coal.

COMMERCE. According to Honduran official statistics, imports and exports for the year ending July 31, 1907, were valued at \$2,331,398 and \$2,012,407 respectively; for 1908, \$2,829,979 and \$1,834,060 respectively. The leading imports are cotton textiles and breadstuffs and other provisions. The 1908 exports were classified as follows: Vegetable products, \$1,050,420; mineral products, \$578,939; animal products, \$197,135; manufactures, \$7516. In the first class were: Bananas, \$768,508; coffee, \$77,058; cocoanuts, \$75,866; mahogany, \$36,271; rubber, \$30,272; sarsaparilla, \$22,037. The minerals included: Cyanide products, \$204,802; ore, \$167,360; coined silver, \$98,280; silver in bars, \$85,912; gold, \$18,360. Animal products included: Hides, \$72,569; cattle, \$65,038 (\$133,735 in the preceding year); cheese, \$31,682; deerskins, \$15,641; mules, \$10,186. Of the manufactures, straw hats had a value of \$3949. Imports from and exports to the countries commercially most important were in the fiscal year 1908 respectively: United States, \$1,878,942 and \$1,591,351; Great Britain, \$339,746 and \$32,131; Germany, \$248,650 and \$90,160; British Honduras, \$108,735 and \$33,040; France, \$97,540 and \$1861. In April, 1909, the government prohibited the importation of spirituous liquors into the country.

COMMUNICATIONS. Means of communication and transportation are very inadequate. There is a railway of 57 miles from Puerto Cortez to San Pedro Sula and Pimienta, and its continuation to La Brea, on the Pacific, as well as branch lines, is projected. From Ceiba a railway extends 32 miles into the Zárate banana

lands. A line 18 miles in length is under construction from Armenia inland. A railway of about 350 miles (capital \$10,000,000,) has been projected from Trujillo Bay to Juticalpa, with branches to Tegucigalpa and various other interior towns. This line when completed will penetrate a region rich in gold, silver, and other minerals and hard woods. Contracts for other lines have been approved by the government, but their construction is not assured. There is some steamboat river navigation; a regular line of steamers plies on the Ulúa River from its mouth to Progreso, 125 miles. In 1908 there were 2842 miles of telegraph line.

FINANCE. Revenue and expenditure for fiscal years ended July 31 are reported as follows, in pesos:

	1906	1907	1908
Revenue	\$3,535,078	\$2,828,386	\$3,442,476
Expenditure	3,294,747	4,023,350	3,391,956

For the fiscal year 1909 the budget balanced at 3,703,216 pesos; for 1910, 4,714,065 pesos. Estimated receipts for the latter year included: Import duties, 1,800,000 pesos; liquor and tobacco taxes, 1,750,000; export duties, 142,500. The largest item of expenditure is for the army. In July, 1908, the external debt, with arrears of interest since 1872, amounted to \$107,528,498. In 1906 the internal debt stood at 3,125,993 pesos paper. The silver peso is worth about 36.5 cents.

ARMY. An active army of about 2000 is maintained and a militia of about 30,000. Legally each citizen is liable for service in the army from his 21st to 35th year and in the reserve from his 35th to 40th.

GOVERNMENT. The executive authority is vested in a president, who is elected by popular vote for a term of four years, and is assisted by a cabinet of six members responsible to himself and to the Congress. The legislative power devolves upon a unicameral Congress of Deputies (42 members, elected by direct vote for four years). The executive in 1909 was General Miguel R. Dávila, who assumed provisional charge of the presidency April 18, 1907, and became president early in the following year.

HISTORY. Difficulty occurred at the close of 1908 between the American Consular agent at San Pedro and one of the court officers, resulting in an act considered insulting by the American agent, and early in the following month, at the demand of the United States government, an apology was made by President Dávila, and the court official was dismissed. The protection of American interests in San Pedro was reinforced by the presence of the United States gunboat, *Marietta*, which was sent to the Honduran coast in May. A revolt was reported at Ceiba early in June and an American gunboat was sent there to guard American interests. In July martial law was proclaimed along the north coast, the revolt having assumed a somewhat formidable phase. It arose from the government's inability to pay its troops and civil servants, owing to the delay in receiving the \$2,000,000 indemnity from Guatemala for the revolution of July, 1908. Attempts to float a loan were unsuccessful. The trouble was attributed to the interference of President Zelaya of Nicaragua, who was said

to control Honduras and to appropriate her revenues. It was reported that when the unpaid officials tried to recoup themselves by the seizure of customs duties at the Atlantic ports they were prevented by Zelaya.

HONDURAS, BRITISH. See BRITISH HONDURAS.

HONGKONG. An island off the southeast coast of China, which, together with a strip of territory on the mainland leased from China, constitutes a British Crown colony. Area of the island, about 30 square miles; of the mainland, 341. Total population, estimated 1907, 421,499 (Chinese, 401,461). Capital, Victoria. There were in 1908 73 government schools, with 6178 pupils. There is a considerable ship repairing and construction industry. The port is fortified, and has been "the one free port of the Far East," but in 1909 the Legislative Council passed an ordinance providing for the collection of duties on imports of alcoholic liquors. The harbor, one of the finest in the world, has a water area of about 10 square miles. Hongkong is the centre of trade (mostly transit) for many articles, among the principal being opium, sugar, flour, salt, oil, amber, cotton, timber, hemp, ivory, live-stock, etc., etc. There are no official returns of trade. The British Board of Trade returns give the imports into Great Britain from Hongkong for 1908 at £547,339, against £618,860 in 1907; the exports of British produce to Hongkong at £3,088,340, against £3,355,402 in 1907. Shipping entered, 1907, 18,013,307 tons; 1908, 17,323,985 tons. The money of account is the Mexican dollar, worth 49.8 cents. The revenue and expenditure for the fiscal year 1908 were 6,104,207 and 7,929,477 dollars respectively, against 6,602,280 and 5,757,203 dollars in 1907. Large amounts are expended annually for waterworks and in fighting plague. The public debt stood, January 1, 1908, at £1,485,732. The colony is administered by a governor (1909, Sir F. J. D. Lugard), aided by an executive and a legislative council. A sanitary board controls all sanitary measures. The Imperial garrison numbered (1907) 1551 Europeans, 1958 Indians, and 55 Chinese. Early in the year a new university, designed to attract Chinese students, was proposed for Hongkong. A small fund for that purpose was subscribed by a colonial broker and donations gradually accumulated. In the summer the Viceroy of Canton suggested that the provincial funds should be applied to that purpose and urged the Pekin authorities to assist in the plan. He raised a considerable sum from the provinces and the Wai-wu-pu.

HOOKWORM DISEASE (Syn. *Ankylostomiasis*; *Uncinariasis*; *Miners' Anæmia*) received a good deal of attention from sanitarians during 1909. The disease is a true anæmia produced by the activity of an intestinal worm, the *uncinaria* or hookworm, which parasite fastens itself to the intestinal mucous membrane and sucks the blood therefrom. The individual harboring the parasite becomes anæmic, loses ambition, lacks resistance to disease, and is able to perform only a limited amount of work. In 1902 Dr. Charles W. Stiles, Chief of the Division of Zoölogy in the Hygienic Laboratory, proved that the hookworm was the cause of the invalidism of the Southern "poor whites." Estimates made by

Dr. Stiles showed the disease to be widespread and the number of its victims at least two millions. These observations were afterwards confirmed, though received with incredulity at first, and the discovery was recognized as one of the greatest triumphs of medical laboratory work in the United States.

Seven years have elapsed between the discovery and full public awakening to the important relation of the disease to the industrial prosperity of the South. Mr. John D. Rockefeller recently gave \$1,000,000 for the purpose of combating the malady by a campaign of education and the establishment of a commission to study the problem in its various phases. The known facts in regard to the disease as pointed out by Stiles in the Public Health Reports for July, 1909, are briefly as follows: The parasite has been appropriately named *Necator americanus* (American murderer). It is a cylindroid worm, the female having a length of from 5 to 18 millimeters, the male 6 to 10 millimeters. It is provided with a mouth armed with six incurving teeth, by which it fixes itself firmly on the intestinal surface. The disease exists in Africa, and may possibly have been brought by the negro to this country. The negro is partially immune, so that the disease is less manifest; but there are a great number of cases in a mild or latent form among the black race. The ovum of the parasite may enter the system either with food or drink or through the skin, the latter mode of entry being probably the most common. Unhygienic living, especially in regard to soil pollution, favors infection with the parasite, and for this reason the negro is more likely to contract the disease than the white race, particularly in the country districts, where not only farms, but even schools and churches are unprovided with privies. Hookworm disease, Dr. Stiles points out, while not rapidly fatal, induces anæmia, renders the organism less resistant to disease in general, and favors the occurrence of other infections. Hookworm disease increases the death rate from pulmonary tuberculosis, for example, and perhaps explains the high negro mortality from the latter malady, which is about three times as great as among the whites. Another important effect is the reduction of intellectual activity and learning capacity during the school period, and this is most marked in negro children. The prevention and control of ankylostomiasis must be through a general recognition of its existence, the proper treatment of individual cases of the disease, and the prevention of soil pollutions. Vermifuges, of which male fern, thymol, chloroform and eucalyptus oil, and betanaphthol are most effective, are useful in clearing the intestinal tract of the worms.

W. C. Alvarez, of Cananea, Mexico, calls attention to the existence of endemic foci of ankylostomiasis in the whole of Mexico from the Isthmus of Tehuantepec and Yucatan to the states just above the City of Mexico, and to the migration of individuals infected with the hookworm to the United States.

HOPS. The fact that for several years low prices have prevailed in the hop market was the principal cause in reducing the acreage of hops in 1909. In Oregon the drought during the summer of 1908, followed by unfavorable winter and spring seasons, was injurious to the vines and proved an additional factor in

reducing the acreage in that State. In Washington the prospects during the season were more favorable than in Oregon, and in California the outlook was about normal. New York also reported a reduced acreage. The shortage in the world's supply, which became apparent in 1909, raised the price considerably, and while the estimated American crop this year, about 40,000,000 pounds, is below the 5-year average of 51,589,400 pounds, the higher price raises its value to about \$8,000,000, ranking second only to the crop of 1906, which reached the high value of over \$12,000,000. The price went up to 33 cents per pound in New York and to 24 cents in Philadelphia, but as a large proportion of the crop on the Pacific coast had been previously contracted for at a much lower figure, many growers were unable to avail themselves of the good prices. The European crop for 1909 is estimated by foreign commercial authorities as follows: England, 24,840,000 pounds; Austria-Hungary, 21,392,000 pounds; Germany, 21,280,000 pounds; Russia, 8,720,000 pounds; France, 3,360,000 pounds; and Belgium, 2,240,000 pounds.

HORNBY, JAMES JOHN. An English clergyman and educator, died November 2, 1909. He was born at Winwick in 1826 and was educated at Eton and at Balliol College, Oxford. After his graduation from the university he was elected Fellow of Brasenose. In 1853 he was elected principal of Bishop Cosin's Hall in the University of Durham, and remained in this position eleven years. In 1864 he returned for a short time to Oxford as classical lecturer. In 1867 he became Second Master of Winchester School. Here he remained a little more than one year, when he was appointed Head Master of Eton. This position he held for sixteen years, when, in 1884, on the death of Dr. Goodfellow, he was elected Provost of Eton. This position he held until his death.

HORTICULTURE. Although the interest in improved cultural practices continued unabated, commercial horticulturists in 1909 were most actively engaged in working out problems dealing with crop disposal in all of its phases. In spite of individual crop failures, such as the short olive crop in Italy and the continued short apple crop in the United States (estimated at 22,750,000 barrels), the world's production of horticultural crops was increased, and competition, both internally and in export channels, was keener. Growers have awakened to the need and value of co-operative and marketing associations, and of exchanges equipped not alone to secure uniform grading and packing, but to divert the crops into timely markets and to open up new markets as well. During the season of 1908-09, the well-organized California growers successfully marketed some 40,592 cars of citrus fruits, while Florida growers, through lack of organized distribution, secured poor return for their crop of 4,800,000 boxes, or about 16,000 cars, of citrus fruits. The Florida Citrus Exchange, an organization similar to the California Citrus Exchange, was started by the growers and was already demonstrating its value as a regulator of market conditions at the close of 1909. Through organized distribution and exploitation the Hawaiian planters built up their canned pineapple trade with the mainland of the United States to a value of \$1,229,000 for

the fiscal year 1909, as against \$267,000 for the fiscal year 1907. California made the largest fresh deciduous fruit shipments in the history of the industry—13,096 $\frac{1}{2}$ cars other than apples and mixed lots, as compared with 10,700 cars in 1908. California's cured fruit output for 1909 was estimated at 185,000 tons, as compared with 144,750 tons, the final figures for 1908. In 1908, the United States shipped over 700,000 cases of canned fruits to Great Britain and over 600,000 cases in 1909. Unusual efforts were being put forth to develop the fruit trade between the British colonies and the United Kingdom. Canadian canned fruits and fresh apples were competing successfully with apples from the United States. Tasmanian, New Zealand, and Australian apples were finding a good market, as they come in when the American apple is about exhausted. South African fruit was also being sold in British markets to a small extent, particularly pineapples. A considerable freight reduction recently made on Cape fruit, bids fair to stimulate the industry.

In Germany, the country of small intensively cultivated fruit gardens, horticulturists were actively agitating the development of extensive commercial orchards. Germany ranks second to the United States in number of fruit trees; next to Switzerland in number of trees in proportion to population; imports annually about \$11,900,000 worth of fresh, dried, and preserved fruits, and produces about \$59,500,000 worth of domestic fruits and nuts. Brazil, with a view to developing her fruit trade, was reported to have issued an official order compelling all steamship lines doing business with Brazil to have refrigerators and ventilated space on board their steamers for the proper accommodation of fruit shipments. The Brazilian Department of Agriculture is to give four prizes to shippers at each of the Brazilian ports, ranging from \$600 to \$3000 gold, to the largest shippers for exports during the eight months following the issue of the decree authorizing the prizes.

Late in the year it fell to the lot of Belgium, sometimes called the cradle of horticulture, to establish the first distinct Department of Horticulture. France attached a broad technical Commission of Horticulture to her Ministry of Agriculture, whose duties it shall be to pass on all matters of consequence to the horticultural interests of the country.

The munificent bequest made by the late Mr. John Innes of Merton, England, bids fair to prove a lasting benefit to British horticulture. Under the terms of this bequest, a body of trustees is to administer a sum approximating £10,000 a year for the purposes of an institution to be known as the "John Innes Horticultural Institution," and to have for its object the promotion of horticultural instruction, experiments, and research. A horticultural station is to be equipped, and the trustees are empowered to establish and equip similar stations in other parts of the country. Professor W. Bateson, F. R. S., Professor of Biology at the University of Cambridge, has accepted the post of Director.

POMOLOGY. In view of the large experimental and commercial plantings of the Satsuma orange being made in the Gulf States, the United States Department of Agriculture, acting on the results of investigations made by Swingle,

announced that the Satsuma orange was almost a complete failure on sour-orange stock on any soil and in any climate, and succeeded well only when budded on Trifoliate-orange stock. To protect purchasers against receiving trees grafted on sour-orange stock, the Department offered for the present to pass upon stocks submitted for determination.

The fruit marketing, transportation, and storage work of the United States Department of Agriculture was extended to the new and growing California lemon industry, and quickly showed that these lemons could be shipped in sound condition throughout the United States if handled without bruising in the fields and curing houses. In the storage work with table grapes, clean redwood sawdust was found to be even better than fine ground cork as a packing material. The pre-cooling studies with oranges were continued and showed that pre-cooling before shipment not only reduces the losses in transit and extends the market area, but also affords more car space, as the packages can be placed closer together. The results from this work caused the transcontinental railroad lines running out of California to construct plants, where train loads of fruit could be quickly cooled after loading. Several plants were also constructed by growers' organizations.

O. Schneider, a Swiss investigator, concluded as a result of several respiration and transpiration experiments with fruit stored in dry and dark locations, together with experiments on the respiration of injured stored fruits, that sunlight, through its warming effect, increases both the respiration and transpiration of stored fruit, and therefore should not be allowed to enter the storage place. Diffused daylight, on the other hand, did not appear to materially influence the life activities of stored fruit. When the fruit had been injured a respiration acceleration was evident for several days.

Lewis and Vincent, of the Oregon Experiment Station, reported that only fifteen out of eighty-seven varieties of apples studied by them were entirely self-fertile, and that fruits of the self-fertile varieties were improved in size by cross-pollination. They determined a number of suitable pollinizers for several commercial varieties of apples. They found that apple pollen is capable of maintaining its viability for at least three weeks, provided it is not allowed to ferment. The New York Station published the results for the first five years of an exhaustive study of tillage versus the sod-mulch or Hitchings method of cultivating apple orchards. The work as conducted in an old bearing orchard, showed an increase of over 54 per cent. net income per acre in favor of tillage. The tilled fruit was better in quality but less highly colored, and from one to three weeks later in maturing than the sod grown fruit. A. S. Gherbintzki, a Russian investigator, demonstrated in an experimental way that seedless apples can be produced through the castration of the blossom by the apple blossom weevil (*Anthophonus pomorum*). The seedless apples were somewhat smaller and more irregular in form than the normal apples.

Considerable work with grapes was reported. Investigations to determine the adaptability of Phylloxera and chlorosis-resistant stocks to soils and to determine their influence on different varieties used as scions were being car-

ried on in practically all countries where *Vitis* grapes are grown. It was still a disputed question whether the hardy American stocks are detrimental to the vines of European varieties used as scions. The North and South Carolina Stations conducted several studies of the Scuppernong and other Muscadine grapes of the South. Reimer, of the former station, published a bulletin on their history and development. Newman, of the latter station, determined experimentally in 1908 that if these vines (which are usually allowed to ramble at will) are pruned during the months of October and November, there will be no serious effects, but when cut later in the season they will bleed badly and seriously injure if not destroy the vine. The grapes at the Porto Rico Station were making exceptional growth, to the exclusion of fruiting. Three varieties were forced into bearing by two heavy prunings, one in spring and the other in early fall, together with frequent bud pinching. R. A. Saccà, working at the Royal Agricultural High School of Portici, Italy, studied the leaves of various species and varieties of grapes grown under similar conditions, and found a correlation between yield and the amplitude of the angle formed by the median nerve and the lowest constant lateral nerve. In general, the yield decreased with the size of the angle. The same correlation was noted for the sugar content of the must. The acid content increased as the angle decreased. Although cultural conditions appeared to influence the intensity of the skeleton network, they did not affect the relative direction of the nerves.

In Hawaii methods for the propagation of citrus, mango, and avocado trees were worked out, and prospects were fair for the extension of tropical fruit culture on the islands. Kelley, of the Hawaii Station, investigated the failure of pineapples to grow successfully on certain black spots in the otherwise reddish soils, and attributed it to the excessive manganese content in the black soil.

The work of determining and developing varieties of fruit suitable for the rigorous climate of Alaska was continued and gave promise of limited success with apples, cherries, and plums. Most bush fruits do well, although black raspberries and blackberries are a failure in Alaska. The results at the different stations have shown that an abundance of hardy vegetables could be produced in that country. Certain strawberry hybrids gave promise of having combined the hardiness of the native parents with the quality of the cultivated ones.

EXPERIMENTS IN FORCING AND RETARDING PLANTS. Commercial florists in Europe are becoming interested in the warm bath method of forcing plants, recently investigated by H. Molisch. This method consists in soaking cut branches or rooted plants of various trees and shrubs in warm water for from nine to twelve hours, and then forcing them in the usual manner. It was found to be applicable to a large number of the shrubs generally employed for forcing purposes, although bath temperatures yielding the best results for each plant remain to be determined. In general, the stimulating effect of the bath greatly diminishes toward the end of the winter rest period. If the bathed branches or plants were first exposed to the open air for two, three, or four weeks, under ordinary autumn or winter conditions,

and then forced in the hothouse, they showed the same advance over the unbathed portions as though they were placed in the hothouse immediately after the bath; also, the effect of the bath appeared to be local, as was evidenced by the behavior of bathed and unbathed buds on the same plant. Plants immersed beyond twelve hours suffered from lack of oxygen. When the bath temperatures suitable for forcing various shrubs are accurately worked out, it is believed that this method will largely displace etherizing as being a much more simple process.

In Normandy P. Noel reported success in retarding the flowering season of several varieties of plums, such as the Boston, Satsuma, Kelsey, etc., which flowered freely every year, but failed to form fruits owing to the frosts in early May. The roots of the trees were etherized, the ether being poured into a hole sixteen inches deep bored into the ground in the neighborhood of the roots, and the hole closed. Unsuccessful attempts to anæsthetize the trees led to the conclusion that the beneficial effects of the ether in retarding growth were due to a refreezing of the soil through rapid evaporation of the ether rather than through its anæsthetic properties.

In summarizing his own work and the work of others relative to the effect of ether, chloroform, and other substances upon plants, W. Stuart, of the Vermont Station, concluded that anæsthetics and toxic substances, such as alcohol, acetone, and other similar agents employed in small amounts, as well as non-anæsthetic or non-toxic agents, such as freezing, vacuum, and desiccation, all arrest growth and remove the moisture from the plant tissues in a very similar manner, and result in a more or less decided growth acceleration. Hot water appears to impart a distinct shock to the cell protoplasm and tissues, acting also as a solvent upon the winter protecting scales enclosing the leaf and flowering buds, thereby hastening the winter forcing of shrubs. Taking into consideration all the factors which influence growth, it was concluded that thus far no one forcing substance may be said to be superior to all others, although ether, because of its more general use, has come to be regarded as the best anæsthetic to use in forcing plants.

PLANT BREEDING. Many new and improved varieties of fruits, vegetables, and ornamentals were announced during the year by amateur, commercial, and scientific breeders. Burbank's Wonderberry, so extensively exploited, was not proving a valuable addition to our economic fruit supply. Extensive variety tests of vegetables made by the United States Department of Agriculture showed that trade names for vegetables have little value for descriptive purposes, since various strains of the same varieties were found to have entirely different names.

In France, E. Griffon has made a study of the grafting of *Solanums* and other herbaceous plants for several years. He finds that seedlings grown from previously grafted plants show no unusual variations over those grown from ungrafted plants.

LITERATURE. Three valuable contributions to grape literature should be noted: *Foundations of American Grape Culture*, by T. V. Munson (Denison, Tex., 1909), is of value to viticul-

turists and botanists as well. *The Grapes of New York*, by U. P. Hedrick and associates of the New York State Station (New York State Sta. Rpt. 1907, pt. 2), is not local in scope, as its name implies, for it records the state of development of all the important American varieties of grapes. *Geschichte des Weinbaus unter besonderer Berücksichtigung der Bayerischen Rheinpfalz*, by F. Basserman-Jordan (Frankfort-on-the-Main, 1907, vols. 4), may well be considered an encyclopedia of German viticulture. Other prominent books were *L'Hybridation en Horticulture*, by G. Bellair (Paris, 1909); *The Orchid Stud-Book*, by R. A. Rolfe and C. C. Hurst (Kew, 1909); *The American Apple Orchard*, by F. A. Waugh (New York, 1908). Many popular books on fruit and vegetable growing, as well as on different phases of ornamental horticulture, appeared during the year.

HOSPITALS. The year 1909 was marked by a number of large gifts to hospitals. In New York, the Presbyterian Hospital received a bequest of \$1,000,000 from John S. Kennedy, to be used for construction purposes. The will of F. C. Hewitt gave to the Post-Graduate School and Hospital \$2,000,000, and to the Free Industrial School for Crippled Children and the Sheltering Arms Society of New York \$200,000 each. W. V. Lawrence, in addition to \$125,000 already given, added \$150,000 to his endowment of the Lawrence Hospital at Bronxville, N. Y. Mrs. Maria Teller bequeathed \$25,000 to the New York University and Bellevue Hospital Medical College; \$5000 each to the Children's Aid Society and the New York Orthopedic Dispensary and Hospital. Ninety-six thousand dollars has been subscribed by the people of New York toward the endowment fund for the Lincoln Hospital. It is proposed to make this institution New York's monument to Lincoln, which medical and surgical leaders believe would not only be a most fitting tribute, but would be of great benefit to the sick and poor of the city. The new Jewish Maternity Hospital on East Broadway was dedicated January 24. The Gibb operating pavilion of the New York City Home for the Aged and Infirm on Blackwell's Island was opened on February 24. Dr. Ferris, chairman of the State Lunacy Commission, announced that a site for the proposed Mohansic State Hospital for the insane had been purchased at Yorktown Heights, N. Y. This site consists of 564 acres of land, 75 per cent. of which is tillable. It is the intention of the commission to spend about \$2,000,000 on the plant, in the erection of a complete hospital for 2000 patients. The Matteawan State Hospital for the Criminal Insane has purchased about 130 acres of farm land out of the appropriation of \$15,000 for this purpose by the State Legislature. The site for the Eastern New York Custodial Asylum for Defectives was selected at Thiells, Rockland county. It is proposed to name the colony Letchworth Village, in recognition of the services of William Pryor Letchworth in behalf of the defective wards of the State. Ex-Governor Odell has presented Newburgh with a hospital and camp for the treatment of tuberculosis patients. The plant consists of 4 acres of ground and a dwelling to be used as an administrative building. An infirmary costing \$25,000 was also erected. The Harrington Hospital for Children was dedicated

May 28 in Buffalo. In Pennsylvania, the new \$2,000,000 Hospitals for the Insane at Overbrook was opened June 11. The institution will accommodate 1300 patients. In Massachusetts, the Burnham Memorial Building, on the grounds of the Boston City Hospital, erected at a cost of \$150,000, was opened; the new Rufus S. Frost Hospital, Chelsea, was opened for inspection October 11. The formal opening of the Sydenham Hospital for Infectious Diseases in Baltimore took place April 3; the building will accommodate 32 patients. In Ohio, the new Union Hospital, between Philadelphia and Canal Dover, was dedicated March 17; the building accommodates 150 patients and cost \$17,000. The City Park Hospital was opened at Mason City, Iowa. In California, patients were received for the first time at the new Merritt Hospital, Oakland, on January 23; the building cost \$200,000 and has accommodations for 40 patients. The Mission Emergency Hospital at San Francisco was opened April 11. Among many other hospitals either opened or planned were the Sacred Heart Hospital of Spokane, costing \$500,000; a new hospital at Ogden, Utah, costing \$75,000; the Bethany Hospital at Kansas City, to cost \$150,000; the City Hospital of Little Rock, Arkansas; the St. Barnabas Hospital, Minneapolis, the latter costing \$60,000.

In Canada, a new hospital was opened in Montreal under the name of the Hospital St. Luc. Its work is especially among the school children of that city, particular care being paid to cases of eye, ear, nose, throat, and mouth diseases.

In Paris, the opening of the American Hospital took place on October 28. The hospital is located at Neuilly-sur-Seine, a suburb, and contains 25 beds in separate rooms, with bathrooms, the equipment being according to the latest hygienic standards. The institution was founded by certain Americans residing in Paris, and will receive sick and needy Americans, who will be cared for free. Well-to-do Americans may likewise be received, under certain conditions. Two beds will be reserved for emergency cases without regard to the nationality of the patient. At Buch, a suburb of Berlin, a new municipal hospital for old people was opened, with accommodations for about 1500; the cost of the building was about \$1,560,000. There are in the city of Berlin altogether 2286 beds for invalids, which cost annually \$271,680. At Madrid, two well-equipped tuberculosis dispensaries were opened and placed in charge of leading physicians.

HOUGH, GEORGE WASHINGTON. An American astronomer, died January 1, 1909. He was born in Montgomery county, N. Y., in 1836, and graduated from Union College in 1856. In 1859-60 he was assistant astronomer at the Cincinnati Observatory, and from 1860 to 1874 was astronomer and director of the Dudley Observatory at Albany, N. Y. In 1879 he became director of the Dearborn Observatory and professor of astronomy in Chicago University, holding the latter post until 1887, when he became professor of astronomy at the Northwestern University. There he remained until his death. Professor Hough discovered more than 600 variable stars, but his most notable work was his observation in regard to the planet Jupiter. He invented many devices and instruments for astronomical observation. His

publications in scientific journals were numerous.

HOUSE FLY. See ENTOMOLOGY and INSECTS AND THE PROPAGATION OF DISEASE.

HOWARD, OLIVER OTIS. An American military officer, died October 26, 1909. He was born in Kennebec county, Maine, in 1830 and graduated from Bowdoin College in 1850. He then obtained an appointment to the Military Academy at West Point, from which he graduated in 1854. In the following year he was made acting professor of mathematics with the rank of first lieutenant at West Point. When the Civil War broke out he offered his services to the Governor of his native State and went to the front as colonel of the Third Maine Volunteers. He took part in the battle of Bull Run and for gallant service was created a brigadier-general of volunteers. At the battle of Fair Oaks he was twice wounded in the arm while leading his brigade in a charge against the enemy. It was necessary to amputate his arm on account of these injuries. On his recovery he returned to his regular corps and took part in the Pope Campaign in Virginia, participating in the second battle of Bull Run. He was promoted to the rank of major-general of volunteers of 1862. He succeeded General McPherson as commander of the Army and Department of the Tennessee, and his corps formed the right of General Sherman's army during the famous march through Georgia. For his part in this campaign General Howard was appointed brigadier-general in the regular army. He took a similar part in the campaign in the Carolinas and assisted in the operations which resulted in the surrender of General Johnston's army in 1865. He took a prominent part also in the battles of Chancellorsville and Gettysburg. For his services in the final campaign he was brevetted a major-general in the regular army. Following the Civil War, General Howard was assigned to duty in the War Department in the bureau of refugees, freedmen, and abandoned lands. He took part in several campaigns against the Indians in the West and in 1881 was appointed Superintendent of the Military Academy at West Point, serving in that capacity until the following year, when he was transferred as commanding officer to the Department of Omaha. He was afterwards commanding officer of the Department of the Atlantic, with headquarters at Governor's Island, New York City. General Howard was a zealous worker in behalf of the negroes and freedmen of the South, and he was the founder and at the time of his death president of the Board of Directors of the Lincoln Memorial University at Cumberland Gap, Tennessee. He was the author of a number of books and in 1907 wrote his war reminiscences. The degree of LL.D was conferred upon him by four different universities, and in 1884 the French government made him Chevalier of Honor. He was the last of the ranking army officers who commanded Union armies during the Civil War. In 1908 Congress passed a resolution which placed him on the retired list of the army as a lieutenant-general. He also received the thanks of Congress for meritorious service to the nation during the war.

HOWARD UNIVERSITY. An institution of higher learning founded in 1867 under the

Freedmen's Bureau. It is under the control of the Interior Department of the United States government. The enrollment for the year 1909 was 1205 students. These came from 35 States and from 9 foreign countries. Howard University is the only institution where the nation directly touches the education of the negro. It includes a school of medicine, school of law, school of theology, school of arts and sciences, teachers' college, department of manual arts, commercial college, and a preparatory department. The total disbursements during the year were \$154,845. The University has a number of scholarship funds and special funds for the assistance of students. These amounted in 1909 to \$174,077. The attendance in the various schools in 1909 was as follows. School of medicine, 409; school of law, 100; school of theology, 97; college of arts and sciences, 115; teachers' college, 112; department of manual arts, 227; commercial college, 87; preparatory department, 323. The president is Wilbur P. Thirkield.

HOWE, WILLIAM WIBET. An American jurist, died March 17, 1909. He was born in Canandaigua, N. Y., in 1833. After graduating from Hamilton College, he practiced law in New York and St. Louis. He enlisted in the Union army and rose to the rank of major. Before the close of the Civil War he settled in New Orleans. From 1868 to 1873 he was associate justice of the Louisiana Supreme Court. The position of United States District Attorney was offered to him successively by Presidents McKinley and Roosevelt, and declined. In 1897 Judge Howe was elected president of the American Bar Association. He lectured before the law departments of many universities and wrote several studies of civil law, as well as municipal history of New Orleans.

HOWLAND, ALFRED CORNELIUS. An American artist, died March 17, 1909. He was born at Walpole, N. H., in 1838 and studied under Schultz and Eppindale in Boston. He afterwards went to Düsseldorf and Paris. In the latter city he was a pupil of Lambinet. Among his best known works in genre and landscape are: "Sunlight Path" (1871); "Ford's Glen" (1878); "Monday Morning" (1879); "The Gossips" (1880); "Rendezvous of the Veterans" (1884), and "The Coming of the Circus" (1886).

HUDSON MEMORIAL BRIDGE. See CONCRETE and BRIDGES.

HUGHES, CHARLES JAMES, JR. An American public official, United States Senator (Democratic) from Colorado. He was born in Kingston, Mo., in 1853 and graduated from Richmond College in 1871. He studied law at the University of Missouri and in 1877 began the practice of law in Denver, Colorado. He engaged actively in politics and was Democratic Presidential elector in 1900. From 1903-6 he was professor of mining law at Harvard Law School, and also acted as professor of mining law at the Denver Law School. He acted as counsel in important mine litigation in the United States courts, and is considered to be one of the most eminent lawyers of the State. In the primary election of November, 1908, he

received the largest number of votes as candidate for the United States Senate to succeed Henry M. Teller, and on January 19 was elected by the legislature to that office.

HUGHES, DAVID CHARLES. An American Baptist clergyman, died December 15, 1909. He was born at Tredegar, Wales, in 1832. He learned the printer's trade, studying in the meantime for the ministry. He came in 1855 to the United States and joined the Methodist denomination, receiving assignments to preach in Orange and Ulster counties, N. Y. He continued his studies and for a time was at Wesleyan University. He then joined the Baptist denomination and became pastor of the Baptist Church at Glens Falls, N. Y. He was afterwards pastor at Oswego, N. Y., and Newark, N. J. In 1854, after a brief service as one of the secretaries of the American Bible Union, he became pastor of the Union Avenue Baptist Church at Brooklyn, where he remained until 1884. He afterwards served pastorates in Jersey City, New York City, Scranton, and Brooklyn, N. Y. He retired from active pastoral work in 1901. He was the father of Governor Charles E. Hughes of New York.

HUGHES, ROBERT PATTERSON. An American army officer, died October 28, 1909. He was born in Pennsylvania in 1839 and was educated in Jefferson College. He enlisted as a private in the Twelfth Pennsylvania Infantry in 1861 and was honorably discharged in August of the same year. He was commissioned first lieutenant in the Eighty-fifth Pennsylvania Infantry in October, 1861, and was promoted to captain in 1862. He became colonel of the One Hundred and Ninety-ninth Pennsylvania in 1864 and was brevetted colonel in 1865. He was mustered out of volunteer service on June 28, 1865, and in 1866 he was appointed captain of the Eighteenth United States Infantry. He was made major and inspector-general in 1885, lieutenant-colonel in 1885, colonel in 1888, brigadier-general in 1898. He was honorably discharged in 1899 and the same year made brigadier-general of volunteers. In 1902 he was made major-general and was retired by operation of law in 1903. In 1898 he was made Provost Martial General of Manila and suburbs. In 1899 he commanded the first military district in the Philippine Islands and in 1900 the Department of the Visayan Islands.

HUNTINGTON, WILLIAM REED. An American Protestant Episcopal clergyman, died July 26, 1909. He was born in Lowell, Mass., in 1838, and graduated from Harvard College in 1859. He studied for the ministry and in 1861 became a curate of Emmanuel Church in Boston. In the following year he was chosen rector of All Saints' Church in Worcester, Mass. Here he remained for 21 years, until he was called to the rectorship of Grace Church, New York, in 1882, to succeed the late Bishop Potter. Dr. Huntington, during his service as rector of Grace Church, which continued until his death, was one of the most prominent and influential clergymen in New York City. He was perhaps the strongest debater and extempore speaker of his denomination, and was also its leading historical authority. He took a notable part in the revision of the Protestant Episcopal Prayer Book, and was chairman of the committee which, for nine years, was engaged on this work. His

chief fame, however, rests not on his power as an orator or historian, but on the vast amount of labor he accomplished as rector of his parish. Although Grace Church was fast becoming a "down town" church, he steadfastly refused to consider any project for its removal farther north. He organized and supervised many important movements in the church for the aid and advancement of the poorer members of his parish, while the religious aspects of his ministry were not allowed to wane.

In November, 1908, on the occasion of the twenty-fifth anniversary of his ministry in Grace Church, Dr. Huntington expressed the desire to resign. A fund of over \$40,000 was raised by members of his congregation for his personal use. In response to the protests of his parishioners, he withdrew his resignation, while the fund was made the basis for a "rector's discretionary fund," to be used as its title implies.

During the panic of 1907 Dr. Huntington brought into use the word "meliorist," in contradistinction to "pessimist" and "optimist," as signifying a hope based on confidence and faith. Dr. Huntington was progressive in his views of church doctrine and polity, and was sometimes spoken of as a radical. He was a prolific writer, and was the author of a book of verses. Among his works are *The Church Idea* (1870); *The Causes of the Soul* (1891); *Peace of the Church* (1891); *Short History of the Book of Common Prayer* (1893); *A National Church* (1898); *Psyche, a Study of the Soul* (1899); *Sonnets and a Dream* (verse, 1899).

HUNTLEY, ELIAS DeWITT. An American Methodist Episcopal clergyman and educator, died February 12, 1909. He was born in Elmira, N. Y., in 1840 and graduated from Genesee College in 1866. In the same year he entered the ministry. He was for six months professor of ancient languages at the Genesee Wesleyan Seminary, and was later presiding elder of the Madison, Wisconsin district. From 1879 to 1883 he was president of Lawrence University. He resigned to become pastor of the Metropolitan Church, Washington, D. C. From 1883 to 1886 he was chaplain of the United States Senate. He served in pastorates at Baltimore and Annapolis, and at Trinity Church, Washington. In 1881 he was a delegate to the Ecumenical Methodist Conference in London.

HYDROGEN. See CHEMISTRY, INDUSTRIAL.

HYGIENE. The International Office of Public Hygiene was put on a practical footing in Paris in 1909. It was first proposed at the International Sanitary Conference of Paris in 1903 and again at a conference held in Rome in 1907. The object of the office is to supply economically and promptly all information relative to public hygiene, especially in regard to infectious diseases such as cholera, plague and yellow fever, to the twelve countries signatory to the instrument. This agreement was ratified by the President of the United States February 15, 1908, and was definitely authorized for a period of seven years. The information collected, being both practical and scientific in character, is expected to be of great service in the quarantine and sanitary administration of the interested nations. President Taft, during 1909, renewed the efforts made to secure a satis-

factory national public health policy by the establishment of a national bureau of public health. Such an organization would have for its object the binding together of the various existing public health agencies and their expansion and necessary coordination.

According to recent experiments made by Major Horrocks of the English army, there is some foundation for the popular belief that sewer-gas may occasion mysterious outbreaks of diseases such as pneumonia, peritonitis, typhoid and malarial fevers, croup and diphtheria. He introduced known bacteria, such as *Bacillus prodigiosus* and *Bacillus coli*, into drainage systems, in the upper parts of which he exposed dishes of culture media. He recovered his test bacteria in various parts of the systems, in one case even at the height of 50 feet above the traps, showing that specific bacteria present in traps and drains may get into the air by splashing and bursting of bubbles or even from the surface of liquids in quiet motion. The apparent discrepancy between the results of various investigators led Winslow to study the question. He used a new method, by which the bacteria in a measured volume of air drawn into large culture-bottles were allowed to settle on media in the bottom of the bottles. Foaming bacterial emulsions were poured rapidly into water-closets and samples of air collected at the crown of the upper trap. In this experiment, however, 43 out of 44 samples of air contained no bacteria. The actual conditions as they exist in different plumbing systems were then studied, pipes were tapped at various places and samples of air drawn into culture-bottles. In 197 tests 48 samples gave bacteria capable of development at 37 degrees C.; only 4 contained sewage bacteria, and in collecting these samples of air mechanical spraying of sewage took place at the point of collection. The results of Winslow's experiments indicate that bacteria may be ejected from liquids in sewers into the air above, but at the same time they show that the general air of house drainage systems is fairly free from bacterial life, and there is therefore little reason to believe that sewer air is to be feared as a medium of conveying infectious diseases.

ICELAND. A Danish colony, with an area of 40,456 square miles and a population (1901) of 78,470. The total imports from Denmark alone amounted in 1907 to 6,096,000 kroner; (1 kroner=26.8 cents) the exports, to 5,140,000 kroner. Iceland is the chief of the Danish dependencies, and has its particular constitution and administration. The legislative power is vested in the Althing, 34 of whose members are elected by popular suffrage, and 6 nominated by the King. The responsible head of the administration is a minister (M. Hannes Hafstein in 1909), nominated by the King and residing at Reikjavik. For additional information relating to Iceland, see DENMARK.

ICE YACHTING. The weather in 1909 was unfavorable for ice yachting and all events which had been scheduled in the Shrewsbury River were abandoned. The Hudson River and Hyde Park Ice Yacht Clubs, however, held several contests, the most important being the final 10-mile race for the A. De Gross Point Cup, awarded to the club scoring the most points in the season. Twelve yachts entered the event which was won by the *Mink*, sailed by A.

Rogers, the time for the distance being 33 minutes 17 seconds.

IDAHO. One of the Western Division of the United States. Its area is 84,313 square miles, of which 534 square miles are water. According to a Federal estimate made in 1909 the population in that year was 227,674. The capital is Boise.

MINERAL PRODUCTION. The value of the mineral production of the State in 1908 was \$15,256,382, which was a marked decrease over the value of the product of 1907, which was \$21,300,612. The most valuable of the mineral products of the State is lead, of which 98,464 tons, valued at \$8,270,576 were produced in 1908 as compared with 112,569 tons valued at \$11,032,314 in 1907. Next in point of value ranks silver, of which 7,558,300 fine ounces, valued at \$4,042,900, were produced in 1908, a falling off in quantity and still more in value from the product of 1907, which was 7,886,400 fine ounces, valued at \$5,206,300. Gold was produced to the amount of 69,829 fine ounces, valued at \$1,443,500, an increase over the product of 1907, which was 60,754 fine ounces, valued at \$1,255,900. Copper showed a decrease, both in the amount and value over 1907. The comparative figures were as follows: 1908, 7,256,086 pounds, valued at \$957,803; 1907, 9,707,299 pounds, valued at \$1,941,460. The other mineral products of the State are inconsiderable in value and quantity. Among them are lime, salt, stone, and zinc.

The gold production in 1909 was estimated by the Director of the Mint at 67,207 fine ounces, valued at \$389,300. The silver production was 7,054,500 fine ounces, valued at \$3,669,500.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in the State in 1909, according to the figures of the United States Department of Agriculture, were as follows: Corn, 184,000 bushels valued at \$138,000 from 6000 acres; winter wheat, 9,135,000 bushels valued at \$7,947,000 from 315,000 acres; spring wheat, 5,330,000 bushels, valued at \$4,637,000 from 205,000 acres; oats, 7,788,000 bushels, valued at \$3,894,000 from 175,000 acres; barley, 2,480,000 bushels, valued at \$1,462,000 from 82,000 acres; rye, 86,000 bushels, valued at \$60,000 from 4,000 acres; potatoes, 5,000,000 bushels, valued at \$2,400,000 from 25,000 acres; hay, 1,359,000 tons, valued at \$12,367,000 from 477,000 acres. The wheat production in the State has increased steadily since 1900. The winter wheat crop of 1909 showed a large increase over that of 1908, when there were produced 6,960,000 bushels. The acreage increased from 232,000 to 315,000. Spring wheat also showed a marked increase, rising from 3,937,000 bushels in 1908 to 5,330,000 bushels in 1909, while the acreage increased from 155,000 to 205,000. The hay crop in 1909 was slightly smaller than in 1908, when 1,410,000 tons were produced. The average yield of hay in Idaho is the third largest in the United States. Idaho is one of the few States producing beet sugar. The annual production is about 40,000 long tons from about 30,000 acres. The number of farm animals on January 1, 1910, was as follows: Horses, 163,000; mules, 2000; cattle, 340,000; sheep, 4,248,000; swine, 143,000. Idaho ranks fourth in the total production of wool, the amount in 1909 being estimated at 21,450,000 pounds.

EDUCATION. The school attendance in 1909

was 87,747. The number of teachers employed was 2095 at an average salary of \$72.50. The expenditures for education were \$2,162,549. Among the new laws passed by the legislative session of 1909 were those establishing rural high schools, and providing for teaching agriculture in these schools. The State Superintendent is required to appoint a sufficient number of examiners to read and grade the papers of all applicants for first grade, second and third grade county certificates. Examiners are to be paid a sum not exceeding \$5 a day for their services, together with actual mileage.

FINANCE. According to the report of the State Treasurer there was a balance in the treasury on November 1, 1909, of \$1,074,327. The balance on November 1, 1908, was \$601,186. The bonded indebtedness of the State was \$1,734,500, and there were in the State sinking fund on November 1, 1909, \$231,503. The income is approximately \$1,000,000, while the expenditures per year approximated \$800,000. By direct taxes about \$600,000 are raised and by fees, \$200,000.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State are the Idaho Soldiers' Home at Boise which contains about 120 inmates; the Idaho State Insane Asylum, about 250 inmates; the Northern Idaho Insane Asylum at Clearwater; the Idaho Industrial Reform School in Fremont county, with about 70 inmates; and the Idaho State Penitentiary in Ada county, with about 220 inmates. The State also maintains the Idaho Industrial Training School at St. Anthony. In this school there are forty inmates, including boys and girls.

POLITICS AND GOVERNMENT. On January 12, the legislature re-elected Weldon D. Heyburn United States Senator. The Democratic vote was divided between C. O. Stockslager and W. W. Woods. The most important legislation passed in the session of 1909 was the local option bill, which passed the legislature on February 15. (See below.) During the year local option elections were held in 14 of the 23 counties and the Prohibitionists won in all but two. In addition three counties went on a "dry" basis without the intervention of a local option election under the law giving commissioners power to refuse to grant licenses. The most important industrial development was in connection with the opening to settlement, through the provisions of the Carey Act, of about 750,000 acres of land, increasing the total irrigated and to be irrigated by the Carey Act systems already started to about two and a quarter million acres, and the total cultivated area of the State to about seven million acres.

There were no events in the State during the year comparable in interest with those which led up to the conviction of Harry Orchard of the murder of Governor Steunenberg by the explosion of a dynamite bomb December 30, 1905. Orchard made a sensational confession in 1907 at the trial of Charles H. Moyer, George A. Pettibone and William D. Haywood, officials of the Western Federation of Miners, in which he accused these officials of having employed him to bring about the death of Governor Steunenberg and others. These men were acquitted and the trial of Orchard himself followed in 1908. He pleaded guilty on March 10 of that year, and on March 18 was sentenced to death. The sen-

tence was, however, commuted by the State Board of Pardons to imprisonment for life.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: A law was passed amending the law regulating the period of employment in underground mines. Measures were enacted regulating the liquor traffic by county local option. An employers' liability law was enacted restricting defenses of fellow workmen and assumption of risk. It provides for the recovery, in case of death, of not more than \$5000. Measures were enacted providing for the protection of orphans, homeless, neglected or abused children. A primary election law was enacted with provisions permitting expressions of choice for United States Senator. Measures were passed regulating the operation and equipment of mines. The issuance of passes or free transportation to certain State and county officers over electric and steam railroads and steamboats was prohibited. Wholesale liquor dealers were forbidden an interest in places doing a retail business. See ELECTORAL REFORM.

OFFICERS: Governor, James H. Brady; Lieutenant-Governor, Lewis H. Sweetzer; Secretary of State, Robert Lansdon; Treasurer, Charles A. Hastings; Auditor, S. D. Taylor; Attorney-General, D. C. McDougall; Superintendent of Education, S. Belle Chamberlain; Commissioner of Insurance, C. D. Gosalind; Superintendent of Agriculture, J. P. Fallon—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Isaac N. Sullivan, Republican; Associate Justices: James F. Ailshie, Republican; George H. Stewart, Republican; Clerk, I. W. Hart, Democrat.

The State Legislature of 1909 was composed of 13 Republicans, and 10 Democrat-Fusionists in the Senate, and 44 Republicans and 4 Democrat-Fusionists in the House. The State Representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

IGLESIAS, MIGUEL. A Peruvian soldier and statesman, died November 8, 1909. He was born in 1822 at Cajamarca. He occupied many official positions, including those of the secretary of the treasury and secretary of state previous to the war with Chile. On the breaking out of that struggle he took an active part in the field. His stubborn defense of Lima in 1881 was especially notable, but he was finally forced to surrender. He was held prisoner by the Chileans but escaped and at once set about to secure peace between the two countries. For many years he was a member of the Peruvian Congress, but seldom went to Lima where Congress met. His service was performed by an alternate, which is permissible under the constitution of Peru. He was governor of the province of Udina where he had vast estates.

ILLINOIS. One of the North Central Division of the United States. Its total area is 58,339 square miles. According to a Federal estimate made in 1909, the population in that year was 5,717,229.

MINERAL PRODUCTION. The most remarkable development in the mineral production of the State in the last few years has been the rapid growth of the petroleum product. The State now ranks third, being surpassed only by Oklahoma and California fields. The product of 1908 showed an increase over that of 1907 by nearly 10,000,000 barrels. In the former year

33,085,106 barrels were produced as compared with 24,281,973 barrels in 1907. The value of the product of 1908 was \$22,648,881 as against a value of \$16,432,947 for the product of 1907. Few pools of importance were opened during the year and the production came chiefly from the pools that had been fairly well defined in the previous year in Clark, Crawford and Lawrence counties. At Junction City, north of Centralia oil was discovered after a shot in a coal mine. The oil was found in sandstone where a fault blocked an entry about 650 feet from the surface. About 200 miles of the pipe line from Stoy, Illinois, to Rixford, Pennsylvania, were completed during the year. Illinois ranks second among the coal-producing States, being surpassed only by Pennsylvania. The production in 1908 was 47,659,690 short tons with a value of \$49,978,247. This showed a decrease as compared with 1907 of 3,657,456 short tons, and a decrease in value of \$4,709,135. These decreases are small compared with those of other States and may be attributed to the fact that relatively small quantities of coal were used in the steel and iron trade where most of the effects of the business depression of 1908 were felt. The total number of men employed in the coal mines of the State during the year was 68,035. There was notable freedom from explosions of either gas or dust entailing loss of life or serious injuries. During the year nine men were killed by gas explosions. In the fiscal year ended June 30, 1908, 183 men were killed and 819 injured in the coal mines of the State. The only serious interference with mining operations during the year was the shut-down or suspension in April and May when the operators and miners attempted to reach an agreement on wage scale. Throughout the remainder of the year there were no serious strikes or shut-downs caused by labor troubles. There were manufactured in 1908, 362,182 short tons of coke valued at \$1,538,952, which was a decrease from the production and value of 1907, which was 372,897 tons and \$1,737,464 respectively. There were six coking establishments in the State with 430 ovens built and 40 building. The State ranks tenth in the production of coke. The cement making industry is an important one in the State. In 1908 there were 3,211,168 barrels valued at \$2,707,044 produced, as compared with 2,036,092 barrels valued at \$2,632,576 in 1907. Illinois ranks fourth in the extent and value of its clay products. In 1908 these products were valued at \$11,559,114, a considerable decrease from the value of the product of 1907, which was \$13,220,489. The total value of the mineral products of the State for 1908 was \$122,900,688 as compared with a value of the product of 1907 of \$145,768,464.

The chief influences that have affected the coal mining industry of the State have been the increased use of oil and gas for fuel and also the use of coke or of Eastern coals which has followed the agitation in regard to the suppression of smoke. As a result there was a decreased production in 1909. There was considerable decline in the production of petroleum in 1909 but this was offset in its significance for the future by the discoveries in several localities of deeper oil sands, some of which gave large yields.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to the

figures of the United States Department of Agriculture were as follows: Corn, 369,770,000 bushels, valued at \$192,280,000 from 10,300,000 acres; winter wheat, 31,494,000 bushels, valued at \$32,754,000 from 1,810,000 acres; oats, 159,064,000 bushels, valued at \$60,444,000 from 4,346,000 acres; barley, 868,000 bushels, valued at \$451,000 from 31,000 acres; rye, 1,284,000 bushels, valued at \$935,000 from 71,000 acres; potatoes, 14,924,000 bushels valued at \$9,104,000 from 164,000 acres; hay, 4,135,000 tons, valued at \$40,936,000 from 2,852,000 acres; tobacco, 1,125,000 pounds, valued at \$123,750 from 1500 acres. The State ranks first in the production and acreage of corn. The crop of 1909 was greatly in excess of that of 1908, which was 298,620,000 bushels. The acreage increased from 9,450,000 acres to 10,300,000 acres. Illinois occupies first rank also in the production of oats. The crop of 1909 was greatly in excess of that of 1908, which was 94,300,000 bushels. The acreage increased from 4,100,000 acres to 4,346,000 acres. In the production of hay the State ranks among the most important. The crop in 1909 was less than that of 1908, which was 4,743,000 tons. The wheat crop showed a steady increase since 1902. The number of farm animals in the State at the beginning of 1910 were as follows: Horses, 1,655,000; mules, 152,000; dairy cows, 1,232,000; other cattle, 1,974,000; sheep, 817,000; swine, 3,772,000. The State ranks first in the number of horses, second in the number of swine and fourth in the number of dairy cows. The wool clipped in 1909 was 4,567,680 pounds.

FISHERIES. The total product of the fisheries of the State for the year ending December 31, 1908, was \$1,413,240. The most important of the fish taken in point of value was German carp, of which 21,342,300 pounds valued at \$562,410 were taken. Next in point of value were mussel shells, 39,809,100 pounds, valued at \$184,250; catfish and bullheads, 1,993,600 pounds, valued at \$92,810; crappie, 1,260,600 pounds, valued at \$33,840; dogfish, 1,349,000, valued at \$17,230; drum or sheepshead, 650,700 pounds, valued at \$19,570; turtles and terrapin, 508,400 pounds, valued at \$21,230. Pearls and slugs were taken to the value of \$170,380. Among other important fish were buffalo, black bass, chub, herring, lake trout, and frogs. There were 3048 independent fishermen in the State, 1349 wage-earning fishermen were employed. There were 18 vessels engaged in the fisheries of the State valued at \$38,300. The cash capital invested in the fisheries of the State was \$141,170.

EDUCATION. The school attendance for the school year 1909 was 997,453. There were 5479 male teachers employed. Of these 2893 were in ungraded schools and 2586 in graded schools. There were 23,353 female teachers, of whom 8376 were in ungraded schools and 14,977 were in graded schools. The average salary for male teachers was \$84.54 and for female teachers \$63.49. The expenditure for education during the year was \$32,973,881.

FINANCE. The report of the State Treasurer for the biennium, October 30, 1908, to September 1, 1908, showed a balance in the treasury on October 1, 1908, of \$4,990,041. The receipts for the period were \$14,697,077, while the total disbursements were \$16,332,679, leaving a balance in the treasury October 1, 1908, of \$3,354,439. The principal of the bonded debt of the State

on October 1, 1908, was \$17,500. The chief disbursements are for the State school fund, for the State game protection fund and the State food commissioner's fund.

CHARITIES AND CORRECTIONS. During 1909 the State made a radical change in the system of the administration of its 17 State charitable institutions. This was brought about as the result of a campaign conducted by the State Board of Charities under the direction of Governor Deneen to remodel the service and equipment of the State institutions. The first step was taken in 1905 when a law was passed placing all the employees, with a few exceptions, of the State charitable institutions under the State civil service law. Beginning in 1906 the system of medical administration was completely modernized and made uniform. A State Psychopathic Institute was established to teach physicians in the State service and for research work in the treatment and causes of insanity. The final step in the campaign of advancement came in June in the passage by the legislature and the approval by the Governor of a new charities administration law. The new system creates a centralized administration of all the institutions by one Board, called the Board of Administration, composed of five members. A centralized system of inspection, criticism and recommendation by the Board, known as the Charities Commission, made up of five non-salaried members, was also put into effect. This body is in no way responsible for administration and therefore free to criticise the executive branch of the service. The inspectional and critical service is extended by the new law beyond the central Charities Commission into the several institutions in the form of a non-paid board of visitors for each, and the service is still further extended to each county almshouse and jail in the form of county auxiliary boards, one for each county, each having three members. The board of visitors and the county auxiliary boards must report to the Charities Commission. The new law contains every advanced idea in the administration of public charities that has been tried successfully in other States, especially in the service of the insane; and is unique among American public charity statutes. Some of the names of the institutions were changed by the new law so as to eliminate the words "insane," "feeble-minded," and "asylum" from the legal nomenclatures of the State. The charitable institutions of the State are as follows: The Elgin State Hospital, at Elgin; the Kankakee State Hospital, at Kankakee; the Jacksonville State Hospital, at Jacksonville; the Anna State Hospital at Anna; the Watertown State Hospital at Watertown; the Peoria State Hospital at South Bartonville; the Chester State Hospital at Menard; the Lincoln State School and Colony at Lincoln; the Illinois School for the Deaf at Jacksonville; the Illinois School for the Blind at Jacksonville; the Illinois Industrial Home for the Blind at Chicago; the Illinois Soldiers' and Sailors' Home at Quincy; the Soldiers' Widows' Home at Wilmington; the Illinois Soldiers' Orphans' Home at Normal; the Illinois Charitable Eye and Ear Infirmary at Chicago; the State Training School for Girls at Geneva, and the St. Charles School for Boys at St. Charles.

POLITICS AND GOVERNMENT. The election of Governor Charles S. Deneen on Novem-

ber 2, 1908, was won by a plurality of only 23,164 votes over his Democratic opponent, Adlai E. Stevenson. As a result, a recount of votes was claimed by the Democrats on the plea that Stevenson was elected. A joint legislative committee was therefore appointed in the legislature of 1909 to which the subject was referred. As a result of the investigations of this committee the report of the majority was adopted recommending that Stevenson's petition be dismissed. This action declared Charles S. Deneen legally elected Governor of Illinois, and he was inaugurated on January 18. The principal recommendations in his inaugural address were: Immediate legislation providing for the construction of the \$20,000,000 deep waterway, authorized by a vote of the people and also providing for the development of the water power of the State; the extension of the merit system instituted in the charitable institutions to all other branches of the State's public service; the completion and the physical rehabilitation of the institutions on which work had been interrupted by lack of sufficient appropriation by the legislature; more effective laws for the prevention of blindness, and the removal of the adult blind from Jacksonville to Chicago; amendments to the primary law to prevent frauds and to prohibit the undue expenditure of money; a further revision of the insurance laws; the creation of a State Board of Education and the revision of the State's school laws; more adequate protection of the safety of persons employed in mines and in other dangerous callings.

The legislature was in session until June 3. It failed to pass the waterway bill advocated by Governor Deneen. The inheritance tax law was amended and the charities bill was passed. The anti-local option forces failed in their efforts directed at a dismemberment of the existing local option statute. The most important measures passed at this session of the legislature will be found noted in the paragraph *Legislation* below.

On June 16 the State Supreme Court for the third time declared invalid the Illinois primary law, and for the third time the State was without a primary election law. This law was passed in 1908 and went into effect on July 1 of that year. The act was declared unconstitutional because of defects in the provision relating to the qualifications of voters and because of its lack of provisions for cumulative voting for the nomination of candidates to the General Assembly. As a result of this decision the indictments returned by the grand jury which investigated the alleged primary frauds in the State primaries of August, 1908, were quashed as they were voted on provisions of a law which did not exist. The primary law had been supported by Governor Deneen at the time of its passage and following this decision he at once began a campaign for the enactment of a new law. He declared that an extraordinary session of the legislature would be called to enact such a law, and also to take action on the deep waterway plans which had failed in the regular session. The extraordinary session met on December 14. Bills for primary election laws, drawn with the approval of Governor Deneen, were at once introduced. These bills were declared to be broader in scope and finer in detail than any primary act on the statute books of the United States. Five

bills relating to the subject of primaries were introduced. The first of these was a simple, direct plurality primary law for all offices except for Representatives in the General Assembly, and for city, village and incorporated towns, township and school offices. It provided for an advisory vote upon United States Senators and for President and Vice-President of the United States. The second bill carried this enactment into cities of 5000 or more. The third bill provided for direct nomination of the members of General Assembly, and the fourth provided for nomination of municipal officers by petition or by referendum vote of a city wishing to take advantage of the law. The primary system it was provided might be re-adopted by a city by referendum vote. No action was taken on these bills previous to the adjournment of the legislature over the Christmas holidays. See *ELECTORAL REFORM*.

On May 26 William Lorimer (q. v.), while holding the office of Representative in Congress from the Sixth Illinois District was elected United States Senator to succeed Albert J. Hopkins. The election of Senator Lorimer ended one of the most stubborn and prolonged political battles in the history of Illinois politics. On January 19 both houses of the legislature took the first ballot for the election of Senator and from that date to May 26 a deadlock was maintained, no candidate receiving the requisite majority of 103 votes. Senator Hopkins was a candidate for re-election. Throughout the struggle Mr. Lorimer did not appear as an active candidate until shortly before his election. He had been, however, for years one of the strongest figures in Illinois politics.

In September the law prohibiting women employed in factories, etc., from working more than ten hours a day, passed by the legislative session of 1909, was declared unconstitutional by Judge Tuthill of the Cook County Circuit Court. This made the law ineffective until passed upon by the State Supreme Court. The suit which led to the decision was brought by two women, employees of a paper box concern, who swore that if they were restricted to ten hours of labor they could not earn enough to support those dependent upon them. Judge Tuthill held that the law violated the freedom of contract. As a result of elections held on November 2, saloons were ousted from three counties in the State. The no-license party carried the five precincts in Calhoun, Morgan, Scott and Polk counties necessary to make these counties entirely dry. Five precincts were lost in Pulaski county, which goes back to the "wet" column. The net result was the increase of three in the number of counties entirely dry, making a total of 39. Jacksonville, which was the only large town voting, was won by the no-license party by a majority of 202, as compared with 774 in 1907. In the election held on April 20, 41 of the 72 towns and villages in the State which voted were won by the license party. See *ELECTORAL REFORM*.

OTHER STATE EVENTS. On January 11, as the result of an explosion in the Leiter mine at Zeigler, 26 miners were killed. One of the most terrible disasters in the mining history of the country occurred at Cherry, a mining village on the Chicago, Milwaukee & St. Paul Railway near Spring Valley on November 13. Nearly if not quite 400 men were entombed in the St. Paul Mine as a result of fire which originated

in a stable in the second level of the mine. On November 20, 21 of these miners were rescued. The others perished. A band of twelve rescuers who volunteered to go into the mine following the first discovery of the disaster, lost their lives, bringing the total number of lives lost up to probably 411. Not all the bodies were recovered at the end of the year. On November 11 a mob estimated to number about 10,000 people lynched two men, one a negro and the other a white man, at Cairo. The negro had been accused of atrociously murdering a young woman, and because of the state of public opinion against him he had been taken by the sheriff out of town and hidden in the woods. Several thousand people, however, after persistent search found him and took him into town where he was hung and shot. The mob then broke into the county jail, seized a white man charged with wife murder and hung him in the streets. Laxity in the enforcement of the criminal law for several years was generally admitted to have caused this outbreak of mob violence. Cairo was placed under military rule for several days by Governor Deneen. On July 11 a tornado wrought great havoc in Xenia, Pana and other towns in the State. On August 22 a fire at Decatur destroyed 19 business establishments in the city and damaged six others. The total loss was over \$1,000,000.

CHICAGO. As a result of the primary elections held on February 24, I. N. Powell was nominated for city treasurer by the Republicans and Harry Hildreth, Jr., by the Democrats. The total vote cast was 92,472, against 217,000 in the primaries of the previous August. At the election held on April 6, Powell, the Republican candidate for treasurer, was elected by a majority of 5698 votes over the Democratic candidate. Eighteen Republicans and eighteen Democrats were elected aldermen, and F. D. Connery, Democrat, was elected city clerk. Control of the new Council was safely vested in the "reform" element of that body. The proposal to levy a special tax for the establishment of a tuberculosis sanitarium was carried by a large majority. Proposals to annex Evanston and Cicero were defeated by the voters of those suburbs. The results were largely due to the efforts of the Municipal Voters' League, which has been active for years in the fight for better government of the city. The attempt of the advocates of no-license to have the people vote at this election on the question of excluding saloons from the city under the local option law fell through from inability to secure the necessary 100,000 petitioners to place the question on the ballot. Less than 50,000 names were obtained. A new city charter was introduced into the legislature on March 23, but it was defeated in both the Senate and the House of Representatives.

The Commercial Club of Chicago, which for nearly three years had been engaged upon the preparation of a plan for the improvement of the city, made its report in the summer. The work was in charge of Daniel H. Burnham, Chief Architect and Director of Works at the World's Columbian Exposition of 1893, to which exposition the plan of the improved city is directly due. Edward H. Bennett and Charles Moore were associated with Mr. Burnham in the preparation of the report. The plan contemplates many elaborate improvements, especially in the water front of the city, and in the cre-

ation of new parks and playgrounds. Attention is given also to the betterment of commercial facilities, methods of transportation and to the increase of convenience. Its main features are: First, the improvement of the lake front; second, the creation of a system of highways outside the city; third, the improvement of railway terminals and the development of a complete traction system for both freight and express; fourth, the acquisition of an outer park system and parkway circuits; fifth, a systematic arrangement of streets and avenues within the city in order to facilitate the movement to and from the business district; sixth, the development of centres of intellectual life and civic administration, so related as to give coherence and unity to the city. It is not intended that these improvements shall be made at once, but it is hoped that they may become the general plan upon which the city will develop in coming years.

A modification of the budget system devised and advocated by the New York Bureau of Municipal Research will be used in the preparation of the municipal appropriations of the city for 1910. By this system a careful record will be made of all expenditures and other improvements will be made.

Investigations into alleged corruption of city officials were carried on during the year. As the result of deliberations of the grand jury, indictments were found against Inspector Edward McCann, several city officials and thirteen resort keepers. This was in the latter part of July and the September grand jury continued the investigation. Inspector McCann after trial was found guilty on September 24 of extorting bribes from resort keepers. In September, after investigation by State's Attorney Wayman, conditions were found to exist in the Cook county jury commissioners' office, as a result of which it was charged jurors had been "fixed." The October grand jury, after examining into these charges, declared that the jury system was fraught with fraud and irregularity. The grand jury's report charged that the absence of records required by law to be kept, and the system in vogue and the methods pursued in the jury commissioners' office had given the widest latitude for the manipulation of jurors, for the substitution of names and for permitting the selection of jurors to rest in the personal choice of employees of the office or of the commissioners themselves. On August 4, George M. Shippy resigned as chief of police of the city as the result of ill health, and he was succeeded by Colonel Le Roy Steward.

On November 23 William J. Moxley was elected Congressman from the Sixth Congressional District, comprising a part of the city of Chicago. The election was to fill the vacancy caused by the election of William Lorimer as United States Senator. The contest was of interest as being the first Congressional election after the tariff bill had been passed. Mr. Moxley, who endorsed the tariff law and opposed the movement against Speaker Cannon, received 14,623 votes to 8342 votes for Carl L. Barnes, Independent Republican, and 6435 for Frank S. Ryan, Democrat. The total number of votes for all candidates, 30,225, showed a marked decrease from that in the election of 1908, when 32,540 votes were cast for Lorimer, and 53,254 for all the candidates for the seat. Speaker Cannon took part in the campaign, defending his

course as Speaker. On July 29 Mrs. Ella Flagg Young was elected Superintendent of the Chicago public schools by the Board of Education to succeed E. G. Cooley, resigned. In October the Appellate Judiciary confirmed the sentence imposed by the trial judge on John R. Walsh, sentencing him to five years in the Federal prison for violating the national banking laws in the management of the Chicago National Bank. The closing of the bank caused also the Home Savings Bank and the Equitable Trust Company to go out of business, Walsh having been at the head of all three. For four years Walsh had fought the government's prosecution in this case.

On December 1, receivers were appointed for the Illinois Tunnel Company and the Chicago Warehouse and Terminal Company, having \$75,000,000 of securities and being subsidiary corporations of the Chicago Subway Company. This action was taken to safeguard the properties in the custody of the Federal courts and to prevent a multiplicity of suits in various courts and consequent dismemberment and destruction of the valuable properties. It was declared that the Illinois Tunnel Company, owner of about 60 miles of subway used for traffic purposes, under the streets of the city, was insolvent.

Announcement was made on December 26 that Chicago financiers had bought out the Morgan Syndicate in the Chicago City Railway Company, and had consolidated this system with the Calumet and South Chicago Railway Company, the Southern Street Railway Company, and the Hammond, Whiting and East Chicago Railway Company. Stocks and bonds of these companies taken over amounted to \$50,735,000. The new company is known as the Chicago City and Connecting Railways. The syndicate which brought this about was headed by James B. Forgan, President of the First National Bank. In financial circles the consolidation was taken to indicate probably near consolidation of all the street railway lines in the city.

On January 20 about 70 workmen lost their lives and 40 more were injured in a fire which destroyed a temporary crib in Lake Michigan, a mile and a half from the shore at Seventy-first Street, used by a contractor in the construction of a new water-supply tunnel. The men were unable to escape from the crib after the fire had been discovered. The fire originated from an unknown cause, probably the carelessness of a workman, while many of the employees were asleep.

A dispute between the officials and the employees of the street railway lines which threatened to stop traffic on the lines by a strike was settled on August 12 by an agreement that the companies should pay conductors and motormen of five years' service a maximum scale of 30 cents an hour by a graduated series of advances, the last advance to become effective August 1, 1911. See **STRIKES**.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: An act was passed requiring the publishers of school books who desire to offer them for sale for use in the public schools of the State to file sample copies of the books in the office of the Superintendent of Public Instruction. Publishers of school books entering into any pool or combination to control prices or restrict competition in the adoption or sale of school books in the State, or who are found to have given

any money or used their influence to secure the adoption of their books, shall have their licenses revoked and all their books omitted from the list of licensed books. An important statute was enacted providing for the revision of laws relating to charities and corrections. Measures were enacted amending the laws relating to marriages, making a ceremonial marriage necessary in order to constitute a valid marriage under the laws of the State.

OFFICERS: Governor, Chas. S. Deneen; Lieutenant-Governor, John G. Oglesby; Secretary of State, James A. Rose; Treasurer, Andrew Russell; Auditor, J. S. McCullough; Attorney-General, W. H. Stead; Adjutant-General, _____; Superintendent of Insurance, Fred'k W. Potter; Superintendent of Public Instruction, Francis G. Blair—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Wm. M. Farmer, Dem.; Associate Justices, John P. Hand, Rep.; Frank K. Dunn, Rep.; George A. Cooke, Dem.; Alonzo K. Vickers, Rep.; Orrin N. Carter, Rep.; James H. Cartwright, Rep.; Clerk of the Court, J. McCan Davis, Rep.

The State Legislature of 1909 was composed of 38 Republicans and 13 Democrats in the Senate, and 89 Republicans and 64 Democrats in the House. The State representatives in Congress will be found in the section **Congress** of the article **UNITED STATES**.

ILLINOIS, UNIVERSITY OF. An institution of higher learning at Urbana, Ill., founded in 1867. There were in 1909, 4960 students with 497 members of the faculty. The university is supported by the Federal and State governments and fees. The total income for the year 1908-9 from these sources was \$1,414,984.21. Among the important changes in the faculty were the resignation of Professor T. P. Breckenridge to go to the Sheffield Scientific School, and Professor Raymond Weeks to go to Columbia University. There were added some fifteen new members to the faculty as professors, associate professors and assistant professors. Among them were Professor Henry Ward, head of the department of zoölogy, and Professor H. H. Stock, head of the new department of mining engineering. Of the additions twelve were to fill new positions. The president is E. J. James, Ph. D., LL. D.

IMBER, NAPHTHALI HERZ. A Yiddish poet, died October 8, 1909. He was born in Zloczow, Galatia, in 1854. He wrote from an early age and for the last twenty years of his life was active in voicing the beliefs of Zionism in the form of verse. He was the author of a hymn, which was adopted by the Zionists as the chief one of their creed. He wrote three volumes of verse in Hebrew under the title of *The Dawn*. Another of his books was *The Music of the Psalms*. During his last years he was director of a Yiddish magazine in New York City. He was, for a time, associated with Israel Zangwill, the novelist, and is said to have taught the latter the Yiddish language.

IMMIGRATION AND EMIGRATION.

During the fiscal year 1909, 944,235 aliens entered the United States, of whom 751,786 were of the immigrant class, that is, had left a permanent residence outside of the United States and were entering with the intention of residing permanently in this country, while 192,449 were of the non-immigrant class, that is, were either former

residents of the United States returning after a temporary absence or were permanent residents of foreign countries entering for temporary purposes only. During the same period 400,392 aliens departed, of whom 225,802 were of the emigrant class, that is, were leaving a permanent residence in the United States with the intention of residing permanently abroad, and 174,590 were of the non-emigrant class, that is, were departing with the intention of remaining abroad temporarily or were returning to their native land after a temporary stay in the United States. During the fiscal year 1908, aliens to the number of 924,695, of whom 782,870 were immigrants and 141,825 were non-immigrants, entered the United States, while 714,828 aliens, of whom 395,073 were emigrants and 319,755 were non-emigrants, left the United States. Therefore, while immigration for 1909 exceeded that for 1908 by 19,450, the emigration for 1908 exceeded that of 1909 by 314,436. There was, therefore, an actual increase of the alien population of the United States of 543,843, while in 1908 the actual increase was 209,867. This growth was confined to the last half of the fiscal year, the first six months having shown even a less increase than in some months of 1908. This would seem to indicate that the trend of immigration is upward and that it is rapidly assuming the large proportions from which there was a temporary departure in the fiscal year 1908 and the first half of the year 1909. Of the immigrant aliens who entered the country in 1909, 624,876 were between the ages of 14 and 44, while 88,893 were under 14 and 38,517 were 45 or over. As to illiteracy, 191,049 could neither read nor write and 2431 could read but could not write. These figures include no aliens under 14 years. Compared to the corresponding figures for 1908 this is an increase in illiterates from 26 per cent. of the total to 29 per cent. Arriving aliens brought \$17,331,828, an average of \$23.50 apiece. It is not certain, however, that all money possessed by these aliens was shown to the inspection officers. About one-third of those admitted were assisted by others to reach this country. Of the 225,802 aliens departing, 9804 were less than 14 years of age, 165,778 were from 14 to 44, and 20,512 either 45 years of age or over; 160,154 had resided in the United States less than 5 years, 26,967 from 5 to 10 years, 4027 from 10 to 15 years, 2666 from 15 to 20 years, and 2280 over 20 years. As to occupation, 174,800 of the immigrant aliens entering, and 118,936 of the emigrant aliens departing, were common unskilled laborers against 87,160 immigrant aliens entering and 21,919 emigrant aliens departing, who were members of the skilled trades. These figures seem to substantiate the general impression that the temporary element of the immigrant is constituted largely of the unskilled classes.

During 1909 as in the several preceding years, a very large proportion of the immigration has been from the countries of southern and eastern Europe. Italy, Austria-Hungary, Greece, Turkey in Europe, and the small principalities adjacent, and Russia supplied about 67 per cent. of the immigrants admitted; in 1908 these countries furnished 64 per cent. There were rejected at the United States ports during the year 10,411 aliens, or about 1.9 per cent. of the total number applying for admission. There was a marked increase in the number

rejected on moral grounds, due to the unremitting efforts to detect members of these especially undesirable classes and turn them back at the ports. During the year 2124 warrants of deportation were issued after granting hearings to the arrested aliens, compared with 2069 executed during the previous year. During the year 5266 aliens physically, mentally, or morally below the standard set by the law were returned to the foreign ports of embarkation, and 69 criminals, 261 immoral women, 30 procurers and one anarchist were arrested and deported. The Commissioner-General of Immigration recommends in his report that the law regarding the moral defects of immigrants be amended and strengthened in several important respects.

As a result of the acts prohibiting the immigration of Japanese and Corean laborers, which became effective in March, 1907, 212 of the 2644 Japanese applying for admission to continental United States were debarred. Of the number applying, 237 were not in possession of proper passports. During the same period 1539 Japanese applied for admission to Hawaii, of whom 1493 were admitted.

Under the Chinese exclusion laws, 836 Chinese were arrested during the year, which, with the 445 similar cases that remained pending at the close of the previous year, made a total of 1281 of such cases to be dealt with. Of these 39 died or escaped, 189 were discharged, 665 were deported and 338 cases remained pending at the close of the year. The Secretary of Commerce and Labor recommends the adoption of the recommendation made by his predecessor that the Chinese immigration service be consolidated with the general service. In 1908 the Department of Commerce and Labor authorized, on the recommendation of the Commissioner-General of Education, the adoption of a plan under which all American citizens of the Chinese race residing in the Hawaiian Islands could be furnished with a certificate of identity which affords them protection and the right of prompt ingress and egress. This plan proved so satisfactory that during the year 1909 the Commissioner-General recommended that a similar plan be adopted with respect to all Chinese hereafter admitted to the main land, either as domiciled merchants or as the wives or minor children of such class of merchants, or as American citizens by birth. This recommendation was approved and it is believed that the arrangement will be of benefit both to the Chinese and to the government.

A Division of Information having for its purpose the promotion of a "beneficial distribution of aliens admitted into the United States among the several States and Territories desiring immigration," was established on July 1, 1907. During the fiscal year 4168 persons were distributed through its means. Of this number 2565 were distributed among agricultural communities and received employment as farmers or farm laborers. Forty States and one Territory were represented in this field of the Bureau's activities, and in the distribution 45 nationalities were represented. Of those directed to employment, 1028 were Poles, 879 Germans, 428 Russians, 406 Swedes, 256 Italians, 221 Norwegians, 202 Danes, 127 Finns, 73 Irish, 59 English, 43 Swiss, and 8 Scotch. The records of the branch offices of New York, Baltimore, and Galveston showed that 26,477 appli-

cants sought to obtain information. The Bureau is in touch with State agencies and State boards of immigration and harmonious working arrangements are being established as the work progresses.

The table below, taken from the Report of the Commissioner General of Immigration for 1909, shows the immigration into the United States by countries in the fiscal years 1908-9.

IMMIGRATION COMMISSION, UNITED STATES. See IMMIGRATION and AGRICULTURE.

INCINERATORS. See GARBAGE.

IMMIGRATION BY COUNTRIES IN FISCAL YEARS 1908 AND 1909.

Countries	1908	1909
Austria-Hungary	168,509	170,191
Belgium	4,162	3,692
Bulgaria, Servia and Montenegro	10,827	1,054
Denmark	4,954	4,395
France, including Corsica	8,788	6,672
German Empire	32,309	25,540
Greece	21,489	14,111
Italy, inc. Sicily and Sardinia	128,503	183,218
Netherlands	5,946	4,698
Norway	12,412	13,627
Portugal, including Cape Verde and Azore Islands	7,307	4,956
Rumania	5,228	1,690
Russian Empire, and Finland	156,711	120,460
Spain, including Canary and Balearic Islands	3,899	2,616
Sweden	12,809	14,474
Switzerland	3,281	2,694
Turkey in Europe	11,290	9,015
England	47,031	32,809
Ireland	30,556	25,033
Scotland	13,506	12,400
Wales	2,287	1,584
Other Europe	97	46
Total Europe	691,901	654,875
China	1,397	1,943
Japan	15,803	3,111
India	1,040	203
Turkey in Asia	9,753	7,506
Other Asia	372	141
Total Asia	28,365	12,904
Africa	1,411	858
Australia, Tasmania, and Zealand	1,098	839
Pacific Islands, not specified	81	53
British North America	38,510	51,941
Central America	1,175	930
Mexico	6,067	16,261
South America	2,315	1,906
West Indies	11,888	11,180
Other countries	17	49
Grand total	782,870	751,786

The Immigration Commission appointed in 1907 had practically completed its study of immigration problems at home and abroad in the latter part of 1909 and at that time published several preliminary reports, the most important of which related to the white slave traffic. This report showed deplorable conditions, and, as a result of the investigations made by the Commission, prosecutions were carried on in various parts of the country, notably in Chicago and New York.

A new immigration act was introduced into the 61st Congress. It is entitled "An Act to Regulate the Immigration of Aliens to and the Residence of Aliens within the United States." This act is intended to regulate the entire matter of immigration, and is intended to prevent many of the irregularities which occur under existing laws. Provisions are included for the collections of data regarding incoming aliens. The measure includes a section consisting of the compilation of all the provisions of the immigration act and the Chinese exclusion laws regarding classes of aliens not to be admitted. Measures were taken also to prevent serious

INDIA, BRITISH. That part of the Hindustan Peninsula and of Burma which is directly or indirectly under British rule. Popularly the term is often used to include certain other states, as Nepal, which lie beyond its borders, but which are under the control or protection of the Governor-General. The capital is Calcutta.

AREA AND POPULATION. The total area and population (according to the last census, 1901) of India (that is, inclusive of Burma and the native states and agencies) are 1,773,168 square miles and 294,361,056, an increase of 7,046,385 over 1891. British India proper comprises 1,097,901 square miles, with 232,072,832 inhabitants, an increase of 10,695,875 over 1891. The area of the native states and agencies is 690,272 square miles, with 61,325,376 inhabitants, a decrease from 1891 of 4,178,420. The British-born inhabitants in 1901 numbered 96,653. Aryan languages were spoken by 221.16 millions and Dravidian by 56.51 millions. The languages spoken by the largest number of persons were: Hindi, spoken by 87.14 millions; Bengali, 44.62 millions; Telugu, 20.70; Marathi,

18.24; Punjabi, 17.07; and Tamil, 16.53. According to religion, the population was divided as follows: Hindus, 207,050,557; Mohammedans, 62,458,077; Buddhists, 9,476,759; Animists, 8,584,148; Christians, 2,023,241 (1,202,169 Roman Catholics); others, 148,128. The principal cities, with population in 1901, are: Calcutta (with suburbs), 1,026,987; Bombay, 776,006, (1905, 977,822); Madras, 509,346; Hyderabad, 448,466; Lucknow, 264,049; Rangoon, 234,881; Benares, 209,331; Delhi, 208,575; Lahore, 202,064; Cawnpore, 197,170; Agra, 188,022; Ahmedabad, 185,889; Mandalay, 183,816; Allahabad, 172,032; Amritsar, 162,429; Jaipur, 160,167; Bangalore, 159,046; Howrah, 157,594; Poona, 153,320.

Coolie emigration in 1906-7 amounted to 21,003, and 8197 returned; in 1907-8, 15,117, and 6774 returned. Vital statistics are defective. In 1906 the reported birth rate per 1000 inhabitants was 37.38, and death rate 34.73; 1907, birth rate 37.66, and death rate 37.18.

EDUCATION. The census of 1901 showed that about one male in ten and one female in 144 could read and write. The government is giving increased attention not only to primary but to agricultural, commercial, and technical instruction. Recently education has made notable progress, and yet in British territory less than 26 per cent. of the boys and less than 4 per cent. of the girls of school age attend school.

On March 31, 1907, there were in India 162,757 educational institutions, with 5,400,293 scholars; on March 31, 1908, 165,612 institutions, with 5,711,485 scholars.

The universities of Calcutta, Madras, Bombay, Allahabad, and the Punjab are merely examining bodies, but have numerous affiliated colleges.

For the year ending March 31, 1907, the expenditure (exclusive of that in British Baluchistan) on education, including that from provincial revenues, local and municipal funds, fees, subscriptions, endowments, etc., was £3,734,207; for 1908 £4,018,764. The expenditures from provincial revenues for the two years were £1,236,617 and £1,327,179 respectively.

to 1906-7: Food grains and pulse, 180,369,792 acres (195,117,838), including: rice, 75,980,682 (73,541,128); jawar, or great millet, 21,963,751 (20,781,722); wheat, 18,424,191 (25,137,982); bajra, or spiked millet, 15,133,229 (15,033,742); barley, 7,629,550 (7,700,110); corn, 6,296,375; fibres, 18,598,640 acres (17,987,267), including cotton, 13,909,269 (13,771,214); jute, 3,942,675; oilseeds, 12,485,973 acres (13,965,315), including: sesamum, 4,287,728; rape and mustard, 3,297,455; linseed, 1,401,220;—sugar, 2,876,965 (2,623,874); condiments and spices, 1,270,845; tobacco, 974,458; opium, 538,042 (614,915); tea, 513,437; indigo, 405,905 (448,594); coffee, 99,511; fodder crops, 4,914,090 (4,547,733).

The estimated yield in 1907-8, including crops in certain of the Native States was: Cleaned rice, 387,300,200 cwt. (427,743,800 cwt. in 1906-7); wheat, 6,136,400 tons (8,491,700); cotton, 4,479,433 bales of 400 pounds (5,361,655); jute, 9,667,400 bales of 400 pounds (9,206,400); sugar, 2,054,700 tons (2,205,300); tea, 248,020,398 (241,403,510); sesamum, 271,600 tons (541,000); rape and mustard, 681,900 tons (1,053,100); linseed, 163,200 tons (425,200); indigo, 51,400 cwt. (65,700).

Government irrigation works, as well as private works, have greatly improved agricultural conditions. The total capital outlay on the government works up to March 31, 1908, was £34,542,941, which, aside from the resulting agricultural benefits, yielded a profit to the state of about 63 per cent. The total area irrigated (by government and private canals, and by tanks, wells, etc.) was over 21,000,000 acres, or, counting both harvests, 40,062,880 acres (36,653,903 in 1906-7). The government major irrigation works had 10,459 miles of main canal, with 28,755 miles of distributaries; minor works, 2977 miles of main canal, with 1158 miles of distributaries. The Indian government is steadily developing the irrigation system. See **IRRIGATION AND STOCK RAISING.**

MINERALS. The production of the principal minerals for which returns are available, in British India and the Native States, is reported as follows:

Minerals	1906-7 Value	1907-8 Quantity	1907-8 Value
Coal, tons	£2,609,726	12,769,635	£3,356,209
Gold, ounces	2,133,691	566,867*	2,156,635*
Manganese ore, tons	769,372		
Petroleum, gals.	610,015	176,646,320	702,009
Salt, tons	398,147	1,279,937	487,680
*Mica, cwts.	228,161	26,392	126,834
†Jadestone, cwts.	74,402	4,058	84,450
Rubies, sapphires, and spinels, carats.....	95,115	211,194	47,921

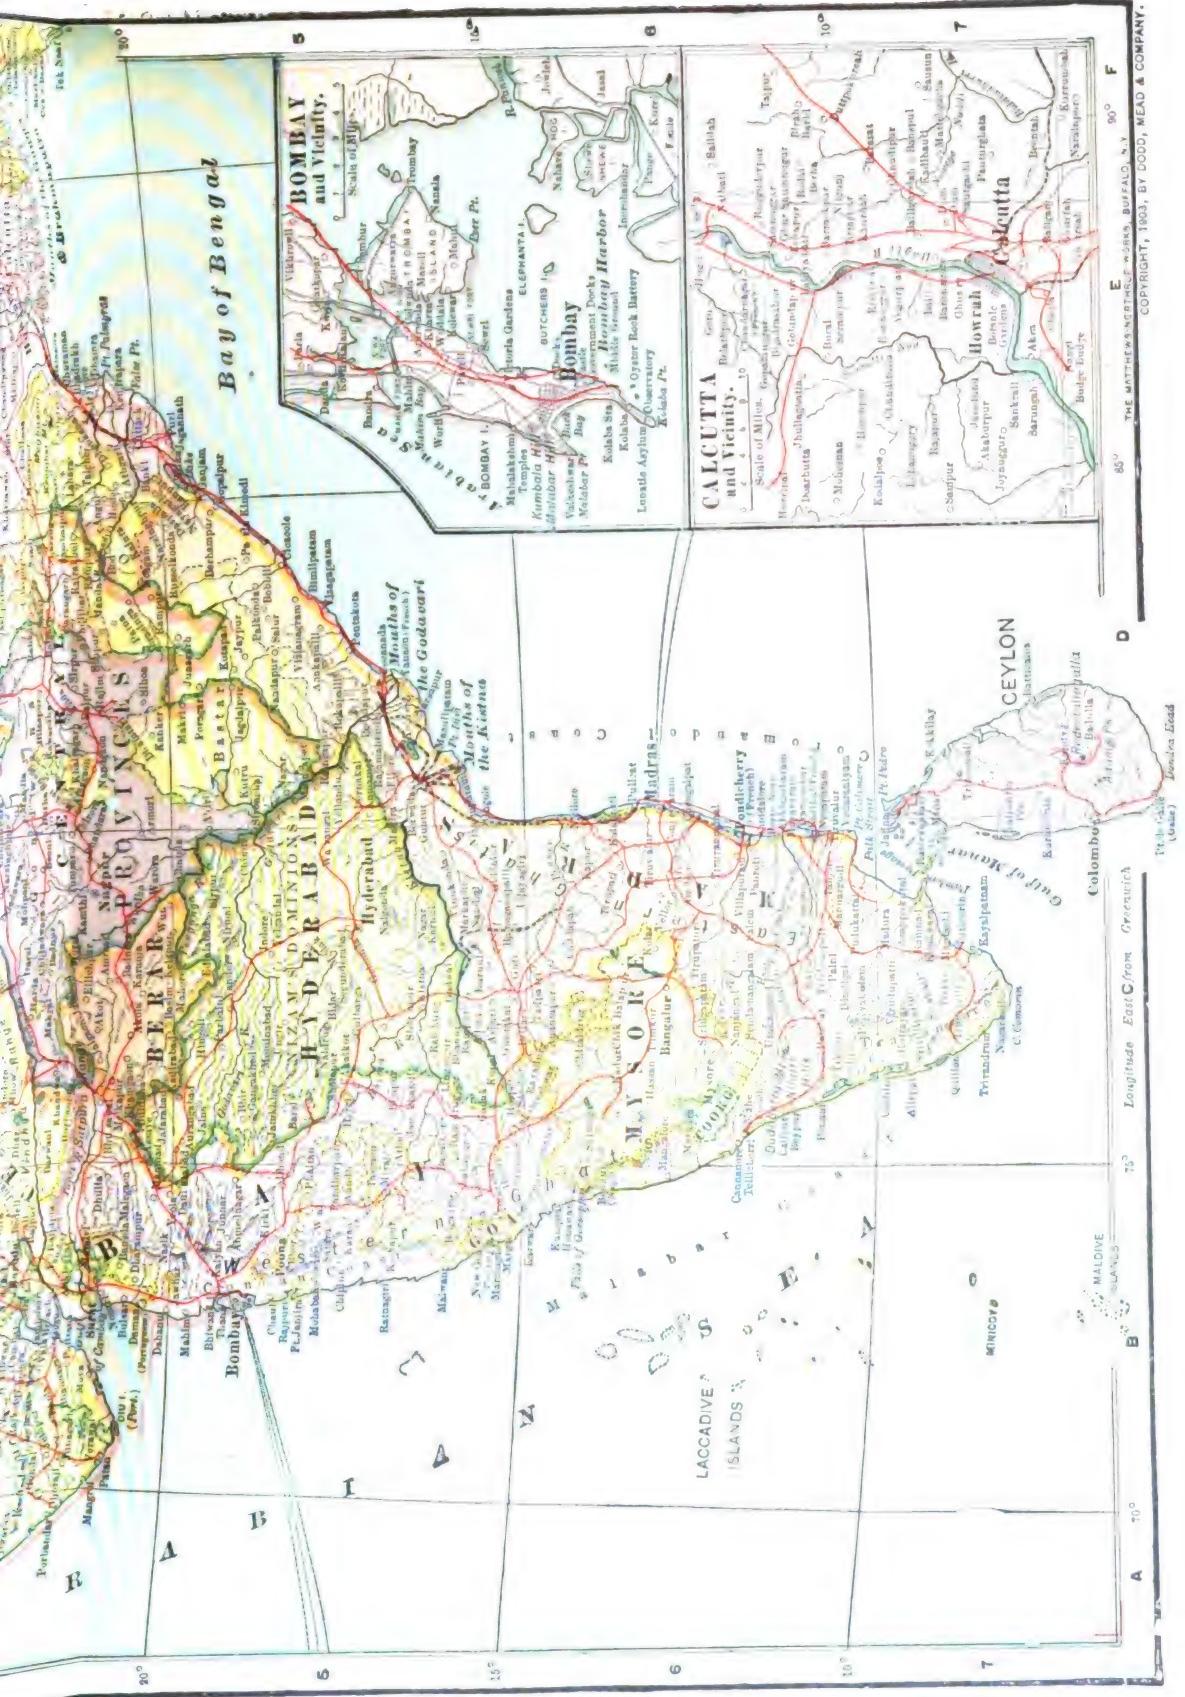

*Approximate. †Exports.

In 1907-8 there were published in India 753 newspapers, 1,062 periodicals, 1,524 books in English or other European languages, and 7,095 books in Indian languages.

AGRICULTURE. Agriculture is by far the most important occupation of the people. In 1907-8, out of a surveyed area of 619,456,133 acres in British territory, 82,808,585 acres were reported as forest, 113,300,659 cultivable waste, 55,337,509 fallow and 210,883,660 sown with crops (214,026,319 in 1906-7). The total acreage cropped in 1907-8 was 237,635,293 acres, including 26,751,633 cropped more than once. The areas planted to the principal crops were as follows, the figures in parenthesis relating

to the coal output in 1907-8, 11,559,911 tons were raised in Bengal; of the petroleum, 173,402,790 gallons in Burma; of the gold, 535,039 ounces in Mysore. Of the mica over three-fourths is produced in Bengal; about three-fourths of the salt is produced in Madras, Bombay, and Sind. Manganese ore is mined chiefly in the Central Provinces. Burma produces all of the jadestone, rubies, sapphires, and spinels reported.

MANUFACTURES. The more important manufactures include cotton and jute textiles, paper, indigo, and beer. In 1907-8 there were in operation 227 cotton mills (especially in Bombay and Ahmedabad), containing 5,763,710 spindles

and 66,718 looms. The production, in 1907-8, was 638,295,115 pounds of yarn and 808,426,561 yards of woven goods; in 1908-9, 656,830,279 pounds and 824,489,164 yards. In 1907-8 there were 50 jute mills (chiefly in or near Calcutta), containing 562,274 spindles and 27,244 looms; 6 woolen mills, with 28,868 spindles and 820 looms; 9 paper mills (output in 1907 55,000,000 pounds); 23 breweries (production in 1907 5,610,121 gallons). There is a small manufacture of iron and steel and refined sugar.

COMMERCE. The following table shows India's sea-borne foreign trade, in thousands of pounds sterling, for three years ending March 31:

Sea-borne trade.	1907	1908	1909
Imports.			
Private merchandise.....	72,205	86,597	80,844
Government stores.....	5,956	4,429	5,008
Total merchandise.....	78,161	91,026	85,852
Private treasure	18,134	21,880	15,088
Government treasure	11,586	6,309	76
Total treasure	29,720	28,189	15,163
Total imports	107,881	119,215	101,015
Exports.			
Private merchandise:			
Domestic produce.....	115,388	115,652	99,883
Foreign produce (reexports)	2,323	2,511	2,114
Government stores	72	85	77
Total merchandise.....	117,783	118,248	102,074
Private treasure	3,809	3,631	1,771
Government treasure.....	3	2	242
Total treasure	3,812	3,633	4,213
Total exports	121,595	121,881	106,287

The statistics for the foreign land trade, which is largely with Afghanistan, Nepal, and the Shan States, are of doubtful accuracy. The following values, in thousands of pounds sterling, including merchandise and treasure, are given for three years ending March 31:

Land trade.	1907	1908	1909
Imports	5,151	5,718	5,526
Exports	4,275	4,643	4,640

In the sea-borne trade, the principal imports of private merchandise were valued as follows in 1908-9: Cotton goods and yarn, £25,343,000; metals, £8,663,000; sugar, £7,271,000; railway material, £4,947,000; machinery, etc., £4,411,000; mineral oil, £2,606,000; hardware, etc., £1,951,000; woolen goods, £1,941,000; provisions, £1,876,000; apparel, £1,611,000; silk goods, £1,521,000; liquors, £1,323,000; spices, £916,000; instruments, etc., £825,000; glass, £779,000. Imports of government stores included: Railway material, £3,013,000; metals, £380,000; machinery, etc., £256,000. The principal sea-borne domestic exports in 1908-9 were: Raw jute, £13,223,000; raw cotton, £13,179,000; rice, £10,593,000; jute manufactures, £10,491,000; hides and skins, £8,312,000; seeds, £7,785,000; cotton yarn and cloth, £7,691,000; tea, £6,929,000; opium, £6,233,000; lac, £1,863,000; raw wool, £1,389,000; wheat and flour, £1,241,000. The reexports included cotton yarn and cloth valued at £751,000 and raw wool, £186,000. In 1908-9 Great Britain sent 62.6 per cent.

of the imports of private merchandise and received 24 per cent. of the exports of Indian produce and manufacture; China (including Hongkong), 1.9 per cent. and 12 per cent. respectively; Germany, 4.1 and 10; the United States, 2.7 and 8.8; France, 1.5 and 6.4; Belgium, 4.2 and 4; Japan, 1.7 and 4.8; Straits Settlements, 2.8 and 3.5; Austria-Hungary, 3.2 and 3.1.

SHIPPING. In the year 1907-8 there entered the ports of British India, in the foreign trade, 4725 vessels, of 7,119,079 tons (British, 2397 vessels, of 4,375,823 tons), and cleared 4587 vessels, of 7,120,101 tons (British, 2388 vessels, of 5,419,334 tons). In 1908-9 the total number entered and cleared was 8001 vessels, of 12,910,823 tons. The chief ports are Calcutta and Bombay, which together have about three-fourths of the foreign trade; next in order are Rangoon, Karachi, Madras, and Chittagong.

COMMUNICATIONS. Nearly all the Indian railways are owned by the state and administered by a railway board, though many are worked by companies under lease. On December 31, 1907, there were open to traffic in all India 30,010 miles; on December 31, 1908, 30,576 miles. These figures include tramways working outside municipal limits, which are regarded as light railways. To the end of 1908 the total capital outlay was £274,611,400; for that year the gross receipts were £29,884,600, and the working expenses £18,001,667, the net returns on capital outlay being 4.33 per cent.; number of passengers carried, over 21,000,000; tons of freight, 62,000,000; employees, 525,583 (7334 Europeans, 9951 Eurasians, 508,288 natives). On March 31, 1909, there were open to traffic or in hand 30,983 miles, of which about 52 per cent. was standard gauge (6 ft. 8 in.) and about 42 per cent. metre gauge. There were under construction or sanctioned 2741 miles. Rivers and, especially in southern India, canals are important means of communication.

On March 31, 1908, the telegraph system, which is owned by the government, included 68,940 miles of line, 271,944 miles of wire, and 2544 offices; for the year there was a revenue of 2.01 per cent. on the capital cost of £6,857,000. Post-offices numbered 17,777; gross revenue and expenditure were £1,823,108 and £1,706,760 respectively.

FINANCE. The standard coin of India is the British pound sterling, worth \$4.8665, but the current coin is the rupee, valued at 32.44 $\frac{1}{2}$ cents (15 rupees to the pound sterling). The gross revenue and the expenditure charged against revenue, in thousands of pounds sterling, were as follows, in the years ending March 31, 1907 and 1908; revised estimate for the fiscal year 1909:

	1907	1908	1909
Revenue	73,145	71,003	69,629
Expenditure	71,555	70,697	73,350

In addition to expenditure from revenue, there is a capital outlay (not charged to revenue), which in 1907-8 amounted to £10,567,000 on state railways and £846,000 on irrigation works. In 1907-8, of the gross revenue, £70,284,638 were raised in India and £718,637 in Great Britain; of the expenditure charged against revenue, £52,209,962 were spent in In-

dia and £18,487,267 in Great Britain. The figures given in the table above include all receipts and payments therefrom, except that the railway working expenses have been deducted from the railway revenue. By deducting departmental receipts, which are a set-off against departmental expenditures, and railway interest charges, interest charges and working expenses of irrigation works, refunds and assignments, cost of cultivating and manufacturing opium, etc., the net revenue and net expenditure appear as follows, in thousands of pounds sterling, for fiscal years (revised estimate for 1909) :

	1907	1908	1909
Net revenue:			
Land	19,067	17,983	18,946
Opium (export)	3,744	3,572	4,616
Taxation, direct and indirect	20,458	20,778	20,818
Commercial undertakings	4,843	3,910	937
Tribute from Native States	401	389	383
Other	442	374	-34
Total	48,955	47,006	45,666
Net expenditure:			
Collection of revenue	5,556	5,730	6,060
Debt services	944	855	979
Military services	20,170	19,248	19,531
Civil services	19,374	20,592	21,903
Other	1,322	275	914
Total	47,366	46,700	49,387

The principal revised estimates of gross revenue for 1908-9 were: Land revenue, £19,696,000; net railway traffic receipts, £9,985,000; excise, £6,412,000; opium, £5,884,000; customs, £4,852,000; stamps, £4,337,000; irrigation, £3,568,000; salt, £3,217,000; post-office, £1,834,000; forest, £1,701,000; income tax, £1,540,000; telegraphs, £952,000. The principal estimated items of expenditure charged against revenue were: Military services, £20,558,000; railways (interest and annuities), £11,107,000; police, £4,183,000; law and justice, £3,073,000; land revenue (collection charges, etc.), £3,667,000; superannuation, £3,060,000; post-office, £1,913,000; education, £1,695,000; famine relief and insurance, £1,676,000; opium, £1,248,000; telegraphs, £1,033,000.

On March 31, 1909, the consolidated debt stood at £256,604,000, of which the sum of £166,973,000 is known as the sterling debt (contracted in Great Britain) and £89,691,000 as the rupee debt (contracted in India). In addition, miscellaneous obligations amounted to about £20,699,000.

ARMY. For 1909-10 the establishment of the British regular forces serving in India was 76,009, embracing 9 regiments of cavalry, 11 horse artillery batteries, 42 field batteries, 3 howitzer batteries, 8 mountain batteries, 21 garrison artillery companies, 6 heavy batteries, 52 battalions of infantry, details of engineers, medical corps, etc. The native army, amounting to 154,500, consisted of 3 regiments of body guards, 39 regiments of cavalry and the Aden troop, the corps of guides, 12 mountain batteries, 1 frontier garrison company, 26 companies of sappers and miners, 117 infantry battalions, and 20 battalions of Gurkhas. In addition there were British volunteers, 35,400, Indian Army Reserves 22,000, Imperial Service Troops 21,000, local corps 5250, and military police 28,500, making a total aggregate strength of military forces available in India of 342,659.

GOVERNMENT. The government of British India is established by act of 1858. By act of 1876, the King of Great Britain and Ireland

is Emperor of India. Indian administration in England devolves upon the Secretary of State for India, assisted by a Council of not less than 10 members, who are appointed by him for a ten-year term. In 1909 the Secretary of State was the Right Hon. John Morley, Viscount Morley of Blackburn, his appointment dating from December, 1905. The expenditure of Indian revenues, both in India and elsewhere, is determined by the Secretary of State in Council, and all appropriations require a majority vote. In respect of the relations of the Indian government to foreign powers or to the Native States, in making peace and war, and in matters requiring secrecy, the Secretary of State may act independently of the Council. In India, the supreme executive authority is vested in the Governor-General in Council, sometimes styled the Government of India. The Governor-General, or Viceroy, who is appointed by the Crown, usually for a term of five years, in 1909 was the Right Hon. Gilbert John Elliot, Earl of Minto, his appointment dating from November, 1905. The Council consists of six members appointed by the Crown, and the Commander-in-Chief of the army. There are nine departments, each headed by a Secretary—Home, Foreign, Army, Military Support, Finance, Revenue and Agriculture, Public Works, Commerce and Industry, and Legislative. To the special care of one of the members of the Council each department is assigned, except the Foreign Department, which is under the immediate supervision of the Governor-General. By the addition of 16 other members, the Council is expanded into a legislative body, which has power, with certain restrictions, to make laws for all persons within British Indian territory, for all British subjects within the Native States, and for all native Indian subjects of the Emperor in any part of the world. In 1908 the Secretary of State for India announced important reforms introducing native representation in the councils. These were carried out in 1909. (See below, paragraphs on *History*.) For administrative purposes British India is divided into nine great provinces (besides some minor charges) as follows: Madras, Bombay (both under Governors); Bengal, Eastern Bengal and Assam, the Punjab, United Provinces of Agra and Oudh. Burma (these under Lieutenant-Governors); Central Provinces (under a Chief Commissioner); and the Northwest Frontier Province (under an Agent to the Governor-General). The minor charges are Ajmer-Merwara, the Andaman Islands, British Baluchistan, and Coorg (each under a Chief Commissioner). The Governors are appointed by the Crown, the Lieutenant-Governors by the Governor-General, with the approval of the Crown, and the Chief Commissioners by the Governor-General in Council. Each of the Governors and Lieutenant-Governors has a legislative council of his own. The importance and situation of the provinces, all of which are under the control of the government of India, determine the degree of their administrative independence. Usually each province is subdivided into districts under Commissioners, and these again into districts under executive officials called Magistrates, Collectors, or Deputy Commissioners. Of these latter districts, which form the units of administration, there are about 260 in British India. The municipalities, whose committees contain a majority of natives

and are mainly elected by the taxpayers, enjoy considerable latitude of action.

Through British Residents or Agents the government of India exercises varying degrees of control over the Native States, which are governed by their princes, ministers, or councils. In general the more important states are autonomous, but none is allowed to maintain political relations with another native state or with an external state, to make war or peace, or to maintain a military force beyond a specified limit, and in case of misgovernment the British administration may exercise any degree of control. Some, but not all, of the Native States pay an annual fixed tribute.

HISTORY

THE REFORM SCHEME. The reform proposals of Lord Morley and the Indian government which had been under discussion in the closing months of 1908 were the chief object of interest during the year 1909. The main features of the bill as it was finally passed by the British Parliament will be found in the article GREAT BRITAIN, paragraphs on *History*. In India there was naturally a sharp division between the Mohammedans and the Hindus on the question of a separate electorate for the Mohammedans and their representation in excess of their numerical proportion. The Mohammedans insisted on this and the Hindus as strongly opposed it. Lord Morley's original proposals were not satisfactory to the Moslems on these points. The Moslems demanded complete separation from the Hindus in all ranks of the administration and in consideration of the unwavering loyalty of the Mohammedan element urged that numerical strength alone should not be taken as the basis of representation. In January a deputation of the All-India Moslem League laid these requests before the government, urging the special claims of the Moslems to consideration and asking not only that they should have further representation than was based on numbers only, but that the communal basis should be recognized for their minority representation and that a Moslem as well as a Hindu should be selected for the Viceroy's Executive Council. Arguments on these points made up a large part of the discussion that the reform proposals occasioned during the year.

As to the attitude of the native population generally, observers declared that among the people at large there was little sign of interest in the reforms—that, in fact, only a few thousand out of the vast millions of Hindus were in the slightest degree interested. In the civil service there were signs of some dissatisfaction with the proposals as too radical and as likely to return undesirable members. It was said that the Lieutenant-Governors did not want any Councils. The presence of Indian members in the Provincial Councils was also condemned by many. At first the report was circulated that the government was disinclined to meet the demands of the Moslems as to a separate electorate, etc., and this occasioned much adverse criticism on the part of the Mohammedans as a violation of pledges. Later, however, when it became known what the government's intentions were, the Mohammedans were fairly well satisfied. On the other hand the concessions to the Moslems aroused bitter opposition from the Hindus.

On November 15 the details of the reform plans were published and the rules for putting them into effect were issued. The main points of this programme, on which the government of India and the Indian Office had been engaged for the past three years, were as follows: The Imperial Viceroy's Council was to have 68 members; the Provincial Council of Bengal, 51; of Madras, 48; of Bombay, 48; of the United Provinces, 49; of Eastern Bengal and Assam, 43; of the Punjab, 27; of Burma, 18. The Viceroy's Council was to have an official majority of 3 and each Provincial Council a non-official majority ranging from 14 in Bengal to 3 in Burma. Six Moslems would sit in the first Viceroy's Council. The membership of the Councils would now be 370 instead of 126, and the elected members would number 135 instead of 39. The oath of allegiance was required of members, and no one was to be eligible if the Imperial or Provincial government objected to him. The powers of the Councils were greatly enlarged and included the right to ask for information in regard to questions of public interest, to discuss such questions and to discuss the annual financial measures and move resolutions in regard to them. The Moslem sentiment was prevailingly favorable to the plan as announced. The Aga Khan, president of the All-India Moslem League, declared that the measure was a fulfillment of the government's pledges and went far ahead of the earlier plans and that he would urge all Moslems loyally to accept it. On the other hand the Hindu papers were violently against the reforms. They declared that the provincial non-official majorities were a sham and they condemned the Mohammedan separate electorate and special representation. Extremists went so far as to urge a boycott of the reform measure. On the whole conservative opinion inclined to a favorable attitude toward the reform scheme. Although some regarded it as too radical and as designed to bestow parliamentary institutions upon India before it was fit for them, the friends of the measure and the public generally saw in it only a step toward the political education of the natives. Lord Morley expressly disclaimed any idea of thrusting parliamentary institutions upon the natives or even of directly leading the way toward them.

NATIONAL UNREST. The disturbances which had been so marked a feature of the year 1908, including anarchists' plots, bomb-throwings, seditious speeches and publications, continued at intervals during 1909. A religious riot occurred near Calcutta in January in which Hindus and Moslems attacked each other and many were injured. Arrests for sedition under the British Indian Penal Code continued to be made on account of the seditious writings and speeches of newspaper editors and members of Nationalist organizations. On January 19 the government sentenced three journalists for sedition in the press inciting to murder. On February 10 the public prosecutor at Alipur was murdered. At the same time students were sentenced to imprisonment at Kolhapur for inciting to murder, and a bomb-throwing case occurred at Calcutta. Nevertheless conditions seemed in the beginning of the year somewhat quieter on the whole than in 1908. This was attributed in part to the reform proposals and in part to the strictness of the government in deporting agitators at the close of 1908.

The government showed on the whole a firmer policy, as illustrated in the appointment of Sir Norman Baker as Lieutenant-Governor. In Bombay the organization known as Samitis or National Volunteers was rapidly declining. The spirit of anarchism, however, was still rife and evidences were frequent of secret revolutionary organizations, with anarchist programmes framed on the model of Russian societies, which trained young men to deeds of violence, such as the murder of the Alipur prosecutor above mentioned. The high-caste Hindus were said to be in sympathy with this movement and there seemed to be no disposition on the part of the natives to aid in its suppression.

The revolutionary propaganda, in both India and Great Britain, resulted in criminal attempts and in some serious crimes. The most conspicuous of the latter was the murder of Lieutenant-Colonel Sir W. H. Curzon-Wyllie (q. v.) Political Aide-de-Camp to the Secretary of State for India. This murder, which occurred after a reception of the National Indian Association in London, was committed by an Indian student who had come under the influence of the seditious element. It was essentially a political murder and clearly traceable to the seditious agitation in England. For many months past the advocates of violence had been active among the young Indians sent to Great Britain for study. Their spirit was well illustrated by a paper published by Mr. Krishnavarma called the *Indian Sociologist*, which had openly advocated political assassination. Colonel Wyllie was the friend and benefactor of young Indian students. He had written a friendly letter to the assassin, inviting him to visit him. Prominent Indians expressed great horror at the crime. Measures were urged in the press and Parliament for a stricter supervision of the Indian students in England. In India a great many writers and speakers urged a programme of "passive resistance," apparently with no specific object and expressive merely of a general hatred of England. The anniversary of the boycott in India passed off without any serious disturbance. There were signs of a more severe policy on the part of the Imperial government as well as in the Provincial administrations, and this, in addition to the reform proposals, tended to prevent violence.

On the northwestern frontier a raid occurred which resulted in the killing of the chief raider and the capture of six of his men in January. On February 18 a serious riot occurred near Guntur in the Presidency of Madras, resulting in the stoning of the police by a mob of five thousand people. Two rioters were killed and many were injured. An attempted bomb outrage occurred at Calcutta in March, aimed at the chief magistrate of the Presidency. In April the British officer in command of the North Waziristan militia was wounded by a Sepoy. In the same month thirty or forty arrests were made by the Gwalior police for sedition and twelve native soldiers were killed by outlaws. A small body of native cavalry was attacked in Baluchistan in May and three men were killed and one wounded. In the same month twenty-two out of the thirty-six Alipur conspirators were acquitted. Of the remainder two were sentenced to death, seven to transportation for life and five to penal servitude for varying terms. In the same month nine Indians were deported

from England by the government. This caused a protest in Parliament and a demand for their release, which was refused. There was some trouble early in June on the Afghan border in the Zhob valley. In July an attempt to revise the boycott led to the enforcement of repressive measures in Bengal. In August, of the thirty-nine persons arrested in Gwalior in April, four were acquitted, two pardoned and the rest sentenced to varying terms of imprisonment. At the close of September a summary of crimes committed during the previous year showed that there were 329 murders during that period and that only eighty of the criminals had been brought to justice. An unsuccessful attempt was made on the life of the Viceroy, Lord Minto, during his tour of the country in November, but in general he was received, outwardly at least, with enthusiasm.

LORD KITCHENER'S ADMINISTRATION. Lord Kitchener's work of military reorganization was practically completed in 1909. In the spring he announced the results, saying that at present nine infantry divisions and eight cavalry brigades could be mobilized with unprecedented rapidity. The work of equipping the artillery with quick-firing guns and the troops with new rifles was, he said, now practically complete. He also declared that guns, rifles and ammunition could now be produced in India in sufficient quantities to meet the demands. In general the effect of his changes had been to increase the pay and lower the cost of the army. On the eve of his departure for his eastern trip (September 12), a banquet was tendered him and high tributes were paid to his military administration.

Lord Minto declared that as a result of his plan of decentralization he had left the army administration on a sound footing, with better paid and better disciplined troops. The press commented on the tendency of those who had criticised his plans at the beginning to become sincere admirers of his work as it progressed. He was praised, not only for his military skill, but for his statesmanship, which had promoted friendly relations with the neighboring states. As to the efficiency of the army, it was said that it could now perform any task with double the numbers and with greater rapidity than ever before. A circular letter issued by Lord Kitchener drew attention to the improved health of the troops in the last few years. The death rate of the British troops in India, which between 1894 and 1903 was 17.13, was in 1908 9 per thousand, and during the same interval the number of those who were constantly sick in hospitals fell from 5384 to 3139. During the same period the death rate in the Indian army fell from 11.33 to 7.41 per thousand and the numbers of the sick in hospitals declined from 3721 to 2749.

OTHER EVENTS. Early in the year the statistics of the results of the plague during 1908 were published. These showed that 148,700 deaths from the plague had occurred in that year, as compared with 1,316,000 in 1907 and 356,700 in 1906. The Congress of Tropical Diseases was opened at Bombay on February 22, comprising, besides the leading medical men of India, representatives from Japan, the Philippines and England. The Decentralization Committee issued its report on February 27. Among other points it endorsed the Morley scheme in regard to the creation of Executive Councils in the Provinces and the increase of the Bombay

and Madras Executive Councils. It favored also a gradual and cautious provision for local village councils. A Hindu native was appointed a member of the Viceroy's Council in March. He was a barrister in large practice named Satyendra Sinha. The budget for 1909-10 was presented on March 21. The estimated revenue was £73,750,900, and the estimated expenditure £73,520,000, showing a decrease of net revenue from 1908-9 of £3,810,300 and an increase of expenditure of £481,700. The deficit was explained by the famine, the high prices and the bad state of trade. The corner-stone of the new (Canning) college at Lucknow was laid in April. Its chief benefactor was the Maharajah of Bairam. It was expected to be the best equipped institution of the kind in the Province. A large native meeting was held at Bombay on September 14 to protest against the cruel treatment of the Indians in South Africa. It resolved to petition the Imperial government against this practice and against the recruiting of labor. It described the hardships entailed by the practice of deportation. There was also a meeting of leading Indians at Madras to protest against the continued ill-treatment of the Indians in South Africa. The Malaria Conference was held at Simla in the middle of October. It was attended by forty delegates from all parts of India. It drew attention to the fact that in the last ten years the deaths from this cause number four and one-half millions and that during the last year alone five and one-half million deaths had occurred.

INDIA, PORTUGUESE. See PORTUGUESE INDIA.

INDIANA. One of the North Central Division of the United States. It has a total area of 36,584 square miles. The population in 1908, according to a Federal estimate made in that year, was 2,808,115.

MINERAL PRODUCTION. Indiana ranks ninth among the States producing petroleum. In 1907 its rank was eighth, in 1908 it was surpassed by Louisiana. There were produced in 1908 3,283,629 barrels, valued at \$3,203,883, as compared with a production in 1907 of 5,128,037 barrels, valued at \$4,536,930. There were in 1908 402 wells in the State, of which 82 were dry and 320 productive. The decrease in the production of the Indiana oil fields in the last few years has been the result of the opening up of the Illinois fields. These attracted many Indiana operators. The coal production of the State has shown a steady increase in recent years, although the production of 1908 was about 12 per cent. less than 1907. This was the result largely of the financial depression. In 1908 there were produced in the State 12,314,890 short tons, with a spot value of \$13,084,297. In 1907 the production was 13,985,713 short tons, valued at \$15,114,300. In April and May there was a suspension of operations pending an adjustment of the wage scale. After the suspension mining operations were resumed under a new agreement, covering a period of two years or until April 1, 1910. The total number of men employed in the mines of the State in 1908 was 18,380, as compared with 21,022 in 1907. There were killed in the coal mines of the State in 1908, 45 men, while 830 were injured. A considerable amount of coke is manufactured. The clay products of the State in 1908 were valued at \$6,740,167, as compared with \$6,858,024 in 1907. In the production of

Portland cement the State ranks first, being surpassed only by Pennsylvania. There were produced in 1908, 6,478,165 barrels, valued at \$5,386,563, as compared with 3,782,841 barrels in 1907 with a value of \$4,757,860. The State has grown rapidly in the production of this commodity. The State ranks first in the production of lime. There were produced in 1908, 95,988 short tons, as compared with 107,964 short tons in 1907. The stone products are also of great value. In 1908 they were valued at \$3,646,603, as compared with \$3,639,551 in 1907. Other mineral products of the State are coal products, including coal tar, illuminating gas, etc., pyrite and oil stones. The total value of the mineral products of the State for 1908 was \$37,295,494, as compared with the value of the product in 1907 of \$39,141,217.

The chief influences that have affected the coal-mining industry of the State has been the increased use of oil and gas for fuel and also the use of coke or of Eastern coals, which followed the agitation in regard to the suppression of smoke. As a result there was a decreased production in 1909.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the chief farm crops in 1909, according to the figures of the United States Department of Agriculture, were as follows: Corn, 196,520,000 bushels, valued at \$98,260,000, from 4,913,000 acres; winter wheat, 33,124,000 bushels, valued at \$36,438,000, from 2,165,000 acres; oats, 55,510,000 bushels, valued at \$21,649,000, from 1,820,000 acres; barley, 212,000 bushels, valued at \$134,000, from 9000 acres; rye, 940,000 bushels, valued at \$696,000, from 57,000 acres; buckwheat, 104,000 bushels, valued at \$82,000, from 6000 acres; potatoes, 9,025,000 bushels, valued at \$4,693,000, from 95,000 acres; hay, 3,080,000 tons, valued at \$32,340,000, from 2,200,000 acres; tobacco, 19,000,000 pounds, valued at \$2,090,000, from 20,000 acres. Winter wheat has varied greatly in production since 1900, the banner year being 1906, with a production of 48,080,925 bushels. The production of 1909 showed a marked decrease from that of 1908, which was 45,169,000 bushels, while the acreage decreased from 2,721,000 acres to 2,165,000 acres in 1909. The corn crop of 1909 was a considerable increase over that of 1908, which was 137,835,000 bushels, and the acreage increased from 4,579,000 to 4,913,000 in 1909. The hay crop of 1909 showed a slight decrease over that of 1908, which was 3,750,000 tons. The acreage decreased from 2,500,000 acres in 1908 to 2,200,000 acres in 1909. The production of tobacco showed a remarkable increase in 1909, being more than double that of 1908, which was 8,715,000 pounds. The acreage increased from 12,450 to 20,000. The number of farm animals in the State on January 1, 1910, were as follows: Horses, 847,000; mules, 94,000; dairy cows, 687,000; other cattle, 1,020,000; sheep, 1,227,000; swine, 2,578,000. The estimated value of the wool clipped in 1909 was 6,220,800 pounds.

FISHERIES. There were taken in the fisheries of the State in the year ending December 31, 1908, 15,507,500 pounds, valued at \$223,150. The most important were mussel shells, of which 14,431,000 pounds were taken, valued at \$80,860. Next in point of value were pearls and slugs, which had a value of \$73,760. The other fish were buffalo, German carp, drum or sheepshead, lake herring, yellow perch, lake trout and

whitefish. There were 873 fishermen engaged in the fisheries of the State and 113 wage-earning fishermen were employed. Two vessels were engaged in the fisheries, valued at \$6700. The cash capital invested was \$4890.

EDUCATION. The total school attendance in the State in the school year 1908-9 was 530,341, and the average daily attendance was 422,434. The attendance was divided as follows: White males, 261,988; colored males, 4884; white females, 258,161; colored females, 5538. The attendance in the townships of the State was 291,979, in the towns, 62,407, and in the cities, 175,955. The average salary of teachers per year was \$471.04 for male teachers and \$454.04 for female teachers. The expenditures for education were \$14,504,543.

FINANCE. According to the report of the State Treasurer there was a balance in the treasury at the end of the fiscal year 1908 of \$609,085. The revenues for the fiscal year 1909 were \$4,937,817, and the expenditures were \$5,016,626, leaving a balance at the end of the fiscal year 1909 of \$530,278. The chief sources of revenue are from taxation. The chief disbursements are for State institutions, officials and employees. The bonded debt at the end of the fiscal year 1909 was \$1,510,163.

CHARITIES AND CORRECTIONS. A number of excellent laws affecting social work in the State were enacted by the legislature, which adjourned March 8, 1909. Among the more important are the maternity hospital laws, the improved housing act, provisions for county jail supervision, public playgrounds, and medical inspection of public schools. The general appropriation bill also carried provisions for the construction of a hospital for the treatment of tuberculosis on a site at Rockville, purchased in 1908, and for the Southeastern Hospital for the Insane under construction at Madison. Appropriations were also made for a new school for the deaf at Indianapolis, for new cottages at the Village for Epileptics, and for an additional cottage for feeble minded women at the School for Feeble Minded Children. The State institutions include the Central Hospital for the Insane, the Northern Hospital for the Insane, the Southern Hospital for the Insane, the Southeastern Hospital for the Insane, Soldiers' Home, Soldiers and Sailors' Orphans' Home, School for Feeble Minded Youth, Village for Epileptics, School for the Deaf, School for the Blind, and several reformatories.

POLITICS AND GOVERNMENT. The most noteworthy event in the political history of Indiana was that connected with local option on the saloon question by means of election. There had existed (and still exists) a law called the Moore remonstrance law, by which a majority of voters in any ward or township may remonstrate against the issuance of licenses, and the county commissioners are bound to heed it and refuse all licenses, the refusal holding good for two years. The burden of proof that a majority of voters has not signed the remonstrance is on the applicant for any license. In 1908, when the two party conventions for the election of members for the legislature and State offices were held, neither platform contained any pronouncement on the liquor or saloon question; the status under the Moore remonstrance law and under the Nicholson law (which contains severe restrictions on the licensing and conduct of saloons) gave general

satisfaction, apparently. But in April of 1908 the Republicans held their State convention, and a county option plank was adopted calling for an election, on petition, in any county, as to the licensing of saloons, the whole county to vote as a unit and make the decision for that county. The Democratic convention, held a week earlier, had pronounced for a similar election, but making the ward or township the unit. Both parties pledged that the new law should in no wise interfere either with the Nicholson law or the Moore remonstrance law. The significance as to the latter was that if any unit voted "wet," the Moore remonstrance law was still valid to oppose saloon licensing if a majority of the people in the township or ward should sign it. In October of 1908, twenty-five days before the election of that year should be held, Governor Hanly called in special session the legislature, which had been elected in 1908 without reference to the saloon or liquor question, and by active personal work with the legislators obtained the passage of a county option law; although the question was then pending in the campaign. The election, which came on November 3, resulted in the Democrats sweeping the State (although Taft received a majority), electing the Governor, eleven of the thirteen Congressmen, and the State Legislature, thus electing also a Democratic United States Senator. Under this condition it was felt that ward and township option had been approved by the people, and a bill was introduced to repeal the county option law. But it was defeated by a very narrow majority. Since then the Supreme Court of the State has declared the county option law to be constitutional. So county option is the law in Indiana until, or unless, it shall be repealed by some legislature, as may be done at any session (the sessions are biennial). Meanwhile an organization of the State hotel keepers had espoused the cause of its repeal on the ground of unfairness, holding that rural sentiment in a county should not compel them to give up the sale of liquor at their hotels in the towns. Whatever happens to it there is no disposition on any side to interfere with the Nicholson (licensing) law, or the Moore remonstrance law, by which latter a majority of voters may at any time declare a township or ward "dry" for two years. The Anti-Saloon League, under whose active guidance most of the county option election laws have been held, has now declared for State-wide Prohibition and will seek an amendment to the State constitution to that end. The purpose of the League in furthering county option was unconcealed as being the best way to lead up to State Prohibition.

During the year a remarkable series of elections was carried on, as a result of which 64 of the counties of the State had voted for no-license by the first of December. On January 26 elections were held in four counties, Decatur, Putnam, Tipton and Hamilton, and in all these the no-license vote had a substantial majority. On the 29th of the same month the no-license party won the greatest victory they had yet gained. This was in Randolph county, where there was a majority of 2470 for no-license in a total of 5152. On February 5, Huntington, Park and Switzerland counties voted on the question of license, and in each the temperance party won a substantial victory. After a hard fought struggle the no-license party found its

first defeat of the year in Wayne county, on February 5, where the vote for license exceeded that for no-license by about 800. On February 24, however, Morgan county voted on the local option law, and the result of the ballot showed a dry victory by a majority of 1055. The great preponderance of temperance sentiment in the rural counties was again shown on February 25, when the three counties of Fayette, Fountain and Hendricks, none of them having a city of any considerable size, voted no-license by majorities ranging from 800 to 2000. On March 23, local option was carried in Benton, Greene and Montgomery counties by majorities ranging from 900 to 2700. On the 25th of the same month Elkhart and Orange counties voted for no-license by majorities of 1300 and 667. On March 30, Bartholomew, Jennings and Vermilion counties voted no-license, and on the 31st Henry county voted for no-license by a majority of 2816. One of the hardest fought contests was held on April 6, in Cass and Blackford counties, and both were carried for license by small majorities, Blackford by about 200, and Cass by less than 50. White and Jackson counties, on April 26, both joined the dry column as a result of the election. Jackson contains the important city of Seymour. Four elections were held on April 30, and as a result three counties, Jefferson, Martin and Washington, voted for no-license, and Tippecanoe voted for license. On May 26 the no-license party won the elections in Crawford, Owen and Madison counties, and on May 27 Laporte county was carried for license by a majority of over 4000. Floyd county was carried for license while Harrison county was carried for no-license. On July 3 Porter and Valparaiso counties voted for license, and on June 9 Clark county also voted for license. On August 24 Union county was added to the dry column, and on September 30 Knox county voted for license. This county contains the city of Vincennes, which voted for license by a majority of 1709. On November 27 De Kalb county declared against the licensed saloons, making a total of 64 counties in the State under no-license, with six counties dry by remonstrance. By December 16, 66 out of 92 counties had voted "dry," 13 had voted "wet," and 13 had not voted. On December 16 the Supreme Court rendered a decision declaring the county optional law constitutional, two of the five judges joining in a dissenting opinion. The decision had been expected daily for several weeks, and until it was handed down, speculation was rife regarding it.

On January 19, B. F. Shively was elected Senator by the legislature to succeed Senator Hemenway. Senator Shively, a Democrat, was elected as a result of the Democratic victory in the election of November, 1908. His opponents for the Senate were John W. Kern, the Democratic nominee for Vice-President, and L. Ert Slack. It was charged that Shively's election was the result of a combination between the temperance and brewery elements. The Republican minority in the legislature unanimously nominated Senator Hemenway to succeed himself in the Senate. On August 5, the first election of candidates under the new direct primary law of the State was held in Indianapolis. But before the polls opened the Circuit Court issued an injunction against the destruction of the ballots, and this order to

preserve them, so that if frauds were committed they might be investigated, is said to have stopped whatever frauds had been contemplated. While the voting was in progress the State chairmen of both parties, and many of the leading business men, denounced the primary law and steps were taken to have it repealed at the next session of the legislature. As a result of the election, Samuel Lewis Shank defeated Newton W. Harding for the Republican mayoralty nomination by a large majority. Charles A. Gauss was nominated by the Democrats. In the elections held on November 2 the Republicans carried Indianapolis, after a hard fought battle, in which the brewery and saloon elements supported the Democratic ticket. Shank was elected mayor of the city. Results throughout the State showed that the Republicans and Democrats received about an even division in the cities of secondary importance. The election in most of these cities was on strict party lines, although the wet and dry issue appeared in many towns. Among the cities that voted either to restore the saloons or continue them in operation were Muncie, Lafayette, Hartford City, Evansville, Valparaiso, Michigan City and Terre Haute. Howard and Putnam counties (Kokomo and Greencastle, county seats) voted for the abolition of the liquor traffic. The South Bend issue was not on the abolition of the saloons, but on their better regulation. The Democrats elected Charles F. Goetz mayor upon a platform of good government, which had for its chief aim the overthrow of the "wide open town" régime which has existed for several years.

On March 16 the Supreme Court of the State held the State Anti-Trust law constitutional. The case was that of a plumber who brought suit against three firms dealing in plumbers' supplies, alleging that they had formed a combination in restraint of trade, and had adopted a list of prices at which they sold supplies to non-members which were from 30 to 75 per cent. higher than that charged members of the combine. The court decided that this was true and ordered the illegal agreement dissolved. The Supreme Court declared that the plumbers and dealers in plumbers' supplies were within the law, so often applied to railroads, that makes their charges for property and services subject to regulation and control by law, and holds that the anti-trust law is valid. The business done by all the fire insurance companies throughout the State was brought to a standstill on May 10, as a result of the suit filed by the Attorney-General to prevent combinations for maintaining the rates under the so-called Dean schedule.

OTHER EVENTS. On April 30 the State was swept by the severest electrical and rain storm that had visited it for years. The storm was worst in the northern tier of counties, although it extended over a large part of the State from the Ohio River to Lake Michigan. Much damage was done to property, and several persons were injured. The wall of the State prison was blown down and the Governor ordered out militia to guard prisoners. On July 27 the hundredth anniversary of the establishment of the Christian church was celebrated. On September 16 the cornerstone of the State's first tuberculosis hospital was laid. October 12 United States District Judge A. B. Anderson ruled, in a vigorous oral opinion, against the

right claimed by the government to take the owners of the Indianapolis *News* to Washington, there to be tried on an indictment for libel found by the grand jury of the District of Columbia. See UNITED STATES, under *Administration*.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: A measure was enacted establishing a maximum passenger rate of 2 cents a mile on railroads. Laws relating to tenement houses were amended, and amendments were made to the laws governing elections. Provisions were made for public playgrounds in the cities, and the statute relating to sanitation and methods in the shops of food producers was amended.

OFFICERS: Governor, Thomas R. Marshall; Lieutenant-Governor, Frank J. Hall; Secretary of State, Fred A. Sims; Treasurer, Oscar Hadley; Auditor, John C. Billheimer; Attorney-General, James Bingham; Adjutant-General, Oran Perry; Superintendent of Education, R. J. Aley—all Republicans except Marshall, Aley and Hall, Democrats.

JUDICIARY. Supreme Court: Chief Justice, John V. Hadley; Justices, Quincy A. Myers, James H. Jordan, Leander J. Monks, Oscar H. Montgomery; Clerk of the Court, Edward V. Fitzpatrick—all Republicans.

The State Legislature of 1909 was composed of 27 Republicans and 23 Democrats in the Senate, and 40 Republicans and 60 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

INDIANA UNIVERSITY. An institution of higher learning at Bloomington, Ind., founded in 1820. There were in 1908-9 2470 students, with 83 members of the faculty. The number of volumes in the library is 70,800. The productive funds of the University amount to about \$890,000, with a total income of \$236,657. The president is William L. Bryan, Ph. D., LL. D.

INDIAN EDUCATION. See INDIANS.

INDIANS. The session of the Sixtieth Congress led to the enactment of several important laws relating to the Indians. In that part of Oklahoma occupied by the Five Civilized Tribes the lands of all intermarried whites, all freedmen, and all mixed bloods with less than half Indian blood have been set absolutely free, while the homesteads of full-bloods and of mixed bloods with as much as half Indian blood are to remain inalienable till April 28, 1931. Another act authorized the cutting of timber and manufacture of lumber on the Menominee Reservation, Wisconsin, while still another eliminated the difficulties in the clearing of titles to Indian lands.

In conjunction with the Smithsonian Institution, the Indian Office authorized Dr. Aleš Hrdlicka to investigate the prevalence of tuberculosis among the Indians of the United States. Among 403 Menominee examined, only 78.5 per cent. were found free of all suspicion of tuberculosis; of 428 Ogalalla Sioux, 75.5 per cent.; of 62 Quinalt, 81 per cent.; of 331 Hupa, 77.6 per cent.; and of 357 Moohave, 88.2 per cent. These figures corroborate the belief that tuberculosis is the greatest single menace to the Indian race. To combat the disease, the Commissioner established sanitarium camps, enabling the inmates to live in the open air under

medical surveillance. As it was demonstrated that the wind instruments used by the boys' bands in the schools have been conducive to the dissemination of the tubercle bacilli, their employment has been temporarily discontinued. The employment bureau organized several years ago continues its good work in encouraging Indians to work among white people under conditions similar to those confronting white workingmen. In the Southwest, considerable employment had thus been found for Indians in connection with various projects of the Southern Pacific Railway, which conceded to its Indian employees free transportation. The rigorous interpretation of the rate law by the Interstate Commerce Commission and the financial crisis combined to diminish the success of the employment bureau's efforts; nevertheless the net earnings of a large number of Pima and Papago navajos amounted to \$8,382.25. The Apache employed on the Roosevelt reclamation project earned as much as \$34,000. The sheep industry has kept the Navaho busy at home and yielded profitable occupation to the Pueblo Indians. In southern California, the superintendent of a great reclamation enterprise found his 500 Indian laborers extremely satisfactory. He found them thoroughly acclimated to the desert and working at ease under a temperature of 120 degrees; indeed, their services seem to be indispensable to the successful execution of the undertaking. At Fort Belknap, the Indians are engaged in raising crops which will prepare the ground for sugar beets next year. An act of Congress has given them permission to lease their lands for the cultivation of sugar beets, and the experiment thus begun will presumably be followed by corresponding enterprises on other reservations. Some progress has also been made in making the Sioux self-supporting farmers, though they are loth to tend their crops while they are maturing. The work of suppressing the liquor traffic is being pursued with considerable success. A special officer, William E. Johnson, seized and destroyed large quantities of ardent spirits and wine imported for Indian consumption. Numerous arrests were made, and a decision of the Supreme Court established the illegality of introducing liquor upon Indian allotments.

In the matter of education, it is encouraging to note that 87 district schools in the United States are known to have admitted Indian children on equal terms with white children and without cost to the Federal government. The total number of Indian children enrolled in all schools, whether conducted by missions, the government or otherwise, was 25,777 with an average attendance of 21,807. In pursuance of the Commissioner's policy, the number of day schools has been increased from 138 to 167. All the energies of the Commissioner, as well as of the Superintendent of Indian Schools, are bent on equipping the pupils for grappling with the specific problems that are likely to confront them on leaving school. Thus, in the Mount Pleasant school, pupils are drilled in the cultivation of sugar beets, because of the importance of this industry in the State of Michigan, while in California stress is laid on the teaching of fruit growing. Every attempt is likewise made to foster and direct the natural endowments of Indian children in the line of art industry by developing their sense for color schemes and designing.

INJUNCTIONS. The chief injunction proceedings of the year were those growing out of the injunction secured in December, 1907, and March, 1908, by the Bucks Stove and Range Company from the Supreme Court of the District of Columbia against the officers and members of the American Federation of Labor. Late in December, 1908, President Gompers, Vice-President Mitchell and Secretary Morrison of the Federation had been convicted by that court of violating the injunction, Justice Wright rendering the decision, and had been sentenced to imprisonment for one year, nine months and six months respectively. In that case, at which Alton B. Parker appeared for the defendants, the latter had taken the position that the original injunction was wrongly granted, being an infringement of the right of free speech and free press, and therefore in excess of the power of the court issuing it; that therefore a violation of the injunction could not be adjudged a contempt of court as shown by the citation of numerous judicial opinions; but that they recognized that disobeying the order was done at their peril, though they were willing to sacrifice personal freedom in order to secure a determination of the rights of speech and press to be enjoyed by union labor. Justice Wright having upheld the injunction and severely sentenced its violators, there were two issues before the labor leaders; first an appeal to determine the legality of the original injunction, and secondly an appeal from the sentences in the contempt proceedings. In order to take these matters to higher courts, the executive council of the Federation on January 18, 1909, issued an appeal for funds to organized labor, its friends and sympathizers.

On March 11 the Court of Appeals of the District of Columbia, to which these matters had been taken, by a majority of two to one rendered a decision sustaining the rightfulness of the original injunction, but greatly reducing its extent. The validity of the injunction involved the definition of a boycott (*q. v.*), for it was to restrain an alleged boycott that the order was originally issued. Justice Robb, who rendered the majority opinion, reviewed at length the facts in the case and cited numerous opinions to establish the nature of a boycott as "a combination to harm a person by coercing others to harm him." The combination in this case was declared to constitute a boycott so defined and therefore an illegal restraint of trade. The opinion pointed out that while the courts have refused to enjoin the publication of a libel, they have freely enjoined both written and oral utterances constituting the means of carrying out an unlawful combination. The court therefore upheld the lawfulness of the injunction in so far as it prohibited the inclusion of the Bucks Company in the "Unfair" or "We don't patronize" lists of the *Federationist*, and any other official utterance made "in furtherance of the boycott"; but the decision declared any additional interference with the business or publica-

tions of the Federation to be beyond the court's power.

Justice Van Orsdel, while concurring in the above conclusion, did so only after a somewhat different line of reasoning. He strongly upheld the direct boycott, that is, the privilege of one man or any number of men individually or collectively to agree not to patronize a certain person or corporation; but he condemned the secondary boycott, that is, a conspiracy to injure by threats and coercion the property rights of another. He held even that the publication of an unfair list was clearly within the rights of the appellants, "but as soon as by threats or coercion they attempted to prevent others from patronizing a person whose name appears on the list, it then becomes an unlawful conspiracy." He therefore held the original very broad and all-inclusive injunction to be a violation of constitutional rights, but concurred in a modified injunction restraining acts done in furtherance of the boycott.

Chief Justice Shephard in a dissenting opinion held that, although a conspiracy had been properly defined by his colleagues, yet a group of employees had an undoubted right to present their cause to the public in papers and circulars, so long as there was no attempt at coercion; that any number of persons may refuse patronage, and that therefore only to the limited extent that members of the Federation had conspired to threaten or coerce others to do so, could he concur in the modified decree; and that the inclusion of the Bucks Company in the "Unfair" list cannot be restrained, as such publication is protected by the constitutional guarantee of freedom of the press; any damages so inflicted, he held, must be recovered by action for damages and by criminal prosecution. On this latter point Justice Van Orsdel had stated that, while there was nothing complained of in this case for which there was provided a specific legal remedy, yet sufficient excuse for equity jurisdiction existed in the inadequacy of such remedies to prevent irreparable injury and a multiplicity of suits. The officers of the Federation protested that there had been no conspiracy to coerce, and that therefore the decision had been made on an error of fact. On the other hand, the Bucks Stove and Range Company filed suit in the United States Supreme Court to have the modifications of the original injunction removed on the ground that the modified injunction was too limited to accomplish the purpose sought.

The appeal from the decision of the Supreme Court of the District of Columbia rendered by Justice Wright in the contempt proceedings, taken before the same court, was decided on November 2. The court was again divided. Justices Van Orsdel and Robb, holding the proceedings to be criminal, refused to take cognizance of any points except the guilt or innocence of the labor leaders with reference to disobedience to the original injunction. On this ground the judgment was affirmed. While regretting the severity of the imprisonment sentences, they held that the affirmation of that judgment was necessary to the maintenance of the proper position of the courts as organs of government. Justice Van Orsdel said: "If a citizen, though he may honestly believe that his rights have been invaded, may elect when, and to what extent, he will obey the mandates of the court and the requirements of the law as interpreted by the court, instead of pursuing the orderly course of

appeal, not only the courts, but government itself, would become powerless, and society would soon be reduced to a state of anarchy."

Chief Justice Shephard again dissented on the ground that the original injunction was in excess of the rightful power of the court and therefore "null and void, because opposed to the constitutional prohibition of any abridgment of the freedom of speech and of the press."

On November 29 application was made by Mr. Parker, on behalf of his clients, Messrs. Gompers, Mitchell, and Morrison, for a writ of certiorari, bringing the contempt proceedings before that court for review. Such a writ was granted December 6. This suit and that of the Bucks Stove and Range Company were still pending at the end of the year.

In his annual message to Congress, President Taft, who has been called "the father of injunction" on account of decisions rendered by him when a circuit judge, included a recommendation that legislation be enacted defining the rules of procedure of Federal courts in the issuance of injunctions. Such legislation had been promised in the Republican platform upon which President Taft was elected. The President declared that the abuse of the enjoining power of the courts could be prevented by a law forbidding the use of such power until an opportunity to be heard had been given the parties to be enjoined. He thought exception should be made, and a temporary injunction for seven days allowed, where it can be shown that any delay in issuing the restraining order will result in irreparable injury.

As at the previous session, the labor leaders secured the introduction in Congress in December, this time by Representative Sabbath of Illinois, of a bill providing for trial by jury in cases of contempt arising from alleged violation of injunctions, such alleged violation not having been committed in the actual presence of the court; and providing that the judge issuing an injunction shall not be qualified to try those accused of violating it. See LABOR, AMERICAN FEDERATION OF, and BOYCOTT.

INSANITY. Dr. Copp, secretary to the Massachusetts State Board of Insanity, reports the number of insane as 11,544 on October 1, 1908, besides 538 paroled or boarded out, showing an increase of 776 for the year, against an increase of 397 the previous year. Total commitments, including 195 voluntary admissions, were 3195, of whom 2491 were first cases. Alcohol was a causative factor in 21.84 per cent. Secretary Kellogg, of the Connecticut State Board of Charities, reports 3803 patients in insane institutions September 30, 1908 (including an estimated 300 among the town poor).

The Ohio Board of State Charities showed 10,564 insane enrolled on February 15, 1909, of whom 465 were absent on leave. On November 15, 1908, an increase of 288 for the year preceding is shown by the figures. Chairman Jones of Washington State Board of Control stated on September 30, 1908, that there were 1855 insane in the institutions, against 1679 on September 30, 1907. In the former year 613 were admitted, in the latter, 776; of these totals 8.3 per cent. and 7.4 per cent. respectively were of alcoholic origin. Secretary Mitchell of the Committee on Lunacy of the Pennsylvania Board of Commissioners of Public Charities in the report for 1907, published in 1909, gives the number of insane on Sep-

tember 30, 1907, as 14,808 of which number 432 are criminals. In 1909 a building was begun for the latter class. During 1906-7 2014 new patients were admitted. Secretary Butler of Indiana Board of State Charities reported on March 31, 1909, 4613 insane patients under care, an increase of 387 during the previous 6 months, 335 being temporarily absent. Secretary Mastin, in the first annual report of the State Board of Charities of Virginia, for the year ending September 30, 1909, gives the following figures: 3536 patients in hospitals for the insane September 30, 1908; admitted during the year, 1202; remaining September 30, 1909, 3943 patients. Chairman Blair of the Commissioners of Public Charities of North Carolina states a total of insane under care November 30, 1908, of 2298, while in addition there were 26 in jails and 162 in county houses. Secretary Herring of the Maryland State Commission in Lunacy reveals in his report an enrollment of 3505 insane, including feeble-minded, in the various institutions, of which number 799 were in county alms-asylums, 135 in alms-houses, and 920 in private institutions on November 30, 1908. A year previous the total was 3347, and 1470 were admitted during the twelve months. A practically new commission, appointed in 1908, during a thorough investigation uncovered abuses in the treatment of the insane in the alms-houses and county houses, which will be promptly corrected; county supervisors, medical societies and the public being aroused and brought into line to agitate for complete State care. President Edison of the Board of Charities of the District of Columbia shows the number of insane at the Government Hospital for such patients as 1304 on July 1, 1907; admissions during the year following being 327, of which number 11 were re-admissions; the total enrollment being 1367 on June 30, 1908, of whom 7 were on parole. Secretary Graves of the Illinois State Commissioners of Public Charities reports 10,522 insane in State hospitals on July 1, 1909, all patients formerly in alms-houses having been transferred to State care. Of this number 212 were in the asylum for insane criminals. In addition to those enumerated, 526 were on parole, and 18 were temporarily absent. The annual increase is about 300. During 1909, the efforts of 13 years culminated in the enactment of a new charities administration law, under whose terms the institutions were named State Hospitals; a psychopathic institute with director and staff was established; employees, except superintendents, were put under civil service regulations; provision was made for boarding insane in private families; after-care was instituted; inspection and licensing of private hospitals were provided; occupation of inmates was inaugurated; conferences of superintendents with the Board of Administration and the Commission was authorized.

President Ferris of the New York Commission in Lunacy reports 31,541 committed insane on September 30, 1909, of whom 1127 were in the hospitals for criminal insane, and 1051 in the 22 licensed private houses. The net increase for the year in the 15 public hospitals was 1015, in private houses 15. The number of first admissions during the year was 5146, while that of relapsed cases was 1328, making a total of 6474 cases. From the 13 civil public hospitals

1524 patients were discharged recovered, 215 much improved, 901 improved; while 2374 patients died. Of those admitted, 36 proved to be mere inebriates, 11 were drug habitués and 53 were found to be not insane under the statute. Advantage of the voluntary admission provision of the law was taken by 94 persons. The amount appropriated for maintenance in the annual bill was \$4,848,046. Upon new buildings and improvements, exclusive of reappropriation of amounts formerly appropriated, was expended \$1,376,373. The annual per capita cost of maintenance (exclusive of charge for rent of buildings) was \$186.67. Delay in completion of additions causes an overcrowding of over 2000 patients. Creedmoor Rifle Range, covering 200 acres, was not sold, and no new site on Long Island was obtained; but 564 acres were secured in Yorktown, Westchester county, upon which a hospital for 2000 will be erected, commencing in 1910. Two additional sites are needed at once. The Psychiatric Institute of the Hospitals, intimately connected with Manhattan State Hospital on Ward's Island, continued to provide courses of instruction and carry on research and laboratory work; its Director continued to conduct inter-hospital conferences in various hospital districts, the quarterly conferences of superintendents with the Commission were held, and the quarterly Bulletin published. A statistician pursued his work on tables and data from April through the year.

The report of the Commissioners in Lunacy for England shows that there were known to be under care in England and Wales on January 1, 1909, 128,787 insane, exceeding by 2703 the number certified a year ago. The average increase for the past ten years has been 2370 persons. The increase this year is assigned to the rise in numbers of those in the county and borough asylums. In the Metropolitan District asylums only 227 new cases were retained. There were 11,455 insane in the ordinary workhouses and 847 in the criminal asylums (Broadmoor and Parkhurst). The number boarded out from county asylums in workhouses was 103. The ratio in England and Wales of insane to population is 1 to 278, as compared with the ratio of 1 to 450 in the United States, and 1 to 284 in New York State. The Commissioners advocate the provision of observation wards, reception houses and mental hospitals into which the insane could be received on the first manifestation of derangement. This is in line with the work done at the psychopathic wards of Bellevue Hospital and Kings County Hospital, New York City, and Pavilion F of Albany Hospital, and advocated by the New York Commission in Lunacy for one general medical hospital in each town or city in the State. Consult *New York State Hospitals Bulletin*, July, 1908, and May, 1909, "The Care of the Insane Pending Commitment." See ALCOHOL.

INSECTS. See ENTOMOLOGY.

INSECTS AND THE PROPAGATION OF DISEASE. The part played by the common house fly (*Musca domestica*) in the spread of typhoid fever and other intestinal diseases has long been known, and its connection with epidemics of these maladies has been shown on numerous occasions. Dutton calls attention to the fact that other familiar insects may also become carriers of typhoid fever under favorable conditions. Pomace-flies, or little fruit flies, the most abundant species of which is *Drosophila*

ampelophila, the vine-loving pomace-fly, is frequently found feeding on table fruits such as pears, peaches, plums, grapes and apples. They also feed on foul decaying substances, and so may deposit pathogenic germs upon fruits, which they often breed in as well as feed upon. In Pittsburg, in September, 1908, Dutton secured cultures from pomace-flies found in a garbage can, in which excreta had been thrown, within 100 feet of a restaurant where hundreds of people dined every day. Of the blue-bottle or green-bottle flies the *Lucilia caesar* is the commonest and most likely to frequent houses, especially before rain. Some species breed on meat, others on open sores, decaying vegetable material, cow manure and human dejecta. Their habits make them a tangible factor in the dissemination of typhoid fever, and Dutton has observed an instance in which several members of a family were infected through the agency of these flies, which fed upon the discharges of a typhoid patient and carried the infected material to the food used by the household. House ants feed on all sorts of waste and are found about squalid homes in great numbers. Three varieties are common: The little red ant (*Monomorium pharaonis L.*); the little black ant (*Monomorium minutum Mayr*); and the pavement ant of the Atlantic seaboard (*Tetramorium caespitum L.*). While their probable connection with the spread of typhoid has not been scientifically proved, their habits of feeding and their free access to the family food in unclean homes make it probable that they carry infection in some instances and are therefore a constant menace. Cockroaches are among the commonest and most offensive insects which frequent human habitations. The American roach (*Periplaneta Americana*) is plentiful in the United States. Domestic roaches congregate in large numbers at night and feast upon almost any kind of food, dead animal matter, cereal products, leather, cloth, etc. Their omnivorous habits make them a prolific source and ready carrier of infectious diseases. Engelmann observed that this insect may carry typhoid from the source of infection on its body or limbs to household drinking vessels or even into food. Dutton accuses the house flea (*Pulex irritans L.*) of carrying typhoid fever. From 500 human fleas which were allowed to suck the blood of typhoid patients, he secured 20 typhoid cultures, and 5 cultures from 650 dog and cat fleas. The bedbug (*Cimex lectularius L.*) is found in all sorts of dwellings. It is nocturnal in its habits, and while its food is normally human blood, yet it may subsist for a time on other substances. The bedbug has been found to be a factor in the transmission of various diseases, such as tuberculosis and relapsing fever. Dutton observed that among the Poles, Italians and Russians in filthy quarters where beds had been used by typhoid patients, succeeding occupants were stricken with typhoid fever. He collected some bedbugs, starved them for several days, and placed them on the abdomen of a typhoid patient, incarcerating them under a square piece of cloth fastened at the edges. After six hours they were removed, and allowed to remain 24 hours without food, and then transferred in a corresponding way to a healthy person. After their removal, cultures were made from the bugs and typhoid bacilli found. The healthy subject developed a virulent typhoid infection in 14 days. The vitality of the *Bacillus typhosus* in the bedbug

persists for several weeks without any apparent loss of virulence; in fact the virulence may even be increased. Mosquitoes which have sucked the blood of typhoid patients contain typhoid bacilli, and the vitality and virulence of these germs are preserved during their stay in the insects. Typhoid bacilli may be found in mosquitoes from 8 to 21 days after they have sucked the blood of a typhoid patient. The faeces of these infected insects contain virulent bacilli as long as they persist in the alimentary canal or in the blood or secretions. Infected insects may communicate the disease for 2 or 3 weeks. The bed linen or other material, on which infected insects may be crushed, offers a ready medium of dissemination. See also TROPICAL MEDICINE.

INSTITUTE OF AGRICULTURE. See AGRICULTURE.

INSURANCE, LIFE. The subjects of general interest throughout the year were the restrictive legislation growing out of the insurance scandals of 1905, and the tendency toward increased taxation of insurance premiums or assets. The New York companies in particular continued their objections to the restriction of the amount of new business that may be written in any year. In a pamphlet prepared by President Ide of the Home Life Insurance Company it was shown that the amount of insurance in force in the New York Life, the Mutual, and the Equitable companies had steadily diminished since 1905, but that the death claims paid had not declined to an equal degree. He held that, owing to the limitation of new business to \$150,000,000 a year, the mortality ratio of these large companies must eventually increase. To show the extreme to which the rather wholesale and indiscriminate restrictive legislation has gone, it was stated that one State prohibits discrimination against negroes, in spite of the well-established fact that negro mortality is above the average. In this class also is the law making the insurance company liable even when suicide is committed immediately after the issuance of the policy; making the recommendation of the medical examiner final as to the issuance of a policy, even though he may have conspired with the applicant to defraud the company; imposing a penalty for resisting a claim believed to be unjust, and regulating the details of management. While it was generally agreed that some of the legislation of this sort was foolish, and while some writers condemned in an outspoken manner the whole policy of legal regulation as against the natural regulation of competition, there were those who held that insufficient time had elapsed to make possible a rational judgment of the real merits or demerits of the fundamental laws of 1906.

The growth in the taxes levied upon insurance throughout the country was shown by contrasting the \$1.40 per \$100 gross premiums taken in taxes in 1890 with the \$2.30 taken in 1909. The aggregate in the latter year exceeded \$12,000,000. At the meeting of life insurance presidents and officials in Chicago in January existing taxes were condemned as excessive, inequitable, and an unjustifiable burden on policyholders. A campaign was planned for bringing this matter to the attention of policyholders and legislators. The argument was frequently reiterated that the taxation of

insurance was injudicious, because insurance both directly and indirectly, encourages thrift. The opposition was sounded at the fortieth annual session of the National Convention of Insurance Commissioners at Colorado Springs late in August by Commissioner Love of Texas. He contended that the property of insurance companies should be taxed like all other property. He held the argument that such a tax would check savings to be equally effective against a tax on real estate or any other form of investment. He favored a uniform rate among the different States on the gross premium receipts.

An interesting development of recent years has been the organization of numerous companies in the South and Southwest. In the ten years ending in 1909 there were 130 companies organized on the legal reserve plan that were still in business in 1909. Of these, 78 were organized during the last half of that period. They were in part stimulated by the insurance scandals of 1905 and were built up largely on local pride and sectional antipathy. While there were failures among these new companies, they needed only honest and conservative management to insure success.

That the insurance possibilities of the country are far from exhausted was shown by a table prepared by an actuary for the Travelers Insurance Company. This took no account of industrial and assessment insurance, and therefore considerably understated the number of persons insured. The summary showed that of the 40,142,000 insurable persons in the country between the ages of 15 and 50, only 12.5 per cent. were insured under the usual forms of life insurance.

The year opened with a sensation in life insurance circles due to the removal of the assets and records of the Washington Life Insurance Company from New York on the night of December 31, 1908, by the Pittsburg Life and Trust Company. The latter company had in the previous September purchased a majority of the stock of the former company. The transferred assets included \$5,000,000 in cash and securities and \$13,000,000 in mortgages. The New York State Insurance Department at once made a peremptory demand for the return of the assets to its jurisdiction as a guarantee that the interest of policyholders would be protected. This was at length done the third week in January. At the same time the Pittsburg company applied for a permit to do business in New York State. This was denied in June, and the suggestion was made that the Washington Life policies should be reinsured and the assets kept within the State. In July, however, satisfactory conditions having been agreed upon, a permit was granted. Among the conditions were the provision that property of the company equal to the surplus and reserve of Washington Life policies should be kept within the State and the agreement that the accounts of the Washington Life policies should be kept separately. These conditions were believed fully to protect the interests of the policyholders.

Early in the fall of 1905 Mr. Thomas F. Ryan had obtained possession of the Hyde holdings of stock in the Equitable Life Assurance Society, this amounting to \$51,000 of the total \$100,000 of the society's capital stock. While the reorganization of the company had

provided that 28 of its 52 directors should be chosen by the policyholders, the control of a majority of the stock by one man was deemed by many an unsatisfactory condition. This dissatisfaction was lessened but by no means removed by the acquisition of this stock by Mr. J. P. Morgan late in 1909. The contention was still made that the vast wealth of the company and the interests of a half-million stockholders require the full mutualization of the society.

In January the Associated Fraternities of America, including most of the leading fraternal societies of this country, decided to have prepared a new mortality table. A commission of men of high standing in the fraternal insurance world was accordingly appointed to secure data from all fraternal societies in the United States and Canada. It is expected that a total membership of three million will be brought within the inquiry, and that on such a broad basis a truly scientific table of mortality for such societies may be prepared.

In December the new Superintendent of Insurance of New York, William H. Hotchkiss, brought to light certain irregularities in the management of the Phenix Insurance Company of Brooklyn. He charged that Mr. George P. Sheldon, president of that company for twenty-two years, had regularly speculated with the funds, with considerable loss to the Company; that President Sheldon had made loans to various officials of the State Insurance Department, and by this means and otherwise had escaped an examination during the entire period of his incumbency; that the assets of the Company were juggled with so as to make a favorable showing on December 31 of each year; and that the funds were tampered with in various other ways. The company's solvency was found to be unimpaired by the various irregularities disclosed. For fire insurance see FIRE PROTECTION.

IOWA. One of the North Central Division of the United States. Its total area is 56,147 square miles. According to a Federal estimate made in 1909, the population in that year was 2,192,608.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, are as follows: Corn, 289,800,000 bushels, valued at \$142,002,000, from 9,200,000 acres; winter wheat, 3,110,000 bushels, valued at \$2,892,000, from 144,000 acres; spring wheat, 4,336,000 bushels, valued at \$4,032,000, from 295,000 acres; oats, 116,100,000 bushels, valued at \$40,635,000, from 4,300,000 acres; barley, 10,890,000 bushels, valued at \$5,009,000, from 495,000 acres; rye, 943,000 bushels, valued at \$594,000, from 53,000 acres; buckwheat, 135,000

bushels, valued at \$115,000, from 9000 acres; flaxseed, 294,000 bushels, valued at \$382,000, from 30,000 acres; potatoes, 12,905,000 bushels, valued at \$7,098,000, from 145,000 acres; hay, 5,983,000 tons, valued at \$42,479,000, from 3,648,000 acres. The crop of winter wheat was about the same as that of 1908, while spring wheat showed a decrease, the production of 1908 having been 4,960,000 bushels. The corn crop was practically the same as that of 1908, with a slightly increased acreage. The State ranks second in the production of oats, being surpassed only by Illinois. The crop of 1909 showed an increase over that of 1908, which was 110,440,000 bushels. The acreage, however, decreased in 1909 from 4,545,000 acres to 4,300,000 acres. In the production of hay the State also ranks second, being surpassed only by New York. The crop of 1909 showed a considerable decrease over that of 1908, which was 6,480,000 tons. The acreage also was somewhat decreased. In the production of corn Iowa is surpassed only by Illinois. The farm animals in the State on January 1, 1910, were as follows: Horses, 1,447,000; mules, 47,000; dairy cows, 1,570,000; other cattle, 3,611,000; sheep, 754,000; swine, 6,485,000. The State ranks first in the number of swine and is surpassed only by Texas in the number of neat cattle, by New York in the number of dairy cows, and by Illinois in the number of horses. The wool clipped for 1909 was estimated at 3,950,800 pounds.

MINERAL PRODUCTION. The chief mineral production of the State is coal. In this the State ranked eighth in 1908, having surpassed Kentucky, which previously had occupied this relative position. The total production in 1908 was 7,161,310 short tons, with a value of \$11,706,402. This was a decrease of 413,012 short tons from the production of 1907. The reason to be assigned to the comparatively slight decrease in the production of coal in 1908 is that the State is almost entirely agricultural, manufacturing not having been developed to such an extent as in some other portions of the country. Farmers were generally prosperous throughout 1908 and the consumption of coal was, except for the decrease due to mild weather, equal to normal. Mining operations were suspended in a large number of mines in the State while the wage scale was under discussion, but as consumers generally had anticipated the shut-down and had laid in a supply during the preceding months, this produced no material inconvenience. During the suspension 5248 men were idle upon an average of 23 days each. The total number of men employed in the coal mines of the State in 1908 was 16,021, as against 15,585 in 1907, the industry showing an increase in labor supply notwithstanding the decrease in production. During the year there were 121 accidents in the mines of the State, of which 31 were fatal and 90 were non-fatal. It is estimated that the original coal supply of the State was 29,160,000,000 tons, of which 223,000,000 tons have been exhausted. The clay working industries of the State are important, giving it fourth rank in the production and value. In 1908 the value of the clay products was \$4,069,497, which was a considerable increase over that of 1907, which was \$3,728,785. Other mineral products of the State are coal products, including coal tar, illuminating gas,

stone, zinc, lead, and mineral water. The total value of the mineral products for the State in 1908 was \$18,088,537, as compared with a value of the product in 1907 of \$17,623,094.

FINANCE. The report of the State Treasurer for the biennial period ended June 30, 1908, showed a balance in the general revenue fund July 1, 1907, of \$872,877. For the fiscal year ended June 30, 1908, the receipts were \$3,663,154. The disbursements for the same period were \$3,891,842, leaving a balance July 1, 1908, of \$644,189. The principal sources of revenue are property, insurance companies and the inheritance tax, and the payments by the counties for the support of the insane. About 50 per cent. of the disbursements are for the State charitable institutions. See below.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include hospitals for the insane at Cherokee, Clarinda, Independence, and Mt. Pleasant; the Reformatory, at Anamosa; the State Penitentiary, at Fort Madison; Industrial School for Boys, at Eldora; Industrial School for Girls, at Mitchellville; School for the Deaf at Council Bluffs; College for the Blind, at Vinton; Iowa Soldiers' Home, at Marshalltown; Iowa Soldiers' Orphans' Home, at Davenport; Institution for Feeble-Minded Children, at Glenwood; State Hospital for Inebriates, at Knoxville; and State Sanatorium for the Treatment of Tuberculosis, at Oakdale. The cost of the maintenance of these institutions from October 1, 1908, to October 1, 1909, was \$1,537,063. Special appropriations were made for their support to the amount of \$373,925.

EDUCATION. The average school attendance for the school year 1909 was 361,805. The number of female teachers was 2801 and male teachers 25,006. The average monthly salary of male teachers was \$73.58 and of female \$44.50. The total expenditures for education in the State during the year was \$12,702,190.

POLITICS AND GOVERNMENT. On January 14, Beryl F. Carroll was inaugurated Governor and George W. Clarke Lieutenant-Governor of the State. In his inaugural address Governor Carroll declared for tariff revision and said that it should be made without departure from the principle of protection, which, he asserted, had been largely responsible for the greatness of the United States. He said that much remained to be done by the legislature in the way of regulating corporations, and that the laws already passed along this line should be closely scrutinized for the purpose of perfecting and perpetuating such laws as will best protect the interests of the people. He advocated the appointment of a commission of not more than ten or fifteen citizens of the State to investigate the subject of the conservation of natural resources. He favored the appointment of a public utilities commission. In regard to the enforcement of the liquor laws, Governor Carroll said that the statute problem was one of the hardest of any on the books to enforce. In the matter of local influence in regard to its enforcement he said: "In the main I believe the people will be given just such official service as they demand. There may be—in fact there is—great difference between public officials as to their natural inclination toward strict construction and enforcement of laws, but I believe there are few men in an official position who will not respond to the demand

of the people." The Governor declared that if officers failed or neglected to do their duty in the matter of enforcement, provision should be made for their peremptory removal. On January 19 former Governor Albert B. Cummins was elected United States Senator to succeed Senator Allison. For the first time in the history of the State a United States Senator was elected without a party caucus and without a nominating speech. The Republicans in the Assembly were unanimously for Senator Cummins, who was the Republican choice at the primary elections of 1908. The Democrats voted for Claude Porter.

A joint resolution to amend the constitution of the State, so as to provide for absolute Prohibition, was introduced into the legislature early in the session, and on March 10 it was passed by the House by a vote of 68 to 37. The resolution was, however, defeated in the Senate on March 31, by a vote of 26 against and 21 for. This action will probably postpone constitutional Prohibition for the State for two years at least. On the same date, by a decision rendered in the District Court at Davenport, it was declared unlawful for Iowa saloonkeepers to reengage in the liquor business in the State after once being enjoined, without securing the written consent of a majority of the voters in the State. Hitherto saloonkeepers who had been enjoined from the sale of intoxicating liquors have reentered business by securing new permits from the Councilmen and filing new bonds with the County Auditor. On April 15 Governor Carroll signed a bill restricting the number of saloons in the State. See ELECTORAL REFORM.

OTHER EVENTS. On August 27 the removal of Mayor A. M. Henderson of Marengo from office was ordered by Judge Preston of Oskaloosa, under the Cossom law, passed by the last General Assembly. The ground alleged was intoxication. On September 23 James C. Mabray and 84 others were indicted by a Federal grand jury on the charge of conspiring to defraud by illegal use of the United States mails. It was declared that the amounts lost by the alleged victims of Mabray and others would exceed half a million dollars. The list of the names of the victims given in the indictment included men of prominence in all parts of the country and victims in 18 States. As a basis of operation the combination used the cities of Council Bluffs, Davenport and Burlington in Iowa, and St. Louis, Little Rock, Seattle, Denver, and New Orleans.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those given below. Measures were passed giving district courts power to deal with parents and children when the latter are neglected. Provision was made for the removal of county attorneys, sheriffs, mayors, and police officers by the district court for neglect of duty and other causes. Laws were enacted establishing the rule of comparative negligence in railroad cases, prohibiting drinking on railroad trains, limiting saloons to one for every thousand of population, regulating hotels, prohibiting secret fraternities in public schools, making Lincoln's birthday a holiday, providing for the parole of convicts, prohibiting discrimination in the purchase of dairy and poultry products or grain for the purpose of creating a monopoly, and prohibiting the use of cigarettes by minors.

OFFICERS: Governor, B. F. Carroll; Lieutenant-Governor, George W. Clarke; Secretary of State, W. C. Hayward; Treasurer, W. W. Morrow; Auditor, J. L. Bleakly; Attorney-General, H. W. Byers; Superintendent of Education, J. F. Riggs; Adjutant-General, Guy E. Logan—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, William D. Evans, Republican; Judges, Scott M. Ladd, Republican; Emlin McClain, Republican; John C. Sherwin, Republican; Horace E. Deemer, Republican; S. M. Weaver, Republican; Clerk, H. L. Bousquet, Republican.

The State Legislature of 1909 was composed of 34 Republicans and 16 Democrats in the Senate and 79 Republicans and 28 Democrats in the House. The State Representatives in Congress will be found in the section *Congress* of the article **UNITED STATES**.

IOWA, STATE UNIVERSITY OF. An institution of higher learning at Iowa City, Iowa, founded in 1847. There were in attendance in 1909 2246 students, with 160 members of the faculty. The number of books in the library was 87,000. During the year a law building, to cost \$125,000, was in process of construction and was completed in January, 1910. A physics building, to cost \$215,000, was begun during the year, as well as an extension of the University Hospital, to cost \$75,000. Engineering shops to cost \$20,000 were also built during the year. The president is George E. MacLean, LL. D. The income of the University is about \$100,000 annually.

IRELAND. See **GREAT BRITAIN**.

IRON AND STEEL. The year 1908 was marked by a great depression in the iron indus-

try to 14,023,247 long tons, as compared with 23,362,594 long tons in 1907.

The immediate result of the financial depression of the fall of 1907 was the cessation of operations in a large number of manufacturing plants, blast furnaces, and mines, due to the decrease in the demand for their product. From the middle of 1908 conditions slowly improved, very slowly during the summer, but more rapidly during the fall and winter, so that by the summer of 1909 a normal state of affairs again prevailed. The demand for iron and steel products was reduced over 50 per cent. as compared with previous years. In spite of this the prices did not show such a marked decline as might have been expected, owing to an agreement among the iron makers to desist from destructive competition. The total decline of prices in finished steel products from January 1 to December 31, according to the *Iron Trade Review*, averaged only about \$2.50 per long ton.

The year 1908 marked an epoch in steel manufacture, for in this year the production of open-hearth steel passed that of Bessemer steel for the first time in the history of steel making in the United States. The tonnage of both, however, was much lower than that of 1907. The decrease in the production of pig iron and steel in 1908 from that of 1907 was about 40 per cent., while that of iron ore was about 30 per cent.

During 1908 iron ore was mined in 27 States. Of these, three States produced ores for fluxing purposes only; the others produced ores for blast furnace use. The following table gives a comparison of the iron production by States for 1907-8:

State	1907		1908	
	Quantity, In long tons	Value	Quantity, In long tons	Value
Alabama	4,039,453	\$4,863,129	8,734,438	\$4,358,902
Arkansas and Texas	118,667	120,060	*65,968	30,663
Colorado	11,714	21,085	10,176	18,432
Connecticut and Massachusetts	37,166	136,440	28,112	105,457
Georgia	444,114	837,102	821,060	540,189
Kentucky, Maryland, and West Virginia	62,808	95,891	53,235	84,898
Michigan	11,830,342	86,441,330	8,839,199	25,150,861
Minnesota	28,969,658	76,668,836	18,682,220	42,318,974
Missouri	†111,768	†226,286	98,414	218,182
Montana, Nevada, New Mexico, Utah and Wyoming	1819,544	†967,190	†518,449	†708,760
New Jersey	549,760	1,815,586	394,767	1,162,474
New York	1,375,020	2,820,135	697,473	2,098,247
North Carolina	50,439	113,488	48,522	76,877
Ohio	23,589	41,081	26,585	36,736
Pennsylvania	837,287	1,298,717	443,161	572,346
Tennessee	813,690	1,325,134	635,343	876,007
Virginia	786,856	1,538,920	692,223	1,465,691
Wisconsin	838,744	2,665,737	733,993	2,027,208
	.51,720,619	131,996,147	35,983,336	81,845,904

* Texas alone. † Includes Iowa. ‡ Includes 1907, California and Washington; 1908, Washington.

try of the United States. The greatest decline took place in the fall of 1907, but the depression continued until the middle of 1908, from which time there was a steady but slow recovery. Resulting from this depression the production of iron ore dropped below that of the three preceding years and the output of pig iron was the lowest since 1901. The total quantity of iron ore produced amounted to 35,983,336 long tons, as compared with 51,720,619 long tons in 1907; the output of pig iron to 15,936,018 long tons, as compared with 25,781,361 long tons in 1907; and that of steel

During 1908, of the 407 iron ore mines in operation, 150 produced over 50,000 long tons of iron ore, as compared with 169 mines in 1907. The maximum production of any one mine was 2,926,614 tons, from the Hull Rust of the Mesabi range in Minnesota. The apparent consumption of iron ore in the United States in 1908 was 32,473,268 long tons, as compared with 51,880,398 long tons in 1907. This is merely an estimate, for no data are available in certain factors which should enter into the official result.

The quantity of iron ore imported into the

United States during 1908 was less than the importation during any year since 1889, with the exception of the year 1904. About three-fourths of the imports were from Cuba, about one-sixth from Spain, and the bulk of the rest from Newfoundland. The total amount imported was 776,898 long tons, with a value of \$2,224,248. The United States exported 309,099 long tons, a slight increase over the iron ore exports in 1907.

During 1908 the production of pig iron, as noted above, amounted to 15,936,018 long tons, as compared with 25,781,361 long tons in 1907. The blast furnaces in operation on December

ity. The Southern iron ore mines also made an increased production. In the East there was much work done in extending old mines and in reopening deposits formerly worked. In the Lake Champlain and Adirondack region in New York, there was much development of this kind.

The output of pig iron in 1909 increased greatly with slight fluctuations throughout the year. In February and in April the production was slightly less than in the preceding months, and except in these months the increase was steady. The *Engineering and Mining Journal* estimates the total production for 1909 at 25,711,846 long tons, as compared with

State	1907			Total Ingots and castings	1908			Total Ingots and castings
	Bessemer	Open-hearth	Crucible and all other		Bessemer	Open-hearth	Crucible and all other	
Massachusetts, Rhode Island, and Connecticut	1,421	239,797	3,980	245,198	837	158,417	3,344	162,598

Indiana and Illinois	1,723,073	1,194,913	6,281	2,924,237	1,237,147	650,403	4,736	1,892,886
Other States	254,989	308,356	4,769	568,114	88,793	331,065	3,346	423,204
	11,667,540	11,549,736	145,309	23,362,594	6,116,755	7,836,729	69,763	14,023,247

31, 1908, numbered 459, of which 236 were in and 223 were out. The greatest number of ovens was in Pennsylvania, where there were 160, 73 being in and 87 out.

The above table shows the production of all kinds of steel ingots and castings in 1907 and 1908 in long tons.

The open-hearth castings in 1908 amounted to 7,836,729 long tons, while the Bessemer castings amounted to 6,116,755 long tons.

The year 1909 marked a great revival of the iron industry in the United States, so that the production of both iron ore and pig iron reached nearly that of 1907, the year of maximum output up to the present time. Estimates made by the United States Geological Survey indicated an increase in 1909 of more than 9,500,000 tons of pig iron and more than 15,000,000 tons of iron ore. The estimated production of pig iron and iron ore in the United States in 1909 was in round numbers 51,000,000 long tons, according to the figures of the United States Geological Survey. The estimates of the *Engineering and Mining Journal* are slightly larger, as will be seen in the table given below, which records the production in 1908-9, in long tons, with the changes indicated:

	1908	1909	Changes
Lake Superior....	26,014,987	42,533,873	I. 16,518,886
Southern States....	5,900,000	7,350,000	I. 1,450,000
Other States.....	1,875,000	3,150,000	I. 1,275,000
Total product'n.	33,789,987	53,033,873	I. 19,243,886
Add imports.....	776,896	1,650,000	I. 873,104
Total supply....	34,566,883	54,683,873	I. 20,116,990
Deduct exports....	309,099	465,000	I. 155,901
App. consumpt'n.	34,257,784	54,218,873	I. 19,961,089

The mines in the Lake Superior region during the year were pushed to the utmost capac-

15,936,018 long tons in 1908. The same authority divides the production in long tons as indicated in the following table:

	1908	1909	Changes,
Foundry and forge...	4,307,734	6,866,274	I. 2,558,540
Bessemer	7,216,976	10,357,290	I. 3,140,314
Basic	4,010,144	7,892,318	I. 3,882,174
Charcoal	249,146	391,732	I. 142,586
Spiegel and ferro...	152,018	204,232	I. 52,214
Total	15,936,018	25,711,846	I. 9,775,828

Figures for the steel production for 1909 are not available for any part of the year. The only approximation that can be made is an estimate based on the output of pig iron. The *Engineering and Mining Journal* estimates the production as follows: Bessemer, 10,750,000 tons; open hearth, 12,500,000; other, 150,000 tons; open-hearth, 12,400,000 tons, an increase of 9,393,000 tons over 1908 and a gain of about 100,000 tons over 1907. The revival in production and demand was shown earlier and more strongly in steel products than in foundry products and wrought iron. There was an increase in the production of open-hearth steel, owing to the opening of the Gary works and the substitution of open-hearth furnaces for Bessemer converters in some important plants.

UNITED STATES STEEL CORPORATION. This corporation produced about 60 per cent. of the total output of finished material during 1909. Its managers were obliged to abandon their policy of limited output and high prices, but this was done in a way which preserved their influence in the trade. The earnings of the corporation showed an increase of between 40 and 50 per cent. over those of 1908. For the

nine months ended with September, 1909, of which reports were available at the end of the year, the total net earnings of the corporation amounted to \$90,508,666, and the surplus, after meeting all fixed charges, was \$51,427,605. The net earnings increased from \$22,921,268 in the first quarter to \$38,246,907 in the third quarter, and the surplus from \$11,873,106 to \$23,543,067. In the June quarter the dividends on the common stock were increased from 0.5 to 0.75 per cent. quarterly, and for the September quarter there was a further increase of 1 per cent. It was estimated that the earnings of the fourth quarter of the year would bring the total net earnings for the year up to about \$135,000,000 and the surplus to \$80,000,000. The unfilled orders on the books on September 30, 1909, amounted to 4,796,833 tons, an increase of over 1,000,000 over the first of the year.

IRON AND STEEL IN FOREIGN COUNTRIES. In nearly all the chief iron-producing countries the year 1909 was one of gradual recovery from the depression of 1908, although depression and recovery were less sharp than in the United States. In Germany the German Iron and Steel Union reports the pig iron production for the eleven months ended November 30 as 11,741,851 metric tons, as compared with 10,716,985 in 1908. In France the production of pig iron for the first half of the year was 1,713,461 metric tons, a decrease of 33,173 tons from 1908. Steel production, however, showed an increase of 141,350 tons, the total for the half year being 1,506,329 tons. In Great Britain the British Iron Trade Association reported the production of pig iron in the first half of the year 1909 at 4,715,679 long tons, as compared with 4,635,851 long tons in the first half of 1908 and 4,653,989 in the second half. The average number of furnaces in blast during the half year was 313. The steel production showed little change. The foreign trade showed a decrease chiefly in ships. The exports and imports of iron and steel and their manufactures for the eleven months ending November 30 was reported by the Board of Trade as follows: Exports, £66,365,940; imports, £11,349,051. The decrease in imports is £6,944,074, and the increase in imports is £121,598. The imports of iron ore into Great Britain for the eleven months ended November 30, 1909, were 5,712,220 long tons, as compared with 5,521,199 long tons in 1908. Belgium in 1909 showed the greatest increase in production of any European country. The total pig iron made in the ten months ending October 31, 1909, was 1,322,490 metric tons, follows:

OPERATIONS UNDER CAREY ACT TO NOVEMBER 1, 1909

	Acres
Area applied for.....	4,383,553.79
Area relinquished or rejected before segregation.....	83,611.71
Area segregated.....	2,776,599.33
Area relinquished or canceled after segregation.....	106,795.20
Area patented.....	314,563.98
Area unpatented.....	3,076,138.22
Area for which applications are pending.....	733,339.35

an increase of 334,920 tons over 1908. The foreign trade showed an increase of about 10 per cent. for the period. In Sweden the production of iron and steel for the six months ended June 30 was as follows: Pig iron, 289,900 metric tons; wrought iron, 61,200 tons; Bes-

semer steel ingots, 40,900 tons; hearth ingots, 458,100 tons; total steel, 499,000 tons. The production was decreased by the general strike (see SWEDEN, paragraphs on *History*) and by the light demand. The exports were 176,200 tons. For the figures on foreign production of iron and steel given above, we are indebted to the *Engineering and Mining Journal*.

IRRIGATION. Previous articles on irrigation have dealt almost exclusively with the United States, but the same activity in extending irrigation which has been so noticeable in the United States for the last few years has existed in other countries. The movement for government aid in the construction of irrigation works, which began in the Western Hemisphere with the passage of the United States Reclamation act in 1902, has spread to Latin America, resulting in the passage in Brazil of the law of 1904 providing for the construction of irrigation works by the government; in Mexico in the passage of the law of June 17, 1908, providing for the lending of government credit for securing funds for the construction of irrigation works; in the appropriation of \$4,000,000 for the construction of irrigation works in Porto Rico; and in the creation of commissions to investigate the subject and propose systems of government participation in this work in Argentina, Brazil, and Chile. In the arid countries of the Old World the governments have very generally aided to a greater or less extent in the construction and management of irrigation works, notably in Italy, India, Egypt, Turkestan, and Australia. The form in which this aid is extended and something of the results are given in the following paragraphs:

UNITED STATES. In the United States most of the irrigation works have been constructed by private parties, the area irrigated in that way up to 1909 being estimated at 13,000,000 acres, including lands reclaimed under the Carey act. Under the Carey act (act of August 18, 1894) the United States granted to each of the arid States 1,000,000 acres on condition that the States provide for its reclamation. In 1908 the provisions of this act were extended to the Territories. The States have provided for the actual work of reclamation being done by private parties under contracts with the States, fixing the prices at which water is to be furnished the settlers, and certain other conditions. The operations under this law up to November 1, 1909, as shown by the records of the General Land Office, are as follows:

Under the Reclamation law (act of June 17, 1902) the United States government builds irrigation works and sells rights to the water to be supplied for prices which will repay the cost of construction, the funds set aside for this purpose being the receipts from the sale

of public lands. The cost of water rights is to be paid by the water users in ten annual installments, without interest on deferred payments. The following statement, showing the condition of the reclamation fund, is taken from the report of the Secretary of the Interior for 1909:

BRAZIL. In 1904 Brazil began the construction of certain canals specifically authorized, and in 1905 (law of October 10, 1905) provided for cooperation between the Federal government and the States in the construction of other works. This is a direct contribution by the general government and there is no pro-

CONDITION OF RECLAMATION FUND, JUNE 30, 1909.

Estimated total receipts to June 30, 1909.....	\$58,582,140.66
Net expenditures to June 30, 1909.....	45,757,918.94

The following statement regarding the progress of the works undertaken is compiled from the same report and from a statement supplied by the statistician of the United States Reclamation Service:

vision in the law for its repayment. In 1906 a commission was appointed to investigate the condition of works already built; to receive requests for the construction of other canals; to supply information regarding irrigation

Area actually irrigated, 1909.....	424,549 "

MEXICO. In Mexico all irrigation works are constructed by private parties. Statistics as to areas irrigated are not available. The law of June 17, 1908, provided for the creation of a bank for loaning money for the construction of irrigation works and for the promotion of agriculture, this bank to be organized by four of the leading banks of Mexico. The government of Mexico names three of the fifteen directors, the banks organizing the institution five, and the stockholders the remaining seven. Funds for loaning are to be secured by the issue of bonds guaranteed by the Mexican government, in a sum not exceeding \$50,000,000 (Mexican) or its equivalent in foreign money. This law has been in force so short a time that no statement of results can be made.

PERU. Irrigation works in Peru in general are built by private parties under government grants. The area irrigated was estimated in 1908 to be 126,000 acres, and the irrigable area 2,500,000 acres.

CHILE. Existing irrigation works in Chile have been built by private parties without government supervision. A commission appointed to consider this matter reported in 1908 in favor of a law providing for the issue of bonds to secure funds for the construction of irrigation works, the cost of the works to be repaid to the government and constitute a permanent revolving fund for the purpose. It proposed also the creation of a permanent National Office of Irrigation to control the streams of the country and grant rights to their use.

ARGENTINA. The area irrigated in 1908 was estimated at 1,800,000 acres, the works having been built principally by private parties. For several years there has been agitation for government construction, and in 1905 a law providing for it passed the Chamber of Deputies, but was defeated in the Senate. The latest proposal is for the construction of irrigation works by the railroad companies, to be paid for in government bonds issued for that purpose, the bonds to be paid off by charges for the water supplied.

practice and agricultural machinery; to make a general report regarding present and proposed irrigation works, with estimates of their cost and utility; and to determine what agency should provide for the construction of the new works proposed. There has been proposed also a code of water laws defining fully the status of rights to water and providing for their acquisition.

ITALY. Government aid to irrigation in Italy takes two forms: The direct construction of works, the water from which is disposed of under leases, usually to mutual companies, which distribute it to the members; and contributions to the cost of works built by associations organized for that purpose, the contribution consisting in the payment of a part of the interest on the cost of the works for a period of years, the total contribution amounting to 50 per cent. of the cost of the works. Further aid is granted in the form of loans from State banks, the conditions regarding security, repayment, and rates of interest being fixed by the government.

Egypt. The government in Egypt controls the use of water from the Nile. It has repaired the ancient canals and built new canals and dams for the storage, diversion, and distribution of the water. The most notable of these works is the Assuan Dam, built for the purpose of storing a part of the flood waters of the Nile, the original purpose of this storage being not the reclaiming of new land, but the conversion of lands from basin irrigation to perennial irrigation, approximately doubling its value in this way. The area converted up to and including 1908 was about 352,000 acres, and the area to be converted in 1909 was about 53,000 acres, making the total area slightly over 400,000 acres. Land values due to this conversion are reported by the government engineers to have advanced from £E65 per feddan to £E135 per feddan (about \$320 to \$660 per acre). In 1907 it was decided to raise the Assuan Dam seven metres, increasing the storage capacity two and one-fourth times,

IRRIGATING YOUNG ALFALFA, USING THE CORRUGATION METHOD

IS SHOWN IN PROCESS OF CONSTRUCTION
IRRIGATION

and providing for the irrigation of 1,000,000 acres of new lands. This work is now in progress, and it is estimated that it will require five years for its completion. The government gets its returns from the land revenue rather than from a direct charge for the water supplied.

RUSSIA. It is estimated that in European Russia there is an area of something over 25,000,000 acres which are uncultivated on account of lack of moisture. Most of this land is in the southern and southeastern parts of the country. In this section the government has built canals, principally for Crown lands, but it has also made loans for other works and encouraged the construction of irrigation works, furnishing technical assistance. Irrigation has not, however, had any great development in this part of Russia. In Turkestan large areas are irrigated by ancient canals, the crops being cereals, forage crops, raisins, and other fruits. The area actually irrigated in 1908 is estimated at about 5,000,000 acres. Since 1895 the Russian government has been building canals for the irrigation of Crown lands for the purpose of raising cotton. The extent of the Crown lands susceptible of irrigation is estimated at 1,500,000 acres, and adjoining areas which will be included in the government projects, bringing the total of these projects up to 2,000,000 acres. This government construction is now in progress. The Russian government is also building works for the irrigation of large areas along the Trans-Siberian Railway.

INDIA. India has a larger irrigated area than any other country in the world. The total irrigated area is about 44,000,000 acres, of which 18,500,000 is irrigated by government works, and 25,500,000 by private works. Most of the government works have been built by the British government, the returns being secured in some sections by direct charges for water, in some sections by increase in the land taxes, and in some instances by a combination of the two methods. The government further encourages irrigation development by making loans for the construction of private irrigation works, and by exempting from taxation the increased land values due to the construction of irrigation works for a sufficient length of time to enable the builder to recoup himself for the outlay. The government works are being extended constantly. They are divided into three classes: Productive works, which are expected to pay a net income above the cost of operation and interest on capital cost; protective works, which are intended primarily as a protection against famine and are not expected to pay as do the productive works, although they may do so; and minor works, for which no capital accounts have been kept, so that it is not possible to determine whether they pay a net profit.

AUSTRALIA. Some years ago the states of Australia provided for the creation of "water works trusts" for the building of irrigation works, with funds loaned by the government, but these have been failures, very generally, and the governments have written off or canceled many of the loans made to such trusts. In more recent years the states have been building irrigation works themselves and levying charges for the water supplied. These works have not been financial successes generally. In most sections it is possible to grow

crops or maintain live-stock without irrigation, and as a consequence large areas covered by canals are not watered and do not contribute to the support of the works. Proposed remedies are the purchase of the lands by the state, and their resale under agreements to pay for water, and the levying of charges for water on all land for which it is available, whether it is used or not.

There is considerable activity in the extension of irrigation in other countries. In the Northwest Territories of Canada the Canadian Pacific Railway Company is extending a large project as fast as the lands are settled, while private parties are also building works. In the British Colonies in South Africa, the government is building irrigation works, although the development is not large as yet. Taking the world as a whole, it is probable that there was never a time of greater activity in the construction of irrigation works than the present. See also MESOPOTAMIA.

ISTHMIAN CANAL ZONE. See PANAMA CANAL.

ITALIAN SOMALILAND. A protectorate of Italy, on the eastern coast of Africa, extending from British Somaliland south to the Juba River, which divides it from British East Africa. The estimated area is about 100,000 square miles, and the estimated population about 400,000. The Italian Somali territory comprises the Sultanate of the Mijertins, the Territory of the Nogal, the Sultanate of Obbia, and the Benadir Coast. The Abyssinian boundary was determined under a treaty of May 16, 1908. The inhabitants are engaged largely in pastoral pursuits, but the chief wealth of the country, which is little developed, is the forests of gum and incense-bearing trees. Along the Juba River some Italian companies are attempting cotton and tobacco culture. For 1908-9 the estimated revenue was 2,506,500 lire, of which 1,935,000 lire were a state subsidy; the estimated civil expenditure was 1,267,986 lire, and military 1,288,514. In December, 1907, Abyssinian tribes raided the Benadir hinterland and fighting resulted between them and the Italian troops, resulting in the killing of two Italian officers. On May 16, 1908, a convention was made between Italy and Abyssinia for the delimitation of the frontier by a line running from Dolo on the Juba River to the junction of the Juba and Dana Rivers, and thence to the Webi Shebeli, and thence to the Anglo-Abyssinian boundary. In March, 1909, successful operations against the Dervishes were reported by the Governor of Benadir, resulting in the capture of 2500 cattle, thirty prisoners, and guns and ammunition. Fighting was also reported on July 14 and 17, the tribesmen having tried to burn the settlement of Warsheikh. Their loss was reported at 45 killed and 20 wounded; the Italian loss at 5 of the Askaris and the Italian captain.

ITALY. A constitutional monarchy of southern Europe, including the Italian Peninsula, the islands of Sicily, Sardinia, and Elba, and about 66 minor islands. Capital, Rome.

AREA AND POPULATION. The area is variously stated: By the *Almanach de Gotha* at 286,682 square kilometres, or 110,690 square miles; by the Italian Survey Department at 110,659 square miles; and by a summing up of the areas of provinces and compartmenti

as ascertained, some by the Survey Department, others by the Military Geographical Institute and by the General Statistical Department, at 110,550 square miles. The population, according to the census of 1901, numbered 32,475,253; estimated, January 1, 1908, 33,009,776; January 1, 1909, 34,269,764. There is a large settled and floating foreign population. The movement of the population for three successive years is given as follows:

Marriages	Births including stillborn	Deaths including stillborn
1906.....260,771	1,119,131	745,028
1907.....280,784	1,110,356	748,356
1908.....282,932	1,190,167	821,500

The stillborn numbered in 1906, 48,153; 1907, 48,021; 1908, 51,405. The deaths for 1908 include 77,000 in the earthquake of December.

The emigrants numbered in 1907, 704,675 (to the United States, 285,731); 1908, 486,674 (United States, 128,503). For the first nine months of 1909 the emigration is given as 258,563 (United States, 222,537). The population of some of the principal cities according to the census of 1901 (revised) is given as follows: Rome, 440,254; Naples, 508,018; Milan, 491,460; Turin, 282,753; Palermo, 254,516; Genoa, 169,385; Florence, 158,526; Venice, 150,002.

EDUCATION. Two grades of elementary education are provided, both of which are free, the lower only (ages 6—9 in communes where no higher schools exist, 6—12 where there are such schools) being compulsory. The law of July, 1904, imposing special disabilities on the illiterate has afforded a needed stimulus, 49 per cent. of the population over 20 years of age being thus classed prior to that date. There has been great subsequent improvement. The number of public primary schools (exclusive of infant) numbered 53,259 in 1901-2, with 56,433 teachers and 2,548,583 pupils; private, 8518, with 9306 teachers and 184,766 pupils. There were (1905-6) 443 lyceums and gymnasia, with 48,031 pupils; 137 normal schools, with 21,739 students; 307 technical schools and institutes, 73,294; and 19 mercantile marine institutes, 2186. There are numerous special, professional, technical, and industrial schools and colleges, with increasing attendance. There are 17 state universities, and four free (Camerino, Ferrara, Perugia, Urbino), a total of 21 with an aggregate attendance (1907-8) of 23,297.

The Roman Catholic is nominally the state religion; but entire religious toleration prevails. The population was divided according to religions (1901) as follows: Roman Catholics, 31,539,863; Evangelical Protestants, 65,595; Jews,

35,617; Greek Church, 2472; other faiths, 338; non-professors, 36,092; not known, 795,276.

AGRICULTURE. Of the total area, 20,248,000 hectares (70.6 per cent.) are productive. The area under principal crops in hectares in 1907 and the yield for 1906 and 1907 in hectolitres (1 hectolitre=2.75 bushels, 22 gallons) are given as follows:

	Hectares	Yield 1906	Yield 1907
Wheat	5,230,000	62,185,000	62,566,000
Vines	3,768,000	29,784,000	53,903,000
Corn (1906)	1,817,000	32,776,000	31,162,000
Rice	151,000	9,244,000	10,450,000
Olive oil (1906).....	1,101,000	1,113,000	2,857,000

In 1908 the wheat acreage was given as 12,355,200, with an average annual yield of 162,675,400 bushels. Italy has thus a wheat production of only 13.2 bushels to the acre, and resorts to imports for 25 per cent. of the annual supply. The acreage for 1909-10 is estimated at 20 per cent. above that of the previous year. Italy is second on the list of the world's wine producers, France being first. The yield in 1908 was 1,064,800,000 gallons, showing a reduction compared with 1907. (See LIQUORS, FERMENTED AND DISTILLED.) The olive crop for 1908-9 was in some sections a partial and in others a complete failure, and the total yield was far below the average. A crop not much above two-thirds normal is predicted for 1909-10. Tobacco was planted on 4893 hectares (1906), and yielded 6,713,833 kilos. The citrus fruits were estimated (1903) at 16,700,000 plants.

The average annual production of silk cocoons is estimated at 52,808,000 kilos, and of silk, at 5,610,000. In 1908 the live-stock returns were given as follows: Cattle, 6,190,990; horses, 955,031; mules, 371,926; donkeys, 16,435; asses, 848,988; sheep, 11,160,420; buffaloes, 19,362; goats, 2,714,513; swine, 2,503,733. The value of the forestry products in 1907 was given at 88,000,000 lire. The last official bulletin shows that in 1908 there were of forest area in Italy, under the direction of the Minister of Agriculture at Rome, 7,350,493 acres of wooded forests, 1,083,039 acres in "bush" forests, and 1,893,072 acres bare of trees. The Minister of Agriculture (Signor Cocco-Ortu) calls the woodland crisis a "fearful and dangerous one," and estimates that 8,650,000 acres would be needed to place Italy on a footing with other countries in the matter of forests. See FORESTRY.

MINING, MANUFACTURES, ETC. The total output of all mines for 1907 was valued at 87,939,440 lire (1 lire=19.3 cents). The most important, with production and value (1907), are given below:

Mines (active).	No.	Metric tons.	Lire
Sulphur	522	2,787,765	30,508,304
Zinc		680	70,000
Lead	132	43,037	8,447,516
Lead and zinc		160,517	19,161,552
Iron	39	517,952	9,085,007
Copper	39	167,619	5,140,239
Mineral fuel	42	453,137	4,208,262
Salt, graphite, petroleum	66		3,593,059
Asphaltic and bituminous substances.....	26	161,126	2,201,154
Iron and cupreous pyrites.....	12	126,925	2,128,450
Mercury	8	76,561	1,655,475
Boric acid	11	2,305	668,450

The amount of raw sulphur produced in 1908 was 443,720 tons. The total number of workers in active mines was 56,831. The number of workers in the stone quarries numbered 67,921; value of output, 50,319,746 lire. The lime and brick kilns employed 97,204 persons and had an output valued at 144,641,506 lire.

The silk industries employed (1903) 191,000 persons; the cotton and woolen industries, 178,000; hemp, etc., 26,000. The silk produced from domestic cocoons in 1908 was 4,486,000 kilos, against 4,820,000 in 1907; from foreign cocoons, 1,912,000 kilos, against 1,353,000 in 1907. The value of industrial chemical products (1907) was 123,522,000 lire. There were (1909) about 1200 flour mills (exclusive of small local mills). Rebates and bounties are provided by the government in encouragement of the flour-milling and semolina and paste-producing industries. The tobacco industry, a government monopoly for the past 25 years, produces nearly double the revenue arising from both other state monopolies—salt and the lottery. The number of metric tons manufactured in 1907-8 was 17,737, against 16,803 in 1906-7. The tobacco grown in Italy in 1907-8 was 6459 metric tons. The total amount paid by the government for foreign and home-grown tobacco in 1907-8 is stated at 30,735,731 lire; operating expenses, 33,546,560 lire; total, 64,282,290; total tobacco sales, 255,305,409 lire; net profits, 191,023,119 lire. The match industry showed a total production (1907-8) of 67,795,700,000 pieces. The tax on matches is collected by the sale of special revenue stamps to be attached to the boxes; the number sold in 1907-8, showing approximately the home consumption, numbered 669,300,558. The fisheries employed (December 31, 1908) 25,355 vessels of 73,903 tons, and 101,006 men. The value of the catch (1908) was 16,821,000 lire (tunny fish, 3,290,000 lire; coral, 510,000).

COMMERCE. The trade (special, transit, and precious metals) for 1907, 1908, and the first half of 1909 is given in lire as follows:

	Imports	1907	1908	1909 (1st ½)
Special.	2,880,669,000		2,913,275,000	1,579,114,809
Precious metals.	168,144,000		28,052,000	4,139,099
Total	3,048,813,000		2,941,327,000	1,583,258,908
Exports:				
Special.	1,948,868,000		1,729,263,000	880,199,202
Precious metals	5,811,000		21,012,000	34,408,498
Total	1,954,679,000		1,750,275,000	914,607,700
Transit.	55,645,000		54,101,000	

The principal articles of import and export and their value in lire are given for 1908 as follows:

Imports	Lire
Cotton, raw	301,000,000
Silk.	270,000,000
Oil.	257,300,000
Machinery.	219,000,000
Cereals.	210,000,000
Iron.	138,700,000
Timber.	113,800,000
Chemical products	107,500,000
Skins.	94,900,000
Wool.	80,100,000
Fish.	68,300,000
Brass, etc.	64,500,000
Implements	50,400,000
Woolen manufactures	48,800,000
Silk manufactures	42,900,000
Dyes.	37,100,000
Cotton textiles	34,000,000

Exports	Lire
Silk.	617,200,000
Cotton textiles	116,000,000
Silk goods	92,000,000
Skins	92,000,000
Chemical products	66,200,000
Olive oil	64,100,000
Hemp.	51,400,000
Wooden manufactures, etc.	50,200,000
Cheese.	44,400,000
Fruits.	43,700,000
Wine.	41,700,000
Eggs.	40,000,000
Acid fruits	36,100,000
Almonds	30,500,000
Sulphur.	29,400,000
Marble, etc.	28,200,000
Railway carriages	27,800,000

The articles of import which showed notable increase in 1909 were cotton-seed oil, cereals, tobacco, cotton, and lumber. The export articles showing considerable increase were silk, chemicals, preserves, hemp, wines and liquors, and crude tartar. Calcium citrate declined. Olive oil declined on account of the short crop; citrus fruits on account of the Messina earthquake. The imports and exports of salt in 1907 were 51,604 and 99,191 tons respectively; in 1908, 2610 and 85,489 tons. The value of the trade with important countries of origin and destination is given in lire (1908) as follows:

	Imports	Exports
Germany	521,000,000	245,400,000
Great Britain	500,900,000	131,900,000
United States	405,000,000	203,800,000
Austria-Hungary	300,700,000	144,900,000
France	276,300,000	203,800,000
Russia	127,700,000	11,800,000
British India	107,600,000	18,900,000

COMMUNICATIONS. The total length of railway lines in 1908 was 10,387 miles; state railways, 8380 miles. The total receipts in 1906-7 were 435,563,000 lire. There were (June 30, 1906) 31,000 miles of telegraph lines and 128,

510 miles of wire; 7552 miles of telephone lines and 69,091 miles of wire. There were 9772 post-offices in 1907. Posts and telegraph receipts, 91,117,650 lire; expenditures, 71,100,807. The merchant marine, January 1, 1908, had 4874 sailing vessels of 468,674 tons, and 589 steamers of 526,586 tons. The total number of vessels entered in 1907 was 106,617 of 42,555,001 tons; cleared, 106,495 of 42,520,907.

FINANCE. The revenue and expenditure for three fiscal years are given in lire as follows:

	1905-6	1906-7	1907-8
Revenue..	2,562,152,714	2,256,039,986	2,320,597,699
Exp'diture	2,493,631,328	2,154,190,700	2,258,720,848

The budget for 1908-9 estimates the total revenue at 2,345,435,150 lire; expenditure, 2,289,-

459,895. The principal sources of revenue and items of expenditure are given below:

Revenue	Lire
Monopolies	948,715,259
Direct taxes	446,992,700
Taxes on transactions	276,200,000
Public services	154,481,900
Repayments	145,416,339
State properties	57,325,333
Special (virements)	54,618,049
Total ordinary	2,111,867,430
Extraordinary	233,567,720
 Total	 2,345,435,150
Expenditure	Lire
Treasury	704,585,306
Finance	300,350,916
War	287,492,658
Marine	164,822,031
Posts and Telegraphs	122,310,491
Interior	110,246,089
Public instruction	87,257,971
Justice, etc.	62,580,246
Public works	44,568,369
Agriculture, etc.	21,536,835
Foreign affairs	19,889,991
Total ordinary	1,905,640,883
Extraordinary	383,819,010
 Total	 2,289,459,895

The total public debt of Italy on July 1, 1909, stood at about 13,396,725,000 lire. Interest (including premiums) for the year ending June 30, 1908, was as follows: Consolidated debt, 374,027,752 lire; permanent annuity due to the Holy See, 3,225,000; various, 116,389,354; floating debt, 7,500,000; total 501,142,106.

NAVY. The larger vessels of the effective navy were as follows in 1909: First-class battleships: 2 of 13,426 tons each; 4 of 12,625 tons each;—second-class battleships; 2 of 9800 tons each; 3 of 13,298 tons each;—armored cruisers: 3 first-class of 7294 tons each; 2 first-class of 9832 tons each; one second-class of 4511 tons; 2 second-class of 6396 tons each. In 1909 there were building one first-class battleship of 19,000 tons and 2 first-class armored cruisers of 9832 tons each; and there were projected one first-class battleship of 19,000 tons and 2 first-class battleships of 21,000 tons each. The number and displacement of effective warships, built and building, of 1000 or more tons, and of torpedo craft of 50 or more tons, were as follows in 1909: Battleships of 10,000 tons and over, 11, aggregating 141,200 tons; armored cruisers, 10, of 78,720 tons; one cruiser of 3000 tons; cruisers between 3000 and 1000, 9, aggregating 19,320 tons; torpedo-boat destroyers, 21, of 7053 tons; torpedo boats, 63, of 8898 tons; submarines, 7, of 1087 tons; total, 122 war vessels, aggregating 259,278 tons. The naval expenditure of Italy during the ten-year period ending June 30, 1910, is stated at \$259,531,000.

The battleship *Roma* was finished and commissioned in 1909, but slow progress is being made on the Dreadnought, *Dante Alighieri*, and the press complained about the delay in carrying out the new building programme, especially in commencing the battleship "B," authorized in 1907. One and one-half years ago, at the end of August, because the *Giornale dei Lavori Pubblici* indiscreetly published the contents of the contract plan ahead of time, the Minister of Marine further deferred laying the matter of the proposals before the

state council. The new building programme included the battleship *Dante Alighieri*, now building at Castellamare, battleships (22,000 tons) "B," "S," and "D"; small cruisers (3300 tons) "S," "T," "U"; 12 destroyers (500 tons); 30 coastal torpedo boats of 120 tons; 11 submarines; and a floating dock for submarines. The annual manoeuvres were held in September, with 34 ships, including 9 armored vessels, as well as a flotilla of submarines. The exercises were tactical; those of previous years had been strategical in connection with landing operations.

The publication in April, 1909, of the Austrian naval programme calling for the completion of three and possibly four new *Dreadnoughts* in 1912 indicated that Austria and Germany would soon have a strong naval base in the Mediterranean. Italy's standard of a naval power, twice as strong as that of any other country whose only coast was on the Mediterranean, was thereby threatened. The naval estimates of the Minister of Marine, Admiral Mirabeles, greatly increased the expenditure for the next six years. They called for four new battleships of the largest size (instead of two); three cruisers, many submarines and other small vessels, and a thorough system of coast defenses.

ARMY. Military service is compulsory and universal, the army being composed of an active or regular army, a mobile militia and a Territorial army. Service is for 19 years from the age of 20, and of this two or three (in the case of cavalry) years are spent with the colors, 6 or 5 years with the regular army reserve, 3 or 4 years with the mobile militia, and 7 years in the Territorial army. The quota of recruits each year is divided into 3 classes of which only the first go into the regular army, while the second receive military training but are on leave and the third, also exempted for various reasons, are assigned to the Territorial militia. In 1908 the reorganization law increased the liability to service as various causes, among these emigration, were cutting down the numbers of the yearly contingent available for the army and the nature of exemptions were decreased. It was desired to reduce the time of service with the colors to two years and in that event a still larger contingent would be demanded. The Italian army is under the direction of the Army Council created by decree of February 2, 1908. There are 12 army corps each comprising 2 divisions, except that of the military district of Rome which has 3. There were in the regular army, according to the scheme of organization taking effect October 1, 1909, 96 regiments (288 battalions) of infantry, 12 regiments (36 battalions) of *Bersaglieri*, and 8 regiments (28 battalions) of Alpine troops; 12 regiments of Lancers and 17 of cavalry; 24 regiments of field artillery with 186 6-gun batteries, 1 regiment (6 batteries) of horse artillery (4 guns only in time of peace); 2 regiments of mountain artillery, 3 regiments of fortress artillery; and 3 regiments and one brigade (in Sardinia) of coast artillery; 5 regiments of engineers and companies of other technical troops; 12 legions of *Carabinieri* or *Gendarmes* and 12 companies of sanitary troops and 12 supply companies. According to this organization the peace effective, all ranks, would be (exclusive of the troops in Africa) 13,942 officers and 274,167 men. For the year 1909-

1910 the effective present strength was fixed at 203,000 men. On a war footing the Italian army as arrayed in 1909 would include of the permanent army 39,254 officers and 247,457 men with the colors, on "unlimited leave" 488,487 men, the mobile militia 326,560, and the Territorial militia 2,274,737 or a grand total of 3,403,505. The fact that the Territorial militia are practically untrained destroys much of the effect of these figures. The Italian army on a war footing in 1909 had an effective strength of 3,403,505.

The army estimates showed a considerable increase; the Minister of War, General Spingardi, demanded 10,000,000 francs additional for the present year and 16,000,000 francs for the year following. The increase was explained in part by the increased price of equipment but also by the increase of the effective to 225,000. An extensive plan of fortification was estimated to cost 280,000,000 francs, which was to be distributed over a number of years. The law of military reorganization passed as a result of the reports of a recent Parliamentary Commission went into effect October 1.

GOVERNMENT. The executive authority is vested in the King, who acts through a responsible council of eleven ministers. The legislative power rests conjointly in the King and the Parliament. The latter is divided into a senate (318 members) and a representative chamber of deputies (508). The King in 1909 was Victor Emanuel III. (Vittorio Emanuele III.), born November 11, 1869; married, October 24, 1896, to Elena of Montenegro. The heir apparent is Prince Umberto, born September 15, 1904. The Ministry until December, 1909, was constituted as follows: President of the Council and Minister of the Interior, G. Giolitti; Foreign Affairs, T. Tittoni; Justice, etc., V. E. Orlando; Finance, P. Lacava; Treasury, P. Carcano; War, General Spingardi; Marine, Admiral Mirabello; Public Instruction, L. Rava; Public Works, P. Bertolini; Agriculture, etc., F. Cocco-Ortu; Posts and Telegraphs, Dr. C. Schanzer. For the Cabinet crisis and new Ministry of December 10, 1909, see closing paragraph on *History*.

HISTORY

PARLIAMENT. Early in the year an amnesty was granted by the King to special classes of criminal offenders, chiefly Socialists and labor leaders imprisoned for inciting strikers to violence and for interfering with the freedom of labor. On February 8 the Council of Ministers decided on dissolution. The general elections which were held on March 7 were very favorable to the Ministry. The constitution of the Chamber which met on March 23 was, as a result of the elections: Extreme Left (Socialists, 43; Radicals, 37; Republicans, 23), 103; Constitutional Opposition, 43; Catholics, 16; Ministerialists, 346. The matters before Parliament may here be briefly summarized, and the chief topics will be discussed in succeeding paragraphs. Considerable additions were accepted by Parliament in both the army and navy estimates. Among other measures discussed were a motion to reduce or abolish grain duties, which was defeated, and bills for the payment of the members of Parliament. On the latter subject Premier Giolitti said that the idea of paying members was gaining in favor and that the government would not oppose it. An at-

tack was made on the government's ecclesiastical policy but without result. There was sharp criticism in the Chamber, during the discussion of the budget of the Minister of Public Works of the measures which the government had taken for relief after the earthquake. The government ship subsidy policy aroused violent opposition in July, but the question was deferred to the end of the year. This was the main issue in the autumn general elections. The Chamber reassembled November 18, and the Giolitti Ministry soon afterwards resigned, being defeated on the question of tax reform, and not as had been expected on the Marine Conventions against which the Opposition had been hitherto concentrated.

EARTHQUAKE RELIEF MEASURES. On December 28, 1908, occurred the most disastrous earthquake that ever visited a civilized country. The chief havoc was wrought in the strip of land bordering the Straits of Messina wherein are situated the two large cities of Messina with about 180,000 inhabitants and Reggio with about 60,000 (commune), and from this centre the devastation spread over an area of some 4500 square miles. Both Messina and Reggio were utterly ruined and over forty communities in Calabria and Sicily were destroyed. The estimates of the loss of life varied greatly. Official estimates placed it at 125,000, while other estimates ranged from 50,000 to 100,000. Rescue work was immediately undertaken by the foreign vessels in Sicilian waters and good service was rendered by the men of the American, British and Russian war ships, which were dispatched promptly to the scene of the disaster. Foreign nations also contributed generously in money for the relief of the destitute, the United States Congress voting an appropriation of \$800,000 and a still larger sum being contributed by the American Red Cross Society (see *EARTHQUAKES*).

Parliament passed an act in January providing funds for the work of restoration in the regions visited by the earthquake. For the reconstruction of the national buildings and public works money was obtained from the balance remaining from the budget of 1907-8. The funds for the needs of the provinces and local divisions were raised by a surtax of two per cent. for five years on certain classes of the direct taxes and stamp duties, and for private needs the government promised to pay half the yearly interest and half the annual installment on loans to run for thirty years which it would secure for any person desiring to rebuild. It furthermore paid an insurance to the loaning companies and for fifteen years exempted the borrower from all national and local taxation. In April the King and Queen visited the stricken areas for the second time and the former expressed his approval of the progress made. A number of earthquake shocks occurred in Calabria and Sicily, including one of considerable severity at Messina on July 1, which caused a panic among the inhabitants. A serious riot occurred at Sinopoli in Calabria in May on account of the non-distribution of relief funds, and six persons were killed and many wounded. The government was sharply criticised for dilatoriness and inefficiency in the work of relief. The subject came up in the Chamber during the discussion of the budget of the Ministry of Public Works. On its own behalf the government declared that its work had been hindered

by the damage done by the railways and by the character of the soil and the attitude of the people in Calabria. The relief measures were slowly executed and there was much complaint of a lack of initiative and of a tendency to wait for orders, no matter how urgent and distressing the situation. The red tape and officialism of a bureaucratic administration, especially in the navy, were severely blamed. The correspondents for British newspapers were particularly censorious. Slight progress was made in housing the people of Messina during the summer. It was charged that the work of restoration was even retarded by the officials, that the American plan of building wooden houses had been checked again and again, and that wood for these houses supplied from England was allowed to float for an indefinite period in the Reggio harbor, also that the water supply did not improve. On the other hand, conditions at Reggio were somewhat better and during the summer were improving. See the articles on EARTHQUAKES and on UNITED STATES, paragraph on Congress.

GROWTH OF THE MONASTERIES. The government's policy toward the Church was criticised and on May 31 Signor Chiesa introduced a resolution against the monasteries. As a result of the government's let-alone policy, whereby Catholics enjoyed all the rights granted to individual Italians, there was evidence of growing strength on the part of the monasteries, convents and other church institutions. Signor Chiesa presented figures which indicated a surprising increase. According to these the number of monasteries and convents rose from 951 and 2605 respectively in 1901 to 1203 and 2658 in 1909; and the monastic and conventional schools from 1342 to 2035 with an enrollment of 150,000. The Chamber, however, was unwilling to appear in the light of a persecutor of the Church and the resolution was lost by a majority of 116.

THE SHIP SUBSIDIES. The question of the ship subsidies reached a critical stage just before the adjournment of Parliament on July 12. In the ship subsidies bill introduced by the government an agreement was made with the Italian Lloyd which granted the company certain privileges at variance with the law of April 5, 1908, fixing the conditions of these contracts. For one thing it allowed the company a preliminary period of five years before the amount of the subsidy was fixed for the next twenty. This was attacked by Baron Sonnino of the Opposition as inviting extravagance on the company's part during these first five years in order to secure a larger subvention. Other serious defects in the plan were pointed out. The bill was condemned for conferring on the Lloyd a virtual monopoly, and the government was criticised for not asking Parliament to amend the law of 1908, which in some respects was illiberal, instead of bringing in a bill which covered a private arrangement with the company at variance with that law. The law of 1908 provided for competitive bids and this also was disregarded. Finally the government declared its willingness to place the contract at public auction and asked the Chamber to suspend discussion of the bill. To this the Chamber agreed, and the question was thus deferred to the close of the year.

THE NEW MINISTRY. The weakness of the Giolitti Ministry was manifest on the eve of adjournment (July 12) in the course of the ship subsidy debate. It fell soon after the

meeting of Parliament on November 18, but contrary to expectation the immediate occasion of its overthrow was not the ship subsidy question but a question arising from a tax reform proposal. The new Premier was Baron Sonnino, who had led the attack on the ship subsidy bill in July. General Spingardi, Minister of War, and two other members of the Giolitti Cabinet were retained in the new Ministry. Its composition was announced on December 10 as follows:

President of the Council and Minister of the Interior, Baron Sonnino; Minister for Foreign Affairs, Count Guicciardini; Marine, Admiral Bettolo; War, General Spingardi; Worship and Justice, Signor Scialoja; Agriculture, Signor Luzzatti; Education, Signor Daneo; Treasury, Signor Salandra; Finance, Signor Ariotta; Public Works, Signor Rubini; Posts and Telegraphs, Signor di Sant'Onorio.

OTHER EVENTS. Important archaeological discoveries were made at Rome in February, including finds of statues of Jupiter, Bacchus, Chronos and an Egyptian deity. (See ARCHAEOLOGY.) The Keats-Shelley Memorial was inaugurated on April 5. The house in which Keats died in Rome had been bought by money raised in England and America and turned into a museum and library which it was hoped would serve as a sort of centre for English, Italian and American literature and preserve in good order the tombs of Keats and Shelley. The King attended the ceremonies. In April the beatification of Joan of Arc was solemnized at St. Peter's. On May 17 the Sixth International Cotton Congress was opened at Milan. The fiftieth anniversary of Lombard liberation was celebrated at several cities. The battle of Magenta, which occurred on June 4, 1859, was commemorated at Magenta on June 4.

A feature of the celebration was the presence of the French representatives. The fiftieth anniversary of Solferino was celebrated at San Martino on June 24, the King and Queen participating, and at Genoa a stone was laid to commemorate the departure of the French troops. There were also festivities at Turin, Florence and Rome as well as in France to commemorate the anniversary of Lombard liberation. An important movement had been gaining strength in Italy for some time past, which aimed at turning Italian emigration to Italy's advantage by making the Italian labor supply a basis for demanding commercial concessions from the country of destination. It also contemplated measures for preventing emigrants from giving up their Italian nationality. Signor Tittoni spoke on this subject, but steered clear of visionary proposals. He promised better subsidies for Italian schools in the United States and South America. The Dante Alighieri Society was in sympathy with this programme. The most important meeting in the history of this society was held at Brescia in October. Its membership within a comparatively short time had risen from three thousand to fifty thousand. Its chief objects were to foster the Italian language, promote Italian unity, and prevent Italian emigrants from giving up their nationality. In April the King and Queen of Italy received the King and Queen of England at Baia, and on May 12 the King met the German Emperor at Brindisi. On October 23, the Czar, whose visit to Italy had been widely heralded, arrived at Racconigi. There had been

**PRINCE HIROBUMI ITO
AT HIS SEASIDE VILLA, OISO, JAPAN**

much talk among the Socialists of demonstrations against this visit and the Chambers of Labor had planned a general strike, but in view of the general opposition to these plans they were given up. The visit was regarded as of great international importance. The usual expressions of friendship were interchanged and gratitude was expressed in the King's speech for Russian aid after the earthquake. It was hailed in France as a sign of *rapprochement* between Russia and Italy in spite of the Triple Alliance. See ROMAN CATHOLIC CHURCH.

ITO (HIROBUMI) Prince. A Japanese statesman, assassinated by a Korean, October 26, 1900. He was born in 1841, the son of a small man of the Samurai or feudal fighting class in the town of Shimonoseki in the Province of Chosu. At his birth he was given the name Shunsuke (superior being), but later in life he dropped this and assumed the name Hirobumi, which is freely translated, "Benevolent Literature." He was left an orphan early in life and was adopted by relatives. His early years were devoted to learning the arts of war and in perfecting himself in the discipline of his class. During his youth, the Lord of Chosu, his master, became restive under the tyranny of the Shogun and rebelled against him, and Ito was sent to Tokio to obtain secret information. While in Tokio he caught a glimpse of the great world beyond Japan, and on his return with four companions conceived the idea of escaping from Japan and going to England. At the time a Scotch whaler was anchored in the Strait of Shimonoseki, and in the darkness one night the five boys swam out and boarded her. The captain of the vessel was finally persuaded to take them with him and Ito and the others worked their way on shipboard until they arrived in England. The stay here was short, however, for in 1863 the Lord of Chosu fortified the Strait of Shimonoseki against foreigners and even fired on two United States sloops of war and French and Dutch vessels. Ito, hearing this, hastened home in an effort to forestall the combined movement of foreign warships against his lord. His counsels, however, did not prevail and the foreign fleet arrived and bombarded and leveled the forts. The rebellion which seated the present Emperor on the throne began shortly after this, and Ito, because of his escapade in England and his attempts to dissuade the Lord of the Province against fighting the Westerners, fell under the suspicion of his own people. He, with Inouye, who had accompanied him to England, were attacked by assassins and Ito was saved only by the strategy of a girl who hid him safely. This girl later became his wife. He did not play any great part in the War of the Rebellion, but he emerged as one of the young progressives, whose whole soul was devoted to the Emperor and the cause of an enlightened Japan. He was made first governor of the port of Kobe when, at the demands of the Powers, the ports of Japan were thrown open to foreign commerce. In the following year he was transferred to Tokio as Vice-Minister of Public Works. In 1872 he became a member of an embassy headed by Iwakura, a noble of high rank, which made a two years' circuit of the great Powers in an effort to gain a modification of the earlier treaties. During the progress of this embassy Ito visited the United States for the first time. He played the foremost part in the eventful years which followed

during which Japan was endeavoring to adjust herself and adapt herself to Western civilization. He had the chief part in formulating the constitution under which Japan is now governed. He was prominent also in following up the new country's industrial system and took an active part in the rudimentary beginnings of an army and navy. In 1883 when Prince Sanjo resigned the premiership of the empire, Ito, who had been made a count because of his services the year previous in drawing up the Tientsin agreement with Li Hung Chang, was given the post. He was then 44 years old. He at once became one of the close circle of "elder statesmen," the unofficial body that stands above all constitutional provisions next to the Emperor as an advisory board. He resigned the premiership to fill the chair of president of the newly created House of Peers. In this position he had many important tasks to perform. He met Li Hung Chang as a peace envoy at the close of the short war with China, and at Shimonoseki signed the famous peace which contained the elements of the future greater war with Russia. During the next ten years, Ito, now made a marquis, played an important part in all governmental affairs. His efforts were directed towards strengthening the resources of the empire for the war with Russia, which undoubtedly he foresaw. When the war broke out, from his place near the throne he helped to keep the fortunes of Japan in the ascendant and to strengthen the sympathy for his country among Anglo-Saxons. When the peace of Portsmouth was signed, Prince Ito suffered the popular contumely which included all the officers of the government. His statue in Kobe was torn from its pedestal and his name was generally execrated. He was unmoved by this clamor, however, and in 1895 was given the task of making Korea a Japanese province. He compelled the Korean Emperor to sign away the sovereign rights of the ancient land, and placed on the throne a ruler of his own choosing. Through his masterly efforts the administration of the country was reformed and great progress was made in all social and political branches. Although he was bitterly hated by the Koreans, it is certain that he at no time used arbitrary or unduly harsh measures. In 1907 the title of Prince was bestowed upon him and he resigned the office of Resident-General in May, 1909, to succeed the late Field Marshal, Yamagata, as president of the Privy Council. In August he visited Seoul and received, according to Japanese reports, a cordial welcome. He was assassinated at Harbin, Manchuria, where he had gone for the purpose of holding a conference with M. Kokovoff, the Russian Minister of Finance, in regard to the general railway situation in Manchuria. Three other persons of his party were badly wounded by the assassin. He claimed to have committed the crime simply from patriotic motives without any personal animosity for the victims. See JAPAN.

IVORY COAST, THE. A French colony in French West Africa (q. v.). Area, 125,538 square miles; population (1906), 889,479. It includes the protected native kingdom of Kong. The capital is Bingerville (formerly called Adjamé). The principal settlements are Grand Bassam and Assinie. Corn, coffee, rubber, fruits, and mahogany are produced. Gold output (1906) 4225 grammes, valued at 11,832 francs. Imports (1907), 14,314,000 francs; ex-

ports, 10,911,000 francs. Railway line open (1908) 51 miles; under construction, 107 miles. Telegraph and telephone connection exists with adjoining colonies. In 1907 there were 36 post-offices. In 1908, 1081 vessels, of 1,776,982 tons, entered, and 1087, of 1,780,267 tons, cleared, at the ports. The sum of 10,000,000 francs has been assigned from the colonial loan for railway construction and harbor improvement. The local budget balanced (1904) at 3,368,800 francs. A lieutenant-governor administers the colony under the direction of the Governor-General of French West Africa.

JACKSON, SHELDON. An American clergyman and educator, died May 1, 1909. He was born in Minaville, N. Y., in 1834, and after graduating from Union College in 1855 and from the Princeton Theological Seminary in 1858, was ordained a Presbyterian clergyman. From 1858 to 1869 he acted as missionary to Indians in the West, at the same time acting as pastor at La Crescent, Minn. He made a special study of conditions in Alaska for over 30 years, and from 1885 to the time of his death, held the position of general agent of education in Alaska. Dr. Jackson introduced the public school system into that Territory and was unremitting in his efforts to improve the physical, intellectual and moral condition of the people. In addition his interests in other matters were large, and he was associated in many religious and philanthropic movements. Among other works he wrote *Education in Alaska* (1872); *Handbook on Alaska; Alaska and Missions on the North Pacific Coast* (1880), and many reports for the government.

JAIIME, Don. Pretender to the Spanish throne. See CARLOS.

JAMAICA. An island of the West Indies, constituting, with a number of smaller islands, a British colony. Area, 4207 square miles. Population (census of 1891), 639,491 (whites, 14,892; mixed, 121,955; black, 488,624; East Indian, 10,118; Chinese, 481); estimated (1908), 835,800. Capital, Kingston, with 48,542 inhabitants. There were (1907-8) 683 public elementary schools, with an enrollment of 88,854, and an average attendance of 53,809. There are secondary, high, and industrial schools, and four government training schools. Of the 873,029 acres under cultivation in 1907, 62,164 were under bananas, 31,178 under sugarcane, 25,547 under coffee, 10,537 under cocoanuts. Guinea grass covered 139,783, ordinary pasture 399,473, pasture and pimento 84,523. The total imports and exports in 1908-9 were valued at £2,420,335 and £2,268,253, respectively, against £2,914,013 and £2,376,202 in 1907-8. There are 184½ miles of railway, 889 of telegraph, 430 of telephone lines. The revenue and expenditure for 1908-9 are given at £1,075,389 and £1,061,496 (expenditure from income, £1,052,101, from loans £9395), respectively, against £1,021,937 and £938,204 (expenditure from income £935,384, from loans £2820), in 1907-8. The island with its dependencies (Turks and Caicos Islands, Cayman Islands [qq. v.], Morant Cays, and Pedro Cays), is administered by a governor (1909, Sir Sidney Olivier), assisted by a privy council and a legislative council.

A committee consisting of two experts sent out in 1908 to investigate the distribution of malaria and of certain cattle pests, including ticks, made its report containing certain specific

recommendations which were likely to improve conditions. The tick pest was reported as so widespread as to render the country useless for grazing purposes. By the beginning of June the rebuilding of the commercial centre of Kingston was practically restored, and the Governor expressed satisfaction at the rapidity with which the work had been carried out. During the first week in November, floods caused by heavy rains did much damage to crops, roads and bridges and inflicted a loss of life estimated at twenty.

JANNARIS, ANTHONY. A Cretan scholar and public official, died April 26, 1909. He was born in Crete in 1852. From 1883 to 1885 he was head master of the public gymnasium of Canea. In 1889 he was appointed lecturer in Greek literature in the University of Athens, but resigned this position to take part in the Cretan insurrection, which broke out in the same year. For participation in this he was proscribed by the Sultan of Turkey, and fled to London. Here he remained for six years, devoting the time to the study of Greek literature and language. He returned to Crete and was elected a member of the Cretan Assembly. He acted as correspondent of the *London Times* during the troubles of 1897. In 1907 he was appointed inspector-general of public education in Crete. He wrote numerous books and reviews, and compiled grammars and dictionaries of the Greek language. His stories of Cretan folklore are valuable.

JAPAN. A constitutional empire consisting of Honshiu, Kiushiu, Shikoku, Hokkaido, and many smaller islands off the eastern coast of Asia; together with Formosa (q. v.), the southern half of Sakhalin, the protectorate of Korea (q. v.), and the leasehold of Kwantung. The capital is Tokio.

AREA AND POPULATION. The area of Japan proper is 147,651 square miles (Honshiu, 87,485 square miles). The population (including Japanese abroad), according to the census of 1903, was 46,732,876; estimated in 1908, 49,769,704 (Honshiu, 35,460,542). On December 31, 1907, foreigners numbered 19,094, of whom 12,291 were Chinese, 2320 British, and 1647 Americans. In 1906 there were 353,274 marriages, 1,399,203 births (8.2 per cent. illegitimate), and 961,550 deaths. The larger cities, with population in 1903, are: Tokio, 1,818,655; Osaka, 995,945; Kioto, 380,568; Yokohama, 326,035; Nagoya, 288,639; Kobe, 285,002; Nagasaki, 153,293.

EDUCATION. Elementary instruction is compulsory. In 1907 there were 27,269 elementary schools, with 116,070 teachers and 5,514,735 pupils; 282 middle schools, with 5418 teachers and 100,070 pupils; 70 normal schools, with 1282 teachers and 20,268 students; 4616 special and technical schools, with 7450 teachers and 255,310 students; and various other educational institutions, including the Imperial universities at Tokio, Kioto, and Tohoku, with 512 teachers and 7400 students. Religious freedom prevails.

AGRICULTURE. About six-tenths of the population are classed as being engaged in agriculture, but, owing to the mountainous character of the country, only about one-sixth of the total area is under cultivation. The reported area under cultivation at the end of 1907 was 5,256,440 cho; under forest, 7,321,417 cho; open field, 1,204,170 cho (one cho=2.45072 acres).

The area under cultivation reported at the end of 1908 was 5,436,655 cho, some of the important crop areas being as follows: Rice, 2,922,973 cho; wheat, 1,782,401; beans, 648,064; millet, 295,760; sweet potatoes, 288,792. Although rice is the leading crop, the annual production is about 2,000,000 koku short of the home consumption (one koku=about 5.11 Winchester bushels); and Japan's population is increasing rapidly. The needs of the country

14,157,786; matches, 15,516,980; earthenware, 13,385,982; lacquered ware, 6,809,605; matting, 10,178,379; leather, 10,882,984; oil, 11,613,683. In 1908 the production of paper amounted to 280,000,000 pounds. In the shipbuilding industry, 101 vessels aggregating 79,258 tons were constructed in 1908 (against 127,752 tons in 1907).

COMMERCE. Import and export values have been in yen as follows:

	1906	1907	1908
Exports			
Merchandise	418,784,108	494,467,346	486,257,462
Precious metals	47,211,197	8,256,503	17,544,486
Total	465,995,305	502,723,849	453,801,948
Imports			
Merchandise	423,754,892	432,412,873	378,245,673
Precious metals	25,784,436	18,759,285	8,772,502
Total	449,539,328	451,172,158	382,018,175

are recognized in an effort to increase production, and the rice crop of 1909, estimated at 54,712,051 koku, was the largest on record. The crop of 1908 amounted to 51,932,831 koku; that of 1907, 49,052,065 koku; and the average for the eleven years ending 1909 was 46,286,135 koku. In 1907 the reported wheat yield was about 22,168,000 bushels; in 1908, 21,435,000; the estimate for 1909 was about 20,637,000 bushels. In 1908 the output of raw sugar was reported at 84,787,497 kwan (one kwan=8.2817 pounds); the reported production of refined sugar in 1907 was 138,835,490 catties. (See SUGAR.) Tea production in 1908 was 7,060,079 kwan and in 1907 7,367,985 kwan. Other important crops are barley, buckwheat, and fruits. The production of silk cocoons in 1908 was 2,970,727 kwan and in 1907 3,456,967 kwan; of raw silk, 2,917,500 kwan and 3,236,692 kwan, respectively. The reported number of livestock in 1908 was: Horses, 1,465,466; cattle, 1,190,373; swine, 284,708; goats, 74,750; sheep, 3501. See AGRICULTURE.

MINING. The value of the mineral output in 1908 was \$51,583,000, as compared with \$53,412,800 in 1907. The more important minerals raised in 1908 were valued as follows: Coal, \$30,981,700; copper, \$11,201,900; petroleum, \$3,237,700; silver, \$2,132,800; gold, \$2,073,000; iron, \$963,500; sulphur, \$383,400.

FISHERIES. About one-tenth of the population are dependent upon the fisheries. In 1906 the catch was valued at \$27,227,574; other sea products, as fish oil, fish manure, etc., \$16,704,554; seals and sea otters, \$12,450,000; total, \$56,382,128. A considerable whaling industry has developed since the Russo-Japanese war.

MANUFACTURES. In recent years there has been a large development in manufactures, especially textiles and iron and steel. On March 1, 1909, the estimated number of cotton spindles in operation was 1,695,879, and in construction 258,452. The mill consumption of cotton during 1908 was 878,178 bales. The values of the woven piece goods manufactured in 1908 were: Silk, 70,582,317 yen; mixed silk and cotton, 17,472,498; cotton, 79,751,250; hemp, 2,641,870; besides sashes, and other articles, making a total of 210,355,661 yen. The values of other manufactures in 1908 included: Japanese paper, 15,103,359 yen; European paper,

In 1907 and 1908, 62.2 per cent. and 64.3 per cent. respectively, of the imports were dutiable, the average rate of duty being 15.28 per cent. in the former year and 15.93 per cent. in the latter. Foreign commerce in most countries showed a falling off in 1908, as compared with 1907, and the decline in Japan was very marked. This is seen especially in the trade with Asia, the imports showing a decline of nearly 32,000,000 yen, and the exports of about 34,500,000 yen. As the imports from Asia consist largely of raw material, a decline in them indicates manufacturing depression, which in considerable degree accounts for the diminished exports. The decline in wool, raw silk, cotton yarn, and copper account for about 60 per cent. of the export shrinkage. One of the unfortunate features of the 1908 foreign trade was the fact that, while the prices of imports declined only slightly, there was a heavy fall in the prices of exports; this was especially notable in raw silk exports, the price of which was about 30 per cent. less than in 1907. That business conditions in 1908 were unfavorable is seen also in the movements of gold and silver; in 1907 the precious metal exports exceeded the imports by 10,502,782 yen, and in 1908 the imports exceeded the exports by 13,771,984 yen; the importation being required to compensate for restricted credit. The values of the principal imports in 1908 were as follows, the figures in parenthesis indicating values for 1907: Raw cotton, 90,256,289 yen (115,641,599); oil cake, 24,480,195 (21,042,122); rice, 22,688,539 (30,031,058); iron manufactures, 20,327,000 (20,910,000); sugar, 19,604,038 (19,864,956); cotton goods, 16,675,000 (15,540,000); kerosene, 15,105,200 (14,324,800); iron, 10,070,000 (14,047,000); soya beans, 10,930,671 (9,584,322); ammonium sulphate, 8,796,790 (8,227,472); woolen tissues, 8,564,077 (12,304,887); spinning machines and parts, 7,331,209 (3,842,483); wool, 6,850,177 (14,353,457); paper, 6,379,530; indigo, 5,420,604 (5,876,705); wheat and wheat flour, 5,338,923 (9,881,515); rails, 5,071,446 (3,828,502); locomotives and cars, 3,683,923 (2,933,731).

The leading export values in 1908 were: Raw silk, 108,609,052 yen (116,888,627 in 1907); silk goods, 32,201,057 (34,646,757); copper (ingot and slab), 21,255,013 (29,262,693); cot-

ton yarn, 20,723,904 (30,342,913); coal, 18,233,980 (19,052,886); cotton tissues, 14,611,374 (16,344,097); tea, 11,153,379 (12,018,244); matches, 9,468,602 (9,446,532); timber, 8,822,497 (13,334,811); waste silk, 7,872,465 (6,243,305); mats and matting, 5,765,053 (5,746,279); porcelain and earthenware, 5,078,222 (7,216,034); paper and paper manufactures, 4,783,671 (5,294,397); rice, 3,910,243 (3,664,344); refined sugar, 3,454,150 (2,591,667); sake, 3,329,262 (3,338,586); ships, 3,271,475 (4,404,310); straw braids, 3,179,890 (3,905,538); cotton underclothes, 3,105,796 (3,700,928); camphor, 2,063,410 (5,026,858). Imports and exports of merchandise by countries were valued in 1907 and 1908 as follows, in thousands of yen:

Countries	Imports		Exports	
	1907	1908	1907	1908
Great Britain.....	116,245	107,796	22,443	25,522
Germany	47,668	46,179	11,256	7,976
France	7,025	5,246	42,533	33,746
Other Europe.....	24,275	16,502	18,134	16,748
United States.....	80,697	77,637	131,101	121,997
British India.....	74,593	49,328	13,088	13,632
China	67,992	63,784	106,020	77,746
Dutch East Indies	22,039	23,965	2,261	2,123
Korea	16,372	13,718	32,792	30,273
French Indo-China	8,663	8,484	250	365
Hongkong	821	1,116	24,385	18,539
Other Asia.....	9,616	9,876	12,971	14,723
Other countries..	18,461	14,576	15,179	14,856
Total	494,467	436,257	432,413	378,248

During 1909 business conditions did not make a satisfactory recovery, although export values gained the ascendancy over import. The continuance in 1908 of the industrial and commercial depression which followed the American panic of October, 1907, was ascribed to various causes, including alleged mismanagement of the government finances, but the widespread lack of confidence was due in large measure to the exposé of dishonest practices on the part of various corporations, especially the Japan Sugar Refining Company. According to preliminary returns, imports and exports of merchandise in 1909 amounted in value to 392,646,000 yen, and 412,145,000 yen, respectively.

SHIPPING. In 1907 there entered the ports of Japan 6734 Japanese steamers, of 8,770,491 tons, and cleared 6703, of 8,756,448 tons; 2762 Japanese sailing vessels and junks, of 96,945 tons, and cleared 2771, of 97,450 tons; 4231 foreign steamers, of 11,420,162 tons, and cleared 4131 of 11,210,349 tons; and 104 foreign sailing vessels, of 40,097 tons, and cleared 97, of 38,588 tons; total: entered 13,831 vessels, of 20,336,695 tons, and cleared 13,702, of 20,102,841 tons. In 1908 there entered 13,029 vessels, of 20,310,577 tons, of which 7408 vessels (8,705,776 tons) were Japanese, 2267 (6,409,122 tons) British, and 660 (1,847,957) German. On January 1, 1909, the merchant marine consisted of 2295 steamers, of 1,160,372 tons, and 5333 sailing vessels, of 383,455 tons. In addition there were 21,460 native craft. The principal ports are Kobé, Moji, Yokohama, and Nagasaki.

COMMUNICATIONS. On March 31, 1908, there were open to traffic 4628 miles of railway, of which 4182 miles were government lines and 446 miles private; in addition there were 271 miles of government railway in Formosa; total, 4299 miles. During the year ending on the above date, the government extended its mileage by 91 miles, besides taking over (by purchase)

1246 miles of private line. During the year the government lines carried 101,115,739 passengers, and 18,312,223 tons of goods, and the private lines 39,890,322 passengers and 5,203,383 tons. The government is carrying out a plan for extensive railway improvement and construction. On March 31, 1908, there were 17,601 miles of telegraph line (90,410 miles of wire) and 3853 miles of submarine cable; the post-offices numbered 7261.

NAVY. In 1909 the larger vessels of the effective navy were: First-class battleships: One of 12,320 tons; two of 12,674 tons each; one of 12,700 tons; one of 13,516 tons; one of 14,850 tons; two of 15,200 tons each; one of 15,950 tons; one of 16,400 tons; one of 19,210 tons;—One second-class battleship of 10,960 tons;—armored cruisers: One of 7299 tons; one of 7700 tons; one of 7726 tons; one of 9436 tons; two of 9700 tons each; two of 9750 tons each; one of 9850 tons; two of 13,750 tons each; two of 14,600 tons each (the *Kurama* and *Ibuki*, completed in 1909). In 1909 there were three first-class battleships building, one of 19,800 tons and two of 21,000 tons each; and two armored cruisers of 18,700 tons each were projected. On December 1, 1909, the number and displacement of effective war ships, built and building, of 1000 or more tons, and of torpedo craft of 50 or more tons, were as follows: Battleships of 10,000 tons and over, fifteen, of 233,454 tons; coast defense vessels, three, of 18,786 tons; armored cruisers, thirteen, of 137,611 tons; cruisers over 6000 tons, two, of 13,130 tons; cruisers 6000 to 3000 tons, eleven, of 44,580 tons; cruisers 3000 to 1000 tons, seven, of 14,558 tons; torpedo-boat destroyers, fifty-nine, of 22,768 tons; torpedo boats, sixty-nine, of 6332 tons; submarines, twelve of 2152 tons; total, 191 war vessels, aggregating 493,371 tons. For the four-year period ending March 31, 1910, the naval expenditure of Japan is placed at \$133,807,000.

The battleship *Satsuma*, completed during 1909, was originally designed for 19,350 tons, as a vessel of an improved *Lord Nelson* type. After her launching in 1907, the first *Dreadnought* appeared in England, and the *Satsuma's* original plans were then changed, to make her an improved *Dreadnought*; she also had special features, suggested by experience in war. The original plans of the *Aki*, designed as a sister ship to the *Satsuma*, and launched in 1908, were greatly altered; and she was believed to be more powerful even than the *Satsuma*. The armored cruisers *Ibuki* and *Kurama*, launched in 1908, were designed as copies of the *Black Prince* type of the British Navy; but the building of the *Invincible* caused great changes to be made in their plans, about which nothing was published during 1909. The *Ibuki* had her trials; the *Kurama* was announced to be ready in the following spring. Financial difficulties affected the progress of naval construction during 1909.

The intention was also announced of building three protected 4800 ton cruisers, to take the place of the small cruisers of the *Tatsuta* type as scouts and repeating ships, as these vessels did not meet requirements in the last war. The new ships were to be built by the Mitsubishi Co., Nagasaki, the Kawasaki Co., Kobé and the Navy Yard, Sasebo. The first was to be fitted with Parsons's turbines; the two others, with the Curtis turbine.

The increased tonnage of ships, with which destroyers had to keep pace, on one hand, and also the experience gained in war led to the adoption of a type of destroyers of 1150 tons, turbines of 20,500 horse-power, and 33 knots speed. War experience proved that the present type in service, of 374 tons, 7400 horse-power, and 31.5 knots speed, could not, in bad weather, overtake a fleeing enemy, or attack with security. Besides this, the small cruisers used as flotilla guides up to the present time have been inefficient on account of lack of speed. The new large destroyers were also to be used as flotilla guides. There was in 1909, one destroyer, the *Umekaze*, in Maizuru; a second was building at the Mitsubishi shipyard; and a third, to be shortly laid down at Maizuru. They were to be ready in 1911, and resemble the *Mogami* in outward appearance, with one mast, and four funnels. The armament was to consist of 2 10-centimetre and 5 7.6-centimetre guns, with 3 torpedo tubes. The Kawasaki shipyard, at Kobé, received, during 1909, an order for several submarines, number and kind of which were not announced.

Admiral Togo retired from naval command in 1909, and was succeeded by Vice-Admiral Ijuin. He was appointed a member of the Military Council. In the manœuvres of 1909, 120 vessels of all classes took part; the operations lasted for 30 days, ending on November 17. Progress was made on the great pier building at Maizuru, which was to be finished in 1914, at the latest. Ships of 3000 tons will be able to coal alongside; depth of water at low spring tide, 6 m.

FINANCE. The monetary unit is the yen, worth 49.8 cents. Revenue and expenditure in yen are reported for fiscal year ending March 31, as follows:

	1906	1907	1908
Revenue	508,473,473	514,852,319	823,886,642
Expenditure ..	420,731,068	463,875,135	596,083,223

For the fiscal year 1909 estimated revenue and expenditure balanced at 619,797,671 yen; for the fiscal year 1910, estimated revenue, 518,929,283 yen, and estimated expenditure, 518,921,111 yen. The budget for the fiscal year 1911, submitted to the Imperial Diet by the Minister of Finance on December 18, 1909, balanced at 534,172,708 yen; the estimated ordinary and extraordinary revenue were 488,929,564 yen and 45,243,142 yen respectively; expenditures, 420,980,405 and 113,192,301 respectively. The principal items of estimated ordinary revenue were: Government business and miscellaneous (monopolies, posts and telegraphs, forests, etc.), 125,612,780 yen; saké tax, 87,781,857; land tax, 85,397,080; customs, 45,411,327; income tax, 27,501,644; business tax, 25,303,507; stamps, 24,108,159; tax on textile fabrics, 18,705,505; sugar excise, 15,243,211. The principal branches of estimated expenditure were as follows, the figures in parenthesis indicating extraordinary expenditure in addition to the ordinary: Department of finance, 200,662,191 yen (20,726,826), the principal item being service of the debt; army, 76,289,697 (10,903,731); navy, 38,992,110 (37,088,708); communications, 57,780,680 (17,918,763); home affairs, 11,611,353 (13,773,536); agriculture and commerce, 7,312,719 (7,435,

550); justice, 11,947,562 (730,516); education, 7,647,920 (1,278,671).

On March 31, 1909, the internal debt amounted to 1,084,605,508 yen; external, 1,165,701,224; total, 2,250,306,822 yen.

The total Japanese coinage (exclusive of recoinage) from the foundation of the mint in 1870 to March 31, 1908, amounted to 673,767,456 yen; on the latter date the circulation of Bank of Japan notes was 309,580,569 yen.

On December 31, 1908, the total number of banks was 2194 (with 2369 branch offices), with paid-up capital of 444,204,041 yen and deposits of 1,662,881,003 yen. The Bank of Japan (with eight branch offices), has a paid-up capital of 30,000,000 yen and deposits of 471,052,261; 46 agricultural-industrial banks had a paid-up capital of 28,620,000 yen and deposits of 8,219,649 yen; 484 savings banks (with 711 branch offices), and a paid-up capital of 291,599,745 yen and deposits of 931,050,400 yen.

ARMY. In Japan military service is universal and compulsory, liability to conscription being the lot of every citizen between the ages of 17 and 40, though actual service does not begin until the age of 20. Those that are absolutely fit for service are drawn for the active army (Geneki) spending 2 years in the infantry and 3 years for other arms, with the colors. The remainder of the 7½ year period is spent in the active army reserve (Yobi), which is followed by 10 years in the second reserve (Kobi), and then by the remainder of the period of liability passed in the territorial army (Kokumin). A recruiting reserve (Haju) is maintained to make good the waste of war and is composed of those not required for the first line. In 1909 it was believed that this might be abolished.

The Japanese army organized on a peace basis comprises 76 regiments (228 battalions) of infantry; 27 regiments (89 squadrons) of cavalry; 25 regiments (150 6-gun batteries) of field artillery; 19 battalions of engineers; 19 battalions of train; 1 brigade of railway, telegraph, and balloon troops; 6 regiments and 6 separate battalions of coast and fortress artillery, 3 battalions of mountain artillery and 2 mixed brigades of guards of Formosa, and the militia of Tsoushima for defense of the islands. No exact figures are available for the strength of the Japanese army. The total effective on a peace basis was estimated at 250,000 men, organized into 19 divisions each of 12,500 men. In time of war each could be brought up to 18,000 men and put the effective war total of the active army at 300,000 more. In addition there would be 200,000 from the reserve. The following figures were given by General de Negrier in an article on the "Japanese Forces in 1909":

Annual conscription	520,000
Active army (Geneki and Yobi)	742,800
First reserve (Haju)	382,000
Second reserve (Kobi)	780,000
Drilled men of the landstrum	115,000
Men with elementary practice	846,000

This would indicate that Japan could mobilize, put into the field and maintain, without undue effort in time of war, an army of at least 1,500,000.

In 1909 the officers in actual service numbered 10,088, reserve officers 5034, and territorial reserve officers 3060.

Further progress was made with the reorgan-

ization under the law of 1907. The 19 divisions, 18 of line troops and 1 of guards, to which the army had been increased during the Russian War, were retained, but the cavalry was increased by two additional brigades, of 1200 men each, the 3d and 4th of which were being organized at Motiska and Toyshashi. Two heavy field artillery brigades were contemplated to be equipped with 4-in. guns and 4.7-in. and 6-in. howitzers. A new model of field-gun had been developed and adopted but its introduction was postponed, as was said, for financial reasons. It fired a 14.3 pounder shell with a muzzle velocity of 1700 foot seconds.

GOVERNMENT. Under the Constitution of February 11, 1889, the executive power is exercised by the Emperor, with the advice and consent of the Cabinet Ministers, who are appointed by, and are responsible to, himself. The Emperor also exercises legislative power, with the consent of the Imperial Diet. Every law requires the consent of this body, which consists of two houses, the House of Peers and the House of Representatives. Members of the latter number 379, elected by male subjects having attained the age of 25 and possessing certain property qualifications. The Emperor in 1909 was Mutsuhito, who was born November 3, 1852, and succeeded his father, Komei Tenno, February 13, 1867. The heir apparent is Prince Yoshihito, born August 31, 1879. The Cabinet at the end of 1909 (from July 14, 1908) consisted of the following members: Premier and Minister of Finance, General Marquis Katsura Taro; Minister of Foreign Affairs, Count Komura Jutaro; Home Affairs, Baron Hirata; War, General Viscount Terauchi Masatake; Navy, Vice-Admiral Baron Saito Minoru; Justice, Viscount Okabe; Agriculture and Commerce, Baron Oura; Communications, Baron Goto; Education, Mr. Komatsubara.

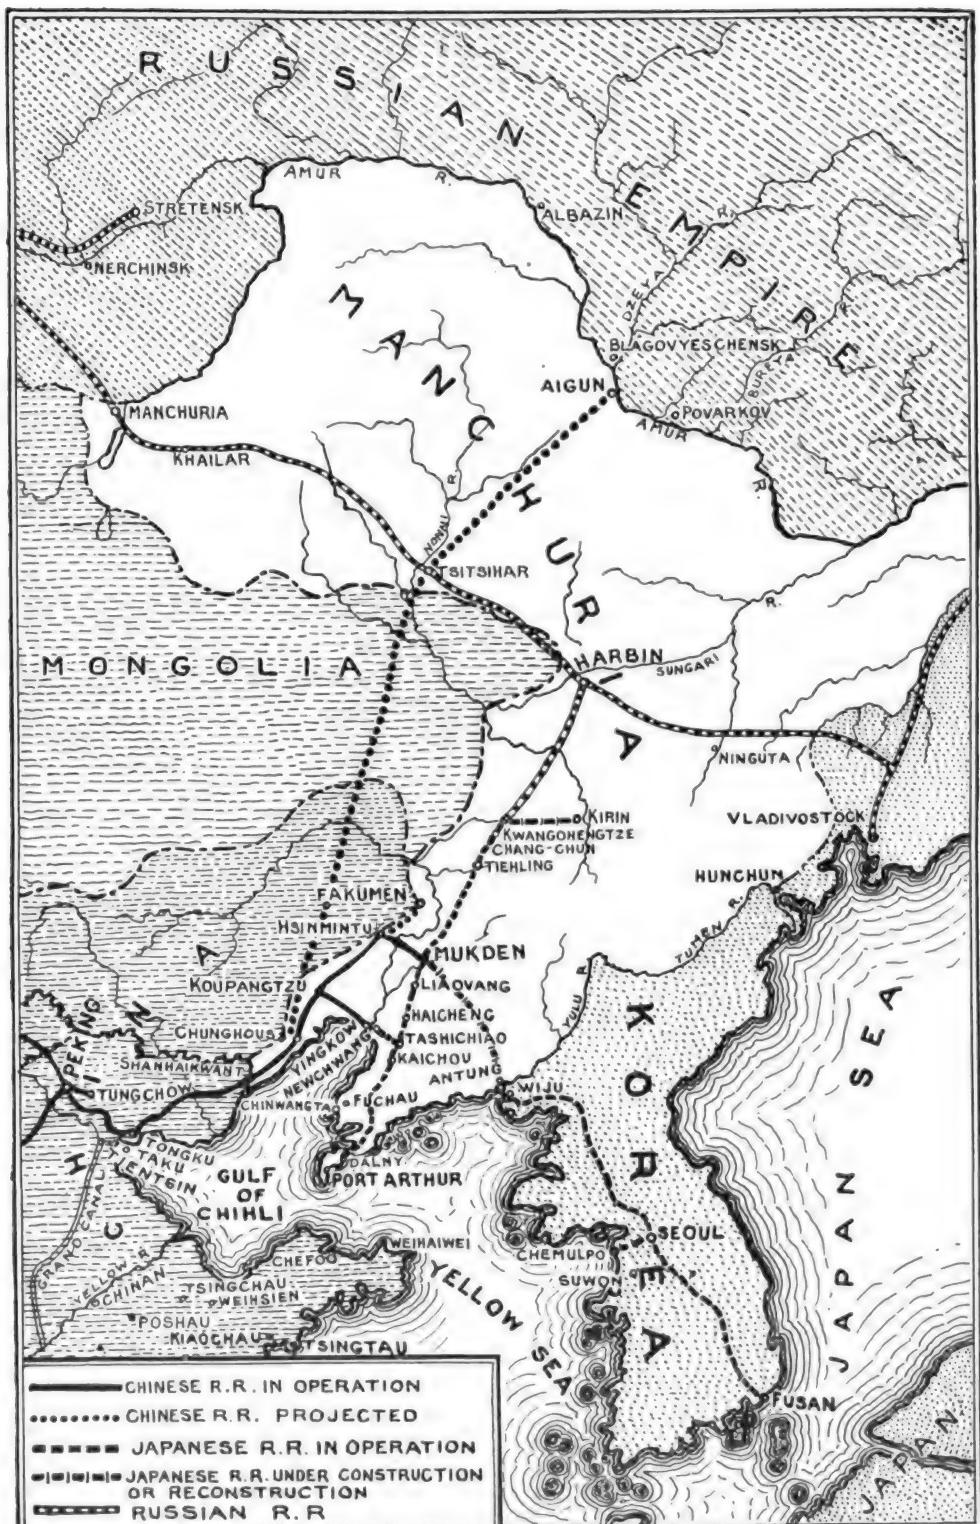

HISTORY

THE NEW PARLIAMENT. The parliamentary session began in December, 1908, but down to the new year accomplished little more than the organization of the Houses, actual business not beginning until after the recess, January 21. The distribution of parties in the lower House was as follows: Out of a total of 379 members, the Seiyu-kai numbered 192, the Progressists, 67; the Boshin Club, 42; the Yushin-kai, 44 and the Daido Club, 34. There was no consolidated opposition against the Seiyu-kai Club on account of the differences between the other groups. In general, the first four of the above parties are liberal and the fifth, that is the Daido Club, conservative. The latter are the only body that have been thoroughgoing supporters of the Ministry. The Yushin-kai are independent free lances of radical tendencies. The Boshin Club, consisting of business men admitted under the new election law of 1901, have always been on the government side, as they have desired above all a stable cabinet. The Progressists, a party of tendency rather than distinct principles, have stood ready for coalition, hoping to be the nucleus of a strong opposition party. At the end of February the ship subsidy bill passed the lower House after an amendment that limited its duration to five years. It subsidized the routes to Europe, North and South America and Australia. There was some danger of a contest between the House

and the Cabinet over the budget, but the Budget Committee finally decided to adopt the government's proposals. A matter that drew much public attention and was widely commented on in the press was the so-called Sugar Scandal. Charges of corruption made against certain deputies of the lower House in connection with the Japanese Sugar Company led to an investigation. In the spring nine deputies were arrested. Later others were arrested and at the trial, which ended on July 4, twenty-four members of the House of Representatives were under the charge of bribery and corruption. Only one was acquitted, the rest were sentenced to prison and ordered to refund the bribes. The accused belonged to all the parties in the Diet, but none were in the first rank. The corruption occurred in connection with the bill introduced by the government for a rebate of the consumption tax, in order to encourage the exportation of sugar. The measure would probably have passed anyhow, as it went through by a large majority. Some few of the accused confessed. Among these was a person who had hitherto been above suspicion, namely the former president of the American Board of Missions College in Kioto. The effect of these disclosures was greatly to shake the confidence of the public in the lower House. The main features of the budget for the ensuing year were: Tax reduction and reform, increase in the salaries of government officials, economy in administrative expenses, and an increase of the sinking fund.

FOREIGN RELATIONS. In his speech on foreign affairs, February 2, the Foreign Minister, Count Komura, referred to the solid basis on which the alliance with Great Britain rested, to the increasing intimacy of the relations with Russia, and to the satisfactory relations with France and Germany. As to the United States, he declared that the traditional friendship between the two countries would not, in his opinion, be adversely affected by the proposed anti-Japanese measures in the California Legislature. (See CALIFORNIA). As to China he expressed the sympathy of Japan with China's reform policy and Japan's adherence to the principle of the open door. The speech was attacked by Count Hattori, especially for the reference to the United States, the speaker declaring that the agreement between Japan and the United States was humiliating to the former country. But the overshadowing questions of the year concerned Japan's relations with China, which are discussed in the succeeding paragraphs.

THE FA-KU-MEN DISPUTE. The principal questions between China and Japan which were carried over from the preceding year were: (1) The Fa-Ku-Men Railway question; (2) The status of the Chien-tao region; (3) The Antung-Mukden Railway question, and (4) certain questions as to the exploitation of coal mines and a question affecting the forests of the Yalu region. China had planned the extension of the railway from Fa-Ku-Men to Hsin-min-tun, basing her rights on the provisions of the Treaty of Portsmouth which left in her hands the commercial development of Manchuria. She took steps to carry out the plan in 1907, awarding toward the close of that year the contract for construction to a British firm. Japan's side of the question may be summarised as follows: Hearing of the negotiations, Japan reminded China of the provision against doing anything

Courtesy of the "Review of Reviews."

RAILWAY MAP OF MANCHURIA, 1909

that could injure Japan's Southern Manchurian Railway and declared that this was a project for a competitive line, especially if the railway were run northward so as to divert the traffic of Northern Manchuria. Conferences had been held on the subject in 1908, but came to nothing. China contended that the line was in no wise competitive, and Japan urged that on this question she should have the benefit of the doubt. In February, 1909, Japan proposed either that China should build the line from Fa-Ku-Men to the Southern Manchurian Railway instead of to Hsin-min-tun or that Japan extend the Southern Manchurian line to Fa-Ku-Men, in which case she would withdraw her objection to China's constructing a line between Fa-Ku-Men and Hsin-min-tun, if she did not extend it beyond Fa-Ku-Men without previous agreement. See CHINA, paragraphs on *History*.

THE ANTUNG-MUKDEN QUESTION. This dispute arose over conflicting interpretations of the Treaty of Peking (December 22, 1905), under which China contended that Japan had the right to improve the road, but not to rebuild. Japan, on the other hand, wished to replace the present gauge with the standard gauge and build on a new track. The road had been used for the despatch of Japanese troops during the war with Russia and Japan was left in control of it under the Treaty of Peking, which, as interpreted by the Chinese, did not give Japan the right to make any such radical changes in the first place, and in the second place fixed a limit of time within which any changes could be made. According to the terms of the treaty to which China appealed, Japan's improvements in the road must be made within the three years following the signing of the treaty. This period expired at the close of the year 1908. After that, Japan was to retain the road during a supplementary period of fifteen years, at the expiration of which time, in 1923, China might buy the road back again if she wished. Japan deferred making any improvements in the road till the close of 1908 when she announced plans of reconstruction. Japan, on the other hand, regarded the road as a branch line of the Southern Manchurian Railway, and held that they were free to make such changes in it as they chose. In the discussion of the subject in the Japanese press, an English version of the treaty was cited as containing the word "transformation" and the Japanese writers contended that the most radical changes were permitted by the treaty; but the Chinese pointed to the original text as referring only to improvements and they took their stand also on the delay of Japan beyond the prescribed limit of three years. In July, the debate reached a very acute stage and the Japanese press contained many aggressive articles on the subject. Finally, on August 6, the Japanese Foreign Office addressed a note to the Powers holding China responsible for the delays, accusing her of an obstructive policy and of having done everything in her power to annul the Peking treaty. This declaration, however, did not discuss the main contention of China in regard to the stipulated period within which improvements must be made. Japan had been using the road for the transportation of her troops, and one cause of anxiety to China was the chance that the road might be used for military purposes. China also protested against the policing of the line by the Japanese. On August 11, the Chinese government issued its reply. It

was very mild and conciliatory in tone. It appealed to the text of the treaty and declared that Japan had exceeded the stipulated time for making improvements, but that China would not press this point; nor would she urge the evident fact that there was no economic necessity for enlarging the road. She would concede these points and would also concede the change of track. A memorandum embodying these concessions was signed by China at Mukden on August 9. Practically it indicated a complete abandonment of her position and was regarded by friendly Powers as too complete a surrender.

CHIEN-TAO DISPUTE AND OTHER QUESTIONS. A dispute had arisen as to the status of the inhabitants of Chien-tao, which is on the border between Korea and China. It had to do with the question of policing the settlements of the Koreans, Japan contending that the immigrants from Korea were under her jurisdiction; and China pointing to an arrangement whereby on entering Chien-tao the Koreans lost their nationality and became subjects of China. There was also a question as to the readjustment of the boundary. Early in the summer Japan waived her claim on behalf of Korea in the matter of the boundary, provided the other questions, including that of jurisdiction over Korean settlers, were decided to Japan's satisfaction. At this time China proposed arbitration, but it was not accepted by Japan, who held that diplomatic measures had not yet been exhausted. In July, Japan made certain other proposals, but the matter could not be adjusted. Chief among the other questions was that of the forests of the Yalu region. The right to develop that region was granted to a Chinese company with the privilege of buying at its own price the timber that was sent down the river to Antung. The Chinese held that they had paid their portion, but that the Japanese had not and they also complained of the insistence of the latter that the timber set apart by the military should be credited to their share of the capital. There were further questions as to the exploitation of the coal mines and as to the right of fishing in Korean waters. Japan offered to allow the Chinese the right of fishing off Korea in return for the right of the Japanese to fish off the Chinese coast near by, but this was refused.

Soon after the settlement of the Antung-Mukden dispute, the other questions which had been pending between the two Powers were settled in the convention of September 4, 1909. The Chinese position in the Chien-tao matter was maintained, but the other points were settled mainly in the interest of Japan. The comments on this whole Manchurian question varied greatly with the national sympathies of the writers. In pro-Japanese quarters, especially in leading English newspapers, the Japanese side was taken throughout, and on the whole the press reports were somewhat colored by pro-Japanese sympathies. On the other hand, many observers well acquainted with conditions in the Far East, condemned bitterly the policy of Japan in Manchuria as aggressive and ruthless, and characterized the course of her diplomacy throughout these disputes as resting merely on brute force, and as springing from the knowledge that China was in no condition to support her claims by war. On behalf of this view the comments of the Japanese press during the year were cited and the note of August to the Powers was characterized as virtually an ultimatum resting at

the last analysis on superior force. The following brief resumé of the Japanese policy in Manchuria is condensed from the account of a French traveler contributed to the December number of the *Revue Politique*:

Article 4 of the Treaty of Portsmouth guaranteed Chinese sovereignty in Manchuria and the policy of the open door to all the non-contracting nations. It provided that "Russia and Japan reciprocally engage not to place any obstacle in the way of any general measure applying equally to all nations, which China may undertake for the development of commerce and industry in Manchuria." In Article 6, Japan and Russia agreed to exploit their Manchurian railways only for economic and not for strategic ends. Since the war, however, Japan has steadily encroached on Manchuria and her leading newspapers and public men have plainly shown their purpose of extending a pacific conquest over the country. For example, in 1908, a prominent economic review published in Japan declared that Japan suzerainty over Manchuria must be asserted; that Southern Manchuria must be regarded as a Japanese sphere of influence and that she must have the right of property there, come what may. It was essential that Japan should have a more advantageous position in Manchuria than any other nation. This was the prevailing view of Japan's leading public men. Evidence meet the traveler on every side of the extreme activity and aggressiveness of the Japanese in Manchuria. They maintain there an army of consular agents who are to be found everywhere and whose intrusiveness is a matter of great annoyance to the other foreigners. They exert a paramount influence over the administration. They treat Mukden, so this observer says, as if it were a conquered city. He found that the two papers published there in Chinese were either directly or indirectly under Japanese control. In diplomacy they pursue a double-faced policy, playing Russia off against China. They have taken advantage of their right to guard the Southern Manchurian Railway by maintaining on it a large force of troops who constantly interfere with matters that do not concern them. The guards of the Manchurian Railway are to be found at distant points in the interior, where they run affairs in a high-handed manner. Frequent raids are made under the guise of expeditions against marauders, but these marauders are often merely imaginary. In short, the policing of the Manchurian Railway by the Japanese has been made by Japan a pretext for violating the Treaty of Portsmouth, by keeping her military in the country. In March, a Tokio paper estimated the number of Japanese in Manchuria at the beginning of the year at 63,000, of whom 14,000 were agents, officials and operatives of the railway, including those depending upon them, and the rest were merchants trading with the Chinese. The same paper congratulated its fellow-countrymen on the fact that traveling along the railroad one might feel himself actually in Japan, all the settlements in sight being so largely of Japanese character. The Chinese officials are obliged to wink at transgressions of the law by the Japanese, knowing that their government will not support them against their more powerful rival. These officials, however, do not disguise their distrust of the Japanese. After the breakdown of China in the Antung-Mukden dispute on August 16, 1909, the Chinese

resorted to their favorite weapon, the boycott, as they did in 1908 during the Tatsu-Maru affair and many of the merchants throughout Manchuria refused to buy Japanese goods. The journey along the Antung-Mukden Railway now takes two days. The plan of the Japanese calls for its reduction to eight or nine hours. The Japanese press generally upheld its government throughout the whole dispute over this railway, taking the position that China had repeatedly obstructed and delayed the negotiations and finally had imposed conditions utterly at variance with the treaty of 1905. See CHINA, paragraphs on *History*, and RUSSIA, paragraphs on *History*.

OTHER EVENTS. On October 26 Prince Ito (q.v.) was murdered at Harbin, whither he had gone to confer with the Russian Finance Committee on the Far Eastern question. He was in the company of the Russian Minister at the time. The murder took place at the railway station and was committed by a Korean, who, according to his own statement, wished to avenge his country and also had a personal grievance in that Prince Ito, while in Korea, had caused the execution of persons closely associated with the assassin. The police believed that the assassination was part of an organized plot. Many expressions of sympathy were received from foreign countries where Prince Ito was well-known and greatly respected. For fifty years he had been a leader in political affairs and was generally regarded as the foremost statesman of Japan. He was Resident-General in Korea from the latter part of 1905 to July, 1909, when he retired. During the three and one-half years of his administration he showed great energy and ability and although distrusted by the natives and by those who condemned Japan's entire Korean policy, his course was generally admitted to be moderate and conciliatory. He aimed to avoid the mistake which his predecessor had made of treating the natives with too great severity and his programme was one of progress and reform under Japanese leadership. He had long possessed the entire confidence of the Mikado. Prince Yamagata was appointed to Prince Ito's place as president of the Privy Council. A great fire occurred on July 1 at Osaka, covering an area of nearly four square miles and destroying about 11,000 houses. Many lost their lives and the destruction of property was estimated at \$2,500,000. A severe earthquake occurred on August 14 in central Japan. It extended over a wide area and destroyed between three and four hundred buildings, including many temples, and damaging a thousand more. The number of the killed was estimated at thirty and of the injured at eighty-two.

JAVA. An East Indian island, constituting the most important colonial possession of the Netherlands. Area, 48,503 square miles. Attached to Java administratively are Madura and several other small adjacent islands, the whole being officially known as Java and Madura, with an area of 50,775 square miles and a population (1905) of 30,098,008. The chief cities, with population in 1905, are: Batavia, capital of the Dutch East Indies, 138,551; Subarvva, 150,198; Samarang, 96,000. Non-white Christians (1905), numbered about 26,000. In 1906 there were 323 government elementary schools for natives, with 74,984 pupils, and 446 private schools, with 50,344 pupils, besides schools for

Europeans. In 1907 the special trade of Java (and Madura) showed imports and exports of merchandise valued at 147,704,000 guilders and 211,634 guilders respectively. See DUTCH EAST INDIES. See also FORESTRY.

Much damage resulted in September from an eruption of Smeroe, the highest volcano on the island, and at the same time in the southeastern part of Java serious floods occurred which were thought to be associated with the eruption. The estimated loss of life was 500.

JEWETT, SARAH ORNE. An American author, died June 24, 1909. She was born in South Berwick, Me., in 1849, and was educated at the Berwick Academy. She began early to write, and when hardly more than a child had contributed stories to *Young Folks*, and the *Riverside*. When she was 19 years old she sent a story to the *Atlantic Monthly*, where it was at once accepted and recognized as of unusual merit. Her first story to appear in book form was *Deephaven* in 1877. Other volumes are: *Play Days* (1878); *Old Friends and New* (1879); *Country By-ways* (1881); *A Country Doctor* (1884); *A Marsh Island* (1885); *The Queen's Town* (1890); and *The Tory Lover* (1901). Miss Jewett's stories are remarkable for the skill and delicacy with which she has delineated the characteristics of the New England villagers and coast dwellers. She wrote with a rare sweetness and simplicity. She traveled much in Europe, but the greater part of her life was spent in her native town of South Berwick. She received the degree Litt. D. from Bowdoin College.

JEWETT, SOPHIE. An American educator, died October 11, 1909. She was born at Moravia N. Y., in 1861, and was educated in private schools. From 1889 to 1897 she was instructor in English Literature at Wellesley College, and from 1897 to the time of her death was assistant professor in the same chair. She was the author of *The Pilgrim, and Other Poems* (1896); and *God's Troubadour* (1903). She edited the *Holy Grail* in 1901, and contributed other poems to several magazines.

JEWS. According to the Jewish calendar, the period from September 16, 1909 to October 3, 1910, is numbered 5670 from the beginning of Jewish history. The statistics of Jews in the world are based largely upon estimates. Only in Russia, Austria-Hungary, Germany, and a few other countries is it possible to obtain official figures. According to estimates based on the *Statesman's Year Book*, the *English-Jewish Year Book*, the *Jewish Encyclopaedia* and the *American-Jewish Year Book*, the total number of Jews in the world at the latest date available was 11,530,848. Of this number the largest portion is found in Russia, where there were something over 5,000,000 Jews. Second in order is Austria-Hungary where the Jews numbered over 2,000,000. The United States is third, with a Jewish population estimated by the *American Jewish Year Book* in 1907 at 1,777,185. In Germany there are 607,862; in Turkey, including Palestine, 463,686; in the British Empire, 380,809; in Rumania, 250,000; in Holland, 106,000; in Morocco, 100,000. Nearly every other country in the world is represented by those remaining. Below in separate paragraphs will be found mention of the chief events in the various countries in which the Jews were concerned during 1908-9.

UNITED STATES. One of the most important

political events relating to the Jews was the passage on March 1 and 3 by both Houses of Congress of joint resolutions introduced by Representative Goldfogle, which called upon the President to secure from Russia the full rights for the holders of passports, regardless of race. Congress of joint resolutions, introduced by the legislature of Rhode Island, and were introduced in the legislature of Connecticut. Oscar S. Strauss, one of the most important Jews in the country, was appointed Ambassador to Turkey by President Taft. The Federation of Jewish organizations in New York petitioned Congress for the appointment of Jewish chaplains in the army and navy, and named a committee to investigate alleged abuses of the method of naturalization.

The question of the Bible in the public schools continued to agitate the Jewish communities in a number of places. A decision was rendered in New Jersey that pupils in public schools are not compelled to participate in devotional exercises. The campaign against sectarian Christmas celebration in public schools was carried on in Baltimore and Philadelphia. Among the large philanthropic bequests was that of \$1,000,000 by the will of Louis A. Heinsheimer, of New York, to a projected federation of six of the largest Jewish charitable institutions of that city, provided federation was consummated within one year after the date of the probate of the will. A Jewish maternity hospital costing \$1,000,000 was dedicated in New York City, and several prominent Jews gave \$30,000 to the Institution for the Improved Instruction of Deaf Mutes.

A number of bills were introduced in the New York Legislature relating to enforcement of the law making Sunday a day of rest. These were designed to obviate the necessity of Jews observing that day. All these measures failed of enactment. Bills to make Sunday a day of rest also failed in California, and in Connecticut and Massachusetts there was agitation in favor of a more liberal Sunday law.

The statement made by Theodore A. Bingham, Commissioner of Police, that alien Jews make up one-half the criminals of New York City, resulted in emphatic denials and retraction of this statement by Mr. Bingham, who admitted that these statistics were faulty. An event of importance was the organization of the Jewish Community of New York as a formal body. This organization aims at the coördination of the Jewish religious, educational and philanthropic institutions of New York City. It has also a wider significance in that it aims to have general supervision over all matters relating to the problems affecting Jewish communities.

ENGLAND. The year 1908-9 was marked by several interesting occurrences relating to Jews and the Jewish faith. The Third International Congress of Religions was held at Oxford in the autumn of 1908, and was attended by many prominent Jewish scholars from all parts of the world. An interesting theory was advanced by Professor Paul Haupt, of Baltimore, that Jesus was not a Jew by race. This was energetically combated by Dr. Moses Gaster and others. A report of the educational facilities of the United Kingdom, disclosed the fact that England had twelve Jewish public schools, providing for 10,902 children. The situation of Jews in Rumania was made the subject of a memorial to the government by the Conjoint Committee of the

Jewish Board of Deputies and the Anglo-Jewish Association at the time when it was believed that the Berlin Treaty was to be revised after the developments in the Balkans. In November, 1908, the Jewish Religious Union held a notable meeting at which reports on the condition of Liberal Judaism in France and Germany were presented. Several Sunday closing bills were introduced into the House of Commons. These aimed to make Jews completely dependent upon their local authority for permission to trade on Sunday. The bills failed of passage.

FRANCE. The Jewish Consistory of Paris numbered in 1909, 3660 members. It was decided that foreign Jews may be admitted to membership if they have lived ten years in France. A Jewish Statistical Society was founded. At the conference of the Jewish French Rabbis, held in Paris in June, 1909, discussion was confined to various suggested changes in the ritual, among others the adoption of a triennial cycle for the reading of the Law.

GERMANY. The Jews of Germany continued to enjoy peace during 1908-9. Of interest is the action of the Bavarian government which decided to exclude all reference to the faith of the holder in the passports for travelers in Russia. A new museum of Jewish ceremonial objects was opened at Strassburg, and an institution for the education of Jewish defectives in a suburb of Berlin. Questions in regard to Jewish participation in the white-slave traffic caused much discussion. Dissatisfaction continued in regard to the position of Jews in the German army. Statistics showed that of some 25,000 volunteers since 1880, not one has reached the rank of officer in the reserve, although the government has officially declared this post open to all German volunteer soldiers regardless of creed. It is alleged also that often Jewish soldiers are subjected to insults and ill treatment by those placed in command over them.

AUSTRIA-HUNGARY. A department to deal with the religious interests of Jews was created by the government. The arrest of 150 suspected Russo-Jewish revolutionists at Budapest aroused much indignation. An economic boycott of Jews in several towns in Hungary was organized by the Union of Tradesmen. The Hungarian Minister of Education decided to recognize only such Jewish communities as have a rabbi at their head.

RUMANIA. Although there were no actual outbursts of anti-Semitism during the year as there were in the year previous, it was alleged that the actual repression of the Jews residing in Rumania still continued. Actions against Jews included the prohibition by the Mayor of Jassy of Jews from repairing schoolhouses. The objectionable oath, *more judaico*, is still required for the Jews by the local courts of justice in Rumania.

RUSSIA. The troubles of the Jews in Russia during the year were not so acute as in several years immediately preceding. In Tiraspol, a family of twelve Jews was murdered by peasants. Similar attacks were made in other towns in the empire. The persecution of Jews generally took the form of orders of expulsion. Jewish artisans were forbidden to reside in the capitals of those provinces which are not within the Pale of Settlement. Trials of the organ-

izers and perpetrators of the pogroms of several years ago were carried on during the year, but there were practically no convictions. Such sentences as were imposed were small. The position of the Russian Jews residing within the Pale of Settlement remains extremely unfavorable, while their condition socially and economically is most precarious. For the first time a congress of Jewish communal workers and representatives of the communities in the Pale was held at Kovno. The subject of Jewish recruits in the army furnished much discussion throughout the year. In Poland the Governor-General levied a tax of 500,000 rubles on those Jews whose sons failed to present themselves for conscription. The Yiddish drama was proscribed throughout the empire, and the Jews continue to be hampered by educational restrictions. The existing law which limits the number of Jewish students in the high schools to 10 per cent. of the total is strictly enforced. (For restriction of admission to universities, see RUSSIA, paragraph *Other Events*.) It is reported that at least 130,000 Jews in southwestern Russia alone are without any educational facilities. The government created a committee on Jewish religious education in secondary schools.

The Octobrists in the Duma decided to press the passage of a bill for the abolition of the Pale Settlement, but the session ended before any action had been taken. The Duma passed a bill, guaranteeing freedom of conscience. See RUSSIA, paragraph on *History*.

TURKEY. The great events which took place in Turkey during 1908-9 will undoubtedly have a great effect upon the Jews residing in that country, but what this will be cannot now be indicated precisely. The establishment of a constitutional régime was enthusiastically greeted by the Jews of Turkey. The Young Turks, on the whole, have been kindly disposed towards the Jews, and the new government has instituted a number of needed reforms in the case of the non-Mohammedan population. The special tax, which the Jews hitherto have been obliged to pay in lieu of military service, has been abrogated, and the army of Turkey is now open to them on the same terms as to other Turks. Reforms have also been proposed in the laws governing religion, education and taxes.

The year in Palestine was marked by efforts looking toward the completion of the Herzl Memorial Forest and the establishment of the new Jewish colony, *Ain Ganim*. Coöperative societies for the purchase of land in Palestine were organized throughout Russia. While existing restrictions on Jewish immigration to Palestine have not been abrogated, those high in authority have expressed the view that Jews should be permitted to settle unrestrictedly in the Holy Land. Announcement was made in May, 1909, that the Imperial Ottoman government intended to abolish all restrictions on Jewish immigration, and to confer full rights of citizenship on Jewish immigrants immediately after their arrival in the country.

MOROCCO. The year 1908-9 saw a turn for the better in the condition of the Jews in Morocco following the decision of the contest over the succession in favor of Mulai Hafid. The Jews continued to be penned up in separate quarters of the towns, but Mohammedans have begun to acknowledge that they have some legal rights.

**JOHN A. JOHNSON
GOVERNOR OF MINNESOTA**

Died 1909

ZIONISM AND ITOISM. Considerable progress was made during the year 1908-9 in the movement toward Zionism. In the United States Zionists were active in their work for the National Fund and for Palestinian development. At the Palestinian Triennial Conference, held at Odessa, 600 delegates attended. At the annual conference of the English Zionist Federation, held at Sheffield on January 31, and February 1, 1909, Dr. Gaster was again chosen president, but those who were opposed to his construction of Zionist policies, succeeded in electing Leopold J. Greenberg, proprietor of *The Jewish Chronicle*, as London vice-president. University Zionist societies were established at Oxford, Cambridge, and in London. In Russia there was considerable trouble, due largely to the activities of the anti-Semitic press, which asserted that the Zionists aimed at the unqualified independence of Palestine. The Minister of the Interior turned over the official supervision of the Zionists to that department which controls the non-orthodox religious sects.

The Ito, a society which is active in providing for the establishment of Jewish colonies in various countries, was active during the year. The Emigration Regulation Department, the Galveston branch of the society, carried on important work, and it was legalized in a restricted sense by the Russian government, providing it confined itself entirely to the regulation of emigration. No decision was arrived at with regard to the proposed Jewish settlements in Mexico. At the London meeting of the Society, the unfavorable report of the Geographical Commission on the proposed autonomous Jewish colony in Northwestern Africa was foreshadowed, and a plan to found Jewish colonies in Mesopotamia was supported. The Commission reported unfavorably on Cyrenaica in Tripoli as a land for Jewish colonists. At another meeting in London and at Leeds, Mr. Israel Zangwill, who is the leader of the movement, announced that the Society would now bend all its energies to establishing Jewish colonies in Mesopotamia. He expressed the hope that a number of prominent Jewish leaders throughout the world would help finance the scheme. It is believed that at least \$40,000,000 are required. In a later interview, Mr. Zangwill said that his organization would probably abandon the Mesopotamia project on account of the "incomprehensible ingratitude" with which it has been received by the Jewish press.

JOHNS HOPKINS UNIVERSITY. An institution of higher learning at Baltimore, Md., founded in 1876. In the year 1909-10 the students numbered about 700 and the faculty, 100. There were in the library 142,000 volumes. Among the changes in the faculty were the appointments of Professor F. von Piquet of Vienna, Austria, as professor of pediatrics, and of Burton E. Livingston, M. D., of the Carnegie Institution, Washington, professor of plant physiology. In 1907 the trustees decided to admit women to graduate courses and about twenty women were in attendance. Plans for new buildings of the University at Homewood have been prepared but construction will not begin until at least \$1,000,000 is available for that purpose. The endowment of the University is about \$4,500,000 and its present academic buildings, equipment and grounds are valued at

more than \$2,000,000. The president is Dr. Ira Remsen.

JOHNSON, JOHN ALBERT. An American public official, Governor of Minnesota, died September 21, 1909. He was born, of Swedish parentage, near St. Peter, Minn., in 1861. His father was of dissolute habits, and when the son was thirteen years of age, died of alcoholic dementia in a county poorhouse. Young Johnson at once left school and undertook the support of his mother. He began work in a grocery store, and later worked in a drug store, and in a general store. During these occupations he found time to read such books as fell in his way. He became, later, time-keeper for a railway construction gang. When he was twenty-five years of age, the editorship of the *St. Peter Herald*, a Democratic paper, became vacant, and the place was offered to him. Although he had done no newspaper work, his wide acquaintance and his popularity made him successful in this post. He became, in a few years, part owner of the paper. In 1894 he was nominated as a Democratic candidate for the State Senate, but was defeated. Four years later he was successful, and served as Senator in three successive legislatures. During this service he showed no especial ability, but became known as a clean, honest legislator, with much skill in securing votes. In 1902 he was defeated for the State Senate. In 1904 the Republican party in Minnesota was disrupted by internal dissensions, chiefly over the question of the taxation of railroads. Johnson, who strongly favored an increase in such taxation, was nominated for Governor by the Democrats. The division among the Republicans and his power with the Scandinavian voters won him the election by 7800 votes, although Roosevelt carried the State by a plurality of 161,000. In 1906 he was reelected by a plurality of 72,000 votes. During the Presidential campaign of 1908, Governor Johnson was the most prominent candidate for the Democratic nomination, after W. J. Bryan. He received the indorsement of the delegates of his State, and 46 votes were cast for him in the National Convention. He made no aggressive effort to secure the nomination. He had declared he would not serve another term as Governor, but he was nominated on August 19, 1908, and was elected by a plurality of 20,000 votes, although Taft carried the State by 85,000 votes. Governor Johnson, although many acts of a radical nature were passed during his administration, was regarded as belonging to the conservative wing of the Democratic party, as opposed to the followers of W. J. Bryan. By many he was considered the strongest logical candidate for the next Democratic nomination. He was a man of the highest moral character. Though not a great orator, he had a magnetism that drew men to him. His popularity in Minnesota was not limited to those of his own party. In 1907 Governor Johnson was given the degree LL. D. by the University of Pennsylvania.

JOHNSON, MARTIN NELSON. An American public official, Senator from North Dakota, died October 21, 1909. He was born in Wisconsin, in 1850, and his parents moved in the year of his birth to Iowa. He graduated from Iowa State University in 1873, and taught for two years in California. He studied law and was admitted to the bar in 1876. He served a term

in each branch of the Iowa Legislature, and was a Hayes elector in that State. In 1882 he removed to North Dakota. He was elected district attorney in 1886 and 1888, and was a member of the constitutional convention which framed the constitution of North Dakota in 1889. From 1891 to 1899 he was a member of Congress from North Dakota. In 1908 he was elected Republican candidate for the Senate at the primary election, and in 1909 was elected to that position by the legislature.

JOHNSON, SAMUEL WILLIAM. An American educator and chemist, died July 21, 1909. He was born in Kingsboro, N. Y., in 1830. He studied at the Sheffield Scientific School and at Leipzig and Munich, and in 1856, he was appointed professor of analytical and agricultural chemistry in the Sheffield Scientific School. In 1874 he was made professor of agricultural and theoretical chemistry, holding that position until 1895, when he became professor emeritus. He was the organizer of the Connecticut Agricultural Experiment Station in 1877, and was its director for twenty-two years. In 1878 he was president of the American Chemical Society. The best known of his writings are *How Crops Grow* (1868, 1890) and *How Crops Feed* (1870).

JOHNSON, WILLIAM ALLEN. An American Protestant Episcopal clergyman and theologian, died May 7, 1909. He was born at Hyde Park, N. Y., in 1833, and graduated from Columbia College in 1853. After graduating from the General Theological Seminary, he was ordained priest in 1858. From 1858 to 1862 he was rector of churches in New York State. From 1862 to 1864 he was missionary in the copper mine region of Lake Superior. He was rector of St. Mary's Church, Ballington, N. J., from 1864 to 1867, and of St. John's Church, Salisbury, Conn., from 1871 to 1883. From 1883 to 1886 he was professor of homiletics and evidences of religion, and from 1887 to 1900 professor of ecclesiastical history in the Berkeley Divinity School. From 1900 to the time of his death he was professor emeritus. He was a constant contributor to the secular and religious press for many years, and was the author of pamphlets on church doctrine of confession and other theological subjects.

JOHORE. A nominally independent state of the Malay Peninsula, at the southern extremity. Its foreign affairs are controlled by Great Britain. Area, about 9000 square miles; population, about 200,000, chiefly Malays and Chinese. Chief town, Johore Bahru. The principal imports are opium, spirits, tobacco, rice, and hardware; exports, gambier, pepper, sago, tea, coffee, and gutta-percha. The Sultan is H. H. Ibrahim.

JONES, Sir ALFRED LEWIS. An English ship owner, died December 13, 1909. He was born in 1846. He was an honorary fellow of Jesus College, Oxford. He was senior partner of the firm of Elder, Dempster & Co., ship owners. He served as president of the Liverpool Chamber of Commerce, and as consul for the Congo Free State in Liverpool. He was a founder of the Liverpool School of Tropical Medicine. He was decorated in recognition of his services to the West Indian colonies and to Jamaica.

JONES, JOHN WILLIAM. An American clergyman, historian and lecturer, died March 17, 1909. He was born at Louisa, Va., in 1836,

and graduated from the University of Virginia in 1859, and from the Southern Baptist Theological Seminary in 1860. He was under appointment as missionary to China, but on the outbreak of the Civil War enlisted as a private soldier. From 1861 to the close of the war he served as chaplain, and carried on, in that capacity, successful revival meetings among the Confederate soldiers. Following the war he served in several pastorates, and as an official of missionary societies. For several years he was chaplain-general of the United Confederate Veterans. He was secretary of the Southern Historical Society from 1876 to 1887. He edited fourteen volumes of Southern Historical Papers. Among his writings are *Personal Reminiscences, Anecdotes and Letters of R. E. Lee* (1874); *Life and Letters of R. E. Lee* (1906), and *A High School and College History of the United States*. His lectures on Lee, Jackson, and other Confederate leaders were well known.

JONES, JOSEPH RUSSELL. An American capitalist and former public official, died April 11, 1909. He was born at Conneaut, O., in 1823. He began his career as clerk in a grocery store, becoming in 1846 secretary and treasurer of a large concern in Galena, Ill. Here he became acquainted with U. S. Grant. He was elected to the Illinois Legislature, where he met Abraham Lincoln. The latter, on his election to the Presidency, appointed Mr. Jones marshal of the northern district of Illinois. He held this position until 1869, when he was appointed Minister to Belgium by President Grant. In 1875 he was made Collector of the Port of Chicago. He was an organizer of many important industrial enterprises, and was one of the pioneers in the commercial development of Chicago.

JONES, LEONARD AUGUSTUS. An American jurist, died December 9, 1909. He graduated from the Harvard Law School in 1858 and practiced law from that date until 1874 when he turned his attention to writing on legal subjects. From 1874 to 1904 he was associate editor of the *American Law Review*, and from 1904 to 1907 was editor-in-chief. His writings include treatises on mortgages, corporate bonds, pledges, liens, real property, easements, landlord and tenant, and an index to legal periodical literature. He was appointed in 1898 judge of the land court, and from that time until January, 1909, when illness compelled him to resign, he was chief judge of that court.

JONES, WESLEY L. An American public official, United States Senator (Republican) from Washington. He was born near Bethany, Ill., in 1843 and graduated from the Southern Illinois College in 1866. He studied law in Chicago, and removed to Washington Territory just previous to its admission as a State in 1889. After working in a real estate office, he began the practice of law in 1890. He took an active part in the Blaine campaign of 1884 and the Harrison campaign of 1888 and has since been active in political campaigns. He was elected a member of Congress from the State at large from 1899 to 1909, receiving the largest number of votes in the primary election of 1908 for United States Senator. He was accordingly elected by the legislature to that office on January 19, 1909.

JONES, WILLIAM. An American anthro-

pologist, killed by savage Illongots in the Philippine Islands in March, 1909. He was born in Oklahoma, of part Indian blood, about 30 years ago. His education was obtained at Hampton Institute and Harvard University. After anthropological work done in the United States for the Field Museum, he was sent by that institution in 1907 to the Philippines to carry on studies among the uncivilized tribes.

JUPITER. See *ASTRONOMY*.

JUVENILE COURTS. The year 1900 completed the tenth year of juvenile courts. First established in Chicago in 1899, such courts have been established in some form in cities throughout the United States and Europe. This movement has been most successful in the Mississippi Valley States, though Denver and Boston have also been among the foremost cities in its advance. Chicago has erected a magnificent juvenile court building, with court room, probation offices, detention home, clinic and school rooms. Philadelphia opened a model house of detention in January. It is four stories high and fireproof, has dormitories, courtroom and executive offices and cost \$164,000. A similar detention home has been constructed at Milwaukee, and one is planned at St. Louis. On January 1, a Children's Court was established in Buffalo, this being the first such court on the new lines authorized in New York State.

The lapse of ten years since the juvenile court movement was inaugurated, makes appropriate a brief summary of its principles and achievements. The essential ideas of the juvenile court are that the child should be treated differently and kept separate from the adult offender; that the court should be an agency, not simply for the punishment of the child, but for his reformation and his rescue from degradation; that the parent be made to feel a keener sense of responsibility for a delinquent child; and that the commitment of children to the common jail is unjustifiable, no matter what their offenses. In the application of these ideas, the juvenile court has adopted the method of hearing children's cases with the greatest possible degree of privacy, with the greatest possible discretion on the part of the judge, and with effort to treat each case individually. The judge has been given assistants, often the probation officers who inquire into the life conditions and antecedents of child offenders before these come to trial. Publicity is avoided; the offender cannot thus pose as a hero, and other children are less likely to imitate.

A very important adjunct of the juvenile court is the probation officer. Upon the faithfulness and efficiency of his work depends the ultimate success of the entire movement, but it is here that the greatest difficulty is met. Legislatures have been slow to recognize the necessity of providing a sufficient number of well-paid probation officers. While Chicago now has 65 probation officers, all moderately paid, New York City has only 3, all supported by private societies; St. Louis has 11, all well paid; Baltimore, and Louisville, 5 each; Cleveland, Cincinnati and Columbus, 6 each; Pittsburgh, 10; Detroit, 9; Denver and Washington, D. C., 3 each; Indianapolis, 4; Boston and Lexington, Ky., 2; and Rochester, Evansville, Muncie, and New Albany, Ind., 1 each. Some cities have probation officers without a special juvenile court. In most cities it is still impossible for the proba-

tion officers to give that careful, intimate personal oversight of each of their charges which the highest efficiency would demand. Thus the number of children per probation officer varied in 1909 from about 40 in Baltimore, to as many as 300 in Cincinnati, with an average of 100 in Chicago and 150 in St. Louis. Women, and particularly college-trained women, have proven highly efficient probation officers for wayward girls. While some judges still follow the method of fixing definite periods of probation, experience proves that an indefinite period brings better results.

The detention home is necessary in order to permit separation of juvenile from adult offenders, both before and sometimes after the court hearing. Such homes have, however, been provided as yet in only a few cities. Baltimore, for example, though ranking high in other respects, still uses its police stations for the detention of children. The belief is gaining ground that detention quarters should provide some facilities for education, play and suitable work, all done under efficient supervision.

At Chicago, a paid physician is employed to give physical examinations to child offenders, and several cities are favored with the voluntary services of physicians for such a clinic. The theory here is that juvenile delinquency is many cases due to physical defect, and can be done away with by expert physical treatment.

A summary of the ten years' experience at Chicago showed that during that time 31,257 children had passed through the court, being brought in on one of three charges, truancy, dependency or delinquency. The vast majority of these were put on probation. A study of the records of delinquents showed that over 80 per cent. of the boys put on probation were not again brought before the court up to January, 1908; but that only 55 per cent. of the girls were not again before the court up to July, 1909. These results indicate the great seriousness of the problem of dealing with delinquent girls. The inquiry also showed that of all the delinquent boys of 1903-4, who could be located, only 4.5 per cent. were found in institutions for criminals. It was revealed that some children had not been properly followed up by probation officers, that in some cases a proper balance had not been maintained by probation officers between the negative method of arousing fear and of making prohibitions and the positive method of appeal to better conduct, and that there was lack of coöperation among probation officers. In Chicago, the Juvenile Protective League has proven a most effective supplementary agency. It now has 18 paid workers; it enforces laws, forms boy's clubs and develops amusements. Recently the city has been divided into probation districts with officers of various creeds and nationalities assigned to each.

Among the problems now receiving wide discussion is the necessity of coördination in probation work. In New York and Massachusetts conferences of judges and probation officers have been introduced. A conference of judges and probation officers of the States of Ohio, Indiana, Illinois, Kentucky, Missouri, Pennsylvania and Michigan was held at Cincinnati, November 9-12. About the same time a similar conference at San Francisco led to the formation of a permanent association of probation officers. All of these conferences developed opinion favorable to the private trial as against the open one,

and favorable to intensive investigation of cases before they come to trial.

While a world-wide impetus was given to the juvenile court by its establishment at Chicago and thereafter in many American cities, the first known provision for a separate children's court was in South Australia in 1890. In 1894 such a court was opened in Toronto, Canada. The New South Wales Legislature established one in 1905, and in April, 1909, a new English law became effective. Up to the close of the year children's courts had been established at Birmingham and Edinburgh. The matter is being actively discussed in other European countries. During the year a representative body of lawyers submitted to the government specific requests embodying all the essentials of the juvenile court. While no Latin country has general provision for such courts, one has been introduced in Florence, Italy.

JUVENILE DELINQUENTS. See JUVENILE COURTS.

KAISER WILHELM CANAL. See CANALS.

KAMERUN. A German West African protectorate on the Gulf of Guinea. Estimated area, 190,000 square miles; estimated population, 3,500,000 (1128 whites in 1908, 971 of whom were Germans). Capital, Buéa. There are government and mission schools at Duala, Victoria, and Garua. Cacao and tobacco are grown, rubber and timber are exported, and a flourishing trade in ivory and palm-oil is carried on. Imports (1907), 17,297,000 marks (1 mark = 23.8 cents); exports, 15,891,000 marks. Total length of railways open and under construction, 320 miles. There are about 500 miles of telegraph lines, and a cable connects with Southern Nigeria. The budget for the fiscal year 1910 balanced at 7,208,306 marks (subvention, 5,000,000 marks). The military force numbers 149 Germans and 1300 natives. The protectorate is administered by a governor (1909, Dr. Seitz), aided by a government council of three.

KAMERUN, MOUNT. See EXPLORATION.

KAMPHAUSEN, ADOLF. A German Protestant theologian, died in September, 1909. He was born at Solingen in 1829, and received his education at the University of Bonn. As private secretary of Bunsen, he assisted the latter in his great work, *Bibelwerk*, and in 1863 he was appointed professor of theology at the University of Bonn. He took a prominent part in the revision of Luther's version of the Bible. Among his writings, which were voluminous, are *Das Lied Moses* (1862); *Das Buch Daniel und die neuere Geschichtsforschung* (1893); *Verhältnis des Menschenopfers zur israelitischen Religion* (1896), and *The Book of Daniel*, a critical history of the Hebrew and Aramaic text (1896).

KANSAS. One of the North Central Division of the United States. The total area is 82,158 square miles. The population in 1909, according to the returns of the Kansas State Board of Agriculture in that year, was 1,707,491.

MINERAL PRODUCTION. The production of coal in the State decreased from 7,322,449 short tons in 1907 to 6,245,508 tons in 1908, while the value decreased from \$11,159,698 in 1907 to \$9,292,222 in 1908. The main cause of the

decreased production was the increased production and consumption of oil and natural gas in Louisiana and mid-continent fields. The exceptionally warm weather which prevailed during the first three and the last three months of 1908 was also partially responsible for the decreased consumption of coal. In addition nearly all the larger mines were idle during April, May, and a part of June, pending a settlement of the wage scale. The shortage of labor which was experienced in 1907 in the coal mines of the State was not felt in 1908. The number of men employed increased from 12,439 in 1907 to 13,916 in 1908. There were 27 men killed and 70 injured in the coal mines of the State during 1908. The production of crude petroleum fell off in 1908 to 1,811,781 barrels from 2,400,521 barrels in 1907. The value decreased from \$965,134 in 1907 to \$746,695 in 1908. There were in the State 566 wells completed, of which 127 were dry. Kansas, with Oklahoma, forms the Kansas-Oklahoma field, which ranks second in the output of crude petroleum among the States. In the past few years, however, Kansas has declined in production, while Oklahoma has increased. The smelting of zinc is one of the important industries of the State, owing to the abundance of natural gas and the central location. Clay products are important. In 1908 they were produced to the value of \$2,248,805, as compared with \$2,370,058 in 1907. The cement industry has increased greatly within the last few years, amounting in 1908 to 3,854,603 barrels, valued at \$2,874,457, as against 3,353,925 barrels, valued at \$4,240,358 in 1907. The State ranks seventh in the production of cement. In the production of salt Kansas ranks fourth, being surpassed only by New York, Michigan, and Ohio. There were produced in 1908 in the State 2,588,814 barrels, valued at \$882,984, as compared with 2,667,459 barrels, valued at \$962,334, in 1907. Among other products are coal products, sand-lime brick, zinc red, and zinc white. The value of the mineral products of the State for the year 1908 was \$26,162,213, as compared with a value of the product for 1907 of \$29,932,608.

The production of petroleum and natural gas continued to decline in 1909.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal farm crops in the State in 1909, according to the figures of the United States Department of Agriculture, were as follows: Corn, 154,225,000 bushels, valued at \$83,282,000, from 7,750,000 acres; winter wheat, 85,478,000 bushels, valued at \$82,059,000, from 5,895,000 acres; spring wheat, 1,725,000 bushels, valued at \$1,656,000, from 150,000 acres; oats, 27,185,000 bushels, valued at \$11,890,000, from 964,000 acres; barley, 4,860,000 bushels, valued at \$2,576,000, from 270,000 acres; rye, 568,000 bushels, valued at \$426,000, from 40,000 acres; buckwheat, 14,000 bushels, valued at \$14,000, from 1000 acres; flaxseed, 385,000 bushels, valued at \$424,000, from 55,000 acres; potatoes, 7,189,000 bushels, valued at \$5,679,000, from 91,000 acres; hay, 2,652,000 tons, valued at \$15,912,000, from 1,829,000 acres. The wheat crop in 1909 was considerably larger than that of 1908, which was 76,808,922 bushels. The corn crop also was slightly greater in 1909 than 1908, when 150,640,516 bushels were raised. The oat crop increased from 16,707,079 bushels in 1908 to

27,185,000 in 1909, while the acreage increased from 831,150 to 964,000. The potato crop showed a considerable increase over the production of 1908, which was 6,419,685 bushels. Large quantities of sugar beets are raised in the State. Butter, poultry, and eggs are among the most important products. Horticultural and garden products are extensively raised. Kansas stands first among the States in the production and value of its winter wheat crop. Its production in 1909 was nearly double that of any other State in quantity and value. The number of farm animals in the State on January 1, 1910, were as follows: Horses, 1,187,000; mules, 154,000; milch cows, 737,000; other cattle, 3,260,000; sheep, 278,000; swine, 1,942,000. The wool clipped in 1909 was estimated at 1,283,840 pounds.

EDUCATION. The attendance for the school year 1909 was 392,009. The male teachers numbered 2474 and the female 10,511. The monthly salary of male teachers averaged \$60.48 and of female \$46.70. The total expenditures for education during the year were \$7,378,194. The consolidation of the rural schools, which was undertaken several years ago, has greatly increased the school population of the State. The number of counties in which high school education is made free has increased greatly in recent years.

FINANCE. The report of the State Treasurer for the biennial period 1906-08, showed a balance on July 1, 1907, of \$760,266. The receipts for the fiscal year ended June 30, 1908, were \$5,195,952. The expenditures were \$4,912,568, leaving a balance on July 1, 1909, of \$1,045,460. The tax levy for 1908 was \$2,208,322 on the assessed valuation of \$2,000,453,691. The permanent school funds of the State amounted to \$724,695. The bonded debt at the end of the fiscal year 1909 amounted to \$520,000.

CHARITIES AND CORRECTIONS. The charitable institutions of the State under its full control include the Topeka State Hospital at Topeka, the Osawatomie State Hospital at Osawatomie, the State Hospital for Epileptics at Parson, the State Home for Feeble-Minded at Winfield, School for the Deaf at Olathe, School for the Blind at Kansas City, State Orphans' Home at Atchison, Boys' Industrial School at Topeka, and Girls' Industrial School at Beloit. The total sum expended for the maintenance and repairs of these institutions in 1908, the latest year for which statistics are available, was \$147,156.

POLITICS AND GOVERNMENT. The legislature convened on January 12, and Governor Stubbs in his message recommended among other measures that should be passed by the legislature, a public utilities law. He urged the lawmakers to utilize the present railroad law as a basis and add the best features of the New York and Wisconsin laws. He praised the commission plan of government and declared that the city schools should be brought under the control of the commission. He praised the primary election law and declared it to be the most important triumph for the preservation of popular government which this generation has witnessed. He urged the consideration of some bank guaranty plan and demanded a flat two-cent passenger rate law, declaring the present statute a humbug. On January 27 Joseph L. Bristow was elected United States Senator by the legislature in joint session. Senator

Bristow was nominated at the primary elections of 1908. On February 9 a bill permitting the election of United States Senators by direct vote of the people was killed in the Senate, and on March 9 the Senate adopted the report of the Railroad Commission, which recommended that the two-cent fare bill be not passed. This ended the agitation for the two-cent fare bill in the session of the legislature. On February 18 the legislature passed a bill forbidding, under severe penalties, the sale, manufacture, or barter of any spirituous, malt, vinous or any other intoxicating liquors within the State. It repealed the provisions of the old law which permitted the sale of whiskey for scientific, mechanical, or medicinal purposes. Not even a druggist on a prescription can now sell any liquid containing alcohol. The drastic character of the law was said to have been due to friends of the liquor traffic, who hoped to make it objectionable on account of its severity. On March 6 an anti-cigarette law, which forbade the sale of cigarettes in the State, went into effect. A law was also passed on March 3 providing for a guarantee of bank deposits in the State. Attorney-General Wickersham in a written opinion held that national banks could not come under the guaranty law, notwithstanding that the latter specifically admits them so far as the State is concerned. Thereupon certain national banks of the State took the question of the constitutionality of the act into the Federal court, and in December Judge Pollock held that the law is unconstitutional, as class legislation, conferring certain advantages and privileges on one class of banks to the injury of others in competition with them. The State will apply for a rehearing before Judge Pollock, who in his opinion indicated that such a rehearing would be granted if the State desired to deny the allegations of fact contained in the petition of the national banks, which in the first hearing it had not contested. (See paragraph *Legislation* below). Measures were passed providing for government of cities of the first class and second class by a commission at the election of the voters within the city, including women. (See below.) In accordance with the provisions of this measure, Kansas City on July 14 voted to adopt a commission form of government, after having the year previous voted against it. On November 2 the city of Topeka voted to adopt the same form of government by a majority of 497. Other cities in the State which adopted the commission plan of government during 1909 were Leavenworth, Hutchinson, Wichita, and Coffeyville. A campaign for its adoption was pending in Emporia at the close of the year. On March 15 President Taft, in reply to a request from Governor Stubbs asking for his help in a controversy between rival political factions, sent a letter to the latter in which he declared that he would not permit himself to be used by any faction for the promotion of its political fortunes. See *ELECTORAL REFORM*.

OTHER EVENTS. The International Harvester Company on February 5 agreed with the Attorney-General and the Supreme Court that in addition to the fine of \$60,000 imposed upon it for its infraction of the anti-trust law and the limited ouster it will submit to the public control of its business in Kansas and the regulation of its prices by the Supreme Court or

a public utilities commission. The company is prohibited from making exclusive contracts with its agents; it is prohibited from discriminating against certain agents or purchasers of machines; it must pay the fine of \$60,000, and if the court or utilities commission find in the future that the company is charging too much for its machines or is arranging restrictions, then the court or the commission may make such orders as are necessary to bring about more equitable prices or conditions for handling the company's business in Kansas. On April 16 the Federal Grand Jury of Topeka returned an indictment against the Cudahy Packing Company of Kansas City, charging it with defrauding the government of \$80,000 by violation of the internal revenue law governing the manufacture of oleomargarine. As the result of a threat made by the State authorities that a receiver would be applied for if conditions were not improved, the Missouri Pacific Railroad urged a compromise with Governor Stubbs on November 25 with reference to improvement on the Central Branch. The Governor agreed not to ask for a receiver if the company would promise to spend \$750,000 on the Central Branch in 1910, lay 100 miles of new eighty-five pound rails and 140 miles of rock ballast.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those given below: An act was passed providing for the guaranty of deposits in State banks (see BANKS AND BANKING). A child labor law was enacted, prohibiting children under 14 years of age from working in any factory or workshop not owned by their parents, and from working in any theatre, packing house, elevator, or mill. All persons under 16 years of age are forbidden to work before 7 A. M. and later than 6 P. M. or more than eight hours a day. An act was passed providing for the government of cities of the first class (over 15,000) and cities of the second class (over 2000) by a commission, at the election of the voters within the city (including women). When adopted, the principle of the initiative and referendum may be enforced in the adoption of ordinances, and that of recall of its officers. A measure was enacted deterring the bringing of suits outside the State against persons living within the State. A measure was enacted prohibiting the sale of intoxicating liquors of all kinds, including alcohol, for all purposes, and prohibiting the drinking of such liquors on railway trains. The sale of cigarettes was prohibited, and the use of tobacco in any form by minors was forbidden. A measure was passed requiring all persons who seek to influence legislation during a session of the legislature to register with the Secretary of State, showing who their principals are, and the legislation they seek to influence. An act was passed enforcing the sale of pure foods, and an act fixing weights and measures. Maximum freight rates for railroads were established and an act was passed providing for good roads and for the supervision of roads by a State engineer. Measures were passed for the protection of people against tuberculosis and a measure was enacted providing for the suppression of tuberculosis in cattle. The code of civil procedure was revised, and an act was passed requiring railroads and other common carriers to obtain permission of the State Board of

Railroad Commissioners to issue stocks and bonds before so doing. A measure was enacted providing for the dissolution of corporations that abuse their privileges, by district courts on application therefor by the Attorney-General of the State, and for the winding up of their estate. This act also provides that the court may appoint a receiver to take charge of the estate of the corporation, not only during the litigation, but generally, and conduct its business under the direction of the court until such time as the corporate management shall change its policy and conduct its business according to its chartered privileges, when the court may return the management of the business to the corporation.

OFFICERS: Governor, W. R. Stubbs; Lieutenant-Governor, W. J. Fitzgerald; Secretary of State, C. E. Denton; Treasurer, Mark Tullay; Auditor, J. M. Nation; Attorney-General, F. S. Jackson; Adjutant-General C. L. Martin; Superintendent of Education, E. T. Fairchild; Superintendent of Insurance, Chas. Barnes—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Wm. A. Johnston; Associate Justices, Charles B. Graves, Silas Porter, Clark A. Smith, Rousseau A. Burch, Henry F. Mason and Alfred W. Bensen, all Republicans; Clerk, D. A. Valentine.

The State Legislature of 1909 was composed of 36 Republicans and 4 Democrats in the Senate, and 85 Republicans and 40 Democrats in the House. The State Representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

KANSAS, UNIVERSITY OF. An institution of higher learning at Lawrence, Kans., founded in 1864. There were in attendance in 1909 2210 students, with a faculty of 125. There were in the library 65,000 volumes. During the year \$5800 was received for industrial fellowships. Among the changes in the faculty were the appointments of three full professors, one associate professor and six instructors. A school of education was established in 1909, as well as a department of correspondence and university extension. A separate department of journalism was also established. The first wing of a new administration building, to cost \$125,000, was erected. The endowment of the University is about \$150,000 and its income about \$95,000, chiefly from the State. The chancellor is Dr. Frank Strong.

KEDA. A British possession on the western side of the Malay Peninsula, between Siam and the Federated Malay States. This territory was formerly under the suzerainty of Siam, which ceded its rights therein to Great Britain by a treaty concluded at Bangkok March 10, 1909 (see SIAM). Estimated area, 3045 square miles. According to native authorities the estimated population in 1905 was 140,000; in the following year the Adviser to the Keda government reported an estimate of 219,000, mostly Malays, although there is a considerable number of Chinese. The capital is Alor Star, which is in daily steamship communication with Penang. The principal product is rice; tapioca is also extensively cultivated, and concessions for rubber culture have been granted. The forests have been impoverished. The mineral resources have been very little exploited, though in the Kualamuda and Kulim districts

tin mining has long flourished. Estimated revenue (derived chiefly from opium) and expenditure for the fiscal year 1907 were 1,105,420 dollars and 1,031,878 dollars respectively (1 dollar = about 50 cents). Keda is nominally governed by a sultan, with a British adviser. Various branches of the administration, including the treasury, have been reorganized, and new civil and criminal codes have been formulated.

KEFIR FUNGI. A mixture of bacteria and yeast capable of causing lactic acid fermentation in milk. Kefir occurs as white, irregular roundish bodies, the size of a walnut, having a rough, furrowed surface, and a gelatinous consistency. The substance contains *Saccharomyces cervisiae*, *Bacillus acidi lactici* and *Diaspora Caucasica*. When added to milk, lactic acid is produced, as well as alcohol and carbon dioxide. The kefir fungi are used for the preparation of fermented milk, rendering the latter more easily digestible. Kefir kumys may be prepared by adding a few grains of kefir to fresh milk kept at a temperature of 70 to 80 degrees F. until fermentation becomes apparent by the rising of the grains to the surface. The grains may then be strained off and the milk left to itself, in well corked bottles, at the room temperature, to continue fermentation. See LACTIC ACID THERAPY.

KELANTAN. A British possession on the eastern side of the Malay Peninsula between Siam and the Federated Malay States. This territory was formerly under the suzerainty of Siam, which ceded its rights therein to Great Britain by a treaty concluded at Bangkok March 10, 1909 (see SIAM). Estimated area, 5500 square miles; estimated population, over 300,000, including 15,000 Siamese and 10,000 Chinese. The capital Kota Bharu, on the Kelantan River, eight miles from its mouth, has about 10,000 inhabitants. Agriculture is the chief industry, and about 450,000 acres (1907) are under cultivation. In 1907 some 500,000 cocoanut trees were productive, and 500,000 more had been recently planted. Over 10,000,000 cocoanuts a year are used for the manufacture of copra, which is an important export. Other products include rice (about 70,000 tons annually), betelnuts, rubber, rattan, bamboo, resin and gharu, tapioca, pepper, sugar, and corn. There is much grazing land, on which the state supports many cattle (90,000 head), buffaloes (20,000), sheep, and goats. Some metals are mined, especially gold, which was exported in the year 1906-7 to the value of 212,084 dollars. Besides gold, prominent exports are copra, betelnuts, paddy and rice, dried fish, cattle, hides, and rubber. The principal imports include cotton goods, provisions, kerosene, and timber. Total imports and exports in 1906-7 were valued at 1,388,435 and 1,153,948 dollars respectively. Kelantan has few roads, communication being effected largely by the rivers. There is direct steamship communication with Bangkok and Singapore. The estimated revenue in 1906-7 was 282,800 dollars, and in 1907-8 319,700 dollars. Revenue accrues from customs, port dues, taxes, royalties, and licenses. Kelantan is governed by a rajah (his office being hereditary), who is assisted by a British adviser.

KELLE, JOHANN VON. A German philologist, died February, 1909. He was born at Regensburg in 1829. He received his educa-

tion in Munich and in 1857 he was appointed professor of the German language and literature in the University of Prague. His work on Otfried includes: *Otfrida von Weissenburg Evangelienbuch* (1856); *Christi Leben und Lehre, besungen von Otfred: Aus dem Althochdeutschen uebersetzt* (1870); and *Glossar zu Otfrids Evangelienbuch* (1879). Not less important was his work on Notker. Its general aim was to prove that the writings bearing his name were not by a school or group of translators, but by Notker alone. These works include *Verbum und Nomen in Notkers Boëthius* (1885); and *Untersuchungen zur Ueberlieferung Uebersetzung, Grammatik der Psalmen Notkers* (1889). He wrote also other works on general philological subjects.

KELLY, EDMOND. An American lawyer and Socialist, died October 4, 1909. He was born in 1841 and graduated from Columbia College in 1870. After graduating he was admitted to the bar and also studied at Cambridge University, England, where he graduated with honors in science. Soon after returning from England he removed his law offices to Paris, where he became known as an authority on international marriages. He was counsel to the United States Legation in Paris and represented several large business interests. In 1890 he returned to New York and at once became prominent as a municipal government reformer. He was the founder of the City Club and his efforts had much to do with the election of Mayor Strong. He made an attempt to organize the workingmen into good government clubs, but this did not meet with success, and he returned to Paris, resuming his practice there. In 1905 he returned again to the United States. Mr. Kelly was greatly interested in socialistic work, especially in the tramp question, and one of his ambitions was to see tramp colonies established in New York State. He was the author of several books, most of them on socialistic questions. Among them were: *The Tramp Problem; Evolution and Effort and their Relation to Religion and Politics; Government and Justice; and Government or Human Evolution*. Mr. Kelly was counsel for Princess de Sagan (Anna Gould) in the divorce suit against her husband, Count Boni de Castellane.

KENNEDY, JOHN STEWART. An American banker and philanthropist, died October 31, 1909. He was born in 1830 at Blantyre, near Glasgow, Scotland, and received his elementary education in the Glasgow public schools. At the age of 13 he became an apprentice with a shipping firm in Glasgow, remaining there four years. For three years following he was in the employ of an iron and steel firm. During this time he carried on his studies, and at the age of 20 came to the United States. Here he traveled for two years for the iron business and then returned to Scotland. In 1856 he again came to New York City and engaged in the business of banking. For ten years he was a partner of M. K. Jesup and Co., and in 1868 established the firm of J. S. Kennedy and Co. This he conducted with great success for fifteen years, when he retired. Mr. Kennedy was widely known in religious, scientific, and charitable circles. His benefactions were large and varied. The best known perhaps was the gift of the United Charities Building at Fourth

Avenue and Twenty-second Street, New York City. This he gave in trust to four societies, the Charity Organization Society, the City Mission and Tract Society, the Association for Improving the Condition of the Poor, and the Children's Aid Society. The building is the charitable centre of New York City. In 1904 Mr. Kennedy gave to the School of Philanthropy of the Charity Organization Society \$250,000, and in 1905 he gave to Columbia University \$500,000, although he was not known as the donor of this gift until 1908. It was employed for the building of Hamilton Hall, the home of the collegiate department of the University. Mr. Kennedy's largest single gift, as far as is known to the public, was one of \$1,000,000 to the Presbyterian Hospital, New York, in 1908. He gave also \$400,000 for the Nurses' Home connected with that hospital. Other institutions which received gifts from him are the Lenox Library, the New York Historical Society, the Metropolitan Museum of Art, the Hospital for Ruptured and Crippled, Robert College and the American Bible House at Constantinople, and boards of Home and Foreign Missions and other boards of the Presbyterian Church. He was, at the time of his death, president of the Board of Trustees of Roberts College and chairman of the Presbyterian Hospital and United Charities Boards. Mr. Kennedy also took active interest in civic matters, and was a member of the Committee of Fifteen which, in 1901, was efficient in cleaning up the East Side of New York City. See GIFTS AND BEQUESTS.

KENNY, PATRICK L. A Roman Catholic priest and educator, Provincial of the Brothers of the Christian Schools, died November 26, 1909. The name by which he was known in the order was "Brother Joseph." He was born in Cleveland, Ohio, in 1857, and went to the schools conducted by the Brothers of Mary, Dayton, Ohio. He entered the novitiate of the Brothers of the Christian Schools at Westchester, N. Y., and after completing the course of study there taught in the grammar grades of the schools of Baltimore. He was Prefect of Discipline in Manhattan College for five years, and for the following five years was director of St. Peter's Parochial School in New York City. He then became professor of history in Tooting College, London. On his return to America he was appointed general inspector of all the Roman Catholic schools in New York City, and shortly afterwards was made director of LaSalle Academy. In 1907 he was appointed Provincial of the New York District, which extends from Halifax to Detroit. This is the highest local post in the Order. He was the representative of the American Brothers to three General Chapters of the Order held at the Executive House in Paris, and was also a representative of the Pope at the canonization of Saint Lasalle, the founder of the Order, and at the Jubilee of the present Pope.

KENTUCKY. One of the South Central Division of the United States. Its total area is 40,598. The population in 1909, according to a Federal estimate made in that year, was 2,406,859.

MINERAL PRODUCTION. Coal is the most important mineral production of the State and its mining has been a record of constant growth. In 1908 the total production was 10,245,553

short tons, valued at \$10,317,162. There was a decrease of 500,571 tons from the production of 1907, and in value of \$1,087,876. The year 1908 was the first in more than a decade in which the coal production was less than the preceding year. There were employed in the coal mines of the State during 1908 16,966 men, an increase of 25 over 1907. Kentucky is one of the most progressive States in the use of coal mining machinery. There were in 1908 750 coal mining machines in use. The State was comparatively free from labor troubles, there being only one small strike in January, which did not materially influence production. The State ranks twelfth in the production of crude petroleum. In 1908 there were produced 727,767 barrels, as compared with 820,854 barrels in 1907. The figures in the latter year, however, include Tennessee. The State produces a small amount of iron ore and has important manufactures of pig iron. There are, too, considerable manufactures of coke. The clay products in 1908 were valued at \$2,239,108, as compared with \$2,611,364 in 1907. The State is a large producer of mineral water, the production in 1908 being 797,186 gallons, valued at \$66,112. Among other mineral products are barytes, cement, lead, lime, sand, gravel, building stone, and zinc. There are also small quantities of infusorial earth, ochre and sand-lime brick. The value of the mineral products of the State for the year 1908 was \$16,141,950, as compared with a value of the product of 1907 of \$19,294,341.

The production of petroleum showed little change over 1908.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to the United States Department of Agriculture, were as follows: Corn, 103,472,000 bushels, valued at \$64,153,000, from 3,568,000 acres; winter wheat, 7,906,000 bushels, valued at \$8,776,000, from 670,000 acres; oats, 3,858,000 bushels, valued at \$2,355,000, from 40,000 acres; hay, 24,000 bushels, valued at \$18,000, from 1000 acres; rye, 165,000 bushels, valued at \$145,000, from 13,000 acres; potatoes, 3,680,000 bushels, valued at \$2,355,000, from 40,000 acres; hay, 653,000 tons, valued at \$7,771,000, from 480,000 acres; tobacco, 350,700,000 pounds, valued at \$37,174,200, from 420,000 acres. There was a great increase in the production of tobacco in 1909 over the preceding year, when only 195,600,000 pounds were produced. The acreage increased from 240,000 to 420,000, and the value from \$17,779,600 to \$37,174,200. This increase was due largely to the agreement arrived at in the latter part of 1908 between the tobacco growers and the American Tobacco Company as regards the price of tobacco. Excessive rain in the Burley district during the early part of the growing season prevented proper cultivation and damaged some tobacco planted on low lands. Later conditions, however, became more favorable. The average yield of 960 pounds per acre is 200 pounds larger than that of 1908. The price in the Burley district, 13.4 cents per pound, was 3.2 cents lower than that of 1908. The corn crop showed a marked increase over that of 1908, which was 84,823,000 bushels, while the acreage increased slightly. There was an increase also in the production of oats, which in 1908 amounted to 2,803,000 bushels. In both the

production and value of tobacco Kentucky ranks first, the value of the production being twice as great as that of North Carolina, which occupies second rank. It forms more than one-third the total for the entire country. The number of farm animals in the State on January 1, 1910, was as follows: Horses, 407,000; mules, 207,000; dairy cows, 394,000; other cattle, 665,000; sheep, 4,240,000; swine, 980,000. Since 1901 there has been a decrease in the number of horses and swine and a large increase in the number of sheep. The wool clipped in 1909 was 4,026,960 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$110,300. There were 5,389,800 pounds of fish taken. The most important in value were catfish, of which 436,100 pounds were caught, with a value of \$26,130. Next in point of value were buffalo, 529,600 pounds, valued at \$21,450; German carp, 449,400 pounds, valued at \$17,970; drum, 354,400, valued at \$16,120; mussel shells and pearls, 3,413,000 pounds, valued at \$10,750. Among other fish taken were black bass, bream or sunfish, paddle-fish, sturgeon, and suckers. There were 452 independent fishermen, and 103 wage-earning fishermen employed in the fisheries of the State. Five hundred and eleven boats were employed, valued at \$11,118.

EDUCATION. The number of children of school age in the State in 1909 was 739,836. There were enrolled in the public schools 519,192 pupils, with an average attendance of 311,192. The number of male teachers was 3892, and of female 7135. The total expenditures of the State during the year was \$5,174,297. The most important changes in the policy of education in the State during the past two years have been the establishment of county high schools in each county of the State and the adoption of a county school district law which makes the county the unit for taxation and for all other purposes, instead of the school district.

CHARITIES AND CORRECTIONS. The institutions under the supervision of the State Board of Control include the Kentucky Institution for Feeble-Minded Children, the Central Kentucky Asylum for the Insane, the Western Kentucky Asylum for the Insane, and the Eastern Kentucky Asylum for the Insane. For new equipment and permanent improvements of these institutions there were expended in the fiscal year ended June 30, 1909, \$160,534. The Board of Control in its annual report points out the need of a manual training and industrial department at the Kentucky Institution for Feeble-Minded Children.

POLITICS AND GOVERNMENT. On April 5, Boyd county, with a population of 40,000, voted for no-license by a majority of 235. As a result of this vote, 96 of the 119 counties of the State have no-license under the county unit law. On April 23 Governor Willson granted full and free pardons to former Governor W. S. Taylor, former Secretary of State Charles Finley, John L. Powers, Zach Steele, Holland Whittaker, and John Davis, who were all indicted for complicity in the assassination of Governor William Goebel in 1903, and who since that time have been fugitives from the State and under the protection of the Governor of Indiana, who has declined to honor requisitions issued to bring them to Kentucky for

trial. They were jointly charged with James Howard and Caleb Powers, who in 1908 were pardoned by Governor Willson. Governor Willson in granting these pardons reviewed all the troubles which led up to the killing of Goebel and stated that he granted the pardons because it would have been impossible to obtain a fair trial in the county where the crime was committed. He declared that from a fair, impartial, and thorough study of the reports of all the trials of these cases, he believed Governor Taylor had no part or guilty knowledge of the murder of Governor Goebel, and that he never would have been indicted but for the political excitement and the passion to prosecute every one whom excited imagination or selfish partisan interests could drag into the field of blame and abuse.

On April 5 the Supreme Court of the United States decided in favor of the Kentucky railroads, affirming the injunction order of Judge Cochran of the United States Circuit Court against the railway company in the fixing of interstate rates.

The night rider troubles in the State, which have been so acute in the past few years, were less serious in 1909 than in 1908. On April 20 a verdict for \$25,000 each was awarded to Lee Baker and Nat Frizzell, negroes, for damages on account of the Birmingham night rider raid in 1908. These men were driven out of Birmingham by the raiders on March 9, 1908, after having been severely whipped. On this raid, John Scruggs, an aged negro, and his daughter's infant child were killed with bullets. It was hoped that the conflict between the combined and the independent tobacco growers had been finally ended by an agreement made late in 1908, but in August the trouble broke out anew, when Clark and Scott, independent tobacco manufacturers of Scranton, Pa., filed suit in the Federal Court in Covington, Ky., against the Burley Tobacco Society, demanding \$135,520 in damages. The suit was filed under the Sherman Anti-Trust law, and the Burley society was charged with being a society in restraint of trade. They were charged with entering into conspiracy with certain growers to control the white Burley tobacco market in the United States. The plaintiffs alleged that in 1908 they were unable to buy the white Burley tobacco in the open market. On October 19 night riders became active again in the Burley tobacco region. Governor Willson at once ordered out the State troops and they were scattered in the counties where night rider warnings had been given.

On August 4 Judge Parker in the Circuit Court at Lexington declared the election for city officers held in 1907 void, on the ground of fraud and corrupt methods. The effect of this decision was to oust the mayor and three other officials from office. The officials, who were all Democrats, entered a motion for an appeal. All the town's twenty-six offices were contested by the Republicans, but twenty-two were dropped because it was impossible to get evidence. The court held that the Republicans did not prove that they were elected, but did prove that the election was void for fraud.

On August 5 the Lexington Railway Company was indicted by the Fayette county grand jury on five counts, for creating, maintaining, and suffering a public nuisance. The mayor

and other officials were also indicted for non-feasance in office, for permitting the alleged nuisance. The grand jury found that the street railway company had operated its system for months without needed repairs and that the mayor had failed to compel the company to comply with its contracts with the city.

Breathitt county, the storm centre of the feud troubles of the State, was agitated during the year as a result of the quarrel between the factions of Edward Callahan and Govan Smith. There were various difficulties during the year, which culminated on June 7 in the shooting of Edward Callahan, the former sheriff of the county and for years the chief lieutenant of Judge Hargis, who in 1908 was killed by his son. Troubles became so acute in the county just previous to the election on November 2 that Acting Governor Cox sent the Lexington Company of State Guards into the county to prevent rioting at Jackson, where the situation was exceedingly critical. On the eve of election the home of Mrs. Mary Deaton, where the ballots for the precinct in Jackson had been housed for safekeeping, was burned. In another section of the city one person was killed and one was wounded. At Jellico, on November 2, James Ayres was killed and several others more or less wounded during an election riot at the voting place. A feud fight took place on August 8 in Knox county, in which three men were fatally injured.

The result of the election for November 2 was favorable to the Democratic party. In Louisville the Democratic candidate for mayor was elected by a majority of about 2500. The legislature was overwhelmingly Democratic.

OTHER EVENTS. On February 12 Lincoln Memorial Hall, at Hodgenville, the birthplace of Abraham Lincoln, was dedicated with imposing ceremonies. President Roosevelt was present and made an address. Addresses were also made by Governors Folk of Missouri and Willson of Kentucky. The hall is erected on the spot where once stood the log cabin in which Lincoln was born.

OFFICERS: Governor, A. E. Willson; Lieutenant-Governor, W. H. Cox; Secretary of State, Ben L. Bruner; Treasurer, Edwin Farley; Auditor, Frank P. James; Attorney-General, James B. Breathitt; Superintendent of Education, John G. Crabbe; Commissioner of Agriculture, M. C. Rankin; Commissioner of Insurance, Charles W. Bell—all Republicans.

JUDICIARY. Court of Appeals: Chief Justice, Thomas J. Nunn, Dem.; Justices, W. E. Settle, Dem.; H. S. Barker Dem.; Edward C. O'Rear, Rep.; John M. Lassing, Dem.; John D. Carroll, Dem.; J. P. Hobson, Dem.; Clerk, Napier Adams, Rep.

The State Legislature of 1909 was composed of 22 Democrats and 16 Republicans in the Senate, and 51 Democrats and 49 Republicans in the House. The State representatives in Congress will be found in the section *Congress* of the article *UNITED STATES*.

KERENS, RICHARD C. An American diplomat, nominated in December, 1909, Ambassador to Austria-Hungary. He was born in Kilberry, county Meath, Ireland, in 1842, and was brought to the United States in his infancy. He was educated in the public schools of Jackson county, Ia., and enlisted in the Union army, serving throughout the Civil War. After the war, he

lived in Arkansas and became contractor for the Southern Overland Mail, controlling many frontier routes. During this time he resided in San Diego, California, but in 1876 removed to St. Louis, where he engaged in railroad operations and acquired many railroad interests. He was active in politics and was a member of the Republican National Executive Committee from 1884-1900, and from 1892 has been a member of the Republican National Committee. He served as one of the three United States Commissioners for the inter-continental railway commission from 1892 to 1900. He was three times voted for as Republican candidate for United States Senator.

KIAO-CHAU, or KIAO-CHOW. A harbor, town, and district on the east coast of the Chinese province of Shantung, constituting a German protectorate, leased from China for 99 years from March 8, 1898. Area of the district exclusive of the bay (about 200 square miles), 193 square miles; population, about 33,000 (white, 3858 in 1908). A neutral zone, or rather a German sphere of influence, surrounds the district and bay to a distance of 31 miles from high-water mark, embracing about 2500 square miles, with an estimated population of 1,200,000. At Tsingtau, in the fiscal year 1907, imports (exclusive of railway and mining materials) amounted to 82,374,000 marks, and exports 34,225,000 marks. A railway of 247 miles runs from Tsingtau to Tsinan, the capital of Shantung, with a branch line of 30 miles to Poshan. The railway is controlled by the Shantung Mining Company, which works coal mines at Fangtse and Poshan and iron mines at Tchin-ling-chen. For the year 1909-10 the administrative expenses of the protectorate were estimated at 12,352,597 marks. The administration is intrusted to a governor under the Navy Department.

KIDDER, BENJAMIN HARRISON. A medical director of the United States navy with the rank of rear-admiral, died October 27, 1909. He was born at Edgartown, Mass., in 1836 and was appointed assistant surgeon of the United States Navy in 1861. He served throughout the Civil War and was made surgeon in 1862. In 1887 he was appointed medical inspector and in 1903 medical director. He was retired in 1898 and was advanced to the rank of rear-admiral retired, on June 29, 1906, for services during the Civil War.

KING, WILLIAM FREDERICK. An American merchant, died February 19, 1909. He was born in New York City in 1850, and was educated in the public schools. He began as an office boy in a wholesale dry-goods house, and finally became a member of the firm of Calhoun and Robbins. Mr. King was, for several years, president of the New York Merchants' Association. He took an active part in local politics, and in 1908 filed charges of malfeasance in office against District Attorney W. T. Jerome. These charges were found without basis by R. L. Hand, a special commissioner appointed by Governor Hughes to hear the evidence. See NEW YORK.

KNOX, PHILANDER CHASE. An American public official, Secretary of State in President Taft's administration. He was born in Brownsville, Pa., in 1853, and graduated from Mt. Union College, Ohio, in 1872. He was admitted to the bar in 1875. In 1876-77 he was As-

sistant United States District Attorney for the western district of Pennsylvania. From this office he resigned and was, until his appointment as Attorney-General of the United States in 1901, engaged in the practice of law with James H. Reed under the firm name of Knox & Reed. In 1904 he was elected United States Senator from Pennsylvania. For the events connected with Mr. Knox's appointment as Secretary of State, see UNITED STATES, paragraphs *Cabinet* and *President Taft's Administration*.

KOCHER, EMIL THEODOR. A Swiss surgeon who was awarded, on December 9, 1909, the Nobel prize for medicine. He was born at Bern in 1841. He was educated in that city and after study in Berlin, Paris and London became professor of surgery in the University of Bern and director of the surgical clinic. His especial field is in operation on the thyroid gland and he first described and studied *cachexia thyropriva*. He is the author of a great number of scientific works ranging from the diseases of children to antiseptic methods in surgery. He edited the *Encyclopædia of Surgery*, published in 1901.

KOREA. The peninsula between the Yellow Sea and the Sea of Japan, constituting formerly an independent monarchy, but, since the conclusion of treaties in 1904, 1905, and 1907, a Japanese protectorate. The capital is Seoul.

AREA, POPULATION, ETC. Estimated area, 84,420 square miles; estimated population, upwards of 10,500,000. The foreign population is small, excepting Japanese, who in September, 1908, numbered 123,655 (34,639 in Seoul, 23,885 in Fusan, 13,118 in Chemulpo, and 10,458 in Ping-yang). Seoul, the capital, has probably over 200,000 inhabitants. In general the Koreans are ancestor worshipers; among the upper classes Confucianism prevails. Through the efforts of Protestant (about 200 American and British) and Roman Catholic (about 60) missionaries Korea has a larger number of native Christians in proportion to population than any other Far Eastern country. The reorganization of the primary school system has been undertaken, and new industrial and technical schools are being established. In 1909 education appeared to be making great progress. Very many primary schools were established in that year. In the promotion of education, missionary enterprise is conspicuously instrumental.

PRODUCTION, COMMERCE, ETC. About 4,500,000 acres are under cultivation, the staple products being rice and other cereals, beans, cotton, tobacco, and hemp. The ginseng industry is controlled by the government and produces a considerable state revenue. Cattle raising is important. The exploitation of the mineral deposits, including gold, copper, iron and graphite, is developing. The value of the annual gold output exceeds \$1,000,000. The total of the foreign trade including gold, silver and specie, in 1908 amounted to 63,687,114 yen, as compared with 66,467,504 yen in 1907. The imports and exports of merchandise (excluding gold and silver) were valued in 1907 at 40,050,405 yen and 17,002,234 yen respectively; in 1908, 41,025,849 yen and 14,114,510 yen respectively. The principal imports are textiles and metal manufactures. The decrease in exports in 1908 was due mainly to a decline in rice and the non-export of ginseng. The prin-

cipal exports in 1908 were valued as follows: Rice, 6,482,000 yen; beans, 3,411,000; animals, 717,000; cattle hides, 520,000; fish, 238,000. Of the imports, Japan was credited with 59 per cent.; Great Britain, 16 per cent.; the United States and China, about 10 per cent each. Of the exports, Japan received 77 per cent., and China 16 per cent.

The length of railways is about 688 miles; there are about 2900 miles of telegraph line, with some 7000 miles of wire; railways and telegraphs are owned by the Japanese government. The Japanese government has undertaken extensive highway construction and has projected several new railway lines.

ARMY. The ancient Korean army with the exception of one battalion of imperial guards was dissolved after the Japanese occupation and there are maintained two divisions of the Japanese imperial army in Korea with headquarters at Hao-seung and Yongsan. In 1909 a corps of gendarmes was formed amounting to 4000 men.

GOVERNMENT AND FINANCE. The Emperor in 1909 was Yi Chök, who was born March 25, 1874, and ascended the throne on the enforced abdication (at the instance of the Japanese) of his father, July 20, 1907. By a Japanese-Korean convention of February 23, 1904, the Korean government agreed to adopt Japanese advice in regard to administrative reforms. The Russo-Japanese peace treaty of September 5, 1905, and the Anglo-Japanese agreement of August 12, 1905, recognized Japan's paramount interests in Korea. The Japanese-Korean agreement of November 17, 1905, gave to the Japanese government the control of Korean foreign relations and provided that a Japanese Resident-General be stationed at Seoul. Another Japanese-Korean agreement, of July 31, 1907, made all administrative measures and all superior official appointments subject to the approval of the Resident-General. An agreement of July 24, 1909, provided that Japan take over the administration of justice and the management of prisons. Thus Korea has ceased to be an independent monarchy, and not the Emperor but the Japanese Resident-General is the real ruler. A permanent Japanese army is established in the country, and the police system is under Japanese direction. At the treaty ports the Japanese consuls have been replaced by Residents. The Japanese are establishing courts, abolishing extortion, and reorganizing the educational and financial systems; in fact, they are introducing reforms of every kind, at a cost to the island empire of about 25,000,000 yen yearly. The estimated revenue of Korea for the fiscal year 1910 was 21,434,723 yen; expenditure, 22,238,655 yen. The first Japanese Resident-General at Seoul was Marquis (later Prince) Ito Hirobumi (q. v.), who resigned and was succeeded in the summer of 1909, by Viscount Sone Arasuke.

HISTORY. Measures for the reform of the government continued during the year. At the close of Prince Ito's administration as Resident-General in 1909, the reforms included the abolition of the Department of Justice, the court becoming a branch of the Japanese Judicial Department, which would appoint the judges but would administer Korean laws. It was understood that while Koreans might be employed as judges, Japanese judges were to be installed if no competent Koreans could be

found. A codification of the Korean laws was soon to be made. The separate Korean department of the army was also to be abolished. The army had been disbanded in 1907. The Premier, Yi Wan Yon (q. v.) was assassinated December 22.

KWANG-CHOW-WAN. A territory on the Chinese coast, north of Hainan, leased to France in April, 1898, for 99 years. It was increased in November, 1899, by the addition of two islands commanding the entrance to the bay. Total area, 386 square miles; population (1906), 177,097. In 1906 imports and exports amounted to 2,350,248 dollars and 1,911,835 dollars respectively (the dollar is worth about 50 cents). The port is free. The territory is under the authority of the Governor-General of French Indo-China. The administrator-in-chief (1900) was M. Dufrénil.

KWANTUNG. A Japanese dependency, occupying the southern part of the Liaotung Peninsula (Manchuria), leased March 27, 1898, by China to Russia for 25 years and transferred by Russia to Japan December 22, 1905. Area, 1221 square miles; population in 1907, 405,685, of whom 381,130 were Chinese and, exclusive of army and navy, about 25,500 Japanese. In the southern part of Kwantung are Port Arthur and Dairen (formerly Dalny), which had respectively in 1908 5882 and 18,967 Japanese inhabitants. The principal products of the territory are corn, millet, rice and other cereals, tobacco, hemp, and vegetables. Since the Japanese occupation, various industries have been established, notably salt works, salt being abundant in the territory. Kwantung is a customs district (since July 1, 1907) of the Chinese Maritime Customs. The customs port is Dairen, which has a fine, ice-free harbor protected by a 1000-yard breakwater. The trade is largely with Japan. The budget for 1909-10 balanced at 4,879,489 yen. The Japanese Governor-General commands the troops, has a general direction of political and administrative affairs, and protects and controls the Japanese railways in Southern Manchuria.

LABOR, AMERICAN FEDERATION OF. No doubt the most important feature of the Federation's activity during 1909 was the continuance of the suits growing out of the injunction secured by the Bucks Stove and Range Company. This injunction, first issued by the Supreme Court of the District of Columbia, on December 23, 1907, and made permanent March 23, 1908, was in restraint of a boycott then being carried on by the Federation against that company. The Federation officials were then charged with violating the injunction, convicted late in December, 1908, and sentenced to imprisonment. Appeal was then taken to the Court of Appeals of the District of Columbia in two suits. One, to test the validity of the original injunction, was decided March 11 by a restriction of the extent of that order; the other, in the contempt proceedings, was decided November 2, the sentences of imprisonment being sustained. This latter case was then taken to the Supreme Court of the United States on a writ of *certiorari* granted on December 6. For further details see INJUNCTION.

A noteworthy phase of the development of the Federation during the past two years has been the organization of the Building Trades Department. Begun in 1907, this Department had, in June 1909, secured the affiliation of 20 inter-

national unions, 2 State councils, and 120 local councils, the latter including practically all the larger cities of the country. This movement followed the failure of the National Building Trades Council and the later Structural Building Trades Alliance to effect a large and solid organization. It resulted in the formation of building trades sections of the central labor unions of New York, Boston, Cleveland and other cities. This Department aims to so extend its affiliations that there will result a central body controlling every branch of the building trades. It performs the difficult and delicate task of adjusting trade disputes, both with employers and with other unions. The overlapping of work has been a constant cause of trouble for both public and employers; this department assists in defining the jurisdiction of each affiliated union. Progress in these trades, as in most others, has taken the direction of reducing the proportion of skilled to unskilled workmen; at the same time new trades have developed; both of these have raised frequent difficulties in the adjustment of the relations of men to employers and of trades to one another.

The Federation has striven to extend the use of the union label by its affiliated bodies. At the various annual conventions the value of union labels, buttons and store cards has been emphasized and resolutions adopted expressing the adherence of the membership to these devices. On March 29, 1909, following a call by President Gompers, 52 representatives of labor organizations using the union label in some form met in Washington, D. C., to form a Union Label Trades Department of the Federation. An attempt had been made previously to secure the adoption of a general label to be used by all the affiliated unions, but unsuccessfully. This was owing to the fact that those unions who had secured the general recognition of their label were unwilling to discard it for a new one. The new Union Label Department will endeavor to induce more unions to adopt a label, and to impress upon the public the advantages of using goods bearing the union label, sold by stores displaying union store cards, and delivered by carriers wearing a union button. It is interesting in this connection to note that no court decision adverse to the use of union labels has been made, although 42 States protect such from counterfeiting.

At the annual convention held at Toronto, Canada, during the week of November 15, Samuel Gompers was again unanimously elected president. The enthusiasm of this relection was doubtless due in part to the impending sentence of imprisonment resulting from the violation of injunction. While there was no open opposition to President Gompers, as there had been in 1907, there does exist considerable dissatisfaction with his administration. His great ability as an organizer and political strategist are conceded, but it is believed by many that he has not taken up quickly enough with the newer methods of industrial consultation and arbitration but has clung too tenaciously to the more warlike methods of strike and boycott.

In his annual report President Gompers laid stress on the success of the policy of resistance to wage-reduction, since the crisis of 1907. He emphasized the importance of securing legisla-

tion from Congress defining the status of trade unions under the Sherman Anti-Trust act. He stated that few suits for recovery of damages had been brought since the decision of the Supreme Court in the case of *Loewe v. Lawlor*, (see BOYCOTT) but that the liability to fine to the extent of three-fold the damages and imprisonment in case of a strike was a great menace to the progress of trade unionism. In fact, he declared, the very existence of a labor union may now be considered as due mainly to the tolerance of governmental authority. Among other legislation that President Gompers urged as necessary were included an extension of the eight hour law so as to include all employees of the government and all employees of contractors and sub-contractors doing work on behalf of the government; an extension of the act of May 30, 1908, so as to provide automatic compensation for accidents to all employees of the national government and to all persons engaged in dangerous trades subject to the jurisdiction of that government and in interstate commerce; the erection of the Department of Labor as an independent department of the national government; and extensive regulation and restriction of immigration.

The convention adopted unanimously the report of a special committee on industrial education strongly favoring public provision therefor. It decided in favor of affiliation with the International Secretariat (see TRADE UNIONS, France). It indorsed the policy of making war upon the United States Steel Corporation (see STRIKES AND LOCKOUTS). It created increased facilities for the unionization of the unorganized workers. The next convention will meet at St. Louis in November, 1910. See INJUNCTIONS, BOYCOTT, and TRADE UNIONS.

LABOR LEGISLATION. The laws enacted by the 42 State legislatures holding sessions in 1909 with reference to several important features of labor legislation are here summarized:

INDUSTRIAL INSURANCE. The question of providing some systematic scheme of industrial insurance, whereby the losses due to accidents may be borne by the industry or by society at large, and whereby workmen may make provision for pooling those losses due to sickness, old age, invalidism, and unemployment, is receiving attention in all industrially developed communities. In New York, Minnesota and Wisconsin, commissions were appointed to report on this subject. Montana provided that a fund should be raised by employers contributing monthly one cent for each ton of coal mined and employees one per cent of their earnings to provide compensation in cases of accident in coal mining. Compensation ranges from \$3000 in case of death, to \$1000 for loss of an eye or limb, and to \$1 per day for twelve weeks for temporary disablement. Maine and New Jersey provided that life insurance companies may issue insurance to workmen at reduced rates where as many as 100 employed by the same firm take out policies. In Massachusetts it is now possible for ten per cent. of the employees of any firm to present a plan for compensation; if approved by the board of conciliation and arbitration it becomes operative. Under this law a pension fund was established by the Boston and Maine Railroad. See OLD-AGE PEN-
SIONS.

EMPLOYERS' LIABILITY. The agitation for accident insurance as noted above has been at-

tended by the widest discussion of employers' liability. An extensive general liability law was enacted in Maine making the employer responsible for injury due to his own negligence or that of anyone of several classes of agents, provided the employee was exercising due care; the act applies to all trades, except domestic servants and farm laborers injured by a fellow servant and persons employed in logging. In New Jersey the employers' liabilities are increased by reducing the risks assumed by the employee to those that remain after the safety regulations of the State have been complied with. In Idaho the "fellow-servant" doctrine was modified by making the employer responsible for acts done by any employee under instructions or regulations; this applies to all transportation industries and includes railway engineers and train dispatchers. Similarly in Indiana, Massachusetts, Michigan, Minnesota, Mississippi, Ohio and Texas the doctrine of contributory negligence was so modified as wholly or largely to relieve railway employees engaged in running trains.

EMPLOYMENT BUREAUS. An employment bureau was established in Indiana under the Bureau of Statistics; and in Oklahoma under the Commissioner of Labor. In Michigan the number of free State bureaus was increased from 5 to 8. In Massachusetts classified lists of those wishing work must be supplied to towns and cities weekly. Several States restricted and regulated the activities of private bureaus. California and Missouri required that they be licensed, and provided for their inspection by the State Commissioner of Labor. Colorado reduced the license fees of private bureaus and at the same time reduced the fees they may charge. Illinois and Indiana passed elaborate laws for the regular inspection of private agencies and the penalizing of false entries or other frauds or violations of numerous regulations. Utah required the licensing of private bureaus, limited their fees to 8 per cent of the first month's wages, and penalized false entries and notices.

UNEMPLOYMENT. New York and Wisconsin provided for thorough inquiries on the state of unemployment. Texas and Utah provided for the punishment as vagrants of all persons physically able to work but idle and having no visible means of support.

HOURS OF LABOR. Arizona established an eight hour day for hoisting engineers at mines, furnace men at smelters, and laundry employees; California, for all persons working underground or at smelters; Idaho, for all persons engaged at ore reduction works of any description; Nevada, for employees in plaster or cement mills, or men in open-pit and open-cut mines; Washington, for coal miners, but not for those mine-employees engaged in transporting miners in and out of the mines; Wisconsin, for all persons employed on any public works; Wyoming, for all persons working underground and all those in mills for the reduction and refining of ore. Missouri repealed its eight-hour law in so far as it applied to telegraphers and train dispatchers. South Carolina modified its sixty-hour per week law for cotton mills by allowing eleven hours in a single day, or even more to make up lost time.

HEALTH AND SAFETY. In 1909 Arizona, California, Colorado, Connecticut, Illinois, Minnesota, Missouri, New York, South Carolina and

Texas enacted additional regulations for the dogs with *B. coli* and *B. proteus* and found that putrefactive products increased in the urine, but these were reduced by feeding the animals with lactic acid bacilli. The bacillus recommended by Metchnikoff, and named by him, *Bacillus bulgaricus*, is widely distributed in nature, occurring normally in human faeces, in the faeces of cows and horses, in many sour acid and aromatic foods, in normal saliva and gastric juice, in various fermented milks, in ordinary milk and in soil. It is best cultivated in milk, or media composed of whey, peptone, and glucose. In milk it may produce more than three per cent. of acidity; the acid being composed approximately of 6 per cent. volatile and 94 per cent. lactic acid. Its disagreeable taste led Metchnikoff to advise the use of the paralactic bacillus (*Streptococcus lacticus*) in combination with the Bulgarian bacillus. Herter and Kendall, as the results of their experiments assume that the lactic acid of sour milk enforces the enfeebled action of the natural intestinal lactic acid bacteria, and increases the amount of acid produced when it exists in insufficient quantities, and thus assists the intestine to overcome and eliminate "wild races" of bacteria which may have become established in the intestinal tract.

LABUAN. An island off the northwest coast of Borneo, belonging to Great Britain and administered by the Governor of the Straits Settlements. Area, 30½ square miles; population (estimated 1901,) 8411, mostly Malays from Borneo. Capital, Victoria, 1500 inhabitants. Extensive coal beds exist. The budget is included in that of Singapore.

LACROSSE. See CHILD LABOR and WOMEN IN INDUSTRY for legislation referring to child and female workers.

LABUAN. An island off the northwest coast of Borneo, belonging to Great Britain and administered by the Governor of the Straits Settlements. Area, 30½ square miles; population (estimated 1901,) 8411, mostly Malays from Borneo. Capital, Victoria, 1500 inhabitants. Extensive coal beds exist. The budget is included in that of Singapore.

LACROSSE. There was no apparent increase in the popularity of lacrosse in the United States in 1909. Canada still remains the chief centre of the sport. The contest in the Dominion for the championship of the National Amateur Lacrosse Union proved most exciting. The Montreals and the Shamrocks, both Montreal clubs, were tied at the close of the scheduled season with 9 victories and 3 defeats each. In the play-off the Montreals won by a score of 5 to 1. The Westminster team which held the Minto Cup successfully defended it against the Regina Club and was therefore again ranked as the world's championship team. In England Oxford and Cambridge played their seventh annual contest, the latter winning by a score of 8 to 6. The championship of the United States Intercollegiate Lacrosse League was won by Johns Hopkins University in the Southern Division, while Harvard and Columbia tied for first place in the Northern Division. The standing of the teams in the Southern Division was: Johns Hopkins, won 3 games, lost 0; Swarthmore, won 2, lost 1; Stevens Institute, won 1, lost 2, and Lehigh, won 0, lost 3. In the Southern Division, Harvard and Columbia each won 2 and lost 1; Hobart won 1, lost 2, and Cornell won 1, lost 2.

LACTIC ACID THERAPY. Since the publication of Elie Metchnikoff's book, *The Prolongation of Life*, with its attempt to establish a definite causative relation between intestinal putrefaction and bodily decay, and its insistence upon the value of fermented sour milk as a preventive of such putrefaction, many observers have studied the subject. Metchnikoff's theory is briefly that senility is hastened by autointoxication arising from the absorption of the products of intestinal putrefaction; that the anaerobic group of bacteria, chiefly *B. aerogenes capsulatus* (*B. Welchii*), are mostly engaged in producing this putrefaction; and that the ingestion of lactic acid producing bacteria, preferably *B. bulgaricus*, will counteract such putrefaction and thus prolong the span of life. Among other investigators, Cohendy took cultures of a bacillus, isolated from the Bulgarian fermented milk, *Yahourth* or *Yoghurt*, and was able with these to reduce intestinal putrefaction materially. He found the bacillus in the faeces for several weeks after discontinuing its administration. Lissier used cultures of Kozai's *B. acidi paralactici* with success; Herter fed

Commercial buttermilk varies in acidity and fat contents. If butter is made from sweet cream, the buttermilk contains very little acid. The amount of fat in buttermilk depends on the thoroughness of churning. The souring of the cream previous to churning may be due to natural processes, or brought about by the use of "starters" or artificial cultures. In the natural process *Streptococcus lacticus* is the usual agent producing acidity; but may fail to give good results if the bacteria are present in excessive quantities. With the commercial "starters," unpleasant flavors are avoided, and the cream may be pasteurized before inoculation, thus killing off foreign bacteria. Buttermilk is sour milk from which the butter fat has been partially removed. Most commercial buttermilk is made by inoculating separator milk or skimmed milk with "starters" and churning after coagulation has taken place. A pleasant and wholesome beverage may be made at home by keeping good milk at the room temperature for 2 or 3 days and then thoroughly shaking it. Of late years a number of preparations for the home production of buttermilk have been marketed under trade names, such as Lactobacelline, Fermenlactyl, Kefilac, Yogurt, Lactone, etc. As to the therapeutic value of sour milk the testimony is not at all convincing. Appendicitis, tropical dysentery, typhoid fever, and other intestinal diseases are said to have been cured or benefited; in particular intestinal putrefaction, intestinal autointoxication, and certain nervous and digestive derangements, are reported to be favorably influenced. For a full discussion of the subject, see an article entitled "Lactic Acid as an Agent to Reduce Intestinal Putrefaction," by P. G. Heinemann, Ph. D., in the *Jour. of the Am. Med. Assoc.* for January 30, 1909.

LADRONE ISLANDS, or MARIANNE ISLANDS. A group in the Pacific, north of the Caroline Islands. Excepting Guam (q. v.), they belong to Germany, being administratively attached to German New Guinea, and have an area of 250 square miles and a population (1904) of 2646. The local seat of government

is on the island of Sarpan. Imports and exports in 1906 amounted to 238,000 marks, and 56,000 marks respectively.

LAFAYETTE COLLEGE. An institution of higher learning at Easton, Pa., founded in 1832. The attendance in 1908-9 numbered 453 undergraduate students, 16 graduate students, and 44 members of the faculty. There were 35,000 volumes in the library. During the year \$47,487 were received towards the endowment. The total productive funds of the college amount to about \$790,000. The total income is \$160,000. The president is Rev. E. D. Warfield, LL. D.

LAFFAN, WILLIAM M. An American newspaper publisher and editor, and art connoisseur, died November 19, 1909. He was born in Dublin, Ireland in 1848, and was educated by private tutors and at Trinity College, Dublin. After his graduation from Trinity he studied medicine at St. Cecilia's School of Medicine. When he had completed his early studies he became artist to the Pathological Society of Dublin as a result of his interest in art and kindred subjects. The possibilities of journalism attracted him strongly and in 1868 he went to San Francisco where he began newspaper work as a reporter. He became city editor of the San Francisco *Chronicle*, and later managing editor of the San Francisco *Bulletin*. From San Francisco he went to Baltimore early in 1870 and worked as a reporter and editor until he became editor and half owner of the Baltimore *Daily Bulletin*. He subsequently acquired full ownership of this paper and of the *Sunday Bulletin*. To the paper he contributed illustrations as well as stories and editorials. After a short time the *Daily Bulletin* was merged in the *Evening Bulletin* and in this paper Mr. Laffan engaged in a fight against the political ring which at that time controlled the city government of Baltimore. For a short time following he left newspaper work and became general passenger agent of the Long Island Railroad. He attracted the attention of Charles A. Dana and in 1877 became connected with the New York *Sun* as a general writer. He devoted a considerable part of his work to essays and criticisms on art. In 1881 he became artist of Harper and Brothers, and remained in that capacity, and as the agent of Harper and Brothers, London, for three years following. He became in 1884 publisher of the *Sun*. He started the *Evening Sun* in 1887 and in 1900 he purchased from the estate of Charles A. Dana its interest in the *Sun* and was elected president of the Sun Printing and Publishing Company, continuing as the active head of this newspaper until his death. He founded and was the head of the Laffan News Bureau, which distributed news to different newspapers in the country. Mr. Laffan had wide interests outside of journalism. He modeled in clay, painted in oils and water colors and had considerable skill in etching. He was one of the most active of the trustees of the Metropolitan Museum of Art and was a member of its Committee on Acquisition. He was an expert in porcelains, and in 1905 he edited the catalogue of the Chinese Porcelain in the Morgan Collection at the Metropolitan Museum of Art. He edited also in 1906 *Chinese Porcelain in the Metropolitan Museum of Art*. In the same year he edited *Oriental Porcelain*. Among his other writings was a

work on *American Wood Engravers*, which was published in 1883. He had a keen interest in and knowledge of archaeology, pottery, antique art and kindred subjects. Mr. Laffan was one of the founders of the Tile Club, afterwards merged in the Salmagundi.

LAGERLÖF, SELMA. A Swedish author, awarded on December 9, 1909, the Nobel prize for literature. She was born at Marbackagord, Värmland, in 1858. She began her career as a teacher and was engaged in this work from 1885 to 1895. Her first work was *Gösta Berlings Saga*, which was a collection of old Swedish stories, published in 1891. It was immediately successful and placed the author at once in the foremost rank of Scandinavian writers. In 1897 appeared her great romance, *The Miracles of Antichrist*, which won immense praise for the brilliancy of fancy and glowing portrayal of country life, and sharp detail of character which characterized it. Among other works are *From a Swedish Homestead* (1901); *Jerusalem* (1901-2); *The Christ Legend* (1904).

LAKE CHAMPLAIN CENTENARY. See CENTENARIES AND ANNIVERSARIES.

LAKE MOHONK CONFERENCE. See ARBITRATION, INTERNATIONAL.

LAMOREUX, SILAS WRIGHT. An American public official, died August 5, 1909. He was born in Madison county, N. Y., in 1843 and received his education there. In 1852 he removed to Wisconsin. At the outbreak of the Civil War he enlisted in the Wisconsin volunteers, serving throughout the war. He served one term as State Senator and was County Judge from 1879 to 1893. From 1893 he was Commissioner of the General Land Office of the United States.

LANDS, PUBLIC. The public lands of the United States, not including Alaska, included in 1909, 731,354,081 acres, which is confined largely to the mountain ranges and the arid and semi-arid plains, and some lands within the Indian reservations. In Alaska there are 368,035,975 acres of undisposed land. The public domain in 1860 included 1,055,911,288 acres. Much of this land was granted to railways and new States, when admitted, for schools and other purposes.

A revision of the principal land statutes, which were enacted over twenty-five years ago, has long been considered necessary, and Mr. Ballinger, Secretary of the Interior, in his annual report strongly recommends such revision. These acts include the Homestead act, the Pre-emption and Timber Culture act, the Coal Land and the Mining acts. As a result of defects in these laws, a large part of the natural resources of the country passed into the hands of land pirates and speculators who had no view to development. Millions of acres of timber and other lands have been unlawfully obtained and actions to recover such lands have in most instances long since been barred by the statute of limitations. Under the administration of President Roosevelt, Secretaries Hitchcock and Garfield vigorously prosecuted the perpetrators of many of these frauds and secured the conviction of hundreds. As a result of this awakening the public mind has grasped the importance of safeguarding the further disposition of our natural resources in the public lands in the interest of the public good as against private greed.

Mr. Ballinger points out the necessity of classifying the public lands into various clearly defined divisions, according to their principal value or use. They have generally been classified as agricultural, mineral, desert, timber and coal lands. Special legislative authority should be given to classify and segregate public lands into well defined divisions according to their greatest apparent use, with the continuing power of reclassification to meet changed conditions and the increased knowledge of their character which may necessitate the transfer of lands from time to time from one class to another. Full legal effect should be given such classification when made so as to prevent entries under laws applicable to one class of land belonging to another class except after application for and a review of the classification. The policy of leaving to the self-interest of applicants the option to claim a particular tract of land as more valuable for mineral, agriculture, timber, phosphate, oil or gas, or for power sites, has resulted in the greater part of the difficulties of the Interior Department in administering the public domain.

COAL LANDS. The Secretary of the Interior recommends that the present coal land laws respecting the States and Territories, as well as Alaska, should be supplanted by an act fully meeting existing as well as future conditions. He declares that the inducements for much of the fraud and crime, both constructive and actually committed under the present system, can be prevented by separating the right to mine from the title to the soil. The surface would thereby be opened to entry under other laws according to its character, and subject to the right to extract the coal. He advocates the leasing or sale of the coal deposits in the lands, subject to forfeiture for failure to exercise the rights guaranteed under such reasonable regulations as may be imposed. These suggestions apply also to the disposition of oil and gas fields in the public domain. On April 10, 1909, Mr. Ballinger changed the system of classification and valuation for the disposition of coal lands under existing laws. The coal deposits are divided into four classes in accordance with their fuel value and the thickness and depth of the coal beds. The prices of the land are determined on the basis of an estimated tonnage and range from one-half a cent to three cents per estimated ton in accordance with the quality, thickness and situation of the coal. Up to November 1, 1909, 31,872,171 acres of coal land had been withdrawn from coal entry pending examination and classification, while 11,862,578 acres had been withdrawn from all entry pending classification. Field work on these has been completed. There had been classified and restored 35,915,255 acres. These coal lands were in the States of Wyoming, Washington, Utah, Oregon, Montana, New Mexico, Colorado, South Dakota and North Dakota. As a result of this new basis there was a gain in the value of the lands from April 10 to October 1 of \$94,810,536.

SEMI-ARID LANDS. Congress by an act of February 19, 1909, authorized the classification and entry of semi-arid lands. The Department of the Interior through the Geological Survey has, under this act, classified 172,097,643 acres. The larger part of this land is in Arizona, Colorado, Montana, Nevada, and New Mexico. The Secretary of the Interior withdrew

temporarily, for the purpose of submitting the subject to Congress for new legislation, areas of oil lands in Wyoming, California, Utah and Oregon amounting to 3,621,062 acres. No legislation exists for the entry of oil and gas lands other than the general mining laws of the United States, which are not adaptable to the disposition of lands containing mineral oils and gas. Under President Roosevelt's administration there were temporarily withdrawn, pending action of Congress, 4,702,520 acres of land in the States of Wyoming, Idaho and Utah, as containing phosphate deposits. These lands were being reexamined in 1909 by the Geological Survey with a view to eliminating all tracts not containing such deposits.

TIMBER LANDS AND RECLAMATION. The Secretary of the Interior recommends the repealing of the so-called Timber and Stone acts of June 3, 1878, and August 4, 1902, and the enactment of a law providing for the disposition of all the remaining timber upon the public lands separately from the soil, and for the disposition of the land after the timber is removed under appropriate agricultural or mineral laws. He also recommends amendment to the act of August 14, 1904, called the Carey act, so that the Secretary of the Interior may, upon application of the State or Territory, withdraw areas of the public lands that appear to be susceptible of reclamation under this act pending examination of the land by State officials and the preparation and filing of their map and plan of irrigation if the State determines to attempt the reclamation.

POWER SITES. There were withdrawn from all forms of entry in 1909 approximately 603,355 acres of land, covering all locations known to possess power possibilities on unappropriated lands outside of national forests, pending new legislation by Congress to prevent the acquisition of power sites on the public domain by private persons or corporations with a view to monopolizing or adversely controlling them against public interest. The Secretary of the Interior recommends enactments that will authorize the classification of lands capable of being used for water power development and to direct their disposal through the Department of the Interior.

GENERAL LAND OFFICE. The area of public lands included in original entries and filings during the fiscal year 1909 was 19,982,503 acres, which was an increase of 802,146 acres over the area entered during the year 1908. The area patented was 13,072,377 acres, of which more than half was disposed of under the Homestead law. The total cash receipts from the sales of public lands, including fees and commissions, was \$9,235,227. There were received, in addition, from the sales of Indian lands, \$2,651,051. The appropriation of \$1,000,000 for the protection of public lands, timber, etc., became available March 4, 1909, and prompt measures were taken to expedite the work to be carried on under said appropriation and to secure prompt action upon pending cases. As a result of the investigation, 1,282,201 acres were restored to the public domain during the past year. During the year 115 convictions were secured in criminal cases for fraud in obtaining lands.

In August 30,000 tracts of land on Indian reservations in Idaho, Montana and Washington were opened to settlement. Over 200,000

persons registered at Spokane, Washington, Missoula and Kalispell, Montana.

ALASKA COAL LANDS. The matter of the disposition of these lands which led to a controversy involving R. A. Ballinger, Secretary of the Interior, and others, will be found discussed under the article UNITED STATES, section Administration. It is the intention of this article to give a brief account of the conditions which led up to this controversy.

Coal in Alaska in large quantities was first discovered in 1901 along the Bering River. It exists here in great masses, and it is estimated that over a billion tons lie undeveloped in this region alone. In 1900 Congress had voted to extend the mineral land laws to this district, but these laws provided only for giving away lands which had been surveyed by the government. The lands in question had never been surveyed and therefore the laws had no effect. An English syndicate, however, under the name of the Pacific Oil and Coal Company, secured from individual locators a nominal claim to fifteen square miles of this district, estimated to contain more than 200,000,000 tons of commercial coal. News of the existence of coal in vast quantities in the meantime had penetrated into the United States, and men with powers of attorney arrived in the district. These persons had the names of numbers of individuals who had assigned to them their rights to file on coal claims. One of these representatives was Clarence Cunningham. He came as agent of a syndicate of business men of Washington and Idaho. He and his associates filed claims on eight square miles of coal lands in the Bering field in which were in sight not less than 90,000,000 tons of high class commercial coal. Other syndicates and groups of persons filed claims in 1903-5, and by the latter date the Bering River field was practically covered with locators. A second field, in the meantime, had been located about 200 miles up the coast at Matanuska River. Here were two large syndicates, one connected with the projected Alaskan Central Railroad, and the other, the largest of all the syndicates, the Michigan-Alaska Development Company. These also filed their claims by means of a power-of-attorney man and they represented hundreds of claims in all parts of the country. Altogether the claimants numbered about 950. These claims were, of course, practically valueless until new laws were passed which would make them valid. In 1903 a committee of the United States Senate made a careful investigation of this country, holding frequent hearings. One of its chief recommendations was for the correction of the abuse of the location of claims in mining districts by powers of attorney. No results came from the report of this committee, as Congress did not take action on its recommendations. In 1904, however, a law was passed allowing land to be taken over by persons who had surveyed it at their own expense. It was thought at the time that this placed the Alaska coal lands upon the same footing as the government coal lands in other parts of the country. The wealthy men who composed the Cunningham syndicate were the most active in procuring the passage of this law.

The coal land laws of the United States which were passed in 1873 provided that the government may grant its coal lands only to individuals or to small associations. These

measures were designed to keep lands containing coal out of the hands of corporations, and corporations up to 1904-5, therefore, were obliged to obtain their coal lands from assignments of individual claims. This led to widespread frauds, and in 1907 Mr. Ballinger, who was at that time Commissioner of the General Land Office, declared that the process was a national scandal. It was thought by the claimants that, under the laws passed in 1904, this procedure would still be applicable; that is, that land might be obtained in large areas through assignment by individual holders. The attorney for the Cunningham claimants inquired of the Land Office whether four locators could join in taking 640 acres in this territory and he was informed that this was not within the meaning of the law, and that such action could not be taken. New affidavits were therefore made out for the Cunningham claimants by which they relied upon the land as individuals.

At this time began a general prosecution by the government of perpetrators of land frauds in the Northwest, which resulted in the conviction of Senator Mitchell of Oregon and others. This agitation in 1905-6 made it difficult for the Alaska coal claimants to make progress. The Cunningham syndicate, however, continued to develop its claims, spending large sums of money on them. In 1906 the government began attacking the methods of taking over coal lands in Colorado, Wyoming and other parts of the West, and in the fall of that year President Roosevelt withdrew all remaining coal lands in the United States from public entry on the ground that it was time to make a general revision of the mineral land laws. On November 12, 1906, an executive order was issued holding up all Alaskan coal lands from claimants. It is alleged that about this time the Guggenheim family, which had secured control of valuable copper mines in southern Alaska and was constructing a railroad to these claims, began to obtain possession of the coal fields. A change was made in the route of the road which the Guggenheims had been building so that it would make the coal fields accessible. The English syndicate, referred to above, had obtained control of the only available terminus, at Cordova, and the Guggenheims purchased control of this route from the syndicate. On July 20, 1907, the representatives of the Cunningham claimants are said to have delivered to Daniel Guggenheim, the head of the American Smelting and Refining Company, a proposal to form a coal company with \$5,000,000 capital.

Claims of fraud in the taking up of the Alaska coal lands had been made as early as 1905, and a special agent was detailed to investigate. He reported a number of fraudulent schemes upon the part of claimants, but no action was taken by the Land Office until 1907. In June of that year Horace T. Jones was detailed to make a further investigation. He advised a thorough investigation by a competent man and called especial attention in his report to the Cunningham and English syndicates and other groups of claims. In December, 1907, Commissioner Ballinger, in his annual report, made the attack previously mentioned upon the methods used by coal speculators and railroads of the West in securing coal. In the same month he detailed to investigate the validity of similar transactions in the Alaskan coal

fields Lou's R. Glavis, a special agent of the field service of the General Land Office.

In February, 1907, while it was generally believed that the government would take no money in payment for Alaska coal lands on account of President Roosevelt's order, the Cunningham claimants tendered payment for their claims to the receiver of the Land Office at Juneau, through whom they obtained a special ruling from the General Land Office at Washington, that while no more coal could be filed upon in Alaska, those who had filed in good faith upon land before the order of November, 1906, could proceed to make purchase and entry of the land. The purchase and entry are made at the time of filing proof and payment, which, in Alaska, may be four years after the location is made. Members of the syndicate swore that they had made their entries in good faith for their individual benefit, and paid \$10 an acre to the Land Office, from which they received their receipts. There remained only one final document to be obtained, the patent to the land. This was held up, however, pending the investigation into alleged frauds in acquiring the lands. Mr. Glavis had been instructed on December 28, 1907, to investigate all the Alaska coal cases for fraud. On January 4, 1908, a telegram was sent by Commissioner Ballinger to the special agent in Alaska, asking him to send the "plats" of the Cunningham claims required for issuing patent, which was the last act of approval necessary from the government for these claims. On January 7 the Assistant Commissioner informed Glavis that the Cunningham claims had been approved for patent. Glavis at once protested on account of evidence of fraud which he claimed to have against them. The order to complete the patent was at once revoked in the Land Office.

On May 28, 1908, a bill was passed by Congress making certain modifications in the coal land laws. By this law coal claimants did not need to show that up to the time of the final entry of the land they had intended to take it for their own use. They need only prove that they had intended to take it for individual use when they found it and located it. In March, 1909, Mr. Ballinger became Secretary of the Interior in the cabinet of President Taft. He at once asked Mr. Glavis to make complete reports of his examination of the coal cases, and Glavis was informed in the latter part of April that the investigation must be concluded by July 1. Glavis insisted that this was impossible if a thorough investigation was to be made. He returned to Washington in May and, with H. H. Schwartz, Chief of the Field Service, prepared a letter under Secretary Ballinger's direction, summarizing the evidence obtained against the Alaska coal claim, and sent this to Attorney-General Wickersham for a ruling on it under the law of 1908. Immediately after this, however, Mr. Glavis was informed that the Interior Department would decide on the law in its own legal department, and on May 19, 1909, the First Assistant Secretary of the Interior gave a decision which ended as follows: "In passing upon entries sought to be perfected under the act of 1908, where the only objection thereto is an arrangement or agreement of the character specifically described in your letter, the same might and should be accepted and passed to patent." This was contrary to the opinion held by Mr. Glavis, and on

June 12, 1909, the Attorney-General rendered a decision sustaining him. This opinion was secured by direct appeal of Mr. Glavis, on his own responsibility, to the Attorney-General, over the head of the law office of the Department of the Interior. The Land Office demanded an immediate trial of the Cunningham group of claimants, to which Mr. Glavis replied that it would be impossible to try them without having evidence obtainable on the ground at Alaska, which, up to that time, there had been no opportunity to get. Mr. Glavis was superseded by James M. Sheridan, who reported that the cases could not be heard until the fall of 1909. Investigations in the claims were being carried on at the end of the year. Mr. Glavis laid his case before President Taft, with the result that he was dismissed from the service at the request of Secretary Ballinger.

LANE, ELINOR (MACARTNEY). An American novelist, died March 15, 1909. She was born in Maryland. She began to write stories of Southern life at the age of 16. She married, in 1891, Dr. Francis Ransom Lane. She wrote *The Mills of God* (1901); *Nancy Stair* (1904); *All for the Love of a Lady* (1906); *Katrina* (1909).

LANG, BENJAMIN JOHNSON. An American musician, died April 4, 1909. He was born in Salem, Mass., in 1837. His father was an organist and piano teacher, and Lang early showed great aptitude for music. In 1855, after receiving instruction in Boston, he went abroad, where he studied for three years with Liszt, Jaell and others. On his return to Boston he soon became famous as a teacher. He became conductor of the Apollo Club in 1868, of the Cecilia Society in 1874, and of the Handel and Haydn Society in 1895. From 1885 he was organist of King's Chapel. Mr. Lang was well known abroad and had a wide acquaintance with notable foreign musicians.

LANG, JOHN MARSHALL. An English educator and clergyman of the Church of Scotland, died May 2, 1909. He was born at Glasgow, Lanarkshire, in 1835, and was educated at Glasgow University. He was deputy to the United States in 1872, and to Amsterdam in 1887. In 1893 he was Moderator of the Church. He was Baird lecturer in 1900-1, and served on several important ecclesiastical boards. From 1900 to his death he was vice-chancellor and principal of Aberdeen University. Among his published works are: *Heaven and Home; Life: Is it Worth Living? Homiletics on St. Luke's Gospel; The Anglican Church; The Church and its Social Mission.*

LAOS. A French protectorate in French Indo-China (q. v.) Area, 111,940 square miles. Population (1906), 663,727. Capital, Vientiane. Within the protectorate are the three protected states of Luang Prabang, Barsac, and Muong Sing. Laos is the largest of the five French Indo-Chinese territories, but is almost entirely undeveloped and lacks population. It is practically inaccessible except by means of the Mekong River. The soil is fertile, producing rice, cotton, indigo, fruits, tobacco, and teakwood. Concessions have been granted to several French companies for the development of the gold, tin, and lead mines. A telegraph line connects Hué, in Annam, with the towns on the Mekong, and these with Saigon. The present King is Som-Deck Phra Chao Sisawong. The

cost of administration is borne by Cochin-China (to the extent of 6-13), Tongking and Annam (5-13), and Cambodia (2-13). The Resident-Superior is M. Maché.

LAURIE, SIMON SOMERVILLE. A Scotch educator and philosopher, died March 2, 1909. He was born in 1829 in Edinburgh and was educated at the High School and University of that city. For five years he taught on the Continent of Europe and on his return to Scotland held many important educational positions. He was secretary and visitor of schools on the educational committee of the Scottish Church in 1855, and in 1872, when the authority of this committee was abrogated by the Education act, he became secretary of the United Schools Commission. In 1876 he became professor of the institutes and history of education in Edinburgh University. He was a member of the Edinburgh University Court and president of the Teachers' Guild of England. Among his published works are: *Philosophy of Ethics* (1866); *Primary Instruction in Relation to Education* (6th ed. 1898); *John Amos Comenius* (6th ed. 1896); *Mediaeval Education and Rise and Constitution of Universities* (1886); *Historical Survey of Pre-Christian Education* (2nd vol. 1901).

LAWN TENNIS. The principal event in the tennis history of 1909 was the contest for the Davis Cup. The preliminaries were decided at Manheim, Penn., on September 11, the American team easily defeating the British players and thereby winning the right to challenge for the trophy which had been won in 1908 by the Australian team. The American team in the preliminaries was made up of W. A. Larned, W. J. Clothier, H. H. Hackett and R. D. Little. The British players were J. C. Parke, J. C. Dixon and W. C. Crawley. The results of the matches were as follows: Singles, Larned defeated Dixon 6-3, 6-2, 6-0; Clothier defeated Parke 6-4, 6-3, 8-6. Larned defeated Parke 6-3, 6-2, 6-3; Clothier defeated Dixon 6-3, 6-1, 8-4; Doubles, Hackett and Little defeated Parke and Crawley 3-6, 8-4, 6-4, 4-6, 8-6. The team chosen to visit Australia in an endeavor to bring back the trophy comprised Maurice E. McLoughlin and Melville H. Long, neither of whom had taken part in the preliminaries. The fact that substitutes are allowable according to the rules governing the Davis international contests aroused considerable dissatisfaction among tennis enthusiasts who, while acknowledging that both McLoughlin and Long were brilliant players, still felt that more experienced men should have represented the United States. The match was held at Sydney, New South Wales, November 27-30, the Australian team (Norman E. Brooks and Anthony F. Wilding) winning in straight matches. A summary of the tournament follows: In singles Brookes defeated McLoughlin 6-2, 6-2, 6-4; Wilding defeated Long 6-2, 7-5, 6-1; Brookes defeated Long 6-4, 7-5, 8-6; Wilding defeated McLoughlin 3-6, 8-6, 6-2, 6-3; in doubles Brookes and Wilding defeated Long and McLoughlin 12-10, 9-7, 6-3.

In the championship tournament held at Newport, August 19-26, W. A. Larned again proved his superiority in the singles, and F. B. Alexander and H. H. Hackett were for the third consecutive year winners of the double championship. The players in the final round for the singles championship were W. J. Clothier and Maurice E. McLoughlin, Clothier winning

by the scores of 7-5, 6-4, 9-11 and 6-3. In the challenge round Larned defeated Clothier 6-1, 6-2, 5-7, 1-6, 6-1. Alexander and Hackett easily retained the doubles championship by defeating McLoughlin and George J. Janes in the challenge round 6-4, 8-4, 6-0. The Women's National Championship in singles, contested for in a tournament held at Philadelphia on June 26, was won by Miss Hazel Hotchkiss of California, who defeated the holder, Mrs. Barger-Wallach of New York, in the challenge round 6-0, 6-1. The championship in doubles was won by Miss Hotchkiss and Miss Rotch of Boston, and the mixed doubles by Miss Hotchkiss and W. F. Johnson, of the University of Pennsylvania. The national indoor championships were won by T. R. Pell in the singles and by Pell and W. C. Grant in the doubles. Pell defeated G. C. Shaffer in the singles finals 6-4, 6-3, 8-4, and Pell and Grant defeated W. B. Cragin, Jr., and M. S. Charlock in the doubles finals 6-3, 6-2, 7-5. The woman's indoor championship in singles was again won by Miss Marie Wagner, and the doubles by Miss Marcus and Miss Moore.

The intercollegiate championship in singles was won by W. F. Johnson of the University of Pennsylvania, who defeated M. H. Long of the University of California in the final round 6-4, 3-6, 5-7, 8-6, 6-4. The doubles were won by W. F. Johnson and A. D. Thayer of the University of Pennsylvania, the runners up being G. P. Gardner, Jr., and R. Sweetzer, of Harvard. In college dual tourneys Harvard defeated Yale 7 to 2 and Princeton 6 to 4; Yale defeated Cornell 6 to 0 and Princeton 6 to 0; Pennsylvania defeated Cornell 5 to 1. The New England intercollegiate championships resulted in victories for Dartmouth, in both singles and doubles. The Western intercollegiate championship was won by Minnesota.

The winners of the more important foreign tournaments in 1909 were: All-England, A. W. Gore in singles, and Gore and H. R. Barrett in doubles; Monte Carlo, F. B. Alexander, America, defeated H. L. Doherty, England, 7-5, 6-4, 6-1; Riviera, F. B. Alexander defeated M. J. G. Ritchie, England, 6-4, 6-2, 6-0; Nice, Alexander defeated Ritchie, 6-2, 6-1, 6-2; Canadian championships, Captain Foulkes, of Ottawa in singles, and Foulkes and Roby in doubles; South African championships, R. F. Doherty, England, in singles and Doherty and Hillyard in doubles.

LAYMEN'S MISSIONARY MOVEMENT. See MISSIONS, PROTESTANT FOREIGN.

LEA, CHARLES HENRY. An American historian, died October 24, 1909. He was born in Philadelphia in 1825 and received a private education. At the age of 17 he entered the publishing house of his father and ultimately became head of the concern, retiring in 1880. He was early devoted to historical studies and from 1857 gave special attention to European mediaeval history. He published *Superstition and Force* (1866); *A Historical Sketch of Sacerdotal Celibacy in the Christian Church* (1867); *Studies in Church History* (1869); *History of the Inquisition of the Middle Ages* (1888); *Chapters from the Religious History of Spain* (1890); *Formulas of the Papal Penitentiary in the Thirteenth Century* (1892); *A History of Auricular Confession and the Indulgences in the Latin Church* (1896); *The Moriscos of Spain: Their Conversion and Expulsion* (1901), as well as many articles in periodicals. He wrote also: *The History of the Inquisition of Spain*

(1906-7), which is one of the most important contributions on the history of the subject. Dr. Lea also wrote and published several papers on Chemistry and Conchology. During the Civil War he organized a system of municipal bounties to encourage volunteering.

LEACH, SMITH S. An American army officer, died October 16, 1909. He was born in Indiana in 1851, and graduated from the United States Military Academy in 1875 at the head of his class. He was assigned to the engineer corps, and during his career he served successively at the Centennial Exposition at Philadelphia, at the Engineers' School at Willet's Point, N. Y., Baltimore, Boston and other places. For two years he had command of the first battalion of engineers at Fort Leavenworth. He was actively identified with the river and harbor improvements in Long Island Sound, on Lake Champlain and the St. Lawrence River, and the Missouri and Mississippi rivers. In 1889 he superintended the construction of the bridge across the Mississippi River at Memphis. At the time of his death he was on duty at the office of the Chief of Engineers at the War Department and was in charge of river and harbor improvement work. He was a member of the River and Harbor Board.

LEAD. The total production of refined lead, desilvered and soft, from domestic and foreign ores in 1909 was estimated at the close of the year by the United States Geological Survey at approximately 444,363 short tons, as compared with 396,433 short tons in 1908, and 414,189 tons in 1907. These figures do not include the estimated output of 12,860 tons of antimonial lead. Of the total production, desilverized lead of domestic origin, exclusive of desilverized soft lead, is estimated at 209,698 tons, against 167,790 tons in 1908. The desilverized lead of foreign origin comprised 87,379 tons, compared with 97,761 tons in 1908. The production of soft lead from Mississippi Valley ores was estimated at 147,286 tons as compared with 130,882 tons in 1908 and 129,607 tons in 1907. Missouri retained first place among the lead-producing States. There was a slight increase in the imports of lead in ore and base bullion, which amounted to 112,467 tons, valued at \$4,210,829, as compared with 109,287 tons in 1908. Of the 1909 imports, 102,300 tons, or 90 per cent., came from Mexico. The imports of refined lead increased slightly, being 3588 tons with a value of \$230,956, against 2795 tons in 1908. The exports of foreign lead (lead of foreign origin smelted or refined in the United States), showed an increase of 16 per cent., being 88,794 tons valued at \$3,221,836, as compared with 76,367 tons in 1908. The exports of lead manufactures decreased slightly, having a value of \$530,000 as compared with \$599,640 in 1908.

The figures of production given by the *Engineering and Mining Journal* differ considerably from those of the United States Geological Survey. According to the former authority the total production in 1909 was 461,103 tons, of which 374,579 tons were domestic. The consumption of lead increased largely through the year, as the business in white lead and oxides, which amounts to about 40 per cent. of the total, was especially good. The Payne tariff law made no change in the tariff on lead and ore and base bullion, but an alteration in the section as to smelting in bond deprived the refineries of the "exempt lead," which formerly was a valuable

perquisite. The price of lead in New York and London in 1908-9 by months is shown in the following table taken from the *Engineering and Mining Journal*:

LEAD

Month	New York 1908	New York 1909	St. Louis 1909	London 1908	London 1909
January	3,691	4,175	4,025	14,469	13,113
February	3,725	4,018	3,868	14,250	13,313
March	3,838	3,986	3,835	13,975	13,438
April	3,993	4,168	4,061	13,469	13,297

New York and St. Louis, cents per pound.
London, pounds sterling per long ton.

LEATHER. Interest in the American leather industry in 1909 centred very largely on the revision of the tariff, as had been realized in the previous year. The demand for free hides had obtained considerable impetus not only from confirmed free trade advocates, but from boot and shoe and other manufacturers and from those who feared that great and concentrated packing interests would control the market. By the Dingley law the schedule of rates on hides was put at 15 per cent. ad valorem and manufacturers of leather at 20 per cent.

As a result of an active propaganda and the sessions of the Ways and Means Committee in 1908 and 1909, the Payne bill, when reported, put hides on the free list. The Senate restored them to the dutiable list, imposing a duty of 15 per cent. At the demand of President Taft, who refused to sign the bill with a duty on hides, this was removed and the bill was duly passed. It reduced the duty on manufactures of leather, but not to a point where any violent objections were expressed by manufacturers. See TARIFF.

During the year there was a scarcity of hides and skins and an inflation in price, contributed

to in part by speculation. This, coupled with tariff uncertainty, in the early months of the year, made the American leather market in 1909 somewhat unsettled. In the previous year hides were at their lowest value in January and increased progressively during the year, and a similar tendency was to be noted during 1909, though explained rather by the comparative scarcity than by the resumption of normal business from the panic conditions of 1907.

The effect of the tariff reduction on hides did not produce any marked lowering of prices. Fearing a withdrawal of foreign hides to the United States, European dealers immediately raised their prices so that at the close of the year foreign hides in the United States ruled at prices equal to or higher than those of domestic kill. In fact at the end of the year the hide and skin markets were on a level with those of the entire world, but leather men in America were convinced that the supremacy of the native product would be maintained through superior facilities and methods. In England there was a shortage of sole leather and fears were expressed that with the greater part of the hides of the world coming to the United States, Europe would be forced to depend upon that country for manufactured leather, as the American product was being increasingly used abroad.

The slaughter of cattle and sheep at markets for the years ending December 31, is indicated in the following table. The totals were estimated at 40 per cent. of the entire domestic supply of slaughtered cattle.

Robert W. Hall, head of the department of biology, was made lecturer on forestry, as well. The total productive funds of the college amount to \$1,178,000. The president is Henry S. Drinker, LL. D.

LEIBLING, SALLY. A German pianist, died September 16, 1909. He was born at Posen and studied music and the piano under Bendel, Kullak and Weitzmann in Berlin. He made a number of concert tours in Germany and played with Thomas's orchestra in the United States in 1875. Subsequently he gave many recitals with well-known artists. In 1884 he studied for a time under the direction of Liszt at Weimar, and in 1888 founded the new conservatory of music at Berlin.

LELAND STANFORD JR. UNIVERSITY. An institution of higher learning at Palo Alto, Cal., founded in 1887. In 1909 there were in attendance 1600 students, with 198 members in the faculty. There were in the library 127,229 volumes. Among the additions to the faculty were the appointments of Dr. H. E. Bolton, formerly of the University of Texas, to the professorship of history; Dr. E. B. Krehbiel, formerly professor of history in Chicago University, to the associate professorship in history; and Dr. A. W. Meyer, formerly professor of human anatomy at Northwestern University, to the professorship at Stanford University. An important step was taken in the appointment of A. E. Roth, of the class of '09, as student adviser. A partial student control of the internal affairs of the University relating to the student body is on trial, and matters of general discipline are turned over to the student committee. There were added to the collections of the University during the year the Arnold collection of fossils, the Towne collection of birds and the important *collection de documents inédits sur l'histoire de France*. The total productive funds of the University amount to about \$25,000,000, and the annual income to about \$860,000. The president is David Starr Jordan.

LEMLY, SAMUEL CONRAD. An American naval officer, died September 3, 1909. He was born in North Carolina in 1853, and was appointed midshipman in the navy from that State in 1869. After service of several years at sea, he worked on the *Nautical Almanac* in 1880. In 1886 he was made a lieutenant, and in 1892 was made captain and commissioned Judge Advocate General of the navy, serving three successive terms. He was Judge Advocate at the Schley court of inquiry. In 1902 he was retired from the active list, but continued to act as Judge Advocate General at intervals until 1908, when he ceased to perform active duties.

LEOPOLD II., KING OF THE BELGIANS, DUKE OF SAXE AND PRINCE OF SAXE-COBURG-GOTHA, died December 17, 1909. He was born at Brussels on April 9, 1835, and was the son of King Leopold I. and of his second wife, Louise, Princess of Bourbon-Orléans, the daughter of Louis Philippe, King of France. He succeeded to the throne of Belgium on the death of his father, December 5, 1865. The events in his reign which will give it an important place in the history of the world are concerned with the creation of the Congo State, originally called the Congo Free State, a vast region of 900,000 square miles in the heart of

Africa. Leopold launched this great enterprise in 1876, when he suggested the founding of the African International Association. Henry M. Stanley was sent to East Africa at the expense of the King, and when in 1877 he revealed to Europe the extent and richness of the Congo Basin, the machinery was already perfected in Belgian hands, and especially of the King, to assume the task. The other great European powers looked on jealously, and their very jealousy rendered them impotent to interfere. The advantages of Belgium, a country of guaranteed neutrality, to assume the tutelage of the new state, which was to be kept neutral and free to the commerce of the world, were diplomatically urged, and one power after another gave assent, the United States among the last, and in November, 1884, the Congress of Berlin assembled to perfect the plans of Leopold. By act of this Congress, the Free State was erected February 26, 1885, and then began the extraordinary history of headlong development, consummate exploitation and unspeakable cruelty, which has continued to the present time. Volumes have been written, as well as countless articles in newspapers and other publications, describing the horrors which were permitted in connection with Belgian rule in the Congo State. Among these was the system of bondage, known as the collection of taxes in kind, which exacted so much of the natives' labor that they starved by the village-full from inability to raise food. There were stories of shooting, flogging, mutilation and other forms of savagery and, allowing discount for exaggeration, it cannot be doubted that conditions of atrocity existed in the Congo State such as the world has never seen surpassed. To what extent Leopold himself was responsible for these abominations cannot be known. In his rule in Belgium he was known as a humane man, fair and just in his dealings with his subjects. It is probable that the increase in the profits which poured in upon him blinded him to the measures by which these profits were obtained. In his defense he urged that he had suppressed the real slave trade, that he had opened the country to missionaries of all religions, that he had completed works for sanitation and education, and had constructed centres of trade and means of transportation. When the scandal became too open and the protests from London, Washington, and other capitals could not be disregarded, Leopold promised reforms, but these were not forthcoming. Active intervention was threatened and there was danger that the Congo Protectorate might be lost, not only to the King, but to Belgium. Leopold then saved the territory for his country by an agreement between the Free State and the Belgian government, made in 1890, that he would surrender his Congo sovereignty in November, 1907. The Belgian Parliament held him strictly to this agreement. He had attempted to hold the Crown Domain erected in 1901 and comprising about one-ninth of the entire Congo territory, but this the Parliament compelled him to surrender and also to concede the reversion at his death of the properties in Belgium known as the "Fondation de la Couronne," and his magnificent villa on the Riviera. This deed was finally consummated August 20, 1908, but neither Great Britain nor the United States had given assent to it at the end of 1909. See CONGO, BELGIAN.

Leopold's relations with his family were, from the very beginning of his reign, unhappy. He married on August 22, 1853, Maria Henrietta, Princess Imperial and Archduchess of Austria, but for many years previous to her death they lived apart. With two of his three daughters he was for many years on terms of enmity. The eldest daughter, the Princess Louise, married, in 1875, Prince Philip of Saxe-Coburg, a nephew of Queen Victoria, and after twenty years of married life she eloped with a young lieutenant of the Austrian Uhlans, whom she met in Vienna at the house of her sister Stephanie, wife of the Crown Prince of Austria. This led to her confinement for many years in an insane asylum, and when she was finally set at liberty, her father would not see her. His second daughter, Stephanie, was married in 1881 to the Archduke Rudolf, Crown Prince of Austria. After his death she married Count Lonyay, against the wishes of her father, and he refused to be reconciled to the marriage even on the intercession of the Pope, and she was forbidden to attend the funeral of her mother, who died in 1902. Leopold's only son, Leopold Ferdinand, died in 1869 when nine and one-half years of age. With Clementine, his third daughter, he was on better terms, but quarreled even with her.

Leopold was, without doubt, one of the most profligate of modern rulers, and his notorious acts were a constant source of scandal, not only in his youth, but his old age. His capacity for spending money was extraordinary. He derived an income of \$860,000 a year from the Belgian people, and he had inherited a fortune of at least \$6,000,000 from his father, yet he was accused of having virtually embezzled and dissipated the dowry of his wife and the fortune of his sister, Carlotta, widow of Maximilian, once Emperor of Mexico, who has been under restraint as insane ever since the execution of her husband in Mexico. The amount of this estate is said to have been over \$10,000,000.

In spite, however, of his frivolity and prodigality, the King was always a wise ruler, and he was much beloved by the mass of his people. He developed enormously the industries of Belgium, investing his own money freely in them, and he was always most scrupulous in keeping within the limits of his power as a constitutional monarch. He favored advanced ideas, such as old age pensions, insurance of industrial workers and the improvement of the dwellings of the poor. He invested much money also in foreign enterprises, and was one of the largest holders in the Canton-Hankow Railroad in China, which was sold to a New York banking house in 1905 for \$2,000,000. He was also a great traveler and visited in his youth the Levant, North Africa and every country in Europe. In 1902 he projected a visit to St. Petersburg, Siberia, China and Japan, but abandoned it on account of ill-health. In 1903 it was announced that he intended to visit the United States in 1904 to attend the St. Louis Exposition. The trip, however, was abandoned without any explanation.

Leopold was well versed in history, literature and politics, and was a great patron of art. His collections at his magnificent home at Laeken, near Brussels, all of them ancient and modern paintings, were of the most magnificent description. In appearance he was imposing.

He was one of the tallest men in Europe, with erect figure, well-formed features, and a square-cut beard, which was once brown, but for many years snow white. He was a well-known figure in Paris and London, and at many of the famous watering places of Europe.

LEPROSY. The International Conference on Leprosy was held in Bergen, Norway, August 16 to 19, 1909. Delegates from most civilized countries were present, and the status of the disease throughout the world was discussed. Bergen was the first city in Norway to build a hospital for lepers (in the thirteenth century), and the discovery of the *Bacillus lepræ* was made by Hansen, a native of this city, in 1872. The official statistics of the Commission of the United States Public Health and Marine Hospital Service gave the number of lepers in 1892 as 278, 145 of whom were born in the United States. Of this number only 72 lepers were segregated. At present the number is approximately 278. In his report of the status of leprosy in the Hawaiian Islands, Dr. Brinckerhoff, of the Leprosy Investigation Station at Molokai, gave statistics which indicate that in spite of the system of segregation, which has been in operation over forty years, the disease is steadily making progress, not only among the native population, but also among the other races on the Islands. The figures available show that in 1876, 1.35 per cent. of the entire native population were lepers; in 1900, 2.5 per cent. were thus afflicted. This increase is explained partly by the more rigid segregation now practiced, but there is no doubt of the actual increase in the number of victims. While segregation is practically voluntary, officials of the law are required to report suspected cases. The result is that lepers remain in hiding until the disease is so advanced that concealment becomes impossible. This period averages nearly four years, so that there is abundant opportunity for spreading the infection. The disease occurs more frequently in crowded districts than in the country. The report indicates also that leprosy is increasing among European and Asiatic immigrants. The Japanese and Portuguese furnish a considerable number of cases. No new methods of specific treatment were discovered during the year.

Treatment by nastin injections, of which much was expected, was generally condemned by observers in several countries. Nastin is obtained as a neutral grease from the culture of a kind of streptothrix (*streptothrix leproides*), and is apparently identical with the neutral fat obtained from the tubercle bacillus. Pure nastin has the quality of producing in some lepers a reaction varying in severity from very slight to very dangerous symptoms. The nastin treatment has to be continued for a year, intermittently. The injections are painful, and while some patients are apparently benefited for a time, others are made much worse. The question as to whether leprosy is transmitted by insects was investigated by the Danish-French Leprosy Expedition. Experiments were made on fifty lepers in the Danish West Indies. Their findings indicate that biting insects are not concerned. At the leper settlement at Molokai eucalyptus baths have been used for two years, and Hollmann states that under this form of treatment the skin becomes very soft and pliable, the leonine facies less marked, there is an improvement in neurotic pains,

ulcers, erosions and abrasions of the skin and mucous membranes are healed, and the leprosous fever is decidedly decreased. Two hundred and seventy-five patients have been treated, with the result that the death rate in the leper settlement has been less than 5 per cent., of which less than 2 per cent. was due to leprosy. It is believed that patients in the early stages of the disease might possibly be cured.

LEROY, JAMES A. An American public official and writer, died March 2, 1909. He was born in 1875, graduated from the University of Michigan in 1896, and engaged in journalism and teaching until 1898, when he was appointed to a place on the Philippine Commission. He remained there until 1902, when ill-health obliged him to resign, and he became Consul at Durango, Mexico. He accompanied Mr. Taft on his tour around the world in 1906. He wrote *Philippine Life in Town and Country*, and was engaged on a longer work on the Philippines at his death.

LIBERIA. An independent negro republic on the western coast of Africa. Coast line, about 350 miles; estimated area, 35,000 square miles; estimated population, 1,500,000, including about 10,000 Americo-Liberians. Capital, Monrovia, 6000 inhabitants. There are government and mission schools. There are extensive and valuable forests in the interior, and much mineral wealth exists, some of which is being prospected by the Liberian Development Chartered Company. The development of the country is hindered by laws prohibiting the ownership of real estate by foreigners, by bad roads, the disturbed condition of the interior, the backward state of the inhabitants, and the limited ports of entry. Imports and exports in 1908 were valued at £240,000 and £182,708, respectively, against £113,843 and £111,398 in 1907. Palm oil, palm kernels, coffee, rubber, and piassava fibre are the chief exports. There are no railways, and few roads properly so-called. The revenue in 1908 amounted to £83,000 (customs £77,000); no estimates are given for expenditure. In 1905 the revenue and expenditure were £47,000 and £59,760 respectively. Total outstanding debt at end of 1908, £189,097. The executive authority rests with a president and a council of six; the legislative power in a parliament of two houses. President, 1909, Arthur Barclay, re-elected, 1907. In April, 1909, the United States government sent out a committee of three to investigate conditions in the republic.

Military service is obligatory for every citizen between 16 and 50 able to carry arms in time of war. The organized militia and police constabulary comprise about 2000 men divided into five regiments and two brigades. This is under European officers.

HISTORY. For some years Liberia has been a source of anxiety to the Powers that controlled adjacent territories, namely, France and Great Britain, and President Barclay went to Europe to consult with the authorities as to plans of improvement. The result of this was the appointment of European customs officers and the commissioning of a gunboat to patrol the coast, and also the formulation of a plan for a frontier force. These measures were approved by Great Britain, France and the United States. The effect of the changes in the customs department was an increase of the revenue which enabled the government to pay a portion of its debts. The gunboat, however, caused some trouble by

its interference with the Kru tribe in their trade, which was contrary to the Liberian port of entry laws. The frontier force, which had been demanded by France for policing the French and Liberian frontier, was organized under a British officer. He raised a force of 200 men, of whom seventy came from the Sierra Leone police. This force, however, was an object of suspicion to Liberians, as its equipment was British. The payment of the troops fell into arrears, and the British officer in command complained, and on February 11 informed the government that unless the arrears were paid he could not be responsible for the action of his men. At that time a British gunboat happened to be in the harbor, and a panic arose among the Liberians at the imagined threat of British aggression. The militia was called out and the members of the Congress met under arms. The trouble, however, was soon settled after a conference of the foreign representatives and the force was disbanded. In 1908 the intervention of the American government had been discussed between Sir Edward Grey and the United States Ambassador, the latter inquiring by what means his government could best co-operate. The former advised judiciary reform and the appointment of a financial adviser. He had also urged the United States to induce the Liberian government to act on the advice of foreigners in the financial administration, the main difficulty being, in his opinion, the inefficiency of the Liberian government in the management of its own affairs. He made it clear that American co-operation was welcome. Three commissioners were sent out by the United States in April to report on the condition of affairs. No official report had appeared at the close of the year, but one of the commissioners in a narrative of the visit declared the chief problem to be the control of the native tribes and their assimilation to the body of Liberian citizenship. Immense difficulties are presented by the question of transportation, owing to the density of the African forest. Progress is also retarded by ignorance of the country's natural resources and of the best means of exploiting and conserving them.

LIBRARY ASSOCIATION, AMERICAN. A society with a membership of nearly 2000, organized to develop the public library in its bearing on American education and by co-operation to increase the efficiency of library administration. It was established in Philadelphia in 1876, and incorporated under the laws of Massachusetts in 1879. The 31st annual meeting was held at Bretton Woods, N. H., June 28 to July 3, 1909. There was an attendance of 620. In addition to the regular committee reports, the principal topics discussed were: Coördination or Methods in Coöperation; Library Coöordination; The School and the Library; Storage Libraries; and Reservoir Libraries. This conference was an unusually important one, as the constitution of the Association was revised and it was decided to remove the Association headquarters from Boston to 1 Washington Street, Chicago. The new headquarters will be the distributing centre for all the American Library Association publications, and it will serve as a bureau of information concerning library work in the United States. It will be the meeting place of the Executive Board of the Association, the Publishing Board, and of the different sections of the A. L. A. Publications of value to librarians

will be on file for the use of library workers and others. The Association has been instrumental in establishing library organizations in thirty-nine States besides many local library clubs in cities and districts. Four sections are maintained: Cataloguing, library work with children, college and reference, and trustees. The Association has affiliated with it the three national organizations of kindred purpose: The National Association of State Libraries, the League of Library Commissions, and the American Association of Law Libraries. These hold separate sessions at the same time and place, with the annual meeting of the larger body. The most important activity of the Association is the Publishing Board, which operates under the gift of \$100,000 made in 1902 by Andrew Carnegie. The income of this fund is used in the preparation of indexes, of bibliographies, reference helps and literature for the promotion of library extension and the selection of books. It published in 1902 an important bibliography of American history, and in 1904 prepared the A. L. A. Catalogue, a guide to classification, cataloguing and book selection, published by the Library of Congress, and first distributed at the International Library Conference held in connection with the Louisiana Purchase Exposition. In 1909 work was started on a supplement to this catalogue to cover the years 1904 to 1909 inclusive. Its officers for 1910 are as follows: President, N. D. C. Hodges, Public Library, Cincinnati; First Vice-President, James I. Wyer, Jr., New York State Library, Albany, N. Y.; Second Vice-President, Alice S. Tyler, Iowa Library Commission, Des Moines, Iowa; Secretary and Executive Officer, Chalmers Hadley, 1 Washington Street, Chicago.

LIBRARY OF CONGRESS. A national institution open to the public at Washington, D. C., founded in 1800. It occupies what is probably the most magnificent and well equipped library building in the world, constructed in 1897 at a cost of over six million dollars. In 1909 at the close of the fiscal year there were in the library 1,702,685 books, 111,343 maps and charts, 501,293 volumes and pieces of music and 303,036 prints. There were in addition a large number of manuscripts concerning which a numerical statement is not possible. The accessions to the library in printed books and pamphlets during the year were 167,677 volumes. The most important gift of printed material received during the year was a set of the great Chinese Encyclopædia (The Tu Shu Tsai Cheng), comprising over 5000 Chinese volumes. This was brought to Washington by the special ambassador charged with the acknowledgments of China to the United States for the return of the Boxer indemnity. The collection of Chinese literature in the library now numbers over 10,000 volumes. Among the gifts of individual merit having special interest were over 100 printed volumes from the library of George Bancroft, presented by Mrs. J. C. Bancroft Davis. The only collections purchased during the year were one of African linguistics, about 5000 pieces, from Mr. Wilberforce Eames, and one of early English plays of about 2000 pieces. Among individual items of importance were, however, sets of linguistic publications of Prince Louis Lucien Bonaparte, and the great edition of 101 volumes of the sacred books of Tibet, secured through Mr. Rockhill, United States Minister to China. Many valuable accessions were made during the

year in the department of manuscripts, including many documents relating to the Revolution and to the individual States. Many manuscripts were also added dealing with persons living in the early history of the country. On January 1, 1909, Worthington C. Ford, the Chief of the Department of Manuscripts, resigned his position to become editor for the Massachusetts Historical Society. He was succeeded by Gaillard Hunt, who had served for twenty-one years in the Department of State as Chief of the Bureau of Citizenship. The preparation of additional calendars of the manuscript collections was continued during the year and the calendar of the Andrew Johnson papers was about completed. The calendar of military correspondence of George Washington during the Revolution will be ready for publication before the close of the fiscal year 1910. Calendars of the Van Buren, Jackson and John Fitch papers, and of the Jefferson accessions are in progress. The calendar of the New Mexico papers now covers from the year 1621 to 1805. The editing of the work of the Journals of the Continental Congress was carried on by Mr. Ford for many years, and is continued by his successor. Appropriations for the fiscal year 1910 for the carrying on of the work of the library amounted to \$685,561. Visitors to the library during the year numbered 833,280 or a daily average of 2296.

LIGHTHOUSES. The chief problem of 1909, as in previous years, was to find a satisfactory form of illumination for the lights of the more important lighthouses. The great reliability of oil had been demonstrated, and after a number of years' experiments, the United States Lighthouse authorities reached the conclusion that vaporizing the oil and using it to heat incandescent mantles of refractory materials, was the most efficient and economical method. Various systems had been tried and it was found that the power of the various lamps was greatly increased, and by 1909 it was thought that apparatus had been developed to a point where it would meet all requirements and lamps were being built and issued at the shops of the Lighthouse Establishment. In Europe, the advantages of incandescent oil vapor had been realized even longer, and very satisfactory apparatus was in use. The great light on Helgoland Island still stood in 1909, not only as the most powerful light in Germany, but in the world, and its 40-million candle-lighting power was not rivaled by any new lighthouse built in that year. It is an electric installation with three revolving searchlights and an emergency light capable of revolving three times as fast as the cluster that can be employed in case of the failure of the latter.

In 1909 the United States government had under construction a new lighthouse at White Shoal, at the extreme northern end of Lake Michigan, in open water, 20 miles west of Old Mackinac Point in the Straits of Mackinac, 14 miles from the nearest land on the north, and 18½ miles from land on the south. This location was formerly marked by a lightship anchored over the shoal, and is one exposed to the face of storms from any quarter. It is also near the route of all traffic through the straits. It was therefore deemed desirable to install a permanent light which was to be a circular tower of steel erected on a skeleton frame with a light 125 ft. above the lake level.

A steel tower lighthouse of great strength

and stability was completed during the year by the Cuban government at Cayo Caiman Grande, Cuba. It consists of an octagonal pyramidal skeleton tower 115 feet in height, surmounted by a lantern and watchroom which are connected by a special stairway in a cylindrical steel shell, with the keeper's apartment below. The tower has a base about 50 $\frac{1}{2}$ feet in diameter and the columns are seated on concrete pedestals built into excavations in the solid rock, very firmly bolted to the rock itself, the entire structure having been planned with reference to the great wind and water pressure to which it is likely to be exposed.

ACETYLENE BUOYS. The opening of the Ambrose Channel in New York Harbor, to commercial use, presented an interesting problem, as it was desired to mark this deep water approach to the city by the most complete and effective system of buoyage available. The use of acetylene buoys was decided upon, as the channel is to be used by night as well as by day, and apparatus was ordered from several makers, for competitive test, in order that the best system could be ascertained by experience. The Lighthouse Board placed at the entrance to the channel on December 1, 1908, light vessel No. 87, a full powered steamer of 488 tons, in which the most modern type of apparatus was installed. It was proposed to increase the intensity of the light by the installation of a lens similar to that used in lighthouses.

ORGANIZATION OF LIGHTHOUSE ESTABLISHMENTS. The Secretary of Commerce and Labor in his annual report for 1909 drew attention to the matter of the reorganization of the Lighthouse Establishment, which under the Department of Commerce and Labor is charged with the supervision and maintenance of the lights and other aids to navigation on the navigable waters of the United States. Attention was called to the fact that there was no executive head to the Lighthouse Establishment, and that the service was divided between representatives of the army and navy, the former serving as engineers and the latter as inspectors. The Secretary suggested that this divided responsibility, with expense for separate tenders, be obviated by placing an entire district in charge of one officer instead of two. It was recommended by the Lighthouse Board that the sixteen existing districts should be increased by three, in order to make separate districts of Porto Rico and Guantanamo, Cuba; the Territory of Hawaii, and other Pacific Islands; and Alaska.

There were in 1909 the following aids to navigation under the control of the United States Lighthouse Establishment:

Character—Lighted aids:

First-order lights	59
Second-order lights	20
Third-order lights	73
Three-and-a-half-order lights	16
Fourth-order lights	331
Fifth-order lights	147
Sixth-order lights	90
Lens-lantern lights	464
Range-lens lights	34
Reflector lights	91
Post-lantern lights	2,333
Electric arc lights	7
Electric incandescent lights	1
Light vessels	53
Light vessels, relief	13
Gas-lighted buoys	94
Total	3,926

Unlighted aids:

Fog-signals, steam, etc.	228
Fog-signals, clockwork	205
Day beacons	1,157
Submarine signals	43
Whistling buoys	94
Bell buoys	169
Other buoys	5,760
Total	7,656
Grand total	11,582

LILIENCRON, DETLEV, Baron von. A German novelist and poet, died July 22, 1909. He was born at Kiel in 1844. He served in the Prussian army in the campaigns of 1866, 1870 and 1871, and was severely wounded in each. After some time spent in travel in America, he was until 1887 in the employ of the German government, after which he devoted himself entirely to literature. Liliencron was one of the most influential of the "Young German" authors, and was a member of the Berlin "Freie litterarische Gesellschaft," and was one of the founders of the Munich "Gesellschaft für modernes Leben." He had great influence over nearly all the members of the new school in Germany. He was better known, perhaps, as a lyrist than a novelist. Among his most popular lyrics are *Breide Hummelsbüttel* (1886; 2d ed. 1900); *Der Mäcon* (1890; 3d ed. 1900); and the *Kriegsnovellen* (1896; 4th ed. 1902). He wrote also several dramas, the best known of which are *Der Trifels und Palermo* (1886), and *Pokahuntas* (1905). The military swing of many of his lyrics won for him the title of "the soldier poet." His narratives were powerful, but they were marred by some affectation of manner. His themes were frequently erotic. His best known poetic works are: *Adjutantentritte* (1884); *Gedichte* (1889); *Neue Gedichte* (1893); *Nebel und Sonne* (1900); and *Bunte Beute* (1903).

LILLEY, GEORGE LEAVENS. An American public official, Governor of Connecticut, died April 21, 1909. He was born in Oxford, Mass., in 1859. His education was obtained in the public schools and in a technical school in Worcester, Mass. He engaged in business and became partner in the firm of Lilley, Swift & Co., of Waterbury, Conn. In 1900 he was elected to the State Legislature, and in 1903 to Congress, where he served until 1908. He became conspicuous in February of that year by charges made by him that there had been gross corruption in the procuring of contracts by the Electric Boat Co., for submarine boats for the navy. A Congressional inquiry found these charges baseless, and Mr. Lilley was forced to retract them. He was also declared to be in contempt, and to have violated the privileges of the House. In November, 1908, Mr. Lilley was elected Governor of Connecticut. Charges of corrupt practices were brought against him, but the law under which they were made was declared unconstitutional by the State courts. He refused to resign his seat in the House of Representatives, and on his inauguration it was declared vacant.

LINCOLN CENTENARY. See CENTENARIES AND ANNIVERSARIES.

LINDSAY, THOMAS BOND. An American scholar, died July 22, 1909. He was born in New York City in 1853, and was educated at

the Genesee Wesleyan Seminary and Wesleyan University, graduating from the latter institution in 1874. From 1874 to 1877 he studied in Germany, and in 1878 was chosen assistant professor of Latin and Sanskrit in Boston University. He became full professor in these branches in 1884, retaining this chair until his death. He edited Cornelius Nepos, Juvenal and Catullus, and contributed to Warner's *Library of the World's Best Literature*. He wrote also *The Place of the Classics in the Modern Curriculum* (1901).

LINDSAY, WILLIAM. An American statesman, formerly United States Senator from Kentucky, died October 15, 1909. He was born in Rockbridge county, Va., in 1835, and was educated in the schools of Lexington, Va. Following his graduation he entered the law office of Judge John W. Breckenridge, where he studied for four years. In 1856 he was admitted to the bar and began the practice of law in Clinton. On the outbreak of the Civil War he enlisted as a private in the Confederate army. He served throughout the war and took part in many important engagements. At its close he was paroled and again took up the practice of law. He was elected to the State Senate in 1867, and in 1870 was elected Judge of the Court of Appeals, which office he held until 1878, serving for the last two years as Chief Justice. After his retirement from the bench he spent considerable time in New York City, where he was a member of the law firm of Lindsay, Kremer, Kalish & Palmer. His work as a judge was of the highest order and he made many important decisions during the term of his office. In 1889 he was elected to the Kentucky State Senate, and in the same year he was appointed a member at large of the World's Columbian Exposition. He was appointed United States Senator from Kentucky to fill the unexpired term of John G. Carlisle in 1893, and a year later was elected for the full term, serving until 1901. He was a sound-money Democrat and was, in 1896, asked by the Kentucky Legislature to resign. This he refused to do in a scathing reply in which he said that he represented the people of the State and not any faction or any political party. He was defeated for reelection to the Senate. Senator Lindsay was a trustee of the Louisiana Purchase Exposition, and of the Carnegie Institution at Washington. He was also a member of the American Bar Association and the Bar Association of New York.

LIQUID CRYSTAL. See CHEMISTRY.

LIQUORS, FERMENTED AND DISTILLED. These products are classed under four general heads; (1) wines, (2) malt liquors, (3) distilled liquors, and (4) liqueurs or cordials.

WINES

The table in next column gives the estimated production of wine in the world for 1906 and 1907, the latest statistics.

The estimates for 1908 show a slight decrease

in France and Italy and a slight increase in Spain: France producing 60,545,265 and Italy 51,748,760 hectolitres.

It is exceedingly difficult to obtain any information as to the actual production of wines in the United States, as they are under no supervision by the government. The following table shows approximately the production of dry wines in the State of California for the last ten years.

THE WORLD PRODUCTION OF WINE, 1906 AND 1907

(Estimate of the *Moniteur Vinicole*)

Country.	1906 Hectolitres	1907 Hectolitres
France	52,079,050	66,070,273
Corsica	146,000	262,076
Algeria	6,905,720	8,601,228
Tunis	230,000	300,000
Italy	29,783,000	53,902,607
Spain	13,600,000	18,384,000
Portugal	3,900,000	4,500,000
Azores, Canaries and Madeira	110,000	150,000
Austria	3,100,000	3,500,000
Hungary	2,805,000	3,100,000
Germany	2,150,000	1,900,000
Russia	2,100,000	2,600,000
Switzerland	1,200,000	900,000
Luxembourg	120,000	105,000
Turkey and Cyprus	1,700,000	1,500,000
Greece	900,000	1,225,000
Bulgaria	1,900,000	2,100,000
Serbia	500,000	550,000
Rumania	2,500,000	2,600,000
United States	1,400,000	1,600,000
Mexico	18,000	16,000
Argentine Republic	1,500,000	1,300,000
Chile	2,500,000	2,000,000
Peru	98,000	95,000
Brazil	225,000	320,000
Uruguay	92,000	90,000
Bolivia	26,000	25,000
Australia	265,000	270,000
Cape of Good Hope	190,000	195,000
Persia		18,000

1 hectolitre equals 26.41705 gallons.

Dry wines produced in the State of California.

	Gallons.
1900	13,762,953
1901	27,000,000
1902	27,000,000
1903	21,900,000
1904	15,590,000
1905	19,500,000
1906	24,500,000
1907	26,000,000
1908	22,500,000
1909	23,000,000

The production, however, of fortified sweet wines being under the regulation of the Bureau of Internal Revenue, can be very exactly determined. The following table shows the production of fortified sweet wines in the four States producing the largest amounts, and the total production for the United States for the years 1908 and 1909.

	Tax gallons of brandy used		Wine gallons fortified			
	1908	1909	Before fortification	1908	1909	After fortification
California	4,233,977	3,678,377	14,057,110	12,235,305	16,491,168	14,368,025
Hawaii	3,706	4,764	14,995	21,058	17,222	24,176
New York	135,337	129,453	471,298	465,261	547,488	539,507
North Carolina	5,567	1,354	49,126	12,500	52,509	13,243
Total production for U. S.	4,380,016	3,814,129	14,601,975	12,734,898	17,119,261	14,946,871

This table shows a very appreciable decrease in production during the year 1909, principally in California, and also that very little advantage is taken of the sweet wine law outside of the States of California and New York.

MALT LIQUORS. The production of fermented malt liquors in the United States was 56,303,497 barrels during the year 1909, as against 58,747,680 in 1908, and 58,546,111 barrels in 1907. This decrease of 2,444,183 the past year, was largely due, in all probability, to the temperance laws which went into effect in various States.

In Great Britain the consumption of beer during 1909 was 32,751,733 barrels, as against 33,850,186 barrels the previous year.

DISTILLED LIQUORS. The statistics of the production of distilled spirits in the United States showed an increase for the year 1909. The report of the Commissioner of Internal Revenue shows 136,287,731 tax gallons in 1909, as against 129,860,202 tax gallons for 1908, but, in spite of this increase of production, there was a decrease in spirits tax paid, 116,285,316 gallons being withdrawn for this purpose, as against 119,703,594 gallons in 1908, indicating that larger amounts are being stored for maturing.

The effect of the new regulations of the Bureau of Internal Revenue as to the marking of distilled spirits in compliance with the Pure Food Law, is shown in the table below, which indicates a remarkable change in the kind of spirits produced during the past year.

The increase in production of whiskey from

It also shows that there has been a steady decrease in production in the last ten years, falling from 63,437,884 gallons in 1899 to 49,529,602 during the year 1909. This decrease in production, however, has been almost entirely in Scotch spirits, falling from 35,769,114 gallons in 1899 to 24,407,727 in 1909. During the past ten years the amount of spirits consumed in Great Britain has decreased steadily from 1.05 proof gallons per capita in 1899 to 0.87 in 1909.

During the year 1909, the controversies arising under the food laws, as to the proper labeling of all kinds of distilled spirits, have continued with unabated zeal. The English Commission continued its labors, giving hearings as to the proper labeling of all kinds of distilled spirits, and, after long deliberation, concluded that whiskey was made from grain, that brandy was made from grapes, that Scotch whiskey was made in Scotland, and that Irish whiskey was made in Ireland; that the distillers did not deceive the wholesaler, but that the consumer was often deceived, but the difficulties of protecting him were so great that it was not worth the trouble. The outcome of this commission is disappointing.

In France the question of limiting the region in which Cognac brandy can be produced and the proper labeling of brandies produced in other parts of the country, has been considered and settled, very sharply defined lines having been drawn about the Cognac section, and all brandies produced outside of this small area cannot be called Cognac brandy.

TABLE SHOWING KINDS OF DISTILLED SPIRITS PRODUCED IN THE UNITED STATES

	Rum	High Wines	Gin	Whiskey	Alcohol	Commercial Alcohol	Miscellaneous
1909.....	1,895,922	50,062	2,756,752	27,708,351	50,925,821	16,849,154	26,793,675
1908.....	1,952,374	221,277	2,483,743	70,152,174	42,563,103	16,078,082

27,708,351 gallons in 1908 to 70,152,174 gallons in 1909, is nothing short of marvelous.—42,443,823 more gallons of whiskey in 1909 than in 1908. Part of this apparent increase was due to the fact that during 1908 a considerable amount of whiskey was classified under miscellaneous, but even considering all the production of 1908 classed as miscellaneous as whiskey, there is still an increase of 15,650,148 gallons over the previous year. The production of alcohol has, however, shown a very large decrease, 8,372,719 gallons less being shown. This either means that the distilling business has largely changed from the production of high proof alcohol to the production of whiskey or that a large amount of high-proof alcohol has been branded whiskey in violation of the regulations. As a matter of fact, it is probable that both factors have been at work,—that there has been a large change in the kind of spirits produced and also a large amount of alcohol diluted and marked whiskey.

The report of the Inland Revenue Office of Great Britain shows a slight increase in the production of spirits during the last year; the following table shows the amounts for 1908 and 1909:

	England gallons	Scotland gallons	Ireland gallons	Total gallons
1908 ...	13,328,083	22,796,555	11,653,513	47,778,151
1909 ...	12,929,631	24,407,727	12,192,244	49,529,602

In addition, the French government has adopted a system of revenue supervision of the production and handling of brandies, so that the purchaser may be assured of obtaining a pure product. This is somewhat of the same nature as the regulations in the United States in regard to spirits in government bonded warehouses, but in addition the government furnishes a certificate of purity.

The government has also issued standards or definitions for many kinds of distilled spirits, which are of exceeding interest and which are, in brief, as follows:

The names, brand (*eau-de-vie de vin*), wine, alcohol or spirits of wine are limited to products derived exclusively from the distillation of wine.

The name apple brandy or pear brandy is applied to products distilled from apple or pear cider.

Pomace brandy is produced from the distillation of the pomace of fresh grapes with or without the addition of water.

The name Kirsch is limited exclusively to the product of the alcoholic fermentation and distillation of cherries or wild cherries.

The name prune brandy and all other fruit brandies is limited exclusively to the product resulting from the alcoholic fermentation and the distillation of the fruits from which they are named.

The name gin is limited to the alcoholic bev-

erage obtained from the simple distillation with juniper berries of the fermented mash of rye, wheat, barley or oats.

The name rum or tafia is limited exclusively to the product resulting from the alcoholic fermentation and distillation either of the juice of the sugar cane or of the molasses or syrup derived from the manufacture of cane sugar.

Mixtures of the fruit brandies with brandy or commercial alcohol, as also brandy mixed with commercial alcohol, may be designated potable spirits (*eau-de-vie*), or may be designated by their specific names, as, for instance, "apple brandy" accompanied by the word "artificial" (*fantaisie*).

Also any manipulations intended to deceive the consumer as to the quality of the article are forbidden.

These clear definitions are very similar to those adopted by the Association of Official Agricultural Chemists in the United States. The International White Cross Society, at its meeting this year, also promulgated a very extended list of definitions of the terms as applied to distilled spirits as well as to other food products, showing the widespread tendency clearly to define the meaning of terms as applied to food products and to provide the consuming public with means of knowing what they are buying.

In the United States the regulations promulgated by the Internal Revenue Bureau for the proper marking of distilled spirits were still under fire. President Taft reopened the whole question by ordering a new hearing on the question what is whiskey, before Solicitor-General Bowers. A protracted hearing of several weeks was given for all interested to present evidence and, as a result, an opinion was rendered by Mr. Bowers to the President in which he held whiskey to be "the spirituous liquor composed of (1) alcohol derived by distillation from grain; (2) a substantial amount of by-products (often spoken of as congeners) likewise derived by distillation from grain and giving distinctive flavor and properties; (3) water sufficient without unreasonable dilution, to make the article potable; and (4) in some cases—though such addition is not essential—harmless coloring or flavoring matter, or both, in amount not materially affecting other qualities of whiskey than its color or flavor."

A mixture of two or more articles, being each a whiskey within the foregoing description, was held to be designated whiskey, as was also a mixture of one or more whiskies, with alcohol or a neutral spirit, provided the alcohol or neutral spirit is derived by distillation from grain. A spirit derived from any other substance than grain, or a neutral spirit derived by distillation from grain, but lacking a substantial amount of by-products derived by distillation from grain and giving distinctive flavor and properties, was not held to be properly designated as whiskey. It was also held that "The term whiskey as a drug is not applicable to a different product than whiskey as a beverage."

This opinion aroused intense opposition and voluminous briefs were filed in opposition to it and submitted to the President for his consideration before deciding the question.

The President, after reviewing the evidence, decided against the opinion of Mr. Bowers, holding that all distillates from grain when reduced to a potable strength (45 to 51.5 per cent. alcohol by volume) are entitled to be called whis-

key, in this agreeing with the decision of the English Royal Commission, but going much farther, and holding that the neutral spirits from grain flavored and colored, are an improvement in the process of making whiskey and antedate the process of coloring by ageing in barrels. He required, however, that whiskies of various kinds be labeled in such a manner as to show the different methods of manufacture. "Straight whiskey," the kind whose right to be called whiskey no one has ever questioned, is distinguished from whiskey made from neutral spirits or alcohol, and mixtures of these two whiskies may be called "A blend of straight whiskey and whiskey made from neutral spirits."

This decision is entirely opposed to the definitions of the Association of Official Agricultural Chemists and the Association of State Officials having charge of the enforcement of State Food Laws, and reverses the decision of President Roosevelt based upon Attorney-General Bonaparte's opinion. The opinion of the President has been certified to the various executive departments interested in its enforcement for the preparation of regulations to guide in its operation.

The result of all this agitation has been to educate the public as to what "straight whiskey" really is, and the results can be seen in the last report of the Commissioner of Internal Revenue. This shows in the great increase in production and sale of whiskey bottled in bond, which assures the purchaser of obtaining a pure, straight whiskey. This report shows that 6,365,839 tax gallons were bottled in bond during the year 1909, as compared with 4,794,358 tax gallons in 1908, an increase of 1,571,481 tax gallons. There has been steady growth in the bottling in bond trade in the past ten years, a fact which is of interest as showing the effect of the pure food legislation.

LITERATURE, ENGLISH AND AMERICAN. The tables on next page give the number of books in the various departments of literature, published in England and the United States during the years 1908 and 1909.

More than half of these books are of a technical or local character intended for limited classes of readers, and of the books of general interest, a large proportion are duplicated in the two lists, although the proportion of English books appearing in the United States is decreasing, owing chiefly to the increased production of American books. Of 10,901 books enumerated in the American list, 8308 were by American authors, 828 were by English or other foreign authors reprinted in the United States, and 1765 were imported from England, bound or in sheets. The number of volumes published continues to increase at an astonishingly rapid and almost equal rate on both sides the Atlantic. The English and American lists of new publications both contain about 35 per cent. more titles than in 1908. The decline in 1907 was merely temporary, due to the financial depression, and there is no indication that the rising tide of literary production has reached its height, except perhaps in fiction, which has dropped from its unprecedentedly high figure of the year before to about the level of 1906.

FICTION. This caption really includes a more diversified group of books than the others, for novels which have equal popularity are not always rivals, but appeal to very distinct classes

of readers. The following list of the "best sellers" for 1909, as reported by the *Bookman*, arranged approximately in the order of their popularity, shows more the diversity than the trend of the public taste: *Katrina*, by Elinor Macartney Lane; *The Trail of the Lonesome Pine*, by John Fox, Jr.; *Peter*, by Francis Hopkinson Smith; *54-40 or Fight*, by Emerson Hough; *The Man in Lower Ten*, by Mary Roberts Rinehart; *The Inner Shrine*, Basil King; *Septimus*, by William J. Locke; *Lewis Rand*, by Mary Johnston; *Mr. Opp*, by Alice Hegan Rice; *The White Sister*, by Francis Marion Crawford; *The Goose Girl*, by Harold Macgrath; *A Certain Rich Man*, by William Allen White; *The Red City*, by S. Weir Mitchell; *The Man from Brodney's*, by George Barr McCutcheon; *The Missioner*, by E. Phillips Oppenheim; *The Red Mouse*, by W. Hamilton Osborne; *The White Mice*, by Richard Harding Davis; *The Bride of the Mistletoe*, by James Lane Allen; *Truxton King*, by George Barr McCutcheon; *The Silver Horde*, by Rex E. Beach; *The Danger Mark*, by Robert W. Chambers; *The Testing of Diana Mallory*, by Mrs. Humphry Ward; *The Bronze Belt*, by Louis Vance; *The Chippendales*, by Robert Grant; *The Story of Thyrza*, by Alice Brown; *The Romance of a Plain Man*, by Ellen A. G. Glasgow; *The Calling of Dan Matheus*, by Harold Bell Wright; *Bella Donna*, by Robert S. Hichens.

Of these, *The Trail of the Lonesome Pine*, *The Man from Brodney's*, *Peter*, *Lewis Rand* and *The Testing of Diana Mallory*, were among the best selling novels of 1908, and some of the others were included in this review last year. Considering the above list as indicative of popular taste, it is of interest to observe that, on the whole, they are of a decidedly wholesome character, notwithstanding the fact that novels dealing with sex problems in an unconventional manner are being produced in large numbers. There are only two or three of the above-named whose propriety could be called in question by anyone. The chief elements of popularity are sentiment, mystery and adventure. Those not mentioned last year may be briefly characterized: *Katrina*, a charming Irish Girl; *54-40 or Fight*, the acquisition of Oregon; *The Man in Lower Ten*, detective story; *The Inner Shrine*, a life shadowed by a thoughtless act; *Septimus*, an amusingly unworldly and self-sacrificing genius; *Mr. Opp*, a masculine "Mrs. Wiggs"; *The White Sister*, Crawford's usual Italian melodrama; *The Goose Girl*, a princess in disguise; *A Certain Rich Man*, an accurate picture of Kansas in pioneer days and the evolution of a plutocrat; *The Missioner*, philanthropic work in an English village; *The Red Mouse*, political intrigue; *The White Micc*, Spanish-American adventure; *The Bride of the Mistletoe*, poetical treatment

FOUR EMINENT WRITERS WHO DIED IN 1909

of an unpleasant theme; *Truxton King*, more remarkable character-sketching and shows the Graustark adventure; *The Danger Mark*, New York society; *The Bronze Bell*, mystery; *The Chippendales*, Boston Brahmins; *The Story of Thyrza*, a modern Hester Prynne; *Romance of a Plain Man*, from barefoot boy to railroad president; *The Calling of Dan Mathews*, the tribulations of a minister; *Bella Donna*, an evil woman in an Egyptian setting. The leisurely and reminiscent style of novel writing is being cultivated with increasing success. William De Morgan in *It Never Can Happen Again* devotes 320,000 words to the intricacies of a matrimonial tangle caused by the English law prohibiting marriage with a deceased wife's sister, and to genial character sketches of all persons concerned in it. *Margarita's Soul*, by Josephine Daskam Bacon, was published under the pseudonym of "Ingraham Lovell." Purporting to be "The Recollections of a Man of Fifty," it depicts a beautiful and gifted woman who had been reared in strict seclusion. *The Old Wives' Tale*, by Enoch Arnold Bennett, is another story of "the Five Towns," remarkable for the skill shown in keeping the reader's attention through a long-continued narrative of commonplace incidents. Mr. Bennett also produced during the year *The Glimpse*, an adventure of a soul temporarily released from the body and seeing the world from another standpoint. *Araminta*, described by John Collins Snaith, is almost as charming and naïve as "Margarita." The custom of continuing favorite characters through a series of books is becoming as common in adult fiction as it has been in juvenile. The Baroness von Hutten zum Stolzenberg in *Kingsmead* brings forward Pam and Tommy for the fourth time; *Anne of Avonlea*, by Lucy Maud Montgomery, is a sequel to *Anne of Green Gables*; and Maurice Hewlett in *Open Country* sticks to his beloved Senhouse, the gipsy, flower-planting, letter-writing anarchist of *Half-Way House* and is now continuing his adventures as a serial. Mrs. Humphry Ward in *Marriage à la Mode*, called in England *Daphne*, attacks the American divorce system by showing its disastrous effect upon the lives of an English fortune-hunter and an American heiress. Herbert George Wells seems to have abandoned his scientific and Utopian romances, and is devoting himself to the complexities of everyday life, particularly the marriage question. He has produced two long novels crowded with life-like characters: *Tono-Bungay*, the rise and fall of a patent-medicine millionaire; and *Ann Veronica*, the unrest of the modern woman finding expression in various unconventional ways. Two volumes of short stories by Rudyard Kipling appeared during the year, *Abaft the Funnel*, thirty sketches and tales contributed to Anglo-Indian periodicals in 1888-90; and *Actions and Reactions*, containing eight recent stories, among them a very clever *tour de force* "With the Night Mail," abounding in unheard of technicalities of future aviation. Gilbert Keith Chesterton gives a running debate between an atheist and a Catholic in *The Ball and the Cross*, a fantastic mixture of symbolism and adventure, similar to *The Man Who Was Thursday*. Eden Phillpotts has two volumes this year: *The Haven*, dealing with the sailors of Brixham, and *The Three Brothers*, with Dartmoor peasants. Henry James's *Julia Bride* analyzes the complications arising from the divorce habit. *Fraternity*, by John Galsworthy, contains some

involuntary inter-relations between rich and poor. *Martin Eden*, by Jack London, deals with the struggle of a seaman to secure recognition as an author. *The Glory of the Conquered*, by Susan Glaspell, is notable only because of its unusual theme, the heroism of medical research. Elizabeth Robins (Mrs. G. R. Parkes) in *The Florentine Frame* deals with the unpleasant theme of the love of mother and daughter for the same man. *The Hungry Heart*, by David Graham Phillips, is a somewhat sensational sex-problem novel. *The Prince of Dreamers*, by Flora Annie Steel, is the story of Akbar, Emperor of India in Elizabeth's reign. The appearance of a new Messiah in modern Egypt is the subject of Hall Caine's *The White Prophet*. Other noteworthy novels of the year are *The Southerner*, by "Nicholas North," showing how Southern conservatism hampers a strong individuality; *True Tilda*, by A. T. Quiller-Couch; *Sebastian* (English title, *The Incomplete Etonian*), by Mrs. Julia Frankau (Frank Danby, pseudonym); *Diamond Cut Paste*, by Agnes and Egerton Castle; *Stradella*, by F. Marion Crawford, the story of an Italian seventeenth-century musician; *The Straw*, by Rina Ramsay, a good, "horsey" piece of fiction; *The Price of Lis Doris*, by "Maarten Maartens" (Joost Marius Willem van der Poorten Schwartz); *Candles in the Wind*, by Mrs. Maud Driver, an Anglo-Indian romance; *The Unlit Lamp*, by Algernon Gissing; *The Title Market*, by Emily Post; *Multitude and Solitude*, by John Masefield; *The Way Things Happen*, by Hugh de Selincourt. Among the best of the short stories are: *Northern Lights*, by Sir Gilbert Parker, Canadian Northwest; *Friendship Village Love Stories*, by Zona Gale; *The Score*, by "Lucas Malet" (Mrs. Mary St. Leger Harrison), containing two stories; and two volumes of "O. Henry's" (Sidney Porter) brilliant but hastily written tales, *Options and Roads of Destiny*.

Poetry and Drama. Although the usual number of volumes of verse have appeared during the year, none of them show distinction or popularity. The sensation created by William Watson's *New Poems* was due more to the personality of "The Woman with the Serpent's Tongue" than any unusual merit. Thomas Hardy having completed his ambitious undertaking, *The Dynasts*, published a volume of miscellaneous verse, *Time's Laughingstocks*. The beginning and end of George Meredith's career are represented by *Poems Written in Early Youth* and *Last Poems*. The final work of the unfortunate John Davidson comes to us in *Fleet Street and Other Poems*, expressing through the personality of Cain his spirit of defiance and discontent. William Dean Howells in a poetic dialogue, *The Mother and the Father*, depicts the emotions of the parents at the birth, marriage and death of their daughter. *Artemision*, by Maurice Hewlett, contains Hellenic idylls, sonnets and lyrics. *The Cliffs*, by Charles M. Doughty, on the contrary, is a dip into the future, and treats of the invasion of England by airships. John G. Neihardt, in his *Man-Song*, gives expression to a primitive masculinity. Richard Le Gallienne's *New Poems* show no advance over his earlier work. The amusing ballads of *Carmina*, by T. A. Daly, deserve mention for his clever handling of the Italo-American dialect as well as the more fam-

far Irish. *The White贝子* contains all of Henry van Dyke's verse of the last five years, except *The House of Rimmon*.

Poems, by the late Richard Watson Gilder; *Poems*, by Percy MacKaye; *Poems*, by Arthur Christopher Benson; *Each in His Own Tongue and Other Poems*, by William Herbert Carruth, and *King Alfred's Jewels*, a dramatic poem, by Kate Nichols Trask, are to be here included.

Of the plays appearing in print the most prominent are those dealing with vital social problems: *The Melting Pot*, by Israel Zangwill, an enthusiastic championship of the amalgamation of races taking place in America; *Strife*, by John Galsworthy, an impartial picture of the struggle between labor and capital; *The Great Divide*, by William Vaughn Moody, the distress of a New England conscience in the Arizona climate, and a translation of Maurice Maeterlinck's symbolic child play, *The Blue Bird*.

ESSAYS, CRITICISM AND LITERARY BIOGRAPHY. The unusually large number of collected works and new editions noticeable in the table of American publications is in part due to celebration of the centenaries of Gladstone, Poe, Darwin, Lincoln, Tennyson, Fitzgerald and Holmes, the second centenary of Johnson and the third of Shakespeare. Biographies, character sketches, romances, selections, appreciations, memorials and eulogies are brought out in profusion by the popular fondness for such anniversary commemorations. The publishers' book-list for 1909 gives 70 such titles under "Lincoln." Most of this occasional literature, however meritorious or useful, is of ephemeral interest only. *The Man Shakespeare and His Tragic Life Story*, by Frank Harris, gives unusual prominence to the personality of the poet, while Algernon Charles Swinburne's essay on *Shakespeare* and analysis of *Three Plays of Shakespeare* eulogizes with his usual eloquent exaggeration, and Charles Frederick Johnson tells of *Shakespeare and His Critics*. *The Life and Times of Laurence Sterne*, by Wilbur C. Cross, is the most thorough and serious study of this author that has ever been made. The first complete collection of the *Letters of Percy Bysshe Shelley* has been made by Roger Ingpen, and A. Clutton-Brock has written a new life of *Shelley: The Man and the Poet*. Two lives of *Samuel Pepys* have appeared, by Miss E. Hallinan Moorehouse and Percy Lubbock, respectively, the former being the more lively and extensive of the two. Lewis Melville has devoted over ten years to collection of published and unpublished material relating to *William Makepeace Thackeray*, and includes it in his two-volume biography. *The Love Letters of Thomas Carlyle and Jane Welsh*, written in the period from 1821 to 1826, have been published in full by Alexander Carlyle, and throw a new light on this much-discussed relationship, though their literary value is small. *Recollections of a Long Life*, by Lord Broughton, edited by his daughter, Lady Dorchester, with additional extracts from his diaries, is chiefly of interest from its plentiful reminiscences of Byron. Our knowledge of Dr. Johnson's circle is enlarged through the biography of *Giuseppe Baretti*, by Lucy Collison-Morley, dealing with his life in Italy, as well as in England. Francis W. Newman, the younger brother of the more celebrated Cardinal, is the subject of a memoir by L. Giberne Sieveking. Other works which must be mentioned in connection with literary

biography are, the *Journals*, by Ralph Waldo Emerson, edited by E. W. Emerson and Waldo Emerson Forbes, the two volumes covering the years 1820-1832; *Memories of Sir Walter Scott*, by James Skene edited by Basil Thomson, and *Sir Walter Scott's Friends*, by Florence MacCunn; *Walt Whitman*, by George Rice Carpenter; *George Canning and His Friends*, a volume of letters, edited by Captain Joseline Bagot; *My Story*, an autobiography, by Hall Caine, interesting chiefly from its anecdotes of Rossetti and his coterie; *William Blake*, by Basil de Sclincourt; *George Meredith in Anecdote and Criticism*, by J. C. Hammerton; *Recollections*, by Washington Gladden; a *Memoir of William Walpole*, edited by A. Francis Stewart; *The Life of Richard Brinsley Sheridan*, by Walter Sickel; *A Georgian Pageant*, by Frank Frankfort Moore, an interesting account of Johnson, Goldsmith and their contemporaries; *Friedrich Nietzsche*, by M. A. Mligrze; *Old Friends*, by William Winter, reminiscences of American men of letters; Moncure D. Conway, *Addresses and Reprints*, 1850-1907. No other book of literary biography and criticism has approached in popularity Gilbert Keith Chesterton's *George Bernard Shaw*. Any book on that subject or by that author would attract attention, so it is no wonder this combination of attractions has made the volume sell like a novel. These two paradoxical philosophers of the day delight in taking antithetical attitudes and in sharpening their wits upon each other. Chesterton has constituted himself the champion of orthodoxy and conventionality and his popularity is probably due in large part to his demonstration that brilliant writing is not necessarily a monopoly of the radicals. His volumes of journalistic essays, such as *Tremendous Trifles*, are widely read. An essayist almost as prolific, but with a quieter and more graceful style, is Edward Verrall Lucas, whose collections of this year is entitled *One Day and Another*. The sixth volume of the *Shelburne Essays*, by Paul Elmer More, deals more with philosophy than literature, being studies of religious dualism in Indian, Greek and more modern writers. Other volumes of essays on miscellaneous topics are: *Yet Again*, by Max Beerbohm; *The Reaping*, by Edward Frederic Benson; *Wayside Wisdom*, by E. M. Martin; *The Human Way*, by Louise Collier Wilcox; *Carlyle's Laugh and Other Surprises*, by Thomas Wentworth Higginson; *The American of the Future and Other Essays*, by Brander Matthews; *Magazine Writing and the New Literature*, by Henry Mills Alden; *On Nothing and Kindred Subjects*, by Hilaire Belloc.

The *Oxford English Dictionary*, on historical principles, edited by Sir James A. H. Murray and others, has reached its seventh thick quarto volume, concluding the letter V. The old "Webster" appears as the *New International Dictionary of the English Language*, completely revised under the editorship of W. T. Harris and F. Sturges Allen. Thomas Raynesford Lounsbury, in *English Spelling and Spelling Reform*, exposes the inconsistencies and inconveniences of the prevailing system, and argues for its simplification. J. B. Williams gives us a *History of English Journalism*. *The Springs of Helicon*, by John William MacKail, is a study in the progress of English poetry from Chaucer to Milton. The *Oxford Lectures on Poetry*, by Andrew Cecil Bradley, are largely devoted to

Shakesperian criticism. Arthur Symons's *Romantic Movement in English Poetry*, includes every writer who was born before 1800 and survived into the nineteenth century, a brilliantly annotated catalogue. A critical and comparative study of *The Autobiography*, comprising eight hundred examples in various languages, has been made by Mrs. Anna Robeson Burr. Other noteworthy works of this class are: *Essays on Modern Novelists*, by William Lyon Phelps; *English Literature in the Nineteenth Century*; a concise *Manual of American Literature*, prepared for the Tauchnitz library, by Theodore Stanton; *Verse Satire in England Before the Renaissance*, by Samuel Marion Tucker. On foreign literature we have a life of *Charles-Augustin Sainte-Beuve*, by George McLean Harper; *Francesco Petrarca: Poet and Humanist*, by Maud F. Jerrold, an able work; *Chateaubriand and His Court of Women*, by Francis Gribble; *The French Procession*, by Mary Duclaux (Mary F. Robinson), essays on great writers from Racine to Anatole France; *A History of German Literature*, by Calvin Thomas; *A Literary History of Rome*, by J. Wright Duff; *Hellas and Hesperia, or The Vitality of Greek Studies in America*, by Basil L. Gildersleeve, with which should be coupled the Lowell lectures of John Pentland Mahaffy on *What Have the Greeks Done for Modern Civilization?* *The Literary History of Russia*, by Alexander Brückner; *Egoists: A Book of Supermen*, by James Gibbon Huneker, sketches of Stendhal, Baudelaire, Huysmans, etc.; *Six Masters in Disillusion*, by Algar Labouchere Thorold, Fontenelle, Merimée, Fabre, Huysmans, Maeterlinck and France; *Verse Plays of Molière*, a new translation, by Curtis Hidden Page; *Mystery of Education and Other Academic Performances*, by Barrett Wendell.

RELIGION AND PHILOSOPHY. The great interest now being taken in religious questions is evidenced by the rapid and continuous increase in the number of volumes appearing in this department. At the present rate it will soon overtake that of fiction in America and England, and some of the books have a sale as large as the popular novels. The most conspicuous tendency of recent years is the growth of what might be called, for want of a better name, the literature of optimistic suggestion. It defies a close classification because the books range from imperceptible gradations from those of a theological and ecclesiastical tone to those that are little more than manuals of practical dietetics. They are all, however, quite definitely characterized by their intent to secure health and happiness by strengthening the will power and banishing the inhibiting thoughts of self-distrust and foreboding; what Professor James calls "the religion of healthy mindedness." These books are too numerous and influential to be ignored, but are in general not sufficiently distinctive from a literary point of view to require specification here. Mention should be made, however, of three works of a critical, rather than a propagandist or inspirational character: *Psychotherapy*, by Hugo Münsterberg, based upon his success in the treatment of functional nervous diseases by suggestion in the Harvard laboratory; *Mesmerism and Christian Science*, by Frank Podmore, an interesting history of the various forms of mental healing from Mesmer to the present day; and *Mental Medicine*, by Oliver Hinkel. *Mysticism* has been receiving greater

attention and more respectful consideration from psychologists and historians since the publication of William James's *Varieties of Religious Experience* (1902), and this year an important contribution is made to the subject in Rufus Matthew Jones's *Studies in Mystical Religion*, a serious and sympathetic account of Christian mystics from the beginning to the end of the Commonwealth. A slighter book is *Aspects of Christian Mysticism*, by W. Major Scott. Doubtless the interest in mysticism is due in part to the popularity of the pragmatic philosophy which lays emphasis on immediacy and personal experience. Professor James has defended his practical conception of truth and its relation to reality in *The Meaning of Truth*, and in *A Pluralistic Universe* discusses various philosophers, especially Hegel, Fechner and Bergson, from the pragmatic standpoint. On the other side, Professor Münsterberg in a solid work on *The Eternal Values*, upholds his form of idealism against the attack of the relativists, and James Bassett Pratt, in *What Is Pragmatism?* adversely criticises the new philosophy in a popular style. Public attention has been directed to spiritism by the visit to this country of Eusapia Palladino, the Italian medium, whose phenomena have gained the credence of some distinguished European scientists in spite of her well-known tendency to use trickery. Among the books on psychical research the most prominent are: *After Death—What?* by the late Cesare Lombroso; *How I Know that the Dead Return*, by W. T. Stead; *Eusapia Palladino*, by Hereward Carrington, who brought her to the United States; *The Survival of Man*, by Sir Oliver Lodge. Notwithstanding the revival of interest in these efforts to obtain experimental proof of immortality, Goldsworthy Lowes Dickinson in his lecture, *Is Immortality Desirable?* argues that the question has less interest for mankind than is generally supposed. Two valuable single volume Bible dictionaries appeared this year: *The Standard Bible Dictionary*, edited by Malanthon W. Jacobus, E. E. Nourse and Andrew C. Zenoa; and a *Dictionary of the Bible*, edited by James Hastings, John C. Lambert and Shailer Mathews. Both are designed to put the results of modern research and criticism at the command of ministers and laymen, for whom the larger dictionaries of Hastings and Cheyne are too elaborate and expensive. Other works of interest in this field are: *Origins of Christianity and Spirit of Christ in Common Life*, by C. Biggs; *The Gospel and Human Needs*, by John Figgis; *Studies in Christianity*, by Borden Parker Bowne; *Luke, the Physician*, by W. M. Ramsay; *The Pauline Epistles*, by Robert Scott; *Christianity at the Cross Roads*, by the late George Tyrrell; *The Religion of the Future*, by ex-President Charles W. Eliot of Harvard; *The Teaching of Jesus Concerning the Future*, by Henry Burton Sharman; *Biblical Criticism and Modern Thought*, by W. G. Jordan; *The Psychological Phenomena of Christianity*, by George Barton Cutten; *Modern Thought and the Crisis in Belief*, by Robert Mark Wenley; *The Will to Doubt*, by Alfred Henry Lloyd; *The Sikh Religion, Its Gurus, Sacred Writings and Authors*, by Max Arthur Macauliffe; *Religious Attitude and Life in Islam*, by Duncan Black Macdonald; *Religion of Babylonia and Assyria*, by Robert William Rogers. Here may be mentioned a volume which can neither be ignored nor classi-

fied, *Scenes and Portraits*, by Frederic Manning, a series of imaginary conversations on life, philosophy and religion, beginning with Adam and Eve in Eden and ending with Renan and Leo XIII. in the next world.

EDUCATION. Most of the numerous books in this field are of a technical nature, but the following are some of those which appeal to a larger circle of readers: *Social Development and Education*, by M. V. O'Shea; *Education and Industrial Evolution*, by Frank Tracy Carlton; *Psychology of Thinking*, by Irving Edgar Miller; *Psychology and the Teacher*, by Hugo Münsterberg; *The Reorganization of Our Colleges*, by Clarence F. Birdseye; *The Women of a State University*, the working of co-education in the University of Wisconsin, by Mrs. Helen Remington Olin; *Impressions of American Education in 1908*, by Sarah A. Burstall; *Education in the Far East*, by Charles Franklin Thwing; *Japanese Education*, by Baron Kikuchi; *History of Education Before the Middle Ages*, by Frank Pierrepont Graves; *The Study of Religion in the Italian Universities*, by the Rev. L. H. Jordan and Beldassare Labanca.

HISTORY. The very energetic production of historical literature, particularly American, during the last few years, seems to have been followed by a lull, in which comparatively few original studies of importance are being made. *The Cambridge Modern History*, planned by the late Lord Acton and carried out by the co-operation of many specialists, published its eleventh volume, covering the period from 1845 to 1871. The handsomely illustrated and comprehensive *History of the United States*, by Elroy McKendree Avery, is one-third completed by the publication of its fifth volume, covering the period from the French and Indian War to the Declaration of Independence. The tercentenary of the discovery of the Hudson River brought out many books on New York, historical and descriptive, of which Mrs. Schuyler Van Rensselaer's *History of the City of New York in the Seventeenth Century*, is the most important. A briefer and more popular narrative is given by William Elliot Griffis in his *Story of New Netherland*. Mrs. Marion McMurrough Mulhall's *Explorers in the New World Before and After Columbus*, is chiefly of interest for its story of the Jesuit missions of Paraguay and its pre-Columbian maps. *Our Naval War with France*, by Gardner Weld Allen, is a clear and readable account of little known incidents of the close of the eighteenth century from contemporary material.

In French history we have a short *History of the French Revolution*, by Robert Matteson Johnson; an anecdotal account of the political, social, literary, scientific and artistic progress of the *Third French Republic* to the end of 1908, by Frederick Lawton; a sketch of *The Court of Louis XIII.*, by Mrs. K. A. Patmore, devoted especially to Richelieu; *The Wars of Religion in France*, 1559-1576, by James Westfall Thompson, a scholarly work incorporating recent research; *The Court of a Saint*, Louis IX., by Winnifred F. Knox. P. Hume Brown, who published the first volume of his *History of Scotland* eleven years ago, reached the third volume this year.

On the British Empire and its dependencies we have: *A Century of Empire*, by Sir Herbert Maxwell; *History of Canada*, 1763-1812, by Charles Prestwood Lucas; *India Through the*

Ages, by Flora Annie Steel, a popular and picturesque history of Hindustan; *A Colonial Autocracy*, New South Wales under Governor Macquarie, 1810-1821, by Miss Marion Phillips; *The Last Years of the Protectorate*, 1656-1658, by Charles Harding Firth; *George I. and the Northern War*, by James Frederick Chance, a study of British-Hanoverian policy in the North of Europe in the years 1709-1721; *A History of Sarawak Under Its Two White Rajahs*, 1839-1908, by S. Baring Gould and C. A. Bampfylde; *Burma Through the Centuries*, by J. Stuart; *Memoirs of Baber, Emperor of India, First of the Great Moghuls*, by Lieutenant-Colonel F. G. Talbot. William Warde Fowler describes *Social Life at Rome in the Age of Cicero*. Part II. of Demetrius C. Boulger's *History of Belgium* includes the years 1815-1865. The history of *Italy from 1494 to 1790*, is told by Mrs. H. M. Vernon (K. Dorothea Ewart).

GENERAL BIOGRAPHY. The year 1909 was rich in biographical literature partly owing to the influence of the centenary celebrations already mentioned. Probably the most notable book of the year in this field is *The Autobiography of Sir Henry Morton Stanley*, supplemented from his letters, diaries and notebooks by his wife, Dorothy Stanley. The remarkable life-story of Sir Robert Hart, who was the head of the Chinese Customs from 1863 to 1908, has been told by his niece, Julia Bredon. That pioneer in psychical research and crystal-gazing, John Dee, has been made the subject of a biography by Miss Charlotte Fell Smith. Miss Alice Shield continues her studies of *The Pretenders* by a volume of *Henry Stuart, Cardinal of York, and His Times*. Miss Alice Drayton Greenwood has published her first volume of the *Lives of Hanoverian Queens of England*.

Other English biographies and memoirs of interest are: *The Life and Letters of James Wolfe*, by Breckles Wilson; *The Last Days of Charles II.*, by Raymond Crawford; *The Girlhood of Queen Elizabeth*, by Frank A. Mumby; *Lady Hester Stanhope*, by Mrs. Charles Roundell; *The Life of Honorable Mrs. Norton*, by James Gray Perkins; *The Correspondence of Priscilla, Countess of Westmorland*, edited by her daughter, Lady Rose Weigall; *Memories of Fifty Years*, by Lady St. Helier (Mary Jeune); and *The Recollections of Lady Cardigan*, which had a succès de scandale on account of her frankness in discussing her contemporaries.

French biographies are numerous as usual, among them: *The Maid of France*, being the story of the life and death of Jeanne d'Arc, by Andrew Lang; *The Rose of Savoy*, Marie Adelaïde, by Hugh Noel Williams; *Louis XVI. and Mary Antoinette*, by Andrew C. P. Haggard; *Madame Elizabeth de France*, by the Honorable Mrs. Maxwell; *The Life of Mirabeau*, by S. G. Tallentyre; *The King Who Never Reigned: Memoirs Upon Louis XVII.*, by Eckard and Naundorff; *Napoleon's Brothers*, by A. Hilliard Atteridge. Mrs. Ady (Julia Cartwright) devotes two large volumes to "the perfect courtier," *Baldassare Castiglione*, 1478-1529. George Macaulay Trevelyan tells the story of the campaign of 1860 in *Garibaldi and the Thousand*. R. Nesbit Bain in *The Last King of Poland and His Contemporaries*, gives a vivid picture of the downfall of Poland. *The Life and Times of Master John Hus*, by Franz H. H. V. Litzow, is a thorough and impartial study of the Bohemian reformer. Miss Ida Ashworth Taylor gives us

lives of Queen Christiana of Syceden and of Henry Edward Manning, "cardinal-democrat."

Of American biography and memoirs we have *Retrospectiva of an Active Life*, by John Bigelow, ninety years in three volumes; *Recollections of Grover Cleveland*, by George F. Parker, written from intimate acquaintance; *The Autobiography of Nathaniel Southgate Shaler*, geologist and man of letters; *Robert V. Haynes and His Times*, by Theodore Behone Jersey; *Robert Fulton and the Claremont*, by Mrs. Alice Cary Sutcliffe; *Stephen A. Douglass*, by Clark Ezra Carr; the second and concluding volume of the *Letters and Journals of Samuel Gridley Howe*, edited by his daughter, Laura E. Richards, dealing with his life in Boston from 1832 to 1876. Of the numerous lives of artists, musicians and actors, there is space to mention only a few: *Raphael*, by Adolf Paul Oppe; *Michael Angelo and Ghirlandaio*, by Gerald Stanley Davies; *John Hopner, R.A.*, by William McKay and W. Roberts; *Grieg as Man and as Composer*, by Henry Theophilus Finck; *Johann Sebastian Bach*, by Sir Hubert H. Parry; *Handel*, by R. A. Streatfeild; *Joseph Jefferson and His Friends*, by Eugenie Paul Jefferson, his daughter-in-law; *Melba's Life, Art and Profession*, by Agnes C. Murphy.

TRAVEL AND DESCRIPTION. Each year shows a large increase in the number of new books descriptive of foreign scenes and peoples, often lavishly or handsomely illustrated with half-tones or color plates. These are useful to persons interested in these particular localities, but few of them are sufficiently distinctive to be discussed here. Four books dealing with familiar places require mention because of their charm of style. *Seven English Cities*, by William Dean Howells; *Italian Hours*, by Henry James; *The Wanderer in Paris*, by Edward Verrall Lucas; *The Wander Years*, by James Henry Yoxall. The year was distinguished by the publication of two narratives of exploration in unknown regions of the earth. Works of as much interest and novelty have been rare in the past and will be impossible in the near future. They are the story of the British Antarctic Expedition, 1907-9, *The Heart of the Antarctic*, by Sir Ernest H. Shackleton, with an account of the first journey to the South Magnetic Pole by Professor Edgeworth David; and *Trans Himalaya*, by Dr. Sven Hedin, giving the results of his exploration of a new mountain range on the borderland of Thibet, to which he has given that name. In this connection reference may be made to *Five Months in the Himalaya*, by Arnold L. Mumm; *Peaks and Glaciers of Nun Kun*, by Fanny B. and William H. Workman; *Kashmir*, by Major Molyneux and Sir Francis Younghusband; *Around Afghanistan*, by Major de B. de Lacoste; *Among the Wild Tribes of the Afghan Frontier*, by Theodore Leighton Pennell; *The Frontiers of Baluchistan*, by G. P. Tate.

The establishment of constitutional government in Turkey and the annexation of Bosnia and Herzegovina by Austria attracted public attention to these two countries; as shown by *The Revolution in Constantinople and Turkey*, by Sir William Ramsay; *The Awakening of Turkey*, by E. F. Knight; *Turkey in Revolution*, by Charles Roden Buxton; *The Soul of a Turk*, by Victoria de Bunsen; *Haremlik*, some pages from the life of Turkish women, by Demetra Brown; *High Albania*, by M. Edith Durham;

Bosnia and Herzegovina, by Maude M. Holbach; *Hungary and the Hungarians*, by W. B. Forster Bovill; *Hungary of To-day*, by Members of the Hungarian Government; *The Development of Hungarian Constitutional Liberty*, by Count Julius Andrassy; *Austria-Hungary*, by Geoffrey Drage; *The Austrian Court in the Nineteenth Century*, by Sir Horace Rumbold; *Racial Problems in Hungary*, by "Scotus Viator." On Africa we have: *The Northward Trek*, by Stanley Portal Hyatt; *Southern Rhodesia*, by Percy F. Hone; *Pre-Historic Rhodesia*, by R. N. Hall; *The Basutos*, by Sir Godfrey Lagden; *The Crime of the Congo*, by Sir Arthur Conan Doyle. On South and Central America: *The American Egypt: A Record of Travel in Yucatan*, by Channing Arnold and F. J. Tabor Frost; *Mexico*, by C. Reginald Enoch; *The Journal of an Expedition Across Venezuela and Colombia*, 1906-1907, by Hiram Bingham; *The Andean Land*, by Charles S. Osborn; *Wanderings in South America*, by Charles Waterton; *Peru and Mexico*, by C. Reginald Enoch; *A History of Jamaica*, by W. J. Gardiner.

The following are some of the miscellaneous books of travel: *A Holiday in Connemara*, by Stephen Gwynn; *The Norfolk and Suffolk Coast*, by W. A. Dutt; *Essex*, painted by L. Burleigh Bruhl, described by A. R. Hope Moncrieff; *England and the English*, from an American point of view, clever and fair-minded studies by Price Collier; *Holland of To-day*, by George Wharton Edwards; *Siena: The Story of a Mediæval Commune*, by Ferdinand Schevill; *Spain of To-day from Within*, by Manuel Audriar; *Cathedral Cities of Spain*, by W. W. Collins; *Going Down From Jerusalem*, by Norman Duncan; *New New York*, by John Charles Van Dyke; *Picturesque Hudson*, by Clifton Johnson; *Americans: An Impression*, by Francis Alexander; *Handbook of Alaska*, by Major-General A. W. Greeley; *The Confessions of a Beachcomber in tropical Queensland*, by E. J. Banfield; *Australia*, by W. H. Lang; *Letters from China*, with particular reference to the Empress Dowager and the women of China, by Sarah Pike Conger; *Things Korean*, by Horace Newton Allen; *Evolution of New China*, by William N. Brewster; *The People of the Polar North*, by Knud Rasmussen.

SOCIAL AND POLITICAL SCIENCE. In this department we shall consider only books of interest to the general reader. On the race question and problems of city life we have *The Story of the Negro*, by Booker Taliaferro Washington, what the negro has accomplished in the way of attaining a higher civilization; *The German Element in the United States*, its political, moral, social and educational influence, by Albert Bernhardt Faust; *The Immigrant Tide*, its effect on Europe and America, by Edward A. Steiner; *Chinese Immigration*, by Mrs. Mary Robert Coolidge; *The Spirit of Youth and the City Streets*, by Jane Addams, based on her Hull House experiences; *Misery and Its Causes*, by Edward T. Devine, a scientific analysis of poverty and disease and a discussion of the methods of their alleviation; *The Family and the Nation*, by William C. D. Whetham and Catherine D. Whetham, a study in natural inheritance and a plea for eugenics; *The Government of American Cities*, by Horace Edward Deming. The leading books on opposite sides of the much debated suffrage question are *Equal Suffrage*, by Helen Laura Sumner, a careful study of the working of the system in Colorado;

and *The Wrong and Peril of Woman Suffrage*, by the Rev. James Monroe Buckley, an argument against it. For and against Socialism there are *Socialism in Theory and Practice*, by Morris Hillquit, one of the leaders of the Socialist party in the United States; *Socialism and Government*, by J. Ramsay Macdonald, advocating a more moderate form of Socialism; *Economic Heresies*, by Sir Nathaniel Nathan, opposing both the orthodox economists and the socialists; *The Menace of Socialism*, by W. Lawler Wilson, a warning of revolution; and *Socialism in Social Government*, by W. G. Towler, an unfavorable criticism of British municipal experiments. On economic history, *Sixty Years of Protection in Canada, 1846-1907*, by Edward Porritt, an original study of Canadian tariff policy; *Evolution of Modern Germany*, by William Harbut Dawson, chiefly concerned with commercial and industrial progress; *Outlines of the Economic History of England*, a study in social development from the Saxon invasion, by H. O. Meredith.

LIVE-STOCK EXPOSITION. See AGRICULTURE.

LOAN AND TRUST COMPANIES. No branch of America banking has expanded so rapidly in recent years as that represented by the loan and trust companies. Thus in 1898 the Comptroller of the Currency's report showed only 246 such companies, while in 1909 it showed 1079. The aggregate resources in 1909 were \$4,008,534,000, an increase of 41 per cent. in four years. These resources equaled about one-fifth the total resources of all banks in the United States, and more than two-fifths those of all national banks. They included loans on real estate and mortgages owned, \$377,318,000; loans on other collateral security, \$1,222,881,000; other loans and discounts, \$460,550,000; stocks and bonds, \$900,190,000; cash on hand, \$264,000,000. The liabilities included capital and surplus, \$856,145,000; and individual deposits, \$2,835,835,000. These companies held 20.2 per cent. of all individual deposits in 1909, as compared with 14.2 per cent. in 1900. The deposits in 1909 included \$657,697,000 of savings deposits, credited to 1,965,000 depositors, and drawing an average of 3.43 per cent. interest. The non-savings deposits drew an average of 2.34 per cent. interest. The cash on hand was slightly less than 8 per cent. of the deposits subject to check.

Pennsylvania ranked first in the number of loan and trust companies with 278, of which 60 were in Philadelphia and 41 in Pittsburg, New York with only 85 stands preëminent in the resources of its companies. Thus the Pennsylvania companies had aggregate resources of \$635,377,000, the 42 Illinois companies, \$450,197,000, and the New York companies, \$1,574,889,000. New York City had 39 companies with aggregate resources of \$1,318,775,000, and Chicago 19 with resources of \$415,282,000. See BANKS AND BANKING.

LODGE, GEORGE CABOT. An American poet, died August 22, 1909. He was the son of Senator Henry Cabot Lodge, and was born in Boston in 1873. He graduated from Harvard

University in 1895, and studied at the University of Paris. He served through the Spanish-American War, with the rank of ensign. Following the close of the war he became private secretary to his father, and held this position until his death. Mr. Lodge was a frequent contributor of verse to the magazines. His published works include *Song of the Wave* (1898); *Poems* (1902); *Cain* (a drama, 1904), and *The Great Adventure* (1905). He was regarded by competent critics as a writer of unusual gifts, distinctly in the first rank of the younger American poets.

LOEB, LOUIS. An American artist, died July 12, 1909. He was born in Cleveland, Ohio, in 1866. At the age of 19 he removed to New York City, where he became well-known as an illustrator. He went to Paris and completed his art studies under Gérôme. Returning to the United States he executed many important commissions. He was elected an associate of the National Academy of Design in 1901, and an Academician in 1906. He won several important prizes, and received medals at the Buffalo and St. Louis expositions.

LOGAN, OLIVE. An American writer, died on April 28, 1909. She was born in Elmira, N. Y., in 1839. After a successful period on the stage she graduated from an English college for women. She lived for a time in Paris, contributing to English and French publications. In 1864 she again went on the stage in a play of her own, *Ereleean*, in which she starred in the United States. She achieved great success in 1865 in a play called *Sam*. Shortly after the completion of her college course she married Edward A. De Lille. She secured a divorce from him in 1865, and shortly afterwards married W. W. Sikes. Following this she left the stage and became a popular lecturer on woman's rights. She wrote and adapted several successful plays, and contributed to many periodicals. In 1883 her husband died and she married her secretary, James O'Neil. He proved to be worthless, and Olive Logan gradually sank from sight until, in 1906, she appeared in a police court in New York asking for relief. She was found by friends and placed in comfortable surroundings, but she became insane and died in an asylum in England. Among her friends were most of the leading writers and public men of her time. Among her works are *Photographs of London Life*, *Château Froissac*, and *Get Thee Behind Me, Satan*.

LOMBROSO, CESARE. An Italian criminologist, died October 19, 1909. He was born in Verona, in 1836, and was educated at the University of Turin. He studied literature, linguistics and archaeology, but changed his plans and for eight years was a military surgeon. In 1862 he was appointed professor of the diseases of the mind at the University of Pavia, and later took charge of the insane asylum at Pesaro. He eventually became professor of medical law and psychiatry at the University of Turin. The appearance of his great book, *The Criminal*, in 1875, marked the beginning of the science of criminal anthropology, and Lombroso became the head of the Italian school. As against Nordau's theory of degeneration, he held that the criminal was insane through abnormalities of development or arrested development. He maintained that the born criminal is distinguished from other men by

physical stigmata which can be easily determined, differentiated from the normal anatomically as well as psychologically. Chief among his stigmata are excessive asymmetry of the skull, small cranial capacity, abnormal features, and slight growth of the beard relative to the hair of the head. For boldly stating his position thirty years ago he was roundly abused by the people of his country. In 1879, when Passanante attempted the life of King Humbert in Naples, the authorities wished the would-be assassin punished, but Lombroso advised sending him to an asylum. Passanante was sent to a dungeon and 13 years later a commission of alienists pronounced him insane. The studies which led him to his conclusion regarding criminals date back to 1866, when a case came under his observation in which a soldier in anger killed an officer and was executed. Lombroso made the autopsy and was surprised to find an occipital dent in the skull. He conceived at once that the soldier's crime was due to an incomplete development of the brain, due to the peculiarity of the skull. He continued his studies along this line and later showed the world how in this way crime originates and criminology is propagated. He found a remedy in careful education and development. In the past few years there has been something of a reaction against Lombroso's theories of criminology. He was a copious writer, and English translations of his works, *The Man of Genius* and *The Female Offender*, were published in 1891 and 1895 respectively. Both caused great discussion. In addition to his works on criminology he wrote two books on pellagra, (q. v.) a disease which is now attracting some attention in the United States, and has long been a scourge of Italy. Among his other books in addition to those mentioned above are the following: *Ricerche sul cretinismo in Lombardia* (1859); *Genio e follia* (1864); *Sulla microcefalia e sul cretinismo con applicazione alla medicina legale* (1873); *L'amore nel suicidio e nel delitto* (1881); *Sulla medicina legale del cadavere* (2d ed., 1890); *Le più recenti scoperte ed applicazioni della psichiatria ed antropologia criminale* (1894); *L'antisemitismo e le scienze moderne* (1894); *Genio e degenerazione* (1897). His last book, translated into English as *After Death, What?* was published in 1909.

LORIMER, WILLIAM. An American public official, United States Senator from Illinois. He was born in Manchester, England, in 1861. His parents removed to the United States in 1866, and lived for a time in Detroit, moving to Chicago in 1870. When the son was 12 years old the father died and the former was left, with his brother, to support their mother and three sisters. He sold newspapers, and did other like work until he obtained a position in the stockyards. He later became a horse car conductor and in this position first showed his talent for handling men. He organized a street railway employees' association and took an active part in politics. He became prominent in ward politics and went into the real estate business. In 1894 he was nominated and elected to Congress and again in 1896 and 1898. In the meantime he had become strong in local politics of Chicago and by 1900 he was able to dictate nominations for city officers. In 1900 he failed of reelection to Congress, but succeeded in electing his candidate for governor of the State. His candidates for State offices met

with defeat in 1904 and in the meantime he had been elected again to Congress, and shortly became even more powerful in local politics. He strongly opposed Governor Deneen, but his candidate was defeated at the polls. In 1908 he formed a coalition against the renomination of Governor Deneen, but was again defeated. When Senator Hopkins appeared as a candidate for reelection to the Senate, strong opposition developed, resulting in a deadlock, which lasted from January till May. Senator Lorimer had hitherto been friendly to Senator Hopkins, but now appeared in opposition. Gradually other candidates against Hopkins were eliminated until Lorimer was able to make the nomination himself. See ILLINOIS.

LOS ANGELES, CALIFORNIA. See ELECTORAL REFORM.

LOUISIANA. One of the Gulf States of the United States. Its total area is 48,506 square miles, of which 3097 square miles are water. The population, according to a Federal estimate made in 1909, was in that year 1,618,358.

MINERAL PRODUCTION. The most valuable of the mineral products of the State is petroleum, in which Louisiana ranks eighth, having in 1908 surpassed Indiana, which previous to that year had held this relative position. There were produced in 1908 in the State 6,835,130 barrels, as compared with 5,000,221 barrels in 1907. The value of the product in 1908 was \$4,131,173, as compared with a value of \$4,003,033 in 1907. Work in the Caddo field was hampered in May and June by high water. In June, 1908, the district was extended to Lewis, about four miles north of Oil City, by the bringing in of a large gas well whose yield was reckoned at 15,000,000 feet per day. On December 15, 1908, the Secretary of the Interior withdrew from entry, by the President's order, all the public lands in the neighborhood of the Caddo field, embracing about 6500 acres. This action was taken pending a careful geologic investigation by the United States Geological Survey, made in cooperation with the State with a view to preventing a waste of natural gas which had been estimated at 75,000,000 cubic feet a day. An investigation of the oil field is in progress and will be available in the spring of 1910. In Southern Louisiana the production was maintained by steady developments at Welsh and Jennings. The State is a large producer of sulphur, in which Louisiana dominates the world's sulphur trade. In the production of salt Louisiana ranks fifth. The production in 1908 was 947,120 barrels valued at \$249,733, as compared with 1,157,621 barrels in 1907 valued at \$228,892. The salt mined in Louisiana comes from the Weeks and Avery Islands, so called, in Iberia Parish. The clay products in the State in 1908 were valued at \$629,924, compared with a value of \$928,570 in 1907. The State is also a producer of mineral water. The value of the mineral products of the State for 1908 was \$12,113,009, as compared with a value of the product for 1907 of \$10,876,719.

There was considerable decline in southern Louisiana in the output of petroleum in 1909. This was offset by an increase in the production in the Caddo field under the stimulus due to the starting of work on the refinery of the Standard Oil Company at Baton Rouge and on

a pipe line connecting it with the Caddo field. The significant feature in this drilling has been the success of persistent efforts to discover oil at lower levels, particularly north and northwest of the former productive region.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to the United States Department of Agriculture, were as follows: Corn, 51,198,000 bushels, valued at \$35,327,000 from 2,228,000 acres; oats, 640,000 bushels, valued at \$397,000 from 32,000 acres; rice, 12,675,000 bushels, valued at \$10,013,000 from 375,000 acres; potatoes, 1,200,000 bushels, valued at \$1,092,000 from 16,000 acres; hay, 34,000 tons, valued at \$364,000 from 23,000 acres; tobacco, 220,000 pounds, valued at \$81,400 from 400 acres. Louisiana occupies first place in the production of rice, surpassing in 1908 Texas, which previous to that time held first place. The crop of 1909 was considerably larger than that of 1908, which was 11,550,000 bushels. The acreage increased from 350,000 to 375,000. The farm animals in the State remained practically constant since 1900 except for an increase in the number of mules and a decrease in the number of swine. The estimated wool clip in 1909 was 475,240 pounds. The cotton crop of 1909-10 was estimated at 280,000 bales. The production of cane sugar in 1909 was estimated at 325,000 tons.

FISHERIES. The value of the product of the fisheries of the State at the close of the year ending December 31, 1908, was \$1,568,800. Of the fish taken, oysters were most important in point of value. Of these 3,073,200 bushels, valued at \$719,700 were taken for market purposes and 550,600 bushels valued at \$43,100. Next in point of value was shrimp, of which 8,581,500 pounds were taken with a value of \$212,500; catfish, 4,404,700 pounds, valued at \$142,800; trout, 1,103,100 valued at \$81,600; channel bass, 578,000, valued at \$33,500; croaker, 369,100 pounds, valued at \$27,500; crabs, 322,200 pounds, valued at \$28,900; terrapin, 52,400 pounds, valued at \$21,000. The number of independent fishermen engaged in the fisheries of the State was 2970. The number of fishermen employed was 2847. 4913 vessels and boats were engaged in fishing, valued at \$899,000.

EDUCATION. The latest statistics available for education in Louisiana are those of 1907. The report of the Superintendent of Education showed that in that year there was a total school population of 496,801. There were enrolled in the public schools of the State 243,731, of whom 163,503 were white, and 80,128 colored. The average attendance among the white children was 116,527, and among the colored children, 57,097. The male teachers employed numbered 907, the female, 3845. There were 436 colored male teachers and 732 colored female teachers. The average salary per month of white male teachers was \$74.50 and of female white teachers \$49.

FINANCE. The biennial report of the State Treasurer for 1906-7, which is the latest available, shows the total receipts in 1907 to be \$6,628,502, and the expenditures, \$5,209,179, leaving a balance in the treasury on January 1, 1908, of \$1,419,322. The chief revenues were from the general fund, the current school fund, the interest tax fund, from the free-school tax fund, and from the penitentiary fund. The

chief expenditures were on account of the general fund, current school fund, interest tax fund, and penitentiary fund.

OFFICERS: Governor, J. Y. Sanders; Lieutenant-Governor, P. M. Lambemont; Secretary of State, J. T. Michel; Auditor, Paul Capdeville; Treasurer, O. B. Steele; Attorney-General, Walter Guion; Superintendent of Education, T. H. Harris—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, J. A. Breaux; Associate Justices, A. D. Land, F. T. Nicholls, Frank A. Monroe, O. O. Probsty; Clerk, Paul E. Mortimer—all Democrats.

The State Legislature of 1909 was composed of 41 Democrats in the Senate and 116 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

LOVETT, ROBERT SCOTT. An American lawyer and railroad official, appointed in September, 1909, to succeed Edward H. Harriman (q. v.), as chairman of the Board of Directors of the affiliated lines, commonly known as the Harriman System. He was born at San Jacinto, Texas, in 1860, and was educated in the public schools and in the Houston High School. In his youth he worked on a farm, and when in 1874 a railroad was put through the town of Shepard, he removed there, taking a position in the general store at a salary of \$10 a month and board. His interest in railroads brought him into the employ of the Houston East and West Texas Railroad as station agent at Shepard, and later he removed to Houston as clerk in the freight office of that railroad. While serving in this position he studied law at night and was eventually admitted to the law firm of Charles Stewart, then a representative in Congress. He was admitted to the bar in 1882. From 1884 to 1889 he was attorney for the Houston, East and West Texas Railway and from 1889 to 1891, assistant general attorney for the Texas and Pacific Railway Company. In 1891 he was made general attorney for that road. In 1904 he was made general attorney and counsel for all the Southern Pacific lines in Texas, and became a member of the firm of Baker, Botts, Baker & Lovett, which represented the Southern Pacific Railroad. Under the direction of Mr. Harriman he amalgamated the system and was elected president of the Houston East and West Texas Railroad. He was shortly afterward made general counsel for the Union Pacific Railway Co., and the Southern Pacific Co. and affiliated lines. In 1908 he came to New York as the general legal representative of Mr. Harriman's railroads.

LOWELL, ABBOTT LAWRENCE. An American educator, inaugurated in October, 1909, president of Harvard University. He was born in Boston in 1856, graduated from Harvard College in 1877, and from Harvard Law School in 1880. From 1880 to 1897 he practiced law in Boston. He was lecturer on government at Harvard from 1897 to 1899, and from 1900 to the time of his appointment as president he was professor of the science of government. President Lowell comes from a family which has long been distinguished in the industrial history of New England. One of his ancestors, Francis Cabot Lowell, was the principal agent in the introduction into the United States of the manufacture of cotton and for him the city of Lowell was named. From his son, John, who

died early in life, the city of Boston received the sum of \$250,000, from which are maintained annual courses of free public lectures on religion, science, literature and art. These lectures are known as the Lowell Institute lectures. James Russell Lowell was an uncle of President Lowell's. On his mother's side President Lowell is a grandson of Abbott Lawrence from whom the city of Lawrence, Mass., takes its name. Professor Lowell's studies have been directed chiefly toward the science of government. He published in 1888 a small volume of essays on government which attracted wide attention. This was followed in 1897 by a two-volume work entitled *Government and Parties of Continental Europe*, which has remained from that time the most scholarly and widely used treatise on the subject. His reputation was further added to in 1908 by the publication of another two-volume work, *The Government of England*, which is generally recognized as one of the notable books of the decade. Before his election to the presidency of Harvard Mr. Lowell had already proved himself a man of well tested administrative capacity. He has been sole trustee of the Lowell Institute since 1900 and has had a governing authority of that successful educational enterprise. Under his administration, its field has been widely extended. He was also for many years a member of the executive committee of the Massachusetts Institute of Technology. Although President Lowell, in the main, agrees with President Eliot's theories in regard to the administration and development of the University, it was generally believed that he regarded certain of these theories as being too widely established. Among these was the elective system, which he believes should, in some directions, be modified. The general ideas of his attitude in regard to educational theories were outlined in his inaugural address. He affirmed his belief that the reconstruction of the American college is, at the present time, urgent everywhere. The most important question to his mind is that of the undergraduate, who, in a large college, is likely to be crushed between the millstones of the professional and secondary schools. He lamented the lack of the old solidarity when the classes numbered only fifty or sixty. He pointed out the need of recasting the elective system and of better direction and control of undergraduate students. He proposed as a stimulation to higher scholarships a series of honorary examinations, which may be patterned somewhat after the Oxford examinations in literature, mathematics and science. He suggested also a new scheme for freshmen residents giving a closer affiliation of students with the younger instructors. President Lowell's inauguration was accompanied with impressive ceremonies in which officials of the State and eminent scholars from the universities of the United States and foreign countries took part.

LUMBER. See FORESTRY.

LURTON, HORACE HARMON. An American jurist, nominated on December 13, by President Taft, to be a fifth justice of the Supreme Court of the United States to fill the vacancy occasioned by the death of Rufus W. Peckham. He was born at Newport, Ky., in 1844, and graduated at Cumberland University in 1867. In the same year he was admitted to the bar. From 1875 to 1878 he was chancellor of the

6th judicial division, Tennessee, and from 1886 to 1893 he was justice of the Tennessee Supreme Court, from January to April, 1893, serving as chief justice. In the same year he was appointed judge of the United States Circuit Court for the 6th judicial circuit and served in this position until his appointment to the Supreme Court. He was professor of constitutional law and dean of the law department at Vanderbilt University. Judge Lurton was never very active in politics, but he was always considered to be a consistent Democrat. President Taft served with Judge Lurton on the 6th circuit and they became intimate friends at that time. There was considerable discussion at the time of the suggestion of Judge Lurton as Supreme Court justice on the point of his age, but no serious opposition to his appointment developed.

LUTHERAN CHURCH. A religious denomination which includes the largest body of Protestants in the world and is the mother church of the Protestant faith. The church is found chiefly in Sweden, Germany, Norway, Denmark, Finland, Eastern Russia, part of Austria-Hungary, Rumania, France, England, Australia and North and South America, but churches of the denomination are scattered throughout the world. The church holds to the "pure Word of God" and the two Sacraments of Christ. It is conservative historically as compared with the more radical Protestant bodies. The church is carried on under Congregational, Presbyterian and Episcopal forms and church government is not essential. The first Lutheran minister came to North America in 1619, and there were Dutch Lutherans in Manhattan in 1623. Heinrich Melchior Muhlenberg was the great organizer of the church in the United States. He is known as the Patriarch of the Lutheran Church in America. He arrived in 1742 and founded the ministerium of Pennsylvania, the Mother Lutheran Synod in this country, in 1748. It was a general body. An attempt was made to combine the various Lutheran synods by the organization of a General Synod in 1820. The church received great increase in its numbers about the middle of the nineteenth century, when many Lutherans came from Scandinavia and Germany and filled up the territories of the Northwest and the West. The General Council, which is prevailingly English, but teaches the Gospel in German, Swedish, and other languages, was founded in 1867. The Synodical Conference, prevailingly German, was founded in 1871. The United Synod South was founded in 1886. The four general bodies of Lutherans embrace two-thirds of the Lutherans in the United States. The chief independent synods are the United Norwegian Synod, the Joint Synod of Ohio, and the German Iowa Synod. The total number of Lutherans in America in 1909 was 2,100,000 embraced in 67 synods. There were about 8300 ministers and 13,400 congregations. The church supports 114 educational institutions, having property valued at about \$8,300,000 and \$2,600,000 in endowments. The Lutherans maintain about 200 benevolent institutions, with property and endowment valued at about \$7,200,000. There are ten mission boards which conduct foreign missions in India, Japan, Liberia, Africa, China, Madagascar, Persia, Alaska, Cuba, Porto Rico and South America. It is estimated that there are about 76,000,000 Lutherans in the world. Sta-

istics relating to the various divisions in the United States are as follows:

General Council, 471,563 communicants, 1565 ministers, 2393 congregations, 303,043 Sunday school scholars; benevolent offerings, \$492,420; value of church property, \$23,288,909. The biennial convention meets at Lancaster, Pa., beginning September 14, 1911.

General Synod. Communicants, 284,808; ministers, 1320; congregations, 1346; Sunday school scholars, 236,952; value of church property, \$18,344,453. The biennial convention meets at Washington, D. C., June 7, 1911.

Synodical Conference (German): Communicants, 735,866; ministers, 2020; congregations, 3278; Sunday school scholars, 217,736; benevolent offerings, \$614,630. The next convention meets at Seward, Neb., in May, 1910.

United Synod of the South: Communicants, 493,774; ministers, 240; congregations, 451; benevolent offerings, \$56,914; value of church property, \$1,714,140; Sunday school scholars, 32,872. The next convention meets at Winchester, Va., September 6, 1910.

Independent Synods: Communicants, 657,494; ministers, 2004; congregations, 5510; Sunday school scholars, 281,267; benevolent offerings, \$728,736.

Statistics prepared by the United States Census Bureau giving the figures from the census of 1890 to 1900 show that the Lutheran bodies have increased in number from the former date from 8595 to 12,703, a gain of 4108 or 47.8 per cent. Each of the principal bodies shows a considerable gain in the number of organizations. The largest numerical increase in any single body is that of the Evangelical Lutheran Synodical Conference of America, which rose in number from 1934 in 1890 to 3301 in 1900, a gain of 70.7 per cent.

The most important events in the Lutheran Church during 1909 were the publication almost simultaneously of three historical works dealing with the "Confessions of the Lutheran Church"; the Fortieth Anniversary at Harrisburg of the founding of the various Mission Boards of the General Synod; closer co-operation of the Germans in the General Council and the consolidation of the various German papers into one official church organ; the organization of the Kropp Commission, charged with the securing of theological students from Kropp Seminary in Germany and the direction of their preparation as missionaries to Germans in America. The United Norwegians and other Norwegian Lutheran bodies agreed to publish an English hymnal for use in their churches. The General Council authorized the elimination of all variations from "The Common Service" now in use among English-speaking Lutherans.

LUTHER LEAGUE OF AMERICA. A denominational religious organization, connected with the Lutheran Church, founded in Pittsburgh, Pa., in 1895. Its basis is the unaltered Augsburg Confession, and it receives into its membership any society of whatever name connected with a Lutheran organization or Lutheran institution of learning. Its membership in 1909 was over 100,000 in twenty-five States, fourteen of which have permanent organizations. The official organ of the League is the *Luther League Review*, published in New York City and edited by the chairman of the National Executive Committee and first vice-president. The next national convention will

be held in Pittsburg in October, 1910. The officers in 1909 were: President, William C. Stoever; General Secretary, Rev. Luther M. Kuhns; Treasurer, C. T. A. Anderson; chairman of the National Executive Committee, E. F. Eilert. There are organizations of the League in Japan, India, Canada, Porto Rico and the United States.

LUXEMBURG. An independent neutral grand-duchy of western Europe. Area, 998 square miles; population in 1900, 236,543; 1907, 250,911, nearly all Roman Catholics. Capital, Luxemburg, with 20,682 inhabitants. The principality is rich in iron ore; mineral output (1907), 7,492,870 metric tons, valued at 21,997,404 francs. Luxemburg is included for customs purposes in the German Zollverein. Length of railways (1907), 340 miles; telegraph lines, 680 (wires, 1410); telephone lines, 1030 (wires, 2990); post-offices, 116. The revenue and expenditure were in 1906, 13,120,770 and 14,674,730 francs respectively; in 1907, 17,467,861 and 18,055,659; in 1908, 17,433,529 and 17,407,927. The budget for 1909 estimated the revenue at 17,819,619, expenditure 18,341,614 francs. Debt (1909), 12,000,000 francs; annuities, 403,150. The savings-banks had (December 31, 1906), 57,491 depositors, with deposits to the sum of 48,562,140 francs. Reining grand-duc, Wilhelm, born April 22, 1852; married, June 21, 1893, to Maria Anna of Braganza (Regent since November 18, 1908). He succeeded his father November 19, 1905. Heiress-apparent (bill passed July 6, 1907, by the Chamber of Deputies), Princess Marie, born June 14, 1894. There is a chamber of deputies of 45 members, elected directly by the cantons.

MACAO. A city on the island of Macao, at the mouth of the Canton River, China, constituting, with the two small adjacent islands of Colôane and Taipa, a Portuguese dependency. Area, four square miles; population (census of December 31, 1899), 63,001 (12,894 in Colôane and Taipa). The whites numbered 3919 (3780 Portuguese). The city is divided into two wards, each having its own administration and the one inhabited by Chinese and the other by non-Chinese. The trade, which is mostly transit, amounted in 1907 to 13,630,431 dollars (Mexican) for imports and 14,657,136 dollars for exports. In that year, besides 4218 vessels in the coasting trade, the shipping entered aggregated 2259 vessels of 963,442 tons. For the year 1908-9, the estimated revenue and expenditure were 700,404 milreis and 678,040 milreis respectively.

MACARTHUR, JAMES. An American litterateur of Scotch birth, died February 11, 1909. He was born in Glasgow, Scotland, in 1866, and was educated in that city. In 1888 he came to the United States. From 1894 to 1900 he was joint editor of the *Bookman*, and also reader and general literary adviser to Dodd, Mead & Co. In 1901 he became literary adviser to Harper & Brothers, and continued in that capacity until his death. He dramatized *The Bonnie Briar Bush*, and *Pilgrim's Progress*, and was joint author of *The Masque of the White Rose*, *Kronstadt*, *Captain Debonnaire* and *The Spoilers*. Mr. MacArthur contributed prose and verse to many magazines.

McCARREN, PATRICK HENRY. An American politician, died October 22, 1909. He was

born in 1849 in East Cambridge, Mass. His parents moved in 1851 to Williamsburg, a part of Brooklyn, N. Y. The boy was apprenticed to a cooper after having attended common schools, and he early engaged in activities of local politics. Before his twenty-first year he had been defeated for the leadership of his district. In 1881 he had become so well known locally that he was nominated and elected Assemblyman from the Fourteenth and Fifteenth wards. His leadership in the Fourteenth ward was assured and his influence spread rapidly. He was reelected to the Assembly, and in 1885 was beaten for the Senate. In 1889, however, he was successful and was elected to the Senate. He continuously served in the State Senate until the time of his death. In 1893 he became virtual leader of the Brooklyn Democracy. Shortly after, he broke with Charles F. Murphy, the leader of Tammany Hall, and from that time a fight was waged between them for the control of the Brooklyn Democracy. In 1904, as a result of Murphy's attempt to overthrow McCarran's leadership one of the bitterest struggles in the history of New York politics took place. The breach further widened in 1906 when McCarran opposed the nomination of Hearst for governor by Tammany Hall. Murphy and Conners, the State Chairman, formed a combination by which McCarran's delegates were forced out and supplanted by Murphy's selections. A similar combination in 1907 kept McCarran and his delegates out of the Democratic National Convention at Denver. This was done at the expressed wish of W. J. Bryan, whom McCarran steadily opposed. McCarran was a lawyer, but had little time for practice of his profession. He was identified with certain corporations, notably the Standard Oil Company and the American Sugar Company. He was a man of keen intellect and was an aggressive fighter. He was one of the strongest opponents in the Senate of Governor Hughes's measures to prevent betting at the race tracks and in his attempts at reform generally.

McCLOSKEY, WILLIAM GEORGE. An American Roman Catholic bishop, died September 17, 1909. He was born in 1823 at Brooklyn, N. Y., and was educated at St. Mary's College, Emmetsburg, Md. He was ordained as priest in 1852, after which he spent a year in mission work in New York. He was then appointed to the chair of moral theology and sacred scripture in St. Mary's College. This position he held from 1857 to 1859. He was the first president of the American College in Rome, holding this office from 1859 to 1868. In the latter year he was appointed Bishop of Louisville. He was one of the two oldest bishops in the Roman Catholic Church, both in years and in point of continuous service.

McCLUNG, LEE. An American public official, since September 23, 1909, Treasurer of the United States. He was born in Knoxville, Tenn., in 1870, and graduated from Yale University in 1892. After traveling abroad he engaged in railroad work, in which he continued until 1904, when he was appointed treasurer of Yale University. Mr. McClung was one of the best known football players in the country during his college course.

McCLURE, ALEXANDER KELLY. An American journalist and politician, died June 6, 1909. He was born in Sherman's Valley, Pa., in 1828.

His early life was passed on his father's farm, but after a short apprenticeship to a tanner, he became, in 1846, editor and publisher of a paper at Mifflin, Pa. He continued in newspaper work, varied by political activity until 1864. In 1856 he was admitted to the State bar. He was a member of the State Legislature 1857-8, and 1864, and from 1868 to 1873 practiced law in Philadelphia. In the latter year he established the *Philadelphia Times* of which he was editor until 1900. Mr. McClure was a prominent figure in State and National politics. He was a member of the convention which nominated Lincoln in 1860, and later became one of Lincoln's intimate friends and admirers. He took an active part in many national conventions, notably in 1872, when Horace Greeley was nominated for the Presidency.

MACCONNELL, CHARLES JENKINS. A rear-admiral (retired) of the United States navy, died February 17, 1909. He was born in Falls township, Pa., in 1837. His early years were spent as a mechanical and civil engineer, and builder. In 1861 he enlisted in the National Guard of New Jersey, but after a few months of service was appointed a third assistant engineer in the naval service. He served under Admiral Farragut and was present at the capture of New Orleans. In 1866 he was made first assistant engineer, and in 1896 commander. He was advanced to captain in 1898 and was promoted two numbers in the list of chief engineers, for conspicuous services. During the Spanish-American War he was fleet engineer of the North Atlantic Squadron. He returned on account of disabilities in 1899, and was appointed to the rank of rear-admiral, retired in 1906.

McCOOK, EDWARD MOODY. An American soldier and public official, died September 9, 1909. He was born in Steubenville, Ohio, in 1833, and was educated in the public schools. In 1860 he was elected a member of the Kansas Legislature. He entered the Union army in 1861 as second lieutenant in the First United States Cavalry, and served throughout the war, rising to the rank of major-general of volunteers. He was four times brevetted for gallant services. He resigned from the regular army in 1866, and in the same year was appointed Minister to Hawaii. From 1869 to 1875 he was Governor of the Territory of Colorado.

MCGILL UNIVERSITY. An institution of higher learning at Montreal, Canada, founded in 1821. In 1908-9 the number of students was 1900, and the faculty numbered 260. In the library are 152,000 volumes. There were received in gifts and endowments during the year land valued at \$142,500; for the purpose of erecting a new medical building, \$450,000; for salaries, \$50,000; for building purposes, \$100,000; and for miscellaneous purposes, \$45,000. Harold A. Wilson was appointed Macdonald professor of physics to take the place of Professor John Cox, retired. Hon. A. G. Cross was appointed professor of commercial law to take the place of Eugene Lafleur, resigned. Louis A. Herdt was appointed professor of electrical engineering to take the place of R. B. Owens, resigned. The new engineering building, erected to take the place of the one destroyed by fire in April, 1907, was formally opened in the spring of 1909. The new medical building, commenced in September, 1908, was

partly finished during the year, and will be occupied at the beginning of 1910. The principal is W. Peterson.

McKIM, CHARLES FOLLEN. An American architect, died September 14, 1909. He was born in Chester county, Pa., in 1847, and graduated from the Lawrence Scientific School in 1867. From 1867 to 1870 he studied at the Ecole des Beaux-Arts in Paris. He returned to the United States in 1872 and began the practice of his profession as architect. In 1877 he formed a partnership with William R. Mead, and two years later Stanford White was made the third member of the firm, which, under the name McKim, Mead & White, designed some of the most notable public and private buildings in the United States. Among these were buildings for Columbia University, Rhode Island State Capitol, the Brooklyn Institute of Arts and Sciences, the Walker Art Building at Bowdoin College, the Music Hall and Public Library in Boston, and the Madison Square Garden in New York City.

MC LAURIN, ANSELM JOSEPH. An American public official, United States Senator from Mississippi, died December 22, 1909. He was born in 1848 at Brandon, Miss., and when less than a year old was taken by his parents to Smith county in the same State, where he lived on the farm and occasionally attended school. At the age of sixteen he joined the Confederate Army and served throughout the Civil War as a private. Following the war he attended Summerville Institute for two years. He began the practice of law in 1868, and in 1871 was elected district attorney. He was elected to the legislature in 1879, and in 1895 became Governor of Mississippi. In 1900, a year after his term of Governor had expired, he was elected to the United States Senate and began his services on March 4, 1901. He was re-elected for another term of six years in 1907. Senator Mc Laurin was one of the most industrious members of the Senate. He was a member of eleven committees and gave a great deal of attention to all of them.

MacLAURIN, RICHARD C. An American educator, inaugurated in 1909 president of the Massachusetts Institute of Technology. He was born near Edinburgh, Scotland, in 1870, and was educated in New Zealand and England. For ten years he served as professor in the University at Wellington, New Zealand. In February, 1908, he was elected professor of mathematical physics at Columbia University as successor to Dr. R. S. Woodward. Dr. MacLaurin has traveled extensively and has made a careful study of educational systems in the United States and in Europe. In addition to his appointments in mathematics and physics, he is a profound student in the profession of the law, and is the author of a legal work entitled *The Realty*. In 1908 he was chosen to the presidency of the Massachusetts Institute of Technology to succeed Dr. R. S. Pritchett.

MCLOUTH, LEWIS. An American educator, died March 15, 1909. He was born in 1835 at Rochester, N. Y., and graduated in 1858 from the University of Michigan. He was for many years a member of the faculty of the Michigan State Agricultural College, and was among the first to urge the establishment of United States agricultural stations. He was almost among the earliest scientific teachers to introduce

laboratory methods in the study of chemistry and physics. From 1887 to 1897 he was president of the South Dakota Agricultural College.

MCQUAID, BERNARD JOHN. A Roman Catholic bishop, died January, 1909. He was born in New York City in 1823. He studied at Chambly College, near Montreal, and later went to St. John's College, Fordham, where he remained as tutor for three years. In 1848 he was ordained as a priest. His first parish was at Madison, N. J., and he at once turned his attention to the building of churches and parochial schools in the surrounding towns. In 1853 he became rector of the Newark Cathedral. Here he founded, and for three years was president of, Seton Hall College and Seminary. He founded also other institutions of learning in the vicinity. In 1868 he was consecrated as bishop, and installed in the diocese of Rochester. He established here, in 1893, St. Bernard's Seminary, and in 1905 St. Anne's Home for the Aged. On August 20, 1908, Bishop McQuaid celebrated his diamond jubilee. His aim throughout his entire life was the establishment of more parochial schools for his people. He was one of the two oldest bishops of the Roman Catholic Church in America.

MC SWEENEY, MILES BENJAMIN. An American public official, from 1896 to 1902, Governor of South Carolina, died September 29, 1909. He was born in Charleston, S. C., in 1853, and was left an orphan when but four years of age. He began work at the age of six, and when still a youth established the *Hampton Guardian*, which became one of the most successful county papers of the State. He was delegated to the National Democratic Convention in 1888, 1896 and 1900. In 1896 he was elected Lieutenant-Governor of the State, and succeeded as Governor on the death of Governor W. H. Ellerbe. He was elected Governor in 1900-2.

MacVEIGH, FRANKLIN. An American public official, Secretary of the Treasury in President Taft's cabinet. He was born on a farm in Chester county, Pennsylvania, and graduated from Yale College in 1862. He studied law at the Columbia Law School and graduated in 1864. Because of ill-health he abandoned the practice of law and established a wholesale grocery business in Chicago, of which he remained the head until President Taft invited him to enter his Cabinet. In 1874 he was president of the Citizens' Association which inaugurated many important municipal reforms. In 1894 he was nominated by the Democrats for United States Senator, but was defeated in the legislature. He was president of the Bureau of Charities and Municipal Art League, Chicago, and is a member of the executive committee of the National Civic Federation, and vice-president of the American Civic Federation. See UNITED STATES, paragraph *Cabinet*.

MADAGASCAR. An island, one of the largest in the world, belonging to France, off the southeastern coast of Africa, separated from the mainland by the Mozambique Channel. The capital is Antananarivo.

AREA AND POPULATION. The estimated area is 228,000 square miles. The population, January 1, 1907, numbered 2,706,661 (1,312,810 males, 1,393,851 females), of whom 2,690,381 were natives (the Hova is the dominant tribe), 7606 French, 2088 other Europeans, 3602 Asiatics,

and 1078 Africans. The movement of the civil near the coast, and between the railhead and European and mixed population in 1907 was as follows: Marriages, 74; births, 538; deaths, 437. Antananarivo had (1906) 72,000 inhabitants; Fianarantsoa, 27,000; Tamatave, 7026; Majunga, 7910.

EDUCATION, ETC. Education is nominally compulsory. There were in 1906 32 primary and infant schools for French and other European children, with 1209 pupils. For natives there were 645 primary schools, with 52,059 pupils; one administrative school (124 pupils), 27 agricultural schools (1464 pupils), and 16 normal schools, with 58 teachers and 1008 students. The French language is obligatory in all schools, including mission schools. A large proportion of the Hova and other tribes in the central districts have been Christianized; about 450,000 are Protestants and 50,000 Roman Catholics. The outlying tribes are still mostly heathen.

PRODUCTION. The area under cultivation by Europeans in 1906 was 339,279 hectares. In the lowlands, rice, manioc, arrowroot, sugar-cane, tobacco, hemp, cotton, vanilla, tea, and coffee are successfully grown. Excepting gold, the principal article of export is rubber, which is indigenous, as is also gum-copal. There is a wealth of timber, and gums, resins, and medicinal plants abound. Sericulture is encouraged, and silk and cotton weaving is carried on. There were in the island in 1906, 2,860,384 cattle, 479,116 swine, 264,083 sheep, 63,367 goats, and 1950 horses, asses, and mules.

Mining concessions to the number of 390 (385 for gold, 5 for iron), covering 223,469 hectares, were in operation in 1906. The gold production for the decade was: 1898, 125,378 grams; 1899, 401,423; 1900, 1,114,000; 1901, 1,045,000; 1902, 1,303,000; 1903, 1,910,000; 1904, 2,460,000; 1905, 2,291,654; 1906, 2,255,108; 1907, 2,060,689. Gold reefs have been discovered in various parts of the island; while iron, copper, lead, silver, zinc, antimony, manganese, nickel, sulphur, graphite, and lignite are present in varying quantities.

COMMERCE. The total imports in 1907 amounted to 25,323,258 francs, against 36,527,622 in 1906; the exports, to 27,270,124, against 28,188,819. The principal articles of import in 1907 were as follows: Textiles, 10,146,000 francs; liquors, 3,306,000; metal wares, 2,596,000; coal, stone, etc., 1,077,000; flour, 578,000; paper, 411,000; various, 7,208,000; total, 25,323,000 (from France, to the sum of 21,835,102 francs; French colonies, 938,287; Great Britain, 484,827; British colonies, 637,100; Germany, 388,435). The principal exports were: Gold, 7,982,000 francs; rubber, 5,243,000; hides and skins, 5,610,000; rafia, 1,611,000; cattle, 1,176,000; vanilla, 997,000; various, 4,651,000; total, 27,270,000 (18,759,833 francs to France, 818,502 to French colonies, 4,973,599 to Germany, 1,165,316 to Great Britain, and 741,006 to British colonies).

COMMUNICATIONS. A railway from Brickaville, on the coast, to Antananarivo is in process of construction, 166 miles of which were completed and in operation in 1909. Tamatave is connected by a railway of about seven miles with Ivondra, whence a canal completes the route to Brickaville. An automobile service between Antananarivo and Antsirabe (63 miles) was started in March, 1909. A French company controls transportation over the waterways

and between the railhead and the capital the government provides automobiles and rickshaws for mails and passengers, while merchandise is carried in handcarts. Besides the wagon roads from Tamatave to Antananarivo and thence to Majunga, and between some of the principal military posts, roads are almost unknown and passengers and goods are carried on the shoulders of bearers. There were in 1909, 3620 miles of telegraph lines and 130 of telephone. Cables connect with Mozambique and Mauritius. There is postal communication throughout the island. In 1907, 6971 vessels of 1,188,672 tons entered, and 6889 of 1,183,135 tons cleared at the ports.

FINANCE. The estimated local revenue and expenditure for 1908 balanced at 32,091,610 francs. The French government in 1909 expended on Madagascar (entirely for military purposes) 15,584,231 francs. The debt stood, January 1, 1907, at 101,390,013 francs. The troops in the island (including Diego-Suarez) consisted of (1908) 3723 Europeans and 8254 natives. The police and militia are provided for in the local budget.

The Comptoir National d'Escompte de Paris has agencies at Antananarivo, Tamatave, Diego-Suarez, Mananary, Majunga, and Tulear. The Banque Grenard (private) draws on the Crédit Lyonnais. The only legal coin is the silver five-franc piece, with its silver subdivisions as well as copper coins of 5 and 10 centimes.

GOVERNMENT. A governor-general, assisted by a consultative council, resides at the capital. Nineteen provinces are under civil, and five territories under military, administration. Natives are employed in subordinate positions in both civil and military government. The colony has no representation in the French Parliament, and no elective assembly.

Diego-Suarez (a French colony since 1885), the island of Nossi Bé (area, 130 square miles) on the west coast, and the island of Sainte Marie (64 square miles) on the east coast, are administered by the Governor-General of Madagascar, who, in 1909, was M. Augagneur.

MAINE. One of the North Atlantic States of the United States. Its area is 33,400 square miles. The population in 1909, according to a Federal estimate made in that year, was 724,508.

MINERAL PRODUCTION. Maine ranks high among the States in the output and value of its stone products. In 1908 these products were valued at \$2,027,508. This value is entirely of the granite produced, although there is a small production also of limestone. The value of the product of 1907 was \$2,147,770, of which \$2,146,420 was the value of the granite produced. In this product Maine ranks second, being surpassed only by Vermont. The State takes high rank also in the production of slate. Its product in 1907 was valued at \$213,707, as compared with a value of the product of 1906 of \$236,606. Maine has long been conspicuous among the States in the production and value of its mineral waters. There were produced in 1908 1,182,322 gallons, valued at \$394,346, as compared with 1,161,832 gallons, valued at \$414,300 in 1907. The State ranks fifth among the States in the quantity and value of lime burned. In 1908 141,934 short tons valued at \$661,453 were produced, as compared with 159,494 tons valued at \$764,140 in 1907. Other important mineral products are clay products,

feldspar, and small quantities of copper, precious stones, sand and gravel. The value of the mineral products of the State in the year 1908 was \$4,044,678, as compared with a value of the product in 1907 of \$4,395,266.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 646,000 bushels, valued at \$517,000, from 17,000 acres; spring wheat, 230,000 bushels, valued at \$253,000, from 9000 acres; oats, 4,588,000 bushels, valued at \$2,661,000, from 124,000 acres; barley, 228,000 bushels, valued at \$176,000, from 8000 acres; buckwheat, 644,000 bushels, valued at \$451,000, from 23,000 acres; potatoes, 29,250,000 bushels, valued at \$13,748,000, from 130,000 acres; hay, 1,330,000 tons, valued at \$19,551,000, from 1,400,000 acres. The State in 1909 occupied third place in the production of potatoes, being surpassed only by New York and Michigan. In the yield per acre it far surpassed any other State, the record for 1909 being 225 bushels per acre, as against 120 bushels for New York, and 105 for Michigan. The acreage devoted to hay is much larger than that devoted to all other farm products. The hay crop of 1909 was slightly larger than that of 1908, while the acreage remained practically the same. The number of farm animals on January 1, 1910, was as follows: Horses, 119,000; dairy cows, 175,000; other cattle, 139,000; sheep, 254,000; swine, 62,000. All classes showed an increase over the numbers of 1908, and there was an especial increase in the number of horses. The wool clipped in 1909 was 1,281,600 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$3,256,580. Of the fish taken the most important in point of value was lobsters, of which 9,929,200 pounds, valued at \$1,269,450, were taken. Next in point of value was cod, of which 20,010,800 pounds, valued at \$438,880, were taken. Herring were taken to the amount of 92,985,200 pounds, valued at \$419,980; haddock, 10,512,500 pounds, valued at \$243,310; clams, 506,100 bushels, valued at \$251,350; scallops, 172,900 gallons, valued at \$195,500; hake, 17,398,500 pounds, valued at \$167,840; pollock, 8,940,800 pounds, valued at \$75,490. Among other important fish taken were alewives, cusk, halibut, mackerel, salmon, shad, smelt, and swordfish. There were 5004 independent fishermen engaged in the fisheries of the State, with 1857 employees. The number of vessels employed was 576, which were valued at \$817,463.

EDUCATION. The total school enrollment in the State for 1909 was 146,810. The average attendance was 109,021. There were 439 male teachers employed in elementary schools and 270 in secondary schools. The female teachers employed in the elementary schools numbered 4804, and those in the secondary schools, 389. The average monthly salary of male teachers in elementary schools was \$42.19; in secondary schools, \$86.75. The average salary per week of female teachers in the elementary schools was \$7.93, and in secondary schools, \$12.13. The total school expenditure, exclusive of new buildings, text-books and repairs, was \$2,713,534.

CHARITIES AND CORRECTIONS. In May the new State Home for Feeble-Minded was opened

at the site in Cumberland county purchased in 1908. The State has remodeled the buildings situated on the farms and is now building a dormitory. The institution will combine the advantages of school and home, and the feeble-minded will be segregated here instead of as hitherto being supported by the State in the localities where they have residence. There were fifty inmates of the Home in July.

POLITICS AND GOVERNMENT. The legislature of 1908 passed many important measures. Many of these are indicated in the paragraph *Legislation*, below. The conservation of State resources was one of the most important subjects taken up in the session. An act was passed creating a commission to collect information relating to the water powers of the State. The total amount of water power now developed in Maine is estimated by the United States Geological Survey at 153 horse-power minimum, which is equivalent to a total of 252,600 horse-power minimum for the six high-water months. The total undeveloped water power minimum for the six high-water months is 530,300 horse-power, making a total of 782,900 horse-power. In addition to this, it is estimated by the same authorities, based upon government surveys, that 416,000 horse-power may be secured by additional storage, making a grand total of 1,198,900 horse-power. The government estimates the value of the water power at regular rates in the United States as \$33 per horse-power per annum. The value, therefore, of the horse-power of Maine, developed and undeveloped, is not far from \$36,000,000 per year. The present horse-power developed is valued at about \$8,000,000 per annum as a market product. What is left undeveloped is worth, in round numbers, \$17,000,000 per annum, and the amount to be added by increased storage equals about \$11,000,000 per year. Measures were passed directing that all plans for the development of water power by private enterprise shall be submitted in advance to the Water Storage Commission and the details and cost of all work done on water powers in Maine shall be reported to this Commission.

In the elections held on March 1, gains were made by the Republicans in eleven cities in the State. Republican mayors were elected in nine cities, a gain of two over 1908, and Republican city governments in eight. The Democratic losses were at Rockland, a Democratic stronghold, and at Bath, which is ordinarily Repub-

lican. Early in May, 1909, a commission named by the government of the Dominion of Canada and the United States, met in Van Buren, for the purpose of adjusting differences growing out of interpretations of the treaty between the United States and England, negotiated in 1842 by Lord Ashburton and Daniel Webster, then Secretary of State, in so far as they pertained to the use of the St. John River for log-driving purposes. The committee held several sessions at Van Buren, Me., and at St. John, N. B. The main point at issue is whether booms strung into the river at Van Buren by American mills for the purpose of sorting and holding their logs constitute an obstruction to navigation under the terms of the Ashburton treaty. There is further involved in the dispute a question of whether the Chamberlain Lake dam at the foot of that lake where it empties into the Allegash

River, a tributary of the St. John, which diverts the waters of said lake to those of the Penobscot River, is a violation of the treaty. It is not expected that the commission will be able to make its final report until the latter part of 1910. See ELECTION REFORM.

OTHER EVENTS. Losses in Maine in 1909 from forest fires amounted to \$81,625, and 32,361 acres were burned over. Of this loss, \$40,180 with an acreage of 21,161 was in incorporated towns, and \$41,443, representing the destruction of timber of 21,100 acres, was in the so-called forestry districts of Aroostook, Penobscot, Washington, Somerset, and Hancock counties. The total loss by fires of \$10,000 and over in Maine in 1909 was \$1,623,000, as compared with \$2,814,000 in 1908. The heaviest fires were at Houlton, Rumford Falls, Skowhegan, Lewiston and Bangor. On October 28 the steamer *Hestia* of the Dominion Line went ashore on Grand Manan near Eastport, with a loss of 35 lives. On May 12 a severe and devastating flood swept over the valley of the St. John River with great loss of life, and on September 29 a flood of widespread destruction at Aroostook, Penobscot and along the St. John River submerged railroads, stopped traffic and caused great loss of property, as well as the loss of one life.

Work was begun late in the summer by the Union Waterpower Company of Lewiston on the construction of the greatest water storage system in Maine. This is to be built at the headwaters of the Androscoggin River, across the Magalloway stream. The dam is to be forty feet high and to hold back the waters of a lake to be created thereby, which will contain half as much water as the entire storage system of Lakes Umbagog, Richardson, Mooselook-megunticook and Rangeley.

On July 22 a stone tower was dedicated at Pemaquid Harbor, reproducing in form the flanker of the old fort William Henry, which was built on this spot in 1692, near the place where Pemaquid Fort stood in 1631, Fort Charles in 1677, and Fort Frederick in 1720. Fort William Henry was destroyed by the French and Indians, and when built in 1692 marked the frontier of British possession to the east upon the continent of America. The tower, which was dedicated on July 22, is to be used as a museum of the relics and records of early Pemaquid, and it encloses a stone which bears the inscription of 1607, claimed by many historians to mark the site of the landing of Weymouth's expedition. The tower was dedicated by the Governor of Maine and representatives of Maine and Massachusetts. On July 31 Calais celebrated its 100th anniversary; on August 18, Solon its 100th anniversary; on August 25, Steuben its 150th anniversary, and Whitefield its 100th anniversary. On August 27 there was celebrated at Paris Hill the 100th anniversary of the birth of Hannibal Hamlin, Governor of Maine, United States Senator, Vice-President of the United States when Abraham Lincoln was President, and later an Ambassador to the Court of Spain.

There were eight fatal hunting accidents in the woods of Maine in the season of 1909.

LEGISLATION. The legislature of Maine met January 6, 1909. An act was passed creating a commission to assist in the topographical survey of the State; to set about the creation of a forest reserve and to have charge of plans

of reforestation. Governor Fernald, who drafted this bill, is chairman ex-officio, the other members being Edward P. Ricker of Poland Spring, James M. McNulty of Bangor, and E. C. Jordan of Portland. The legislature enacted a law prohibiting the transmission of electricity generated from water powers in Maine across the borders of Maine without special charter therefor from the State. For the first time in the history of Maine the attendance of the Attorney-General's office was required in behalf of the State as attorney before all hearings in which franchises were asked by private interests from the State. A 58-hour law for women and children in all cotton mills and other factories, excepting sardine factories and corn shops, was enacted, the same to go into effect January 1, 1910. A State Board of Arbitration for labor disputes was created, and Samuel R. Haines of Pittsfield, Alden M. Flagg of Auburn and R. F. Dunton of Belfast were appointed members thereof. A new tax system was inaugurated, based upon the report of a tax commission appointed by the 73d legislature, the features of this new system being a collateral inheritance tax and an increased tax on public service corporations and on the so-called wild lands of Maine. A new code of military laws governing the National Guard of Maine was enacted. The referendum was invoked for the first time—in one instance upon a private and special law relating to the division of the old town of York, and in the other instance upon a law defining the term "intoxicating liquors" within the meaning of the statutes. These are to be voted upon under the terms of the referendum at the next general election. The legislature appropriated \$350,000 to rebuild the State House.

OFFICERS: Governor, Bert M. Fernald; Secretary of State, A. I. Brown; Treasurer, P. P. Gilmore; Adjutant-General, Elliot C. Dill; Auditor, Charles P. Hatch; Attorney-General, Warren C. Philbrook; Superintendent of Education, Payson Smith; Insurance Commissioner, Beecher Putnam; Commissioner of Agriculture, A. W. Gilman—all Republicans.

JUDICIARY. Supreme Judicial Court: Chief Justice, L. A. Emery; Associate Justices, L. C. Cornish, Albert M. Spear, W. P. Whitehouse, G. E. Bird, Albert R. Savage, A. W. King and Henry C. Peabody—all Republicans except Bird; Clerks, C. F. Sweet, C. W. Jones, L. Barton—all Republicans except Barton.

The State Legislature of 1909 was composed of 23 Republicans and 8 Democrats in the Senate, and 100 Republicans and 51 Democrats in the House. The State representatives in Congress will be found in the section *Congress of the article UNITED STATES*.

MAINE, UNIVERSITY OF. An institution of higher learning at Orono, Maine, founded in 1865. The attendance in 1908-9 was 851, with a faculty of 92. The books in the library number 39,205. Among the changes in the faculty were the appointments of R. P. Gray to succeed H. M. Estabrooke, deceased, as professor of English; G. W. Thompson to succeed J. W. Carr, deceased, as professor of German; and R. H. McKee to succeed A. B. Au- bert, retired, as professor of chemistry. During the year a fully equipped department of domestic science was opened. The University is supported by the State. The president is G. E. Fellows, Ph. D., LL. D.

MALAY STATES, FEDERATED. Several states on the mainland of the Malay Peninsula, each administered under the advice of a British resident-general, who assists the native rulers and is himself under the supervision of the High Commissioner, who is also governor of the Straits Settlements.

AREA AND POPULATION. Their total area is estimated at 26,380 square miles; population (1901), 687,595 (312,486 Malays, 299,739 Chinese, 28,211 East Indians, 1422 Europeans and Americans, and 1522 Eurasians); 1906, 918,400; 1908, 978,000. The largest town in the states is Kuala Lumpor, in Selangor, with about 40,000 inhabitants. Area and population (1906) of the separate states are given as follows: Perak, 6580 square miles and 418,000 inhabitants; Selangor, 3200 and 283,619; Negri Sembilan, 2600 and 121,763; Pahang, 14,000 and 100,000. The states of Kelantan, Tringganu, Keda, Perlis, and adjacent islands have been, by the Anglo-Siamese treaty of March 10, 1909, ceded to the British government, Siam having transferred all its rights of suzerainty, protection, administration and control. These states extend across the Malay Peninsula, with an area of about 15,000 square miles and a population estimated at 450,000.

In 1907 the total number of schools in the four states of the Federation was 310, with a total enrollment of 19,432 pupils, and an average attendance of 16,071. Kuala Lumpor has a very complete institute for medical research.

PRODUCTION. All land belongs to the state, which rents to the individual. The soil is fertile, and there are vast areas of forest land available for plantation. The total area planted to rubber in 1907 was 135,787 acres; the total number of trees was given as close upon twenty millions. The output from the three rubber-producing states in 1907 was estimated at 1,984,285 pounds. The output for the first five months of 1909 shows an increase of 72½ per cent. over the same period in 1908, being estimated at 1,976,898 pounds, as follows: Selangor, 1,312,069 pounds; Negri Sembilan, 367,880; Perak, 290,949. Cocoanuts, rice, coffee, sugar-cane, tapioca, pepper, and gambier are cultivated. Perak has irrigation works which water 70,000 acres of rice. The forests furnish valuable timber, gutta-percha, oils, resins, and fruits; the gross revenue of the Forest Department amounted in 1907 to 628,315 dollars (Straits Settlements dollar, which has a tentative value of \$0.5677585). The country is exceptionally rich in minerals. Seven-tenths of the world's supply of tin comes from the Federated Malay States. The output in 1907 was 813,636 piculs (1 picul=133½ lbs.). The output for the first nine months of 1909 shows a decrease as compared with the same period in the two years previous, being estimated at 35,487 tons, against 37,245 in 1908 and 36,101 in 1907. The output of gold in 1907 was 15,353 ounces. Lead, iron, copper, bismuth, mercury, arsenic, manganese, plumbago, silver, and zinc are found.

COMMERCE. The total imports and exports (exclusive of specie and bullion) for three successive years is given in Straits Settlements dollars as follows:

	1906	1907	1908
Imports	50,926,606	56,867,472	51,343,592
Exports	80,832,325	82,254,433	66,421,978

The chief articles of import are rice, petroleum, opium, and flour. The chief exports in 1907 were valued as follows: Tin and tin ore, 70,625,999 dollars; rubber, 3,892,405; copra, 452,270; gambier, 271,187; gutta-percha, 103,356.

In 1908, 3,165,600 pounds of cultivated rubber were exported. The rubber export for the first nine months of 1909 shows an increase of 90 per cent. over that of the same period in 1908; being 4,050,282 pounds against 2,127,489 in 1908 (first nine months). The tin export for the first nine months of 1909 (564,595 piculs) shows a decline of 34,156 piculs in comparison with the export for the same period in 1908. The export duty paid in 1909 (first nine months) was 4,903,948 dollars, against 5,139,653 in 1908.

COMMUNICATIONS. There are 589 miles of railway, all constructed from revenue, including the Johore State Railway (120½ miles), which was opened for traffic July 1, 1909, thus establishing through communication between Penang and Singapore (cost of construction of Johore State Railway, 11,391,093 dollars). There are 2036 miles of highway. In 1908 there were 1341 miles of telegraph and telephone lines.

FINANCE. The revenue and expenditure for three successive years are given in Straits Settlements dollars as follows:

	1906	1907	1908
Revenue.....	27,223,475	28,793,750	24,623,325
Expenditure	18,899,425	20,224,762	25,354,573

The principal items of revenue in 1907 were as follows: Customs, 12,036,721 dollars; railway receipts, 5,200,911; licenses, 4,696,634; land revenue (exclusive of land sales), 1,157,244; forests, 629,626. Expenditure: Public works, 5,437,801 dollars; railways, 5,349,417. There is no public debt.

GOVERNMENT AND MILITARY. A federal council was constituted in 1909. Each native state is represented, and the rubber and tin interests have been granted special representation. The council deals with matters general to the States. The autonomy of the chiefs is preserved in local affairs. The High Commissioner (also Governor of the Straits Settlements) is Sir John Anderson; the Resident-General for the Federated Malay States, Sir William Thomas Taylor.

The states maintain a regiment of Sikh troops (the Malay States Guides) numbering, in 1908, 872 men and 13 European officers; and are policed by a mixed force of Indians and Malays, officered by Europeans (2670 in 1908, including 60 officers).

HISTORY. In July the Governor of the Straits Settlements, Sir John Anderson, took formal possession of the regions recently acquired by treaty, visiting Kelantan on July 19 and Tringganu toward the end of the same month. During the same month a fight was reported between the police and the members of a Chinese secret society, resulting in the killing of four Chinese and the wounding of many others.

The Anglo-Siamese treaty of March 10, 1909 (see SIAM), definitely completed the cession to Great Britain of the Malay States of Kelantan, Keda, Tringganu, Perlis and adjacent islands. During the year Sir John Anderson, Governor

of the Straits Settlements, made a tour of the ceded territories which ended with a visit to Keda in August. The territories thus being formally taken over, the work of reconstructing the administration was planned. It was understood that it would be carried out with a view to interfering as little as possible with local self-governments. For an account of the opium question in the Malay States and the Straits Settlements, see the latter title. A Federal Council was established in 1908, comprising representatives from the several states, with special representatives for the tin and rubber industries, and having to do with matters of general concern, but respecting the local autonomy of the chiefs. The opening of the Council on December 10 was the occasion of a great gathering of Malay chiefs, an elephant procession and addresses by the Sultans of Perak and Selangor.

MALTA. An island in the Mediterranean; a British Crown colony. Area, 91.6 square miles. The colony includes the islands of Gozo (24½ square miles) and Comino, and several islets, with a total area of 117 square miles. Total civil population, April 1, 1909, 212,888. Capital, Valletta; population (with suburb of Florina), about 31,000. Free elementary education is provided (average enrollment, 19,905), besides secondary schools and a university. The inhabitants are mostly Roman Catholics. Malta is the headquarters and the chief coaling station of the Mediterranean fleet. It is strongly fortified; the garrison numbered, March 31, 1908, 7689 officers and men. The islands are highly cultivated, the area under crops being estimated (1908-9) at 41,029 acres. Corn, fruits (especially figs), onions, potatoes, and honey are produced. There were (1907-8) horses, mules, and asses, 11,055; cattle, 7060; sheep, 14,063; goats, 20,920. A considerable portion of the population is engaged in shipping industries. There is a large transit trade. The total actual imports (exclusive of nondutiable goods) and exports for the fiscal year 1909 were valued at £1,273,049 and £120,330 respectively, against £1,236,530 and £159,436 in 1907-8. There are eight miles of railway, and military (650 miles of wire) and company (720) telephone lines. In 1908-9, 3212 vessels entered (tonnage, 4,036,752). The revenue and expenditure for 1908-9 were £457,520 and £445,021, against £438,348 and £454,869 in 1907-8. Military expenditure for 1908-9, £477,521, of which £5000 was contributed by the colony. Governor and Commander-in-Chief (1909), General Sir H. M. L. Rundle.

Amendments to the constitution were reported at the end of July. The council of government was dissolved.

MANCHURIA. A dependency of the Chinese Empire, lying east of Mongolia and the province of Chili and between Korea and the Amur River. The capital is Mukden.

The estimated area is about 363,000 square miles. The population is variously estimated at from 5,750,000 to 22,000,000; the official Chinese estimate is 18,000,000. Estimates of the area and population of its three provinces are: Feng-tien, or Shengking, 56,000 square miles and 10,312,000 inhabitants; Kirin, 105,000 square miles and 6,000,000 inhabitants; the Amur Province, or Henlungkiang, 203,000 square miles and 1,500,000 inhabitants. The

principal cities, with approximate populations, are: Mukden, over 158,000; Changchun, 80,000; Ying-tse (Newchwang, at the mouth of the Liao River), 80,000; Newchwang (30 miles up the Liao), 50,000; Liao-yang, 40,000; Tsitsihar, 30,000; Tiehling, 28,500; Feng-hwang-cheng, 25,000; Hsin-min-fu and Fakumen, each 20,000. Northern Manchuria is in the Russian sphere of influence, and Southern in the Japanese.

Definite figures for Manchurian production, etc., are not available. There were published, however, early in 1909, agricultural statistics for Feng-tien, the most important province. The approximate area under cultivation and the production are stated as follows: Kafir corn, 2,166,666 acres, 76,526,643 bushels; beans, 1,300,000 acres, 40,716,000 bushels; millet, 433,333 acres, 9,099,993 bushels. The reported acreage under wheat, barley, corn, tobacco, and other crops is 433,334, making the total area under cultivation 4,333,333 acres. There has recently been a rapid increase in the production of soy beans and bean-cake, and the total Manchurian bean export in 1909 was estimated at nearly 1,500,000 tons. The total annual value of agricultural products in Feng-tien is upwards of \$56,300,000. The number of livestock reported for that province is: Horses, 124,008; cattle, 62,000; mules, 124,242; swine, 1,925,260. Manchurian commerce is included in that of China. The Manchurian railways extend from Shantung, on the Chili frontier, to Mukden, and thence to Port Arthur. Mukden is connected at Harbin with the Trans-Siberian Railway, which runs for 960 miles in Manchuria. There are several branch lines. The Japanese have undertaken to standardize the light railway from Antung to Mukden; in 1909 it was announced that a line would be built from Mukden to Chientas. The approximate revenue and expenditure of the three provinces are stated as follows: Feng-tien, \$2,000,000 and \$3,100,000 respectively; Kirin, \$1,400,000 and \$2,250,000; the Amur Province, \$450,000 and \$600,000. Manchuria is administered by a viceroy (Hsi Liang in 1909) appointed by the Chinese government. See CHINESE EMPIRE and KWANTUNG.

MANHATTAN BRIDGE. See NEW YORK; BRIDGES.

MANITOBA. A province of Canada. The capital is Winnipeg, with an estimated population of 130,000 in 1909. The province is administered by a lieutenant-governor, appointed by the Governor-General of Canada, and acting through a responsible council. The legislative power is vested in a unicameral assembly of 41 members elected for four years. The Lieutenant-Governor in 1909 was Sir Daniel Hunter McMillan (appointed in May, 1906), and the President of the Council was Rodmond P. Roblin. For statistics and other details, see CANADA.

MARATHONS. See CROSS COUNTRY RUNNING.

MARCONI, GUGLIELMO (WILLIAM). An Italian electrical engineer and inventor, who shared with Ferdinand K. Braun (q. v.), the Nobel prize for physics, awarded on December 9, 1909. He was born in Bologna, Italy, in 1874, and was educated in the University of Bologna. He began in 1890 on his father's estate, experiments to test the theory that an

electrical current is capable of passing through man, French, Spanish, Japanese, Persian, Serbian and other languages.

MARCONI, Sir GUGLIELMO. An Italian engineer and electrician, born in Italy in 1874. He invented an apparatus for wireless telegraphy, which attracted the attention of Sir William Henry Preece, engineer and electrician-in-chief of the English Postal Telegraph, who tested the apparatus with success in England. Soon afterward Marconi succeeded in sending messages from Spezia to a steamer 15 kilometres distant. He also sent messages from Queen Victoria ashore to the Prince of Wales on the Royal Yacht, 1897. He came, in 1899, to the United States, where he used his method in reporting the election of 1900. He succeeded in 1902 in establishing telegraphic communication across the Atlantic Ocean, and in 1904 a daily ocean news service by wireless telegraphy was inaugurated by him on trans-Atlantic liners. He invented, in 1905, the directive method of wireless telegraphy, and in 1906 the continuous wave system.

MARINE GAS ENGINES. See GAS ENGINES.

MARINE LABORATORIES. See BIOLOGICAL STATIONS.

MARLBOROUGH, LILY, DUCHESS OF. Widow of the eighth Duke of Marlborough, died on January 11, 1909. She was born in New York City, the daughter of Commodore Cicero Price, of the United States Navy. She married Louis Hammersly, of New York. He died, and in 1888 she became the wife of the Duke of Marlborough, who died in 1892. In 1895 she married Lord William Beresford.

MARS. See ASTRONOMY.

MARTENS, FRIEDRICH FRÖMMHOLD VON. A Russian jurist and diplomat, died June 20, 1909. He was born at Pernau, in the Russian Baltic provinces, in 1845. He studied law at the universities of St. Petersburg, Vienna, Heidelberg, Leipzig, and in 1869 received the degree of master of international law from the University of St. Petersburg, and the degree of doctor of international law in 1873. From 1869 Dr. von Martens was continuously in the service of the Russian Ministry of Foreign Affairs. In 1876 he was attached to the person of the Chancellor, Prince Gortchakoff, for special missions. He attended, as Russia's representative, diplomatic congresses at Brussels, Paris, The Hague, Geneva and Vienna. In the deliberations between Russia and Japan for the conclusion of the Russo-Japanese War, at Portsmouth, N. H., in 1905, Dr. von Martens acted as one of the delegates from Russia. He was also prominent in the Peace Conference at The Hague, and was a member of the Permanent International Court of Arbitration. Dr. von Martens was several times chosen as international arbitrator by European and American countries. He served in this capacity as president of the Court of Arbitration, at Paris in 1899, in the dispute between Great Britain and Venezuela. He served as arbitrator at various times, between France and England, England and Holland, and the United States and Mexico. In 1906 he represented Russia at the Geneva Conference for the revision of the Geneva Convention of 1867. He wrote several books on international law of great importance. *Von Martens on International Law* has been translated into Ger-

man, French, Spanish, Japanese, Persian, Serbian and other languages.

MARTIN, Sir THEODORE. An English Parliamentary agent, litterateur and poet, died August 18, 1909. He was born in Edinburgh in 1816, and was educated at Edinburgh University. He practised as a solicitor in Edinburgh from 1840 to 1845. In 1846 he removed to London, and became a Parliamentary agent for the passage of private bills. He continued this throughout his life. His literary work, which was carried on as an avocation, was begun early. In 1847 he published with W. E. Aytoun, a series of ballads and satires, called *Bon Gaultier*. Of this sixteen editions were published. While he was engaged in writing a life of Aytoun, he was requested by Queen Victoria to undertake a Life of the Prince Consort. This he did and the result was a work which is considered the authority on that period of English political history. His relations with Queen Victoria were of the greatest intimacy up to the time of her death. In 1851 he married Helena Faucit, the famous actress. In 1881 he was chosen Rector of St. Andrew's University. He was knighted in 1880, on the completion of the final volume of the *Life of the Prince Consort*. Among the most notable literary work done by Martin were his translations of foreign classics into English. Among these were the *Poems and Ballads of Goethe* (with Professor Aytoun, 1848); *Faust* (1865); *Odes of Horace* (1860); *Catullus* (1861); *Vita Nuova* (1862); *Heine's Poems and Ballads* (1878); *Six Books of Virgil's Æneid* (1896). He wrote also a *Life of Professor Aytoun* (1867); *Life of Lord Lyndhurst* (2d ed. 1874); *Helena Faucit: Lady Martin* (1901), and *Madonna Pia*, and other plays.

MARTINIQUE. An island of the Lesser Antilles; a French colony. Area, 381 square miles; population, 182,024 in 1906, including 546 East Indian immigrants. Capital, Fort-de-France, with 27,069 inhabitants. The primary schools contain 13,460 pupils; the secondary schools, 561. There is a normal school with 90 students, and a law school with 90. The island is very fertile. There are 15,067 hectares under food-crops. Sugar, cacao, coffee, tobacco (under special regulations), and cotton are the principal products. There are 15 sugar works and 69 rum distilleries. The total imports in 1907 amounted to 15,940,039 francs (France 8,282,296); exports, 18,997,221 francs (France, 17,254,000). In 1907, 36,922 metric tons of sugar, 12,803,194 litres of rum, and 502,789 kilos of cacao were exported. The colony has exterior communication by telegraph cables. Subsidized mail coaches supply local transportation and subsidized steamers carry on external trade. There were 53 post-offices in 1907. The local budget for 1908 balanced at 6,016,600 francs; expenditure of France (budget of 1909), 1,292,274. Outstanding debt, January 1, 1907, 2,821,000 francs. The Bank of Martinique (1908) had capital 3,000,000 francs, reserve, 1,897,317. The colony is under a governor, assisted by a general council and elective municipal councils. It sends to the French Parliament one senator and two deputies.

MARVIN, ROSS GILMORE. An American meteorologist and Arctic explorer, drowned near Cape Columbia, Greenland, April 10, 1909. He was born in Elmira, N. Y., in 1880, and

graduated from Cornell University in 1905. After two years spent in the study of meteorology, he returned to Cornell as instructor in the college of civil engineering. He accompanied Commander Peary on his Arctic expedition of 1905-6. He was a member of the Peary expedition of 1908-9 as scientist and secretary to the explorer. He commanded a party which had accompanied Peary in his final dash for the pole as far as 86.38 north latitude, and had then turned back. He was caught in a lead in the ice and was drowned.

MARYLAND. One of the Middle Atlantic Division of the United States. Its total area is 13,327 square miles, of which 3386 square miles are water. The population in 1909, according to a Federal estimate made in that year was 1,319,132.

MINERAL PRODUCTION. The chief mineral products in the State are coal and pig iron. Of the former there were produced in 1908, 4,377,093 short tons, valued at \$5,116,753. This is a decrease from the production of 1907 of 1,155,635 short tons in quantity, and of \$1,506,944 in value. The tonnage of 1908 was the smallest of any year since 1900, when the industry was much disturbed by labor troubles. It was caused largely by the depression in the markets where the coal is consumed. In spite of the decreased production, the number of men employed in the mines of the State shows an increase from 5880 in 1907 to 6079 in 1908. There were no strikes in any of the coal mines of the State during the year. There were produced in 1908, 183,502 tons of pig iron, which was a marked decrease over 1907 when there were produced 411,833 tons. There were five blast furnaces in the State on January 1, 1909, of which two were in operation. The clay products of the State in 1908 were valued at \$1,441,099, as against a value of \$1,886,362 for the product of 1907. The State produced in 1908, 806,673 gallons of mineral water valued at \$75,858. A small quantity of iron ore is also produced. Among other products are slate, stone products, small quantities of cement, flint, glass-sand, metallic paint, sand-lime brick, talc and soapstone. The value of the mineral products of the State for the year 1908 was \$11,489,062, as compared with a value of the product of 1907 of \$19,356,250.

The coal production of the State in 1909 was nearly equal to that of 1907 and surpassed that of 1908.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 21,980,000 bushels, valued at \$14,287,000 from 700,000 acres; winter wheat, 11,168,000 bushels, valued at \$12,282,000 from 770,000 acres; oats, 711,000 bushels, valued at \$348,000 from 28,000 acres; barley, 32,000 bushels, valued at 20,000 from 1000 acres; rye, 282,000 bushels, valued at \$220,000 from 20,000 acres; buckwheat, 149,000 bushels, valued at \$110,000 from 9000 acres; potatoes, 2,800,000 bushels, valued at \$1,848,000 from 35,000 acres; hay, 346,000 tons, valued at \$5,126,000 from 297,000 acres; tobacco, 17,750,000 pounds, valued at \$1,473,250 from 25,000 acres. The corn crop in 1909 showed a considerable decrease over that of 1908, which was 24,705,000 bushels. The acreage, however, increased from 675,000 to 700,000 acres. Hay showed a con-

siderable falling off, the production in 1908 being 480,000 tons. Tobacco also fell in production from 18,200,000 pounds to 17,750,000 pounds, while the acreage fell from 26,000 to 25,000. Market gardening and fruit and vegetable canning are extensive industries of the State. The number of farm animals has changed little since 1900, except for an increase in the number of sheep, and a decrease in the number of swine. The estimated wool clip in 1909 was 678,080 pounds.

FISHERIES. The products of the fisheries of the State for the year ending December 31, 1908, was \$3,306,910. Of the fish taken, the most important in point of value were oysters, of which 5,830,200 bushels, valued at \$2,127,140, were taken for market purposes, and 401,800 bushels, valued at \$101,190 for seeding purposes. Next in point of value were shad, of which 3,936,800 pounds, valued at \$246,590, were taken. Soft crabs were taken to the amount of 7,587,300 pounds, valued at \$195,000, and hard crabs, 12,785,000 pounds, valued at \$124,350. Among other important fish taken were alewives, striped bass, menhaden, white perch, yellow perch, sturgeon, catfish and terrapin. The number of fishermen engaged in the fisheries of the State was 8444, and the number of fishermen employed was 9048. There were 1107 vessels engaged in the fisheries of the State, valued at \$821,141.

EDUCATION. The total school enrollment in 1909 was 239,420. The average enrollment was 189,194, and the average attendance was 147,018. The number of male teachers was 900, and the number of female teachers, 4554. The total expenditures for school purposes \$3,934,413. Through an act of the legislature of 1909, commercial departments were established in about 40 of the high schools of the State. Owing to the fact that about 350 new teachers are needed annually, and the Normal Schools supply slightly more than 100, an effort is being made to devise some additional means of supplying trained teachers. The establishment of a training class in one high school in each county is thought to be the most practical plan.

FINANCE. The report of the Comptroller of the Treasury for the year ending September 30, 1908, showed a balance in the treasury on September 30, 1907, of \$1,364,881. The gross receipts during the fiscal year were \$4,513,255, and the total disbursements were \$4,639,483, leaving a balance in the treasury September 30, 1908 of \$1,238,052, against which were principal funds due amounting to \$908,131, leaving a balance applicable to ordinary expenses of \$330,520.

CHARITIES AND CORRECTIONS. The chief charitable and correctional institutions of the State are the Maryland Hospital for the Insane at Catonsville, Springfield State Hospital at Sykesville, the Maryland Tuberculosis Sanitorium at Sabillasville, and the Baltimore Orphan Asylum. There are, in addition, many private institutions that receive State aid.

POLITICS AND GOVERNMENT. The most important event in the political history of the State during the year, was the defeat, in the election of November 2, of the constitutional amendment submitted by the legislature of 1908, which, if it had passed, would have meant the disfranchisement of the non-taxpaying illiterate negro voters of the State. It resembled in its character similar enactments passed by other

Southern States in recent years. The measure was severely condemned by President Taft. The vote against the amendment was about 16,000, and of this, the city of Baltimore gave about 11,500. The election was for State offices, the highest being that of Comptroller of the Treasury, for a legislature, and for most of the county officials. The Democrats lost several candidates in Baltimore City, but gained in the legislature, the new Senate being 21 Democrats to 6 Republicans, and the House 70 Democrats to 31 Republicans. The Democrats held their State convention on August 11, and a proposed endorsement of Senator Rayner for reelection was rejected, because the nomination of Senator was to be made at primary elections, and it was deemed improper for the convention to forestall the primaries. The result showed that there was no opposition to Senator Rayner's reelection. Senator Rayner's record as a Senator was endorsed by the convention. The proposition to give to Baltimore increased representation in the legislature, provoked a controversy between Senator Smith and Governor Crothers. After a recess had been taken, a compromise was reached. The platform, which was devoted almost entirely to State issues, favored the suffrage amendment to the State constitution referred to above. It favored also the creation of a public utilities commission applicable to all public service corporations, and the passage of a pure food law in the State of Maryland, framed along the lines of the Federal law. The Republicans held their State convention on August 25. Nominations were made for State officers and the ratification of the Federal income tax amendment was advocated. Since April 8, 1908, the inheritance tax of 5 per cent has been in force.

A measure was passed by the legislature of 1908 authorizing the municipality of Annapolis to register only such voters for municipal elections as met one of the three qualifications. They must be naturalized citizens of the United States, possess property taxed at \$500, or be descended from a person who voted or could have voted prior to 1868. The law was designed to eliminate as far as possible the large negro vote in the city. On June 7 this measure was put in force, and Republican leaders decided that the case be brought before a Federal court.

The general result of the election of November 2, aside from the defeat of the franchise measures noted above, was a gain for the Democrats throughout the State. The Democrats elected the comptroller and the legislature by an increased majority, insuring the reelection of United States Senator Rayner. Considerable difficulty was found by negroes, who could not read their ballots, in voting in some of the counties, there being in these counties not only no emblems on the ballots, but no designation of the political party of the several candidates.

OTHER EVENTS. On May 23, 500 members of the Maryland Pilgrims' Association from Baltimore and other parts of the State, took part in the celebration of the 275th anniversary of the landing of colonists on Maryland soil in Saint Mary's county. On June 12, a jury in the case of William F. Downs, a clerk charged with stealing \$67,000 from the city, disagreed after being out twenty-four hours.

OFFICERS: Governor, Austin L. Crothers; Secretary of State, N. Winslow Williams; Treasurer, Murray Vandiver; Auditor, George

R. Ash; Comptroller, Joshua Herring; Adjutant-General, Henry W. Warfield; Attorney-General, Isaac L. Strauss; Superintendent of Education, M. Bates Stevens; Commissioner of Insurance, B. Frank Crouse; Commissioner of Public Lands, T. F. Smith—all Democrats.

JUDICIARY. Court of Appeals: Chief Judge, Andrew H. Boyd; Associate Judges, N. Chas. Burke, William H. Thomas, John R. Pattison, Hammond Urner, John P. Briscoe, S. D. Schmucker, and James A. Pearce; Clerk, Caleb C. Magruder—all Democrats except Schmucker and Urner, Republicans.

The State Legislature of 1909 was composed of 17 Democrats, 9 Republicans, and 1 Independent Democrat in the Senate, and 71 Democrats and 30 Republicans in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

MASON, ANDREW. An American assayer, died April 28, 1909. He was born in Scotland and entered the service of the United States government as assistant assayer at New York in 1850. In 1865 he was appointed melter and refiner, and in 1873 superintendent. He held this office until 1907, when he resigned. His discoveries in methods of separating gold and silver from baser metals saved the government large sums, and from Congress he received a vote of thanks and a present of \$1000.

MASSACHUSETTS. One of the North Atlantic Division of the United States. Its total area is 8266 square miles. The population according to the Federal estimate made in 1909 was in that year 3,162,347.

MINERAL PRODUCTION. Massachusetts is one of the most important States in the production of granite. The value of this product in 1908 ranked only below that of Maine and Vermont. The output for 1908 was valued at \$2,027,463, as compared with a value in 1907 of \$2,328,777. The trap rock produced in 1908 was valued at \$508,672, and in 1907 at \$432,604. The production of sandstone in 1908 was valued at \$241,462, and in 1907 at \$243,323. The value of the marble quarried in 1908 was \$175,648, as compared with a value of the product in 1907 of \$212,438. A small quantity of limestone is also produced. The total value of the stone produced in 1908 was \$2,955,195, as compared with a value of the product in 1907 of \$3,218,979. The State has also valuable clay products. Their value in 1908 was \$1,647,362, a marked decrease over the product of 1907 which was \$2,128,820. A large quantity of lime is also produced. The value of this product in 1908 was \$566,022, as compared with a value of the product of 1907 of \$596,778. The State is notable for its production of mineral water, which was produced in 1908 to the value of \$227,907, from 4,395,049 gallons, as compared with a value in 1907 of \$208,579 from 4,661,115 gallons. Among other mineral products which are produced in small quantities are copper, glass-sand, pig iron, lime, aluminum phosphate, asbestos, coke, Fuller's earth, iron ores, litharge, pyrite, red-lead, salt, talc and soap-stone. The value of the mineral products of the State in 1908 was \$5,925,940, as compared with \$6,584,181 in 1907.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 1,780,000 bushels,

valued at \$1,447,000 from 47,000 acres; oats, 217,000 bushels, valued at \$126,000 from 7000 acres; rye, 65,000 bushels, valued at \$68,000 from 4000 acres; buckwheat, 58,000 bushels, valued at \$44,000 from 3000 acres; potatoes, 4,250,000 bushels, valued at \$3,358,000 from 34,000 acres; hay, 673,000 tons, valued at \$12,720,000 from 585,000 acres; tobacco, 7,040,000 pounds, valued at \$985,000 from 4400 acres. The potato crop in 1909 increased considerably over that of 1908, which was 3,040,000 bushels, while the acreage increased from 32,000 to 34,000 acres. The production of hay decreased considerably from 1908, when 702,000 tons were raised. The tobacco crop of 1909 was slightly smaller than that of 1908, when the production was 7,444,800 pounds. The acreage also decreased slightly. The number of farm animals in the State on January 1, 1910, was as follows: Horses, 84,000; dairy cows, 192,000; other cattle, 88,000; sheep, 46,000; swine, 68,000. There has been a considerable increase in recent years in the number of sheep, while the number of neat cattle and swine have decreased. The wool clipped for 1909 is estimated at 234,000 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$7,095,230. Of these the most important in point of value was cod, of which 72,217,000 pounds, valued at \$1,944,200 were taken. Haddock were taken to the amount of 48,492,400 pounds, valued at \$1,037,920; mackerel, 10,452,600 pounds, valued at \$761,020; herring, 28,440,400 pounds, valued at \$341,110; halibut, 4,132,800 pounds, valued at \$309,820; lobsters, 2,455,300 pounds, valued at \$307,470; clams, 334,000 bushels, valued at \$378,350; oysters, 154,900 bushels, valued at \$217,980. Other important fish taken were flounders, hake, sword-fish, whiting, and alewives. Whale products for the year were \$335,730. The number of independent fishermen in the State was 3141 and the number of employees 8436. There were 671 vessels employed in the fisheries of the State, valued at \$2,927,766.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State are under the direction of the State Board of Charity, which has had full responsibility also of the care and support of the insane since 1904. The State institutions under the supervision of the Board are the State House at Tewksbury, which had a population in 1908 of 1429; the State Farm at Bridgewater, with a population in 1908 of 1398; Lyman School for Boys, with a population of 419; State Industrial School for Girls at Lancaster, with a population in 1908 of 240; the Massachusetts State Sanitorium at Rutland, with a population in 1908 of 347; and the Massachusetts Hospital School at Canton, with a population in 1908 of 87. The Board has supervision also of certain charitable corporations including hospitals, homes for aged persons, orphans' homes, etc. It is required also to visit city and town almshouses, and include in its annual report a statement of conditions with suggestions and recommendations thereto.

EDUCATION. The total enrollment for the year ending June, 1908, was 530,346. The number of female teachers was 1341, and of male teachers, 13,747. The average monthly salary for male teachers was \$151.39, and for female teachers, \$60.69. The total taxation cost for the support of schools, new buildings, repairs, etc., was \$14,662,825, and the total expenditure

for the support of schools, for new buildings, repairs, etc., was \$19,374,780. By a new law passed by the legislature, the commission on industrial education was abolished, and its duties were transferred to the State Board of Education, which was reorganized.

POLITICS AND GOVERNMENT. The long-standing litigation which arose from the consolidation of the New York, New Haven & Hartford Railroad with the Boston & Maine Railroad, and the acquisition by the former road of many lines of trolleys in Massachusetts, was ended by the action of Attorney-General Wickersham in dismissing the suit brought against the New York, New Haven & Hartford for violation of the anti-trust law. In 1908 a measure was passed by the Massachusetts Legislature making this merger possible. The Massachusetts Supreme Court, however, on March 2 of that year, had decided against the New Haven road's holding of trolley lines in Massachusetts. By this decision the road was required to part with all its holdings in various trolley lines in the State before July 1, 1909. The basis for the dismissal of the suit by Attorney-General Wickersham, was the conviction that competition had not been eliminated by the ownership of the trolley lines. On March 23 the House of Representatives killed woman suffrage in the State by refusing to substitute the bill allowing it, for an adverse report of the committee. Elections for State officials, including Governor, were held in Massachusetts on November 2. At the Republican State Convention held in September, Governor Eben S. Draper and Lieutenant-Governor Louis A. Frothingham, were renominated. The convention declared itself in favor of the income tax, and raised the question whether such a tax be levied by the State or by the national government, or whether there should be two taxes, one State and the other national. The Democratic State Convention, held on September 30, nominated James B. Vahey for Governor, and Eugene N. Foss, hitherto an important member of the Republican party, for Lieutenant-Governor. Resolutions were adopted favoring direct nomination, choice of United States Senators by the people, anti-monopoly, condemnation of Governor Draper's veto of the eight-hour bill, tariff reduction, a State tariff commission, and the income tax. At the election on November 2, the Republican State ticket was successful, but it has been many years since the head of the ticket was elected by so small a plurality. Governor Draper's plurality was less than 9000, as compared with the Republican plurality in 1908 for Governor of over 80,000. Various causes led to the reduction of the Republican vote. It was alleged that Governor Draper's feeling toward organized labor, the failure of the Republican Convention to take decisive action on the income tax amendment, the failure of Congress to revise the tariff downward, and the increased cost of living, were among the reasons which led to the increase in the Democratic vote.

Vahey carried Boston by approximately 10,500; Fall River and New Bedford, both of which voted for Draper in 1908, this year cast a majority of votes for the Democratic candidates. It was in the large manufacturing cities that the Republican ticket sustained its greatest loss. During the year the census of the State was completed, covering five years since the previous census. According to the statistics gathered,

the population of the State has risen in that two years by not less than a majority of all the registered voters. Nominations are by petition of not less than 5000 voters. There are no party designations on the ballots. A city council with one chamber of nine members, to be elected at large for three years, three to be elected each year after the first election, nominated by a petition of not less than 5000 voters, was created. Voters may vote for all of the nine councilmen. The salaries of councilmen are \$1500 a year. School committees are nominated by petitions of 5000 names. Under the new charter it is made a criminal offense for a member of the city government to participate in the profits of any city contract, and heads of departments must be appointed by the Civil Service Commission before their appointments by the new mayor are valid. Positions on the ballot are to be determined by the drawing of lots. See ELECTORAL REFORM.

The first year of the savings bank insurance system in the State closed October 31, 1909. The aggregate insurance of the Whitman Savings Bank, of Brockton, outstanding at the end of the year, not including annuity or pension policies, was about \$1,000,000. After paying interest on the guaranty fund, setting apart the full legal reserve, and in addition an amount equal to 4 per cent. of the premiums to the trustees of the general insurance guaranty fund, the insurance departments earned a surplus from which they have declared to the holders of all monthly premium policies a dividend of 8½ per cent. For the payment of this dividend only 25 per cent. of the surplus profit is required. The remaining 75 per cent. was set apart as a surplus guaranty fund in addition to the legal reserve and general guaranty fund. Of the expenses, over two-thirds consisted of medical fees.

BOSTON. The Finance Commission created by the legislature in 1907, by Mayor Fitzgerald to investigate conditions in the city of Boston, reported on January 29 to the legislature. The report was, in general, condemnatory of the management of almost every department of the city government. The report says, among other things, that the present electoral machinery is wholly unsuited to the requirements of a successful municipal government through popular suffrage. It tends to create bad government, no matter how strongly the people may desire good government. The commission condemned the present system of direct primary nomination, saying that practically an honest and popular man can defeat the machine only by a personal contest with ward politicians in their district. The report says further than the City Council gave no serious consideration to its duties. In 1907, 28 of the 42 joint standing committees had no papers referred to them and held no meetings. The report says that utter demoralization was general at the City Hall, and that graft was everywhere common. A specific review was given of the administration of John F. Fitzgerald, as mayor of the city. All of the departments are reviewed in detail to show the corruptness and extravagance of his administration. Largely as a result of the investigations and recommendations of this committee, the city, on November 2, adopted a charter for a reformed city government, known as plan No. 2. Under this plan the term of the mayor is four years, with the privilege of recall at the end of

In accordance with the provisions of this charter, nominations for mayor were made during November and December, closing December 17. Results showed that four candidates had obtained the required number of names on their petitions for nomination. These were James J. Storrow, a nominee of the business men and independents in general; John F. Fitzgerald, who served in 1907 as the Democratic mayor of the city; George A. Hibbard, the mayor in 1909, and Nathaniel H. Taylor, formerly city collector. The day of the election was fixed at January 11, 1910. The campaign carried on was one of the most intense and bitter in the history of the State. No such amount of space as the papers gave to this campaign was ever filled before by any mayoralty contest in Boston. Mr. Fitzgerald, by his wonderful personal efforts and popularity among the Democrats of the city, drew to his support a large part of the Democratic voters. Those who did not believe in ex-Mayor Fitzgerald, joined with most of the Republicans, as followers of Mr. Storrow. Their chief argument for his election was that he was a successful business man of recognized ability and sterling integrity. Mayor Hibbard had not given a particularly strong administration, and his campaign was not very aggressive.

The Suffolk county elections of November 2, resulted in Democratic victories. The chief interest in Boston was the fight for district attorney. For this the Democratic nominee, Joseph C. Pelletier, was successful, leading his nearest opponent, Arthur D. Hill, Republican and holder of office by appointment from Governor Draper, by about 4000. Mayor Hibbard and the officers of the present administration will hold office until the first Monday of February, when the mayor and the councilmen elected at the city election on January 11 will take office and begin the government of the city under the new charter.

On July 1, Michael J. Mitchell, former superintendent of supplies for the city of Boston, and Thomas F. Maher, a contractor, were found guilty of conspiring to defraud the city in connection with the purchase of flagstones.

OTHER STATE EVENTS. On June 2, the first spadefull of earth was dug in the construction of the canal across Cape Cod, by August Belmont, president of the holding company which is financing the work. The canal project has been advocated for many years. The canal will shorten the distance between Boston and New York by nearly 100 miles. The principal gain,

however, will be the avoidance of the rough water and treacherous shoals and beaches of Cape Cod, upon which nearly two thousand wrecks have occurred since 1800. See CANALS.

LEGISLATION. Among the important measures enacted by the legislature of 1909 are those noted below: One of the most important pieces of legislation enacted was the new charter for the city of Boston. (See above.) A measure was enacted incorporating the Boston and Maine Holding Company, which was intended to be a solution of the question of the control of the New York, New Haven and Hartford Railroad over the Boston and Maine. The Holding Company will hold the stock of the Boston and Maine under the Massachusetts law and the New York, New Haven and Hartford will own the stock of this Holding Company and also control the Boston and Maine through the Holding Company, and will also, through the Holding Company, be under the supervision of the State. The sum of \$100,000 annually was placed at the disposition of the Harbor Commission to be used in improving harbors, rivers, tidewaters, and foreshores, thus making it unnecessary to appeal to the legislature whenever an improvement is needed. An amendment to the State constitution was recommended, repealing the provision of the constitution which requires that taxation shall be proportionate, and authorizing the legislature to classify property in a reasonable manner for purposes of taxation. Several laws were passed relating to the subject of State forests. The gaming laws were substantially amended. The Boston and Maine Railway was authorized to adopt a pension system for its employees. Railroads were made liable to towns for the expense of extinguishing forest fires caused by them negligently or in violation of the law. The Governor was authorized to appoint commissioners to promote uniformity of legislation between the different States. New acts were passed relating to the restriction of speed for automobiles and motor vehicles.

OFFICERS: Governor, Eben S. Draper, Rep.; Lieutenant-Governor, Louis A. Frothingham; Secretary of State, Wm. M. Olin; Treasurer, Elmer A. Stevens; Auditor, Henry E. Turner; Adjutant-General, W. H. Brigham; Attorney-General, Dana Malone; Secretary of the Board of Agriculture, J. Lewis Ellsworth; Commissioner of Insurance, Frank C. Hardison; Secretary Board of Education, George H. Martin—all Republicans.

JUDICIARY. Supreme Judicial Court for the Commonwealth: Chief Justice, Marcus P. Knowlton; Justices, James M. Morton, Arthur P. Rugg, Henry Newton Sheldon, John W. Hammond, William C. Loring, and Henry K. Braley; Clerk of the Court, Clarence H. Cooper—all Republicans.

The State Legislature of 1909 was composed of 34 Republicans and 6 Democrats in the Senate, and 174 Republicans, 59 Democrats and 7 others in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY. An institution for technical learning in Boston, Mass., founded in 1864. The attendance in 1908-9 was 1462 students, 95 professors, 68 instructors, 51 assistants and 31 lecturers. There are in the library 80,000 volumes. Gifts amounting to \$83,341 were re-

ceived during the year. The productive funds of the institution amount to about \$2,800,000 and the total income to about \$760,000. Richard C. Maclaurin (q. v.) was inaugurated president to succeed Acting President A. A. Noyes. A new course in electro-chemistry was established in 1909.

MATHEWS, WILLIAM. An American writer, died February 14, 1909. He was born at Waterville, Me., in 1818, and graduated at Waterville College (Colby College) in 1835. He studied law at Harvard College and was admitted to the bar in 1838 and practiced law at Waterville in 1841. Soon after, he established a newspaper, the *Watervillian*, afterward changed to the *Yankee Blade*. In 1856 this was sold and united with the *Portfolio*. In the same year he removed to Chicago, and from 1859 to 1862 was librarian of the Young Men's Association of that city. From 1862 to 1875 he was professor of rhetoric and English in the University of Chicago. From the latter date his time was wholly devoted to literature. Among his published works are: *Getting On in the World* (1873); *Words—Their Use and Abuse* (1876); *Literary Style and Other Essays* (1881); *Wit and Humor—Their Use and Abuse* (1888); *Conquering Success*. He was also a contributor to several encyclopædias.

MATTEUCCI, VITTORIO RAFFAELE. An Italian seismologist, died July 16, 1909. He was born at Senigaglie, Italy, in 1860. After graduating from the University of Naples, and studying at Heidelberg, he entered directly upon the study of seismic disturbances, especially with reference to Mount Vesuvius. In 1902 he became director of the observatory on that mountain. In the eruption of 1900 he was severely wounded. He displayed the highest courage by remaining at his post during the eruption of 1906, and sending messages to allay the panic in the cities below. He was not injured, although the building in which he had stationed himself was wrecked by hot ashes. Dr. Matteucci's studies in seismology are of great value.

MAURER, HENRY. An American Mennonite missionary, killed at Adana, Asia Minor, during the massacres by fanatical Turks (see TURKEY). He was born in 1879, and after a high school education, became an evangelist. He became a missionary in 1906. He was killed while attempting to defend a mission school from attacks of the Turks.

MAURITANIA. A civil territory (since 1903) in French West Africa (q. v.), extending from Senegal northward to Morocco. Area, 344,967 square miles. The population, which includes the Moorish tribes of Trarza and Brakna, was estimated in 1906 at 223,000. At the head of the administration is a commissioner, who is under the Governor-General of French West Africa. In January, 1909, it was announced that all Mauritania, where turbulence is chronic, was to be reorganized as a French protectorate.

MAURITIUS. An island in the Indian Ocean about 500 miles east of Madagascar, constituting a British Crown colony. Area, 705 square miles; population (1901), 375,385, of whom 261,191 were of Indian origin or descent. Capital, Port Louis, with 52,740 inhabitants in 1901. The government provides primary and secondary instruction, expending thereon Rs.

623,131 in 1908 (1 rupee = 32.44 cents). The staple product is sugar, which constitutes over 90 per cent. of the total exports. Imports and exports in 1907 were valued at Rs. 21,798,887 and Rs. 40,478,113 respectively; in 1908, 17,210,947 and 33,464,263. In 1908 there were 129 miles of railway, 63 post-offices, and 57 telegraph offices, with 331 miles of wire. Revenue in 1906-7, Rs. 10,329,618, and expenditure, Rs. 10,174,508; in 1907-8, 8,722,727 and 9,853,009 respectively. The public debt on June 30, 1908, amounted to £1,311,290. The colony is administered by a governor, aided by an executive council. There is a legislative council of 27

made to the regulations was that permitting the use of benzoate of soda as a preservative of meat or meat food product, in conformity with the ruling under the foods and drugs act. Four additional veterinary inspectors were assigned to travel and investigate the meat inspection service at the various stations, making a total of seven inspectors now so engaged.

During the fiscal year the inspection was conducted at 876 establishments located in 240 cities and towns, an increase of 89 establishments and 29 cities and towns.

The number and results of Federal inspections are given in the following table:

FEDERAL INSPECTIONS OF ANIMALS FOR THE TWELVE MONTHS ENDING JUNE 30, 1909.

Kinds of Animals	Ante-mortem inspections			Post-mortem inspections		
	Passed	Inspected	Total	Passed for food	Lard and tallow only	Total
Cattle	7,547,969	40,175	7,588,144	7,287,793	2,441	35,103
Calves	2,069,529	4,050	2,063,579	2,038,494	4	8,213
Sheep	10,990,274	2,306	10,992,579	10,792,078	78	10,747
Goats	69,882	1	69,883	69,111	82	69,193
Swine	35,808,887	22,665	35,831,552	35,244,006	97,014	86,912
Total	56,476,541	69,196	56,545,737	55,431,481	99,537	141,057
						55,672,075

members, 10 of whom are elective. Several small islands and groups in the Indian Ocean are dependencies of Mauritius. A royal commission of three was appointed in May to investigate the conditions and resources of Mauritius. The three commissioners were Sir Frank Swettenham, S. E. L. O'Malley and H. B. D. Woodcock. For the week ending November 25 thirty-eight cases of the plague were reported, and fourteen deaths.

MAYOTTE and the COMORO ISLANDS. A group of islands, half way between Madagascar and the coast, belonging to France and under the control of the Governor of Réunion. Total area, 837 square miles; total population (1906), 96,314. The island of Mayotte (containing about one-fourth of the total inhabitants) had (1902) 3 schools with 78 pupils. Sugar is the chief production; there are 7 sugar works and 3 rum distilleries. Vanilla, coffee, tea, cacao, and rubber are cultivated. Imports (1907), 463,610 francs; exports (chiefly sugar and vanilla), 1,023,397 francs. In 1906, 101 vessels of 121,639 tons entered. The local budget of Mayotte and dependencies (1907) balanced at 247,410 francs. France expended, in 1909, 3000 francs for a hospital building. Outstanding debt, January 1, 1907, 883,760 francs. The Glorieuse Archipelago (with 14 inhabitants) belongs to Mayotte. The Comoro Islands consist of Grande Comore, Moheli, Anjouan, and a number of smaller islands. The population is chiefly Mussulman. The Governor of Réunion appoints an administrator for Mayotte, and a resident each for Grande Comore, Moheli, and Anjouan.

MEAT AND MEAT INSPECTION. The Federal meat inspection work continued to increase during 1909 until it almost reached the maximum that can be carried on under the standing appropriation of \$3,000,000 made by Congress in 1906. During the fiscal year ending June 30, 1909, the expenditure amounted to \$2,888,000, an increase of about \$165,000 over the previous year. The only amendment

Tuberculosis continues to be the cause of condemnation of the greater portion of the condemned cattle and hog carcasses, over 99 per cent. of the condemnations of parts of hog carcasses being due to this disease.

The amounts of meat and meat food products condemned on reinspection during the fiscal year due to being found sour, tainted, putrid or unclean, etc., were: Beef, 13,216,568 pounds; pork, 11,285,323 pounds; mutton, 124,687 pounds; veal, 52,794 pounds; goat meat, 382 pounds; a total of 24,679,754 pounds. This is a decrease of 43 per cent. from those of the previous fiscal year, which indicates improvement in methods of handling the products in sanitary conditions.

Market inspection was extended to 4 more cities, making a total of 37 cities at whose public markets Federal meat inspection is conducted.

During the year, 397,925 inspections were made of export animals, including reinspections of 227,255 animals, besides inspecting 50,943 Canadian animals in transit through the United States for export, and 173 inspections were made of vessels carrying live-stock, in order to see that the fittings, equipment, ventilation, feed, water, attendants, etc., conformed to the regulations.

Dr. A. D. Melvin, Chief of the Bureau of Animal Industry, under whose direction the Federal meat inspection work is carried on, called attention in his annual report to the real and serious danger to the public from uninspected meat, within which class comes almost one-half of that consumed in this country. As the Federal authority only extends to meats which enter into interstate and export trade, the people must look to the State and local authorities to protect them against the danger from that source.

One result of the Federal inspection is to cause the diversion of diseased and suspicious-looking animals to the uninspected establishments, where they are slaughtered for the local

markets. While many cities have an inspection service but very few have a sufficient force of inspectors, and the inspection often consists merely in the examination of meat as offered for sale in the markets, when it is usually impossible to detect disease, the evidence of which may have been removed with the viscera or

though inspection had been extended to 168 more establishments. There has, however, been an increase in the slaughter of calves, as indicated by inspection returns, of over a quarter of a million annually. This increased marketing of veal is augmenting the decrease in the supply of cattle.

EXPORTS OF PRINCIPAL MEAT PRODUCTS DURING THE PAST TWO FISCAL YEARS.

Product	Quantities Pounds	1908		1909	
		Values		Quantities Pounds	Values.
Beef, canned	23,376,447	\$ 3,467,875		14,895,527	\$ 1,645,822

Total value		\$152,181,020			\$129,134,168

organs. As a rule, sanitary conditions are very bad at uninspected slaughter-houses. In order to provide real protection against disease and unwholesome meat a competent veterinary and sanitary inspection at the time of slaughter is essential. As illustrative of the conditions which obtain at local abattoirs, of 327 slaughter-houses recently inspected in Indiana by the State Board of Health only 23, or 7 per cent., were found to fulfill the sanitary standards.

The need of local inspection as a supplement to Federal inspection was discussed by Dr. A. M. Farrington, Assistant Chief of the Bureau of Animal Industry, in an address before the State and National Veterinary Inspectors. He emphasized the fact that it is almost impossible to secure an effective system of local meat inspection without a great increase in the number of competent meat inspectors employed or a concentration of the business of slaughtering. The plan of concentration of slaughtering is supported by the experience of all the older civilized countries. In Europe, union or central abattoirs are owned by the municipalities. By an edict of the German Minister of Agriculture issued in 1908 towns and parishes are obliged to have slaughter-houses, private slaughter-houses being licensed only in cases of exceptionally large exports which cannot be managed in public abattoirs. The towns and parishes are compelled to provide for the execution of meat inspection. Among the advantages to be gained by such concentration of the business of slaughtering are: the use of machinery, increased facilities supplied in the way of abundance of hot and cold water for cleaning purposes, better refrigeration, and the increased value received from the by-products, which are practically lost by the small slaughterer.

There has been a marked decrease in the exports of meat products during the past year, as shown in the above table, due largely to a decreased production and an increased home consumption. During the last three years the number of cattle slaughtered in the United States has decreased until in the past year there were 296,380 fewer cattle inspected at slaughtering points than two years before, al-

During the year the first successful shipment of chilled beef from Australia was received at London, having been 62 days in transit. It now appears that the system of chilling instead of freezing will develop into a considerable movement and bring Australia and New Zealand into the field as competitors with the American trade.

For a study of the retail prices of meat see FOODS AND NUTRITION.

MEDICAL PROGRESS IN 1909. Probably the greatest amount of original investigation continued to be done in tropical diseases, the activities incident to opening up large areas to white domination or settlement affording a constant stimulus in this field (see INSECTS AND THE PROPAGATION OF DISEASE, SLEEPING SICKNESS, TROPICAL MEDICINE). Considerable progress was made in the science of preventive medicine and efforts were made to exchange information among several countries relative to this subject (see HYGIENE, PLAGUE, RABIES, TYPHOID FEVER, TETANUS). The use of specific serums in the treatment or prevention of disease was more extensive than ever before (see ANTITOXIN, SERUM THERAPY). Investigation as to the ultimate cause of cancer continued to be made in many quarters, and popular appreciation of the problems in connection with the control of tuberculosis was widespread (see CANCER, TUBERCULIN, TUBERCULOSIS). A number of new drugs made their appearance (see OXONE, PEROGEN, PARA COTA, PHLORIDZIN, THYRESOL). Other medical items or statistics will be found under their proper heads.

MENDELISM. See CHEMISTRY, INDUSTRIAL.

MENDÉS, CATULLE. A French novelist and playwright, killed in the railroad tunnel of St. Germain, Paris, on February 8, 1909. He was born at Bordeaux in 1841, the son of a Jewish father and a French mother. His earliest years were spent in Italy and Germany. At the age of 18 he founded a magazine, the *Revue Fantaisiste*, at Paris, and at 21 published his first volume of verse, *Philomela*. Shortly after he was imprisoned for publishing an erotic poem called "Le roman d'une nuit." On his release

he went to Germany and studied at Heidelberg. Returning to Paris in 1860, he married Judith, the daughter of Théophile Gautier, from whom he afterwards separated. Mendès wrote 45 novels and volumes of tales, several volumes of poems, much literary and dramatic criticism under the pen-name of "Jean Frollo," and half a dozen remarkable dramas in verse. He was one of those who assisted effectually in making Wagner's operas popular in Paris. His best known books were *Contre Epiques*, *Le Roi Vierge*, *La Femme Enfant* and *Le Confessional*. His notable plays were *Le Capitaine Fracasse*, *Fiammette*, *Le Châtiment*, and *Les Mères Ennemis*. His last work, which remained unfinished, was a drama with Napoleon I. as the central figure.

MENNONITES. A denomination of evangelical Protestant Christians which had its beginning in Switzerland in the sixteenth century. It derived its name from Menno Simons, who was the leader of the sect in Holland. The Mennonites first settled in the United States in 1683, when immigrants built a church in Germantown, Pa. The denomination has twelve bodies, the most important of which is the Mennonites proper, who in 1909 numbered 18,674 communicants, 220 churches and 346 ministers. The other most important branches with their membership are as follows: General Conference, 11,661; Amish, 7640; Old Amish, 5013; Brethren in Christ, 2801; Reformed, 2079; the other bodies numbered only a few hundred members. The total number of all communicants in the denomination in 1909 was 54,798, with 604 churches and 1006 ministers. The denomination maintains educational institutions at Elkhart, Ind., at Newton, Kan., and at Bluffton, Ohio. It maintains a publishing house at Elkhart, where the official paper, *The Herald of Truth*, and several other periodicals are published. The denomination carries on domestic and foreign missions, and great activity has been shown in this work in recent years.

MEREDITH, GEORGE. An English novelist and poet, died May 18, 1909. He was born at Portsmouth, Hampshire, England, in 1828. His mother died when he was in his fifth year and his father, marrying again, emigrated to Cape Town, where he carried on the business of a tailor for some years, until his return, when he settled at Southsea. Of his parents Meredith seldom spoke. His father lived to be 75, and Meredith is reported to have said of him that he was a muddler and a fool. His mother, who was of Irish origin, was said to have been handsome, refined and witty. The boy was practically left alone in boyhood and was placed, by the trustee of his mother's small property, at school. He was sent to school at Neuwied, Germany, where he remained until he was 16 years of age. When he returned to England he found that this trustee had squandered the little estate of his mother, leaving only enough to article him to a London lawyer. He had, however, no taste for law and drifted into journalism. He did work for several papers, earning barely enough to maintain his existence. He wrote poetry at an early date and on July 7, 1849, his first poem, "Chillianwallah," appeared in the *Chambers Edinburgh Journal*. In the same year he married Mary Ellen Nichols, one of the daughters of Thomas Love Peacock, the novelist. She was a brilliant and witty woman,

but their married life was unhappy. In 1851 appeared Meredith's first book of poems, a thin volume of 150 pages, including "Love in the Valley." The book's reception, although not remarkable, was warm enough to encourage the writer to continue. Charles Kingsley and W. M. Rossetti were among those who reviewed the book with considerable enthusiasm. At the end of 1855 was published his first prose work, *The Shaving of Shagpat*, and between the publication of his first volume of poems in 1851 and this work there are few data for biography. His living was earned by contributions to the periodical press, but these were unsigned and there is no record of them. During this period his oldest son was born. *The Shaving of Shagpat*, published, as noted above, in 1855, was a remarkable production, written after the fashion of the *Arabian Nights*, but full of grotesque absurdities and whimsicalities. It received many appreciative reviews, one among others, from George Eliot, but it did not have a large sale. In 1856 appeared his first novel, *Farina*. Meredith seems to have become a professional journalist about 1856 or 1857. About this time he became editor of the *Ipswich Journal* and was also correspondent for the *London Morning Post*. He remained in active journalistic work about seven or eight years, during which his most important experience was obtained as a war correspondent for the *Morning Post* in the Austro-Italian war of 1866. Soon afterward he abandoned journalism, which was not at any time congenial to him. Before this, however, he had put forth the novels which are considered to be his masterpieces, *The Ordeal of Richard Feverel* (1859), the year of the publication of *Adam Bede*; *Evan Harrington* (1861); *Sandra Belloni* (1864), and *Rhoda Fleming* (1865). He published also in 1862 *Modern Love and Other Poems of the English Roadside*. These were the most productive years of his literary career and the most eventful of his life. He was, during this period, a frequent contributor of verse to *Once a Week*, where his poems were illustrated by the greatest artists of the day. In 1860 his first wife died. For the greater part of their married life they had lived separately. In about the same year he succeeded John Forster as reader for the publishing firm of Chapman and Hall, which position he continued to hold for most of the remaining years of his life. At this period he formed warm friendships with Swinburne, D. G. Rossetti, F. A. Sandys, and other notable men. The novels issued during this period, while appreciated by a few, were not received with general praise. *Sandra Belloni*, issued in 1864, was more favorably received than its two predecessors. Of his book of poems, *Modern Love*, even less was said. It was, however, defended against its critics by a brilliant letter by Swinburne in the *Spectator*. In 1864 Meredith was again married. His second wife was a lady of French descent and their life together was an ideal one. At the beginning of 1866 the novel *Vittoria* made its appearance serially in the *Fortnightly Review*, and was later brought out in three volumes. Its reception was not cordial and it was not reprinted for nineteen years. It was, however, warmly praised by the *Revue des Deux Mondes*. This was one of the first indications that Meredith was establishing a foreign reputation. *The Adventures of Harry Richmond* in the winter of 1871, after having run serially in the *Corn-*

George M. Smith

Hill Magazine, with illustrations by George Du Maurier, received rather more attention from the press than any of the author's previous works, although it did not reach a second edition for fourteen years. Except for *The Song of Theodolinda* Meredith published nothing more until 1874, when *Beauchamp's Career* began serially in the *Fortnightly Review*. This was published in book form in 1875, and a two-volume edition by Tauchnitz for continental readers was published in 1876, indicating the widening of the novelist's public. From this period there followed almost twenty years of fruitful literary activity. In 1879 *The Egoist* was published and this was warmly received and widely discussed. In 1881 there came *The Tragic Comedians*, and in 1884 *Diana of the Crossways*, which, as far as the popular taste is concerned, was the most widely read of all Meredith's novels. In the same year his second wife died, leaving a young daughter and son 22 years old. About this time also began a general appreciation of the great novelist in America. In 1890 *One of Our Conquerors* was published serially in the *New York Sun*. In 1894 the last of Meredith's works to be issued in the old three-volume form, *Lord Ormon and his Aminta*, was published, and in the following year appeared his last novel, *The Amazing Marriage*. Although now only 67 years of age and still in fullest possession of his brilliant faculties, Meredith ceased the writing of novels, and, except for occasional poems, he did no further important literary work. In 1898, however, he completed the revision of his novels and made many alterations, many of which are deplored by readers of the former editions. In 1892 on the death of Lord Tennyson, Meredith was chosen president of the Society of Authors. Six years later, when he attained his seventieth year, the occasion was marked by the presentation of a congratulatory address signed by a number of men and women of foremost distinction in literature on both sides of the Atlantic. His health continued good except for an affliction which deprived him of the use of his lower limbs and made him a prisoner in his chair. In 1903 he had a serious illness, from which, however, he recovered with faculties unimpaired. In July, 1905, he was appointed by King Edward to the Order of Merit. His eightieth birthday was an event of almost historic importance in the literary world. He lived still another year, but a chill contracted at the end of the second week in May, 1909, proved too much for his enfeebled frame, and on May 18, 1909, he died of heart failure. On May 22 a memorial service was held in Westminster Abbey.

At the time of his death Meredith was undoubtedly the most conspicuous literary figure in the English-speaking world. As a novelist he is to be considered as contemporaneous rather with the great writers of the middle 19th century, Dickens, Thackeray and George Eliot, and it is this that accounts in great measure for the comparatively slight consideration given to his great novels at the time they were published. To the public which lived upon the works of these great writers, Meredith's keen, psychological and often obscure style was not welcome. It may be said indeed that he never will become one of the popular novelists. Those to whom intellectual effort is an exertion will never take pleasure in reading Meredith. He was, before all things, a student of life, and

his attitude was that of an amused but not unkindly cynic, who stands aside and watches his characters act on each other without apparent sympathy and without any effort to guide their destinies. His so-called "obscurity" of style did not result from his inability to write clearly, but rather from his attempt to pack as much thought as possible into a phrase, to say only what is worth saying and to say it in terms charged with the fullest significance. He is, above all, the novelist of intellect. Among the characters in his books there are many which will always stand among the great personages of fiction. Sir Willoughby Patterne, Evan Harrington, Richmond Roy, Rhoda Fleming, and others represent types as clear as any found in the pages of Dickens or Thackeray. Meredith's poetry partakes of the quality of his prose. By many he is considered to be among the great English poets, but his greatness will never have the stamp of popular approval. He had a perfect understanding of nature and many of his poems are profound in conception and masterly in execution. Among the volumes of his verse, in addition to those mentioned above, are *Ballads and Poems of Tragic Life* (1887); *The Reading of Earth* (1888) and *The Empty Purse* (1892).

MERX, ADELBERT. A German theologian and Orientalist, died in August, 1909. He was born at Bleicherode in 1838 and studied at the Universities of Marburg, Halle and Berlin. From 1865 to 1875 he was professor of Semitic philology and theology at different universities. In the latter year he was appointed to the chair of theology at Heidelberg. Dr. Merx belonged to the school of liberal theologians, which acknowledges the right of unrestricted criticism of the scriptures. Among his published works are: *Das Gedicht von Biob* (1871); *Die saadijanische uebersetzung des Hohenliede ins Arabische* (1883); and *Idee und Grundlinien einer allgemeinen Geschichte der Mystik* (1893).

MESOPOTAMIA. PROPOSED IRRIGATION SCHEME. The irrigation of the valleys of the Euphrates and Tigris promised to become an engineering and economic development of unusual importance when Sir William Willcocks was retained in 1908 as adviser to the Turkish government. The work of this famous engineer in Egypt and the preliminary examination of conditions in Chaldea aroused considerable enthusiasm among the more progressive elements of Turkey, and he was directed to prepare plans for the establishment of an irrigation system which involved the expenditure of over £7,300,000. The Mesopotamian problem differs from that of Egypt, where the floods last from August to October, as in the valley of the Euphrates and Tigris they last from March to May and are followed by a hot, dry season which prevails through the summer. Consequently irrigation by inundation is impossible and an elaborate system of irrigation canals must be undertaken. Mesopotamia has an area of 13,840,000 acres, of which practically one-tenth would be at once available for irrigation and about one-half could be rendered fit for agriculture after preliminary clearing. The territory is shown by the accompanying map, and the plan presented by Sir William Willcocks to the Turkish government on September 21, 1908, provided, not only for irrigation, but for engineering works to prevent floods and improve

the navigation of the Euphrates and Tigris rivers. Dykes closing the breaches in the banks of both rivers at a cost of £20,000 were proposed to stop the floods, while the irrigation of the delta between the Mosayab and Sawama along the Hilla branch of the Euphrates would require three barrages, one above the Hindia barrage and the others at Hilla and Diwania which would be used to restore the old canal. The cost of this was estimated at £1,500,000. To irrigate the delta between Feluja-Mosayab on the Euphrates and Bagdad Seluncie on the Tigris, a territory of 618,000 acres, would require the construction of a barrage at Feluja and the provision or restoration of irrigation canals, the largest of which could be used for

3,212,000 acres. The estimated annual return was £983,000, with the cost of maintenance £650,000 or 10 s. per hectare.

In 1909 Sir William Wilcockes after a personal investigation in the field submitted to the Turkish government on September 1 revised estimates and specifications for four parts of the work which called for the expenditure of £1,394,700 (Turkish). The essential features of these estimates were the construction of a new Hindia barrage, locks in both old and new Hindia barrage and the clearing out of the Hilla branch of the Euphrates at a total of £312,900 (Turkish), the construction of a diversion channel, regulating works to control in a natural reservoir the floodwaters of the

MAP OF THE DELTA OF THE EUPHRATES AND TIGRIS (From *Le Génie Civil*.)

navigation between Feluja and Bagdad. The Euphrates, at a cost of £199,300 (Turkish), the cost of this part of the project was estimated at £2,000,000. The old Hai canal served for the irrigation of a portion of the delta, but in modern times this territory was watered only by the high waters of the Tigris so that it would be necessary to build a barrage at Koot and construct a system of canals at a cost estimated at £1,500,000. This would provide for the irrigation of some 741,000 acres. Ruined canals once provided irrigation for the upper delta of the Tigris or a territory of 445,000 acres and would involve the restoration of the barrage at Samara to the canal system. Finally in the lower delta around Gurna and Basra 173,000 acres could be reclaimed from marsh or irrigated at a cost of about £300,000. The total cost of the projects to be undertaken would amount to about £7,320,000 and would serve

give increased facilities for transportation. He also recommended, as an essential part of the plan for developing the region, the construction of a light railway from Bagdad to the Mediterranean for the transportation of agricultural products.

METALLURGY. See CHEMISTRY, INDUSTRIAL.

METALS. See CHEMISTRY, INDUSTRIAL.

METCALF, WILLIAM. An American steel manufacturer and metallurgist, died December 5, 1909. He was born in Pittsburg in 1838 and graduated from the Rensselaer Polytechnic Institute at Troy, New York, in 1858. From 1860 to 1865 he was in charge of the manufacture of heavy Rodman-Dahlgren guns at the Fort Pitt Foundry, Pittsburg. At this foundry was made most of the heavy artillery used by the government during the Civil War. From 1868 he was engaged in the manufacture of steel and he is credited with having made the first crucible steel in America. At the time of his death he was head of the Braeburn Steel Company, which he organized in 1897. Mr. Metcalf wrote a number of books on the manufacture of steel which are regarded throughout the world as standard works. In 1880 he became president of the American Institute of Mining Engineers and in 1893 was chosen president of the American Society of Civil Engineers, and was a member of many other technical societies. He was also connected with several banking institutions and insurance companies in Pittsburg.

METEORIC FALLS. See GEOLOGY.

METEOROLOGY. MOUNT WEATHER METEOROLOGICAL OBSERVATORY. The Annual Report of the Chief of the United States Weather Bureau for the fiscal year ending June 30, 1908, appeared in May, 1909, and showed that, notwithstanding the total destruction of the administration building by fire on October 23, 1907, the research work at Mount Weather was carried on without material curtailment. The staff of the Observatory was particularly active in solar physical and upper-air research. In the former, records of pressure and temperature were obtained daily, except Sunday, by means of kites and captive balloons. The records were computed for each day so as to show all peculiarities or changes in the temperature gradient, altitudes of clouds, depths of cloud and fog layers, and the highest points reached. The records were obtained for the most part by means of kites, but occasionally when the wind was too light for kite-flying captive balloons were used, thus enabling the observers to get a continuous series of records. Plans have been made to secure, in addition to the data mentioned above, a record of the relative humidities and wind velocities in the upper atmosphere, and to make the kites and balloons a means of studying the electrical conditions obtaining at similar altitudes. The work in solar physics included the measurement of the amount and intensity of the solar radiation, the degree of absorption of the atmosphere, and the polarization of blue sky light, and the determination, by means of the above data and an empirical formula developed by Professor H. H. Kimball, of the solar constant.

UPPER-AIR RESEARCH IN THE TRADES. Messrs.

Teisserenc de Bort and A. L. Rotch published a general summary of the results of the meteorological cruises of the *Otaria* on the Atlantic in 1905, 1906, and 1907. The first expedition was organized in 1905 for the study of the trade-winds and the anti-trades by means of free balloons, the trajectories of which were determined by triangulation. The cruises were confined chiefly to that region of the Atlantic north of latitude 10° N. in which lie the Canaries, the Azores, and the Cape Verde Islands, although, in the summer of 1906, one cruise was undertaken which extended as far as Ascension Island in latitude 7° 55' S. As a result of observations made on the Prince of Monaco's yacht *Princesse Alice* in the region between the Canaries and the Azores, Hergesell Meteord had found northwest winds at different heights above the northwest trades or surface winds, and had in consequence been led to question the existence of the ordinary southwest anti-trades. The observations on the *Otaria* showed that the anti-trades in general exist above the trades and that the presence of northwest winds is not incompatible with that of the anti-trade. The normal stratification of the atmosphere was found to be as follows: The lower stratum, having a drift from northeast, shows a rapid decrease of temperature in the first 500 to 600 metres. Above this zone there is an inversion of temperature in which the wind velocity diminishes. Above the trade-wind there is generally a current from northwest; then, at about 2500 metres near the Tropic of Cancer, and at 3000 or 3500 metres north of the tropic, there occur winds with a southerly component changing from southeast near 15° N. to west-southwest near 25° N.

The isothermal layer or "stratosphere," as it has been called by its discoverer, Teisserenc de Bort, was also investigated. In latitude 25° N. it was reached at 14 kilometres. North of this latitude it was met with at altitudes varying from 12 to 14 kilometres, while nearer the equator it was not found, although in many cases the ballons-sondes reached a height of 15 kilometres. It would seem therefore as though the stratosphere attained its greatest altitude over the equator. Further evidence of this was obtained by the expedition organized by the Royal Prussian Aeronautical Observatory, which made a series of kite and balloon observations of the upper air on Lake Victoria. A registering balloon, which reached a height of 19.8 kilometres, recorded a temperature at that altitude of -84°C., a lower temperature than has ever been found at equal or even greater altitudes over Europe and the United States.

THE ACTION-CENTRES OF THE ATMOSPHERE. In 1881 Teisserenc de Bort found that the different types of winter in Europe and, to a large extent, the general characters of the seasons, were dependent on the variations in the intensity and position of certain areas of high and low pressure, which he called "action-centres." Thus, a continuation of low pressures to the south of Iceland determines a mild winter in northwest Europe, while a development of "highs" in Asia and also in the neighborhood of the Azores is followed by severe winters. Other observers have since shown that atmospheric disturbances at one time in one region are almost invariably followed by disturbances of the opposite nature in some other region not necessarily near the former. Lockyer,

for example, has established the existence of a barometric see-saw of world-wide extent having a period of 3.8 years. Connected with this cycle, it is found that the pressure variations in Argentina are inverse to those centred round Bombay. The South American type of variation is closely associated with the variations in the United States, Central America, and Northwest Africa; whilst the Indian type is connected with those occurring in Europe, Northeast and South Africa, Arabia, and Australia. Hildebrandsson, who has been working in this field for more than a decade, was the first to call attention to the fact that these meteorologically related areas are really subject to a single general law. At the same time, while many examples of the application of the law have been detected, its complete elucidation will only be reached with the gradual extension of meteorological observatories to the unsettled regions of the earth, and particularly to those islands of the ocean which lie from the beaten track, for it is in mid-ocean that many of the important action-centres are situated. It seems probable that the cause of the variations of the intensity of the action-centres and of the different types of seasons of the northern hemisphere is to be sought in the thermal state of the Arctic Ocean. Guided by this supposition, Hildebrandsson examined the meteorological elements for certain regions lying in the northern hemisphere between the eastern shores of North America and Siberia, and found strong evidence in favor of it. For example, the summer temperature at the North Cape is opposed to that of the following spring in Iceland. In fact, a high temperature over the Arctic Ocean in summer should cause a greater melt of ice and in consequence the polar current reaching Iceland in the following spring should bring with it a greater quantity of ice and cold water than usual. The determination of compensating or analogous relations of this character between different regions should render possible more accurate long-distance forecasts, of a general nature.

METHODIST EPISCOPAL CHURCH.

A Protestant religious denomination, which had its beginning from the great movement under the leadership of John Wesley, which was carried on in the middle of the 18th century. The first conference of the church in the United States was held in 1773 and an organization was formed in 1875. The Episcopal College, composed of the bishops of the church, consisted in 1909 of 31 members, 24 general superintendents and 7 missionary bishops. The church lost by death during the year one of its most notable officers, Bishop Hartzell (q. v.), who died December 5, 1909. The total membership of the denomination on December 31, 1909, was 3,442,631. Of these 3,113,935 were full members, and 328,696 were probationers. The increase during the year was 63,047 or 1.865 per cent. This was considerably less than the gain for 1908, which was 72,309 or 2.186 per cent. The total number of ministers at the end of 1909 was 19,567. Of these 14,039 were effective, 1853 were on trial, 884 were supernumerary and 2821 were superannuated. The local preachers numbered 15,030. There were 30,075 churches in the denomination at the end of the year, with 13,577 parsonages. The value of the churches was \$174,039,922 and the value of the parsonages, \$29,809,909. Domestic and foreign missions are

carried on in nearly all the States of the Union and in nearly all the countries and divisions of the world. The total official benevolences of the church in 1909 amounted to \$15,178.015. Of this sum, \$1,235,970 was for the support of foreign missions, \$872,106 for home missions and church extension, \$125,095 for the Board of Education, \$55,879 for the Board of Sunday Schools, \$128,889 for the Freedmen's Aid Society and \$38,497 for the American Bible Society. The foreign membership of the church in 1909 was 318,011, of which 158,378 were full members and 162,465 were probationers. Foreign missions are carried on by the Board of Foreign Missions of the Methodist Episcopal Church, which was organized on January 1, 1907, as the successor of what was known from 1819 to 1906 as the Missionary Society of the Methodist Episcopal Church. Pursuant to the action of the General Conference of 1904, the Board of Foreign Missions undertook the administration of affairs of this body. During the eighty-nine years of its existence the receipts of the Missionary Society amounted in the aggregate to \$46,485,957. Missions in Protestant lands are carried on in Norway, Sweden, Denmark, Finland, Germany and Switzerland. The missions in Roman Catholic lands are carried on in South America, Italy, Mexico, France, the Philippines and Madeira. In these countries there are 168 foreign missionaries, 782 ordained and unordained native preachers and 24,080 full members. The missions in Greek Church lands are carried on in Bulgaria, with a small mission in St. Petersburg, Russia. Missions in non-Christian lands are in Africa, China, Korea, India and Malaysia. In these countries the church has 709 foreign missionaries, 2339 native preachers, 73,844 full members and 125,918 probationers. In Japan there are 82 Methodist Episcopal foreign missionaries. A Japan Methodist Church was organized in 1907. Domestic missions are in the hands of the Board of Home Missions and Church Extension, incorporated in 1865. Its charter was amended and the present name adopted in 1906.

The Board of Education has general charge of the educational work of the church. Its two specific aims are the aid of educational institutions and the aid of worthy young people who are seeking an education. For this purpose the Board has received since its beginning about \$1,671,000 and has aided 16,609 persons. Under the direction of the church are 26 theological seminaries, 54 colleges and universities, 46 classical seminaries and five institutions exclusively for women. The work among colored people of the South is carried on by the Freedmen's Aid Society. It maintains 23 schools and colleges located in as many centres of the Southern States. The enrollment in all departments of these colleges in 1909 was 7,237. Special emphasis is being laid on the normal, industrial and professional courses, as the work of these departments is deemed the most needful under present conditions. Work is carried on among the immigrants to the United States by the Women's Home Missionary Society, which maintains several immigrant homes in New York City and elsewhere. Publications of the church are carried on by the Methodist Book Concern and by the Western Book Concern of the West. Among the official periodicals are the *Methodist Review*, bi-monthly, *World-Wide Missions*,

monthly, and the *Christian Advocate*, weekly. Periodicals are also issued in German.

In 1909 was celebrated the African Diamond Jubilee of Missions. This was the seventy-fifth anniversary of the sending to Africa of the first Methodist foreign missionary. A movement was undertaken to raise \$300,000 in special gifts as a thank offering for the augmenting of foreign missions. The campaign was opened at the Metropolitan Methodist Episcopal Church on January 18, 1909, with President Roosevelt as the principal speaker. His address was one of great significance. Field days and rallies were held in a number of the larger cities of the country. The Field Day in New York, December 13, 1909, was the final meeting. President Taft was the chief speaker and Bishop Hartzell reported the amount received up to date.

METHODIST EPISCOPAL CHURCH, SOUTH. A Protestant religious denomination, which was founded in 1845 as a result of the separation of a body of the members of the Methodist Episcopal Church who differed on the question of slavery. The church had, in 1909, 1,739,614 communicants, 15,727 churches and 7197 ministers. The Epworth Leagues numbered 3951, an increase of 288 over the previous year, and the members numbered 138,542, an increase of 10,618. The number of conferences is 47. The receipts for foreign missions were \$375,909 and for domestic missions \$286,838. There was received for church extension \$149,116. The denomination has 13,844 church buildings, valued at \$37,864,452, and 4830 parsonages. The Episcopal Board of the church consists of eight bishops. Missions are maintained in Japan, Korea and China and other foreign countries. The denomination maintains one university, 15 colleges and 106 unclassified institutions. The endowment of these amounts to \$4,394,782. Among the publications are the *Methodist Review*, Nashville, Tenn., the *Christian Advocate*, Nashville, Tenn., and a number of other denominational publications issued from the General Publishing House which is at Nashville. The denomination has shown a steady increase in growth in recent years.

METHODIST PROTESTANT CHURCH. A Protestant religious denomination, founded in 1828 by members of the Methodist Episcopal Church who withdrew from that body on account of the refusal of the General Conference in 1824 to admit laymen. The denomination assumed its present name in 1830. There were in 1909, 188,806 communicants, 2390 churches and 1362 ministers. The denomination is strongest in the States of Maryland, North Carolina, West Virginia and Pennsylvania, although it is represented in nearly all the Southern and Central Western States of the Union. Efforts have been made in recent years to bring about a union between the Congregational Church and the United Brethren and the Methodist Protestant Church, but these have been in abeyance for several years as the result of the action of the National Council of Congregational Churches in 1907 in voting to defer action. The denomination carries on foreign and domestic missions and maintains publishing houses in Baltimore and Pittsburgh. Among the publications of the denomination are the *Methodist Protestant*, the *Methodist Recorder*, and a number of Sunday school and other periodicals.

METHODISTS, COLORED. See **COLORED METHODISTS.**

METROPOLITAN MUSEUM OF ART. An institution incorporated under the laws of the State of New York in 1870 for the purpose of establishing a museum and library of art, and to encourage the application of the arts and manufactures to practical life. The Museum has its collections in a handsome building in Central Park which is owned by the city and is leased to a corporation. Additions to this building were completed in 1908 and others are under construction. The total attendance at the Museum in 1909 was 937,833 as compared with an attendance of 817,000 in 1908, which in turn greatly exceeded the attendance of 1907. The most notable event in the history of the Museum in 1909 was the conception and successful carrying out of the exhibition of Dutch and American art during and following the Hudson-Fulton celebration. This exhibition included the most extensive collection of Dutch masters hitherto exhibited in this country. The exhibit of early American furniture and other household furnishings was also notable. These exhibitions were attended by many thousands of people. The Museum maintained for the third year an expedition in Egypt and excavations were continued on its concession at the Pyramid of Lish and at the oasis of Kharga. (See *ARCHÆOLOGY*.) Four men prominent in the support of the Museum died during the year. These were: John Crosby Brown, Treasurer of the Museum, and Rutherford Stuyvesant, Charles Follen McKim and William M. Laffan, Trustees. Many important acquisitions were received by purchase and by gifts during the year. Among the important benefactions received were \$1,500,000 from the residuary estate of F. C. Hewitt, and \$1,500,000 as a portion of the bequest of John Stewart Kennedy. Sir Caspar Purdon Clark, the Director, was absent from May 1 on account of ill health. The president of the Board of Trustees is J. Pierpont Morgan.

MEXICO. A North American republic, lying between the United States and Central America. The capital is the City of Mexico.

AREA AND POPULATION. The area (including islands of 1420 square miles) of the twenty-seven states, three territories, and Federal District comprising the republic is stated at 767,258 square miles. The population, according to the census of 1900, was 13,607,259, of whom 19 per cent. were white, 38 per cent. Indian, and 43 per cent. mixed. Foreigners numbered 57,589, including 16,278 Spaniards and 15,266 Americans. Of the total population, 12,380,245 were returned as Roman Catholics and 51,795 as Protestants. The largest cities, with population in 1900, are: Mexico, 344,721; Guadalajara, 101,208; Puebla, 93,152; León, 63,263; Monterey, 62,266; San Luis Potosí, 61,019; Mérida, 43,630; Guanajuato, 41,486. The promotion of immigration and colonization is receiving the serious consideration of the government. A new immigration law became operative March 1, 1909. Exact figures for recent immigration are not available. The arrivals in the country, including not only immigrants but all others, from July to December, 1908, are reported as numbering 24,500, of whom Americans numbered over 11,000.

Primary instruction is free and nominally compulsory. Secondary schools are also provided by the Federal government and the states. Besides public schools there are some 2300 pri-

vate, clerical, and association schools. A considerable number of institutions provide higher and professional instruction. Of late public and official interest in education has noticeably advanced; the school system has been developed, and the attendance has greatly increased.

INDUSTRIES. Up to the present time Mexican mines have constituted the principal source of national wealth. The leading metals exploited are silver, gold, and copper. The annual increase in the output of gold is a matter of great satisfaction. Coal production is increasing, and the petroleum fields in the northwestern part of the republic are being developed. Other minerals occurring in the country and more or less worked are the ores of lead, zinc, iron, and antimony, and graphite, salt, asphalt, and opals.

In proportion to the capabilities of the country, the agricultural production is small. The annual value of cereal crops, fruits, and other products of the soil, and of cattle marketed, is about \$200,000,000. Of this amount the chief items, representing a fair average product, are: Corn, \$50,000,000; cotton, \$17,000,000; henequen, \$16,000,000; wheat, \$13,000,000; sugar and molasses, \$13,000,000; spirits, \$10,000,000; coffee, \$8,000,000; beans, \$6,000,000; and woods, \$5,000,000. In the fiscal year 1908 the production of sugar amounted to 123,285 metric tons, and of molasses, 70,948 metric tons; the estimated sugar output for 1909 was 125,000 metric tons. The latter figure shows an increase of 50,000 tons over the output in 1900. The average coffee crop has been about 88,000,000 pounds, but that of 1908 was estimated at only 45,000,000, and 1908 at 42,000,000; but the estimated production for 1909 was 81,000,000 pounds. The cotton produced in 1907 amounted to about 80,000 bales. Cotton culture is a promising industry and will be greatly developed if the present plans for irrigating the Nazas Valley, Coahuila, by means of a great dam across the river at San Fernandez, are carried into effect. Increased interest is being constantly manifested in the utilization of water courses subject to Federal jurisdiction, and an Institution of Loans for Irrigation Works and the Encouragement of Agriculture has been established. The culture of henequen in Yucatan provides Mexico with one of its chief exports. Other products of considerable importance are tobacco, cacao, and rubber. The guayula plant, formerly considered worthless, is proving valuable as a rubber producer. In 1909 it was reported that the recent discovery of a valuable wax yielded by the candelilla plant would probably result in an important industry. Stock-raising is developing both through an improvement in the care taken of animals and in the importation of pure-bred stock.

Mexico's leading manufacturing industries are those of cotton textiles, steel, tobacco goods, sugar, and spirits. In 1908 the number of spindles in the cotton factories was estimated at 730,000 and the consumption at 175,000 bales. The reported production of tobacco manufactures in 1907 included 525,259,735 packets of cigarettes, 134,055,669 cigars, 164,308 kilos of smoking tobacco, and 27,800 kilos of snuff. In 1909 plans were completed for the erection of a new steel plant and a new chemical factory in the City of Mexico.

FOREIGN COMMERCE. For fiscal years ending

June 30, the values of imports and exports are stated as follows, in Mexican dollars:

	1907	1908	1909
Imports	232,229,579	221,757,464	156,504,447
Exports	248,018,010	242,740,201	231,101,796

The import classifications for the fiscal years 1908 and 1909 showed the following valuations, in Mexican dollars:

Class	1908	1909
Mineral products	69,651,258	44,584,423
Vegetable products	30,668,277	29,366,504
Machinery and appliances	28,648,024	20,121,500
Textiles and manufacturea	30,639,230	16,880,423
Animal products	17,265,463	12,565,348
Chemical products, etc.....	10,349,051	9,655,733
Wines, liquors, etc.....	7,163,891	5,563,336
Paper and manufactures.....	6,134,038	4,648,302
Vehicles	7,410,727	4,313,292
Arms and ammunition.....	3,650,559	2,532,100
Miscellaneous	10,176,947	7,267,425

Classified export values for the fiscal years 1908 and 1909 were:

Class	1908	1909
Mineral products	158,409,327	144,273,543
Vegetable products	70,204,937	67,930,590
Animal products	9,659,593	13,939,350
Manufactures	3,009,423	2,551,207
Miscellaneous	1,456,921	2,407,105

In the fiscal year 1908, silver exports were valued at 73,841,593 dollars, against 93,012,766 in the preceding year; all other mineral products, excepting copper and plumbago, showed satisfactory gains, the gold export amounting to 39,210,080 dollars, against 31,921,299 dollars in 1908, and lead 6,396,986 dollars, as compared with 5,344,541. Henequen exports declined from 27,019,340 dollars in 1908 to 23,882,721 dollars in 1909. Coffee advanced from 10,592,486 dollars to 12,544,327 dollars, and guayula from 1,232,839 dollars to 4,541,071. Exports of tobacco declined from 2,818,133 dollars to 1,707,299 dollars. Hides exported in the fiscal year 1908 were valued at 6,787,453 dollars; in 1909, 9,016,477 dollars; exports of cattle in the two years amounted to 2,227,696 dollars and 3,980,-459 dollars respectively.

In the fiscal year 1909 imports from and exports to the United States were valued at 91,974,000 dollars and 172,946,000 dollars respectively; Great Britain, 19,781,000 and 24,132,000; France, 12,359,000 and 11,009,000; Germany, 17,136,000 and 12,859,000.

COMMUNICATIONS. According to the President's message, the railways at the end of 1908 had a total length of 14,857 miles, of which 11,850 miles were controlled by the Federal government. The reported length on September 16, 1909, was 15,100 miles. New lines and extensions are under construction, and others projected. In December, 1908, the new line from Guadalajara to Colima was opened to traffic. At Colima the line connects with the one to Manzanillo and thus establishes a second rail route between the Pacific and the Gulf of Mexico (the other transcontinental railway is the Tehuantepec). A merger (the National Railways of Mexico) embracing 7012 miles of government-controlled railways (the Mexican Central and the Mexican National) became oper-

ative February 1, 1909. Later in the year the new management announced its intention of beginning on January 1, 1910, an annual expenditure of about \$6,000,000 (gold) on general repairs, especially the installation of heavier rails, on additional rolling stock, etc. In the fall of 1909, it was reported that construction work through the state of Sinaloa of the Southern Pacific Railroad was being actively pushed and that Rosa Maroda, 115 miles south of Mazatlan, had been reached; it was expected that the line would be completed in 1912. On January 7, 1909, a contract was made for a line from Durango to Mazatlan. At this port harbor improvements are projected to cost \$15,000,000 (gold). A line is projected from Monclova (Coahuila) to the town of Chihuahua. In the fiscal year 1907, Mexican railways carried 10,000,031 passengers, and in 1908, 10,747,128; the gross earnings from passenger traffic in the two years were 15,521,132 dollars (Mexican) and 16,436,498 dollars, respectively. Freight traffic in the fiscal year 1907 amounted to 9,124,040 tons, and in 1908, 10,042,144 tons; gross earnings, 52,863,540 dollars and 57,933,153 dollars respectively.

Most of the telegraph lines are owned by the Federal government. The length of government lines in 1909 was stated at 40,640 miles; the number of post-offices 2946.

FINANCE, ETC. Ordinary revenue and expenditure for fiscal years ending June 30 have been as follows, in Mexican dollars (worth 49.8 cents):

	1907	1908	1909
Revenue.....	114,286,122	111,771,968	
Expenditure....	85,076,641	93,177,441	104,040,318

In the fiscal year 1908 the extraordinary expenditure was 11,701,228 dollars. The estimated revenue and expenditure for the fiscal year 1910 were 97,261,000 dollars and 98,935,402 respectively. Revenue accrues mainly from import duties, stamps, excise, etc., and direct taxes. The largest expenditures are for the departments of Finance, War and Marine, and Public Works. On June 30, 1908, the public debt stood at 441,564,600 dollars.

In 1908 there were thirty-four banks, representing a combined capital of 176,000,000 dollars. Thirty were banks of issue, and, at the end of June, their assets and liabilities balanced at 613,311,800 dollars, as compared with 602,860,400 dollars the year previous.

NAVY. The navy includes one unprotected cruiser, of 1220 tons, and nine gunboats. Six cruisers are projected.

ARMY. Service is by voluntary enlistment supplemented by conscription. The active army on a peace footing consists of twenty-eight battalions of infantry, fourteen regiments of cavalry, eight field batteries, four mountain batteries, four batteries horse artillery, one machine gun company, one squadron of sixteen quick-firing guns of small calibre, six companies of engineers, two transport companies, and one company of hospital service. The army was being increased in 1909 and consisted on a peace footing of 3500 officers and 31,000 men. The new organization provided for expanding this force on mobilization to 7000 officers and 186,000 men, which could be increased even to

250,000. During the year a new automatic rifle was adopted. See **MILITARY PROGRESS**.

GOVERNMENT. Mexico is one of the five American republics having the federal form of representative government, the others being the United States, Argentina, Brazil, and Venezuela. The executive authority is vested in a president, who is elected by indirect vote for a term of six years and is assisted by a cabinet of eight ministers. The legislative power devolves upon a congress of two houses, the Senate (fifty-six members, elected for four years) and the Chamber of Deputies (one for every 40,000 inhabitants, elected for two years). The President in 1909 was Gen. Porfirio Diaz, whose seventh term will expire November 30, 1910. The Vice-President was Ramón Corral. The states have their own elected governors and legislatures.

HISTORY. On January 4 the Yaqui Indians signed a treaty of peace. Two serious disasters occurred during the year. The first was a series of earthquake shocks, which began on July 30 and were most severe on the following day. The town of Acapulco was virtually destroyed, leaving hardly a single building fit for occupancy. Great damage was done to the water front, the water after receding having risen in a great flood. The shocks were felt in many other places in Mexico, and though no trustworthy figures of the loss of life could be had, hundreds were said to have been killed. In Mexico City several people were killed. An even greater disaster occurred at the close of August in the neighborhood of Monterey, where floods destroyed the town of Soto La Marina with a population of 6000 and other places in the vicinity. In the valley of the Santa Catarina, it was reported that 1500 people had been killed and 15,000 rendered homeless. The loss of life at Monterey was said to be 1200. The total loss of life was afterward placed as high as 10,000. Mr. Hanna, the American Consul-General in Mexico City, appealed for aid for the victims. The region that suffered from the floods comprised nearly all the territory between Monterey, Matamoras and Victoria. Hundreds of families were left destitute and were reported to be starving in the hills of Nueva León and Tamaulipas. The Red Cross Society at Washington appealed to the American public for aid. On October 16 President Taft reached El Paso, Texas, in the course of his American journey, and a meeting which had been arranged between him and President Diaz occurred on a strip of territory known as El Chamizal, to which the conflicting claims of the United States and Mexico have not yet been settled. After a reception on the American side of the line by President Taft, the latter paid a return visit to President Diaz on the Mexican side.

MEYER, GEORGE VON LENGERKE. An American public official, Secretary of the Navy in President Taft's administration. He was born in Boston in 1858, and graduated from Harvard College in 1879. For the greater part of his life he was engaged in business, but took an active interest in politics. He was a member of the Boston Common Council in 1889-90; member of the Board of Aldermen in 1891; member of the Massachusetts Legislature, 1892-6 (Speaker of the House, 1894-6) and was elected Massachusetts member of the Republican National Committee in 1899. From 1900 to 1905

he was American Ambassador to Italy, and from 1905 to January 28, 1907, was Ambassador to Russia. In the latter year he was recalled in order to become a member of President Roosevelt's cabinet as Postmaster-General. With the exception of Secretary Wilson he was the only member of President Roosevelt's cabinet to be retained by President Taft.

MICHAEL NIKOLAYEVITCH. A Grand Duke of Russia, died December 18, 1909. He was born in 1832, the fourth son of the Emperor Nicholas I. He received the ordinary education of Russian Grand Dukes, in which military training formed an important part. At the age of fourteen he was commissioned sub-lieutenant, and six years afterwards was appointed brigadier-general of the Horse Artillery of the Corps. He took keen interest in the technical branches of his profession and was a member of many important military commissions. In 1857 he took an active part in the researches regarding the best means of efficiently protecting the coasts of the Baltic and the Black Sea, and in 1860 the whole system of military education was placed under his direction. In 1863 he was appointed Viceroy and Commander-in-Chief of the Caucasus, and in this position he remained eighteen years, during which time he had abundant opportunities for displaying his military capacities and his talents for civil administration. He succeeded in pacifying the province and it remained in a peaceful condition until his retirement in 1881. On the accession of Alexander III., who succeeded to the throne in 1881 on the assassination of his father, Alexander II., the Grand Duke was appointed president of the Council of the Empire, and he remained in this important position until several years ago, when declining health compelled him to resign from administrative activity. From that time he led a quiet, retired life on the Riviera. He married, in 1857, the Princess Cecilia of Baden. She died in 1891.

MICHEL, FRANCOIS EMILE. A French artist and writer on art, died May 24, 1909. He was born in 1828 at Metz and was a pupil of Migette and Maréchal, the glass painter, and began to exhibit his paintings in 1853. His best known works include "Une gardeuse d'oeufs" (1853) in the Nantes Museum; "Nuit d'été" (1872) in the Nancy Museum; and "Semaines d'automne" (1873) and "La dune près de Haarlem" (1885), both in the Luxembourg. He contributed many articles on subjects related to art to the *Gazette des Beaux-Arts* and other periodicals. Among his published works are: *Le musée de Cologne* (1883); *Les musées d'Allemagne* (1885); *Rembrandt* (1886, Eng. trans., 1904); *Jacob van Ruisdael et les paysagistes de l'école de Haarlem* (1890). In 1892 he was elected a member of the Institute.

MICHIGAN. One of the North Central Division of the United States. Its total area is 57,980 square miles. Its population in 1909, according to the Federal estimate made in that year, was 2,666,308.

MINERAL PRODUCTION. Michigan is one of the most important States in the production of minerals. Its iron and copper mines rank among the most productive in the country. In the production of iron it was surpassed only by Minnesota. There were produced in 1908 8,839,199

long tons of iron ore, as compared with the product of 1907 of 11,830,342 tons. The chief ranges from which this iron is produced are the Marquette, the Menominee and the Gogebic, the two last of which, however, are partly in Wisconsin. The Marquette range is the oldest of the Lake Superior ranges. The State produces also large quantities of pig iron. In the production of copper it ranks third, being surpassed only by Arizona and Montana. The production of 1908 showed a slight falling off from that of 1907. There were produced in the former year 222,289,584 pounds as compared with 219,131,583 pounds in 1907. The total production of coal in the State in 1908 was 1,835,019 tons, with a spot value of \$3,322,904. This is a decrease of 300,839 short tons in quantity and \$337,929 in value from the production of 1907. Notwithstanding this decrease the tonnage imported in 1908 was larger than in any previous year in the history of the State except 1907. The coal trade in the State is largely dependent on the demand of manufacturing cities along the lake front, and as the industries of these cities were seriously influenced by the panic of 1907, their consumption of coal was decreased. The number of men employed in the mines of the State increased from 3982 in 1907 to 4247 in 1908. The operations during 1908 were almost entirely free from labor troubles, a strike in only one mine having been reported. Salt is produced in large quantities in the State, the production in 1908 being 10,194,279 barrels, valued at \$2,458,303. The State holds first rank in the salt production. In 1908 it out-ranked New York both in quantity and value of output. The State ranks with the most important in the production of Portland cement. The production in 1908 was 2,892,576 barrels, valued at \$2,556,216. This was a falling off from the production of 1907, which was 3,572,668 barrels, valued at \$4,384,731. The value of the clay products produced in 1908 was \$1,728,790 as compared with a value for the production of 1907 of \$1,786,190. Among the other minerals produced are graphite, asbestos, stone and gypsum. The total value of the mineral products of the State in 1908 was \$45,730,798 as compared with a value of the product in 1907 of \$70,242,692.

The production of coal in 1909 was somewhat less than in 1908, largely as a result of the competition of coals from other States. For this reason a number of mines were reported as having closed down during the year. There was a plentiful supply of labor in 1909 and no strikes or suspensions interfered with mining operations.

The production of copper in 1909 exceeded that of 1908.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 69,950,000 bushels, valued at \$42,670,000, from 1,976,000 acres; winter wheat, 14,570,000 bushels, valued at \$16,318,000, from 775,000 acres; oats, 43,310,000 bushels, valued at \$17,757,000, from 1,420,000 acres; barley, 1,655,000 bushels, valued at \$1,010,000, from 67,000 acres; rye, 5,425,000 bushels, valued at \$3,743,000, from 350,000 acres; buckwheat, 829,000 bushels, valued at \$547,000, from 58,000 acres; potatoes, 36,540,000 bushels, valued at \$12,789,000, from 348,000

acres; hay, 3,403,000 tons, valued at \$38,794,000, from 2,618,000 acres. In the production of rye Michigan stands second among the States, being surpassed only by Pennsylvania. It is second also in the production of potatoes, New York being the only State which surpassed it. The oat crop was slightly larger than that of 1908, when it was 41,847,000 bushels. The acreage, however, slightly decreased in 1909. The potato crop of 1909 was largely in excess of that of 1908, which was 23,400,000 bushels, while the acreage increased from 325,000 to 348,000. Michigan is among the first of the States in the acreage and production of sugar beets.

In the production of fruit and vegetables the State also ranks among the first. The number of farm animals on January 1, 1910, was as follows: Horses, 746,000; mules, 4000; dairy cows, 936,000; other cattle, 963,000; sheep, 2,151,000; swine, 1,159,000. All classes except swine show an increase since 1900. The wool clipped in 1909 was estimated at 11,416,800 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$1,473,080. Of these the most important was herring, of which 14,787,400 pounds, valued at \$303,580, were taken. Next in order of importance was trout, of which there were taken 6,798,000 pounds, valued at \$424,080. Whitefish to the amount of 4,768,500 pounds, valued at \$339,230, were taken. Carp, 2,459,000 pounds, valued at \$55,480; suckers, 4,467,300 pounds, valued at \$117,210; and German carp, 2,459,000, valued at \$55,460, were among the other important fishes taken. There were in addition considerable quantities of catfish, dogfish, rock bass, sturgeons, sunfish, and mussel shells taken. The fishermen engaged in the fisheries of the State numbered 1608 and there were 1774 wage-earning fishermen employed. The total number of vessels engaged in the fisheries was 110, and they were valued at \$261,424.

EDUCATION. According to the report of the Superintendent of Schools there were enrolled in the secondary schools of the State in 1909 549,108 pupils. There were 2433 men teachers and 14,974 women teachers. The average salary received by the men teachers was \$71.52 and by the women, \$48.58. The total expenditure for secondary schools during the year was \$13,223,773.

FINANCE. According to the report of the State Treasurer the balance at the end of the fiscal year 1908 was \$3,009,746. The income for the fiscal year 1909 was \$10,468,585, while the expenditures amounted to \$11,864,365, leaving a balance at the close of the fiscal year 1909 of \$1,613,967. The chief sources of revenue are from railway and State taxes. The chief disbursements were for primary schools and for State institutions. The State has no bonded debt.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State with their population on June 30, 1908, were as follows: Michigan Asylum for the Insane at Kalamazoo, 1848; Eastern Michigan Asylum at Pontiac, 1266; Northern Michigan Asylum, Traverse City, 1337; Upper Peninsula Hospital for the Insane at Newberry, 675; State Asylum, Ionia, 374; the Psychopathic Hospital at Ann Arbor, 39; Home for Feeble Minded and Epilep-

tic at Lapeer, 819; State Public School at Coldwater, 161; School for the Deaf at Flint, 316; School for the Blind at Lansing, 117; Employment Institution for the Blind at Saginaw, 31; Industrial School for Girls at Adrian, 353; Industrial School for Boys at Lansing, 736; State Prison at Jackson, 759; Michigan Reformatory at Ionia, 548; The Upper Peninsula Prison, at Marquette, 318; Soldiers' Home at Grand Rapids, 1156; State Sanatorium at Howell, 4. In 1907 an important juvenile court law was enacted which has had beneficial results.

POLITICS AND GOVERNMENT. On January 6, the State Legislature convened in triennial session and continued until May. Its work included a revision of the primary election law. The scope of the law was broadened so as to provide that all nominations shall be made on the same day, which is the first Monday in September. This means candidates for governor, lieutenant-governor, representatives in Congress and in the legislature, and for county offices. As a concession to one element the law authorizes State conventions to be held to nominate candidates for other State officers than governor and lieutenant-governor. Party candidates for United States Senator shall also be nominated at the primaries.

A new State liquor law was enacted imposing far more restrictions on the saloon business than the old law imposed. The general tax law was amended so as to require telegraph, telephone, and express companies to pay ad valorem taxes instead of a specific tax on their gross earnings. Railroads and other corporations are required to pay ad valorem taxes. A commission to devise and put into operation a comprehensive system of reforestation was created. The railroad commission law was enlarged so that the commissioners now have authority to regulate freight rates.

On January 27, former State Treasurer Frank P. Glazier was convicted of misappropriating \$685,000 of State funds, which he used to bolster up the Chelsea Savings Bank, of which he was president. His appeal was argued in the Supreme Court, but up to the end of the year a decision had not been handed down. On January 31, Warden Armstrong of the Jackson State Prison was arrested on a charge of accepting a bribe from a prison contractor. The contractor set a trap and passed him marked bills. A grand jury was called and the warden, the deputy warden and seventeen others were indicted. None have yet been tried.

At the election on April 5, nineteen counties voted to be dry, and some 600 saloons and ten breweries were put out of business. Eleven other counties had previously gone dry, so now thirty of the eighty-three counties of the State are dry. The Republicans elected their candidates for the supreme bench, for university regents, and for members of the Agricultural College Board by 75,000 majority. The only Detroit officials elected were members of the Board of Education, and for these about as many women voted as men. School board members are the only officers that Michigan women can vote for, although the revised State constitution of 1907 provides that no public utility franchise shall be granted, or no public utility properties be acquired by a new municipality except by an affirmative vote of three-fifths of the electors, and upon such propositions women

taxpayers, having the qualification of male electors are entitled to vote.

OTHER EVENTS. The steamer *Aassinibois* on June 8 crashed into a gate of the Canadian locks at Sault Ste. Marie, and partially wrecked the locks. Adrian College during the week of June 15 celebrated its golden jubilee. June 22 the steamer *Theo* was rammed by the *Livingstone* in a fog on Thunder Bay, Lake Huron, and sank. The First National Bank of Ironwood failed on July 2, for \$600,000. Its president, H. F. Jahn, later committed suicide. July 12 the steamer *J. B. Cowle* was sunk by a collision with the *Izaac M. Scott* on Lake Superior and eleven of her crew drowned. On August 27, eighteen companies, organized to develop water power in Michigan, filed articles of incorporation with the Secretary of State, their joint capital being \$3,200,000. On the bitter cold night of December 9 a \$750,000 fire occurred at Kalamazoo. The Burdick House was one of the buildings burned and many guests barely escaped with their lives. On December 24 a merger was reported of nearly all of the larger developed water power properties in Michigan.

OFFICERS: Governor, Fred M. Warner; Lieutenant-Governor, P. H. Kelley; Secretary of State, Frederick C. Martindale; Treasurer, Al E. Sleeper; Auditor, Oramell B. Fuller; Attorney-General, John E. Bird; Adjutant-General, William T. McGurkin; Superintendent of Education, Luther L. Wright; Commissioner of Insurance, James V. Barry; Commissioner of State Land Office, Huntley Russell—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Charles A. Blair, Rep.; Justices, Claudius B. Grant, Rep.; Joseph B. Moore, Rep.; Aaron V. McAlvay, Rep.; R. M. Montgomery, Rep.; Frank A. Hooker, Rep.; Flavius L. Brooke, Rep.; Russell C. Ostrander, Rep.; Clerk, Charles C. Hopkins, Rep.

The State Legislature of 1909 was composed of thirty-two Republicans in the Senate, and ninety-eight Republicans and two Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article *UNITED STATES*.

MICHIGAN, UNIVERSITY OF. An institution of higher learning at Ann Arbor, Mich., founded in 1837. The attendance in 1908-9 was 5223, with 425 instructors. The attendance in the autumn of 1909 was about 5400. The number of volumes in the library was 258,609. Beginning with 1909 the entrance requirements in the department of medicine and surgery were raised so that at least two years of college work are required on entrance. In the summer session two new departures included the enlarged facilities for the summer engineering work on a tract of some 1500 acres on the shores of Douglas Lake in Cheboygan county. At this camp was established for the first time a biological station at which a number of students worked through the summer. A new course in railway administration has been established in the department of political economy. There is in course of construction an addition to the principal engineering building at a cost of about \$100,000, and a new laboratory of chemistry to cost about \$275,000. The alumni memorial building, largely the gift of the alumni, will be ready for occupancy in 1910. The cost of this has been somewhat over \$200,000. Among the additions to the faculty of 1909

were George Luther Clark, professor of law; Carl Eugen Guthe, professor of physics; Cary Leroy Hill, assistant professor of forestry; Charles Vernon Tower, acting assistant professor of philosophy, and Philip George Bartelme, director of outdoor athletics. On October 1, President James B. Angell retired after thirty-eight years of service, with the title of President Emeritus. Dean Harry B. Hutchins, LL. D., of the department of law, is Acting President for the year 1909-10.

MILITARY PROGRESS. The unrest and uncertainty in the Balkan region prevalent in 1909 as in the year previous had the effect of hastening the completion of the rearmaments of the nations directly interested, particularly as concerned their artillery, and led to the accumulation of supplies of ammunition. This feeling of uncertainty spread somewhat to the west of Europe and was manifested more particularly in the rearmament, reorganization, and increase of the artillery, though problems of manoeuvres, material and transport were under discussion and practical experiment. In Morocco the Spanish army had serious work in their operations against the tribesmen about Melilla, and opportunity was given to try organization and weapons under service conditions. The lessons of the Russo-Japanese war in Manchuria were still being digested and studied and the observations of European officers were reflected in changes of method and equipment adopted or in process of trial.

INFANTRY. With rapid marching as an essential of modern military manoeuvres and tactics, more attention was being paid to the soldier's equipment with a view to reducing its weight. This had been done in the German army, where the soldiers perhaps are the most stalwart of any nation, but the heavy packs of the French infantry were most unfavorably commented on in the manoeuvres of 1909. In the United States army a new field equipment was under test and in European armies steps were taken to lighten the soldier's burden. More important, perhaps, was the matter of weapons. Mexico adopted a new automatic rifle which fires ten rounds, and was the first nation to provide an automatic weapon for its soldiers. The new rifle resembles the Hotchkiss machine gun in general principle of operation, and has a small hole in the barrel through which passes a portion of the powder gases into a power-cylinder, where there is a piston by whose action the breech is opened, the empty cartridge shell ejected, a fresh cartridge inserted, and the breech closed. Naturally this new rifle fires the pointed bullet, which has become standard practice for modern rifles. It has a small cylindrical portion, but a long, ogival point. They were able to pierce the steel shield of a field gun 5 mm. (.197 inch) at a distance of 100 yards. Other nations claimed to have automatic rifles in greater or less numbers, but there was no unanimity of opinion as to their state of perfection or the conditions under which they were to be used. This latter topic attracted much attention, for the extended use of automatic rifles was regarded as bound to result, and therefore its application must be considered, especially as there would be involved questions of increased ammunition supply.

CAVALRY. The cavalry of the various nations was carefully watched at all the great manoeuvres of 1909, as their proper use and sphere is

KAISER MANOEUVRES IN GERMANY

The Emperor addressing the generals and staff officers at the close of a day's work

MILITARY PROGRESS

one of the most debated of military questions. The German cavalry most of all retained the old-fashioned ideas of "shock attacks," and their leaders did not employ them for scouting and reconnaissance work as effectively as did the generals of other armies. The German cavalry definitely adopted a new carbine with bayonet, which had been issued to several regiments and was to be provided for all, new "Cavalry Musketry Regulations" having been approved on December 2, 1909. The sword was abolished and in its place the carbine will be carried on the left side. The cavalry were being trained in systematic musketry with but slightly less earnestness than the infantry. The new arm is 1.1 metres (3.61 feet) in length, weighs 3.60 kilograms (7.92 pounds), and is the same calibre, 7.9 mm., as the infantry rifle. Its initial velocity, 870 metres, is only 30 metres less than the infantry rifle. The bayonet is worn at the belt and the carbine is carried on the back when an action is impending. It was desired to give the cavalrymen 75, 80, or 90 cartridges, to be carried in cartridge cases either on a bandoleer or attached to the belt. The working of the new arm and its ammunition was carefully observed in the manœuvres. The Japanese cavalry were about to receive a new gun which will come between a field and mountain gun and be available for rapid transport, yet of sufficient power to be useful under many circumstances. The need of such a light gun was demonstrated in the Russo-Japanese war and a satisfactory model having been manufactured at the Osaka arsenal it was to be issued for trial.

ARTILLERY. Throughout Europe and even in Asia and South America rearmament was the prevailing tendency. The German artillery was being matched by France as fast as it was able. England was organizing a large force of territorial artillery, to which were given the 15-pounder gun converted into a quick firer. Schneider field and mountain guns were being supplied to Spain and Portugal to complete their armament, and were also adopted by Greece. Italy was using a Krupp field gun, which was also gaining a foothold in China, and the introduction of a new model field gun into the Japanese army only waited on financial expediency. The increase in the armament of the artillery of the various powers naturally involved problems of reorganization. The six-gun battery was more economical, but less efficient under modern war conditions gun for gun than the four-gun battery organization.

LIGHT FIELD GUNS. An opportunity was afforded to test some of the recent field guns with which the armies of Europe were being provided in the Spanish war at Melilla. A general rearmament had been in progress for several years previously, but no adequate opportunity was given to try out the new weapons under service conditions. The Spanish gun was of the Schneider type with a pneumatic recoil cylinder, which many European artillerists thought inferior to apparatus where the recoil was absorbed by springs. The hydro-pneumatic recoil was found to render the gun much steadier in action, which results, not only in a more rapid rate of fire, but in more accurate shooting. This is of importance, as by the provision of shields for field guns they had been made safe from shrapnel and required a direct hit to be rendered inoperative. The field guns of Krupp, Schneider

and Ehrhardt, which fire a 14.3-pound projectile with a muzzle velocity of 1640.42 feet per second, remained during the year in their standard form, but experiments were made with their projectiles, especially in the hope of finding one that would be efficient as either a shrapnel or a high explosive shell. Thus in the Ehrhardt shrapnel purchased extensively by the German army the head contained a high explosive charge and the bullets were packed in trinitrotoluol, a new high explosive said to be safe, powerful, and having good keeping qualities, but difficult to detonate. In the Krupp projectile this is secured by a method of progressive detonation, nitroglycerine in a steel cylinder being exploded by the fuse and its explosion in turn detonating the central exploder, which finally detonates the main charge. High explosive shells were being filled with ammonium in which trinitrotoluol entered as an ingredient. A new Armstrong 14.3-pounder gun was brought out in England of remarkable accuracy and showed a mean error in range at 6502 yards, or over 3½ miles, of but 26 feet, or practically a direct hit on a shielded gun at almost every shot. The new Vickers-Maxim gun was also brought out as a piece of extreme accuracy, and a new English field gun from the Coventry Ordnance Works of slightly greater power was shown where a flat trajectory for a 15-pound shell was obtained. In France Colonel De Port's new differential field gun was brought out, a 16-pounder with a muzzle velocity of 1730 foot-seconds and weighing but 2240 pounds. It is so mounted that it can be used at a high elevation, as much as 75 degrees, either as a howitzer in attacking shielded guns or as a balloon gun. The same principle has been used in mountain guns by Krupp and Montloucon, the former having a hydraulic buffer and the latter a spring arrangement. This last named gun was considered an important advance, as for a 14.3-pounder the weight had been reduced so that with the exception of the shield it could be packed by three mules instead of the usual number, five. Most mountain guns were being made capable of high elevation and for that reason mountain howitzers were not considered at all desirable except in the large calibres where the matter of transportation militated against their use. The development of a suitable quick-firing field howitzer was in progress, Great Britain having adopted an improved weapon from the Coventry Ordnance Works in advance of other European nations who were engaged on this problem.

GUNS FOR AIRSHIPS. With the growing use of airships in military operations it was but natural that means for their defense and for their destruction should be devised. In Europe balloon guns were receiving the attention of ordnance experts and 3-pounders were proposed for the defense of dirigibles, as such a weapon with a reasonable amount of ammunition would not be too heavy and would not produce sufficient concussion to wreck the balloon, which would be safe if there were no gas leakage. For attacking balloons the Krupps devised a special high-angle howitzer which would project a shell leaving a visible smoke trail to show to the gunner its path. During the year three types of this gun were brought out: one, a 9-pounder of 2.6 inches calibre on an ordinary field gun mount, the second a 3-inch 12-pounder mounted on a 50 horse-power motor car, and the third a 4.2-inch gun firing a 40-pound shell, on a naval

mount. While shrapnel could be fired from these guns it was considered preferable to have a special form of grenade, which instead of merely piercing one compartment without disabling the balloon as a whole, would in addition ignite the gas with obviously disastrous effect. The sighting of the gun was effected by a telescope sight of special design and the guns could be elevated to 75 degrees.

MACHINE GUNS. These weapons continued to find increased application in military tactics and manœuvres and as a result they were being extensively added to the equipment of many armies. In the French army an improved type of Hotchkiss gun, known as the Puteaux machine gun, was being provided both for the mobile army and the frontier defenses. The weapon has been improved by strengthening the lock, increasing the length of the radiator for cooling the barrel, and supplanting the familiar pistol grip with two stout handles. The water jacket was done away with both on the ground of being cumbersome and on account of the steam which would render visible the position of the piece. With the different types of automatic rifle already mentioned, the "portable" gun, a machine gun, was attracting much attention in 1909. Weighing only about 16 pounds, it could be carried and fired readily by one man. Such a gun of the Rixer type was adopted by the Russian cavalry, but there were also heavier models weighing about 25 pounds, which were provided with a water jacket. The lighter weapon during firing was to be supported by two props under the muzzle and from it 250 rounds a minute could be fired for a short time until the barrel heated. In the German army the number of machine-gun companies was raised from 17 to 50 by the creation of 33 new units taken from the 12 service companies. The mitrailleuses (six Maxim's per company) were drawn by two horses each. This gave the Germans two of these guns to each battalion as compared with the French, where there are but four guns to each three battalions.

One lesson of modern warfare has been the difficulties of carrying fortifications by assault in the face of rifle fire, so that more attention was being paid to mining operations. On the other hand European fortresses to resist such attacks were adding to and strengthening their counter mine galleries. In the case of coast defenses the protection of the submarine mine fields by quick-fire guns and electric search lights was a most important matter. Increased use was being made of portable search lights, an improved form of which used in Europe was comprised in two motor cars, one of which contained the dynamo and the other the search light itself.

THE KAISER MANŒUVRES of 1909 took place between September 13 and 17 and were noteworthy for the fact that the effective strength present was 125,000 or one-fifth of the Prussian army on a peace footing. Furthermore, all the troops of the southern states—Bavaria, Württemberg and the Grand Duchy of Baden—participated with the Prussians over a territory where once they fought as enemies. The Blue Army, commanded by General von Bock und Polach, was composed of the 1st Bavarian army corps, the Thirteenth Württemberg, and a corps of combined cavalry; each corps consisted of 2 infantry divisions of 2 brigades each, 1 brigade of

field artillery, and 1 of cavalry. The cavalry corps was composed of 2 divisions of cavalry, of 3 and 2 brigades respectively, 1 sub-division of signalers, and 1 of machine guns. The total of the Blue Army was 52 battalions of infantry, 67 squadrons of cavalry, 47 batteries of field artillery, and 4 batteries of foot artillery. Opposed to this force was the Red Army, commanded by General Field-Marshal Prince Leopold of Bavaria, and consisting of the Third Bavarian Army Corps, the Fourteenth Baden and a combined corps of a Baden and Bavarian division, or a total of 74 battalions, 67 squadrons, 62 field batteries, and 7 foot batteries, being thus superior in infantry and artillery to the Blue, but supplied with fewer cavalry. The manœuvres involved the operation of two completely independent armies, the general problem being "Whilst the troops of the Blue Army concentrate on a distant strategic point the Red State orders the mobilization of its army." By rapid marching, averaging 31 miles and amounting to 38½ miles and even 40½ miles in the case of the Rhenish Jägers, the Red Army was concentrated and brought into effective positions. The deployment of the infantry and their successful taking advantage of cover so that their motion was all but invisible was noteworthy and this it was thought would be further emphasized by the general use of the dark gray uniform adopted and issued during 1909.

THE FRENCH MANŒUVRES for 1909 occurred in the Bourbonnais district and the Thirteenth Army Corps under General Goiran and the Fourteenth Army Corps under General Robert, with a total strength of about 100,000 men, were engaged, the two forces being about evenly divided. The infantry was divided into regiments of three battalions, with their companies at full war strength, the artillery was organized in four-gun batteries, and the cavalry regiments were of four squadrons each. There was not a continuous movement of one army against the other, as in the case of the German manœuvres, but a succession of independent actions, the whole under the direction of General Tréneau. The strategy manifested in these manœuvres was deemed superior to that of the Germans, but the organization was far inferior.

MILITIA. As a result of measures which went into effect in 1908 there was established a division in the office of the War Department, known as the Division of Militia Affairs, and the enactment of other measures made the militia in effect a body of reserves to be called out at the discretion of the President. The creation of a Division of Militia Affairs was made necessary by the increasing volume of general business pertaining to the militia, especially under the Act of May 27, 1908, which placed militia affairs upon a new footing. By the terms of this act which amends the act of January 21, 1903, the militia consists of every able-bodied male citizen of the respective States and Territories and the District of Columbia, and every able-bodied male of foreign birth who has declared his intention to become a citizen, who is more than 18 and less than 45 years of age. The militia is divided into two classes, the Organized Militia, to be known as the National Guard of the State, Territory, or District of Columbia, or by some such similar designation, and the remainder to be known as the Reserve Militia. The Organized Militia is composed of the regular enlisted, organized

and active militia in the several States and Territories and in the District of Columbia who had, previous to the passage of the amendment, participated, or who shall thereafter participate in the annual appropriation provided by the revised statutes of the United States. On and after January 1, 1910, the organization, armament and discipline of the Organized Militia in the several States, Territories and District of Columbia, is to be the same as that which is prescribed for the regular army of the United States subject to certain supervision. To the President is given power in case of emergency to call forth such part of the militia of the State or States as he may deem necessary to repel invasion, suppress rebellion, or to enable him to execute such laws and to issue his orders to such members through the governors of the respective States or Territories or through the commanding general of the militia of the District of Columbia.

This act marks the first time that the powers of Congress with respect to the militia, which are granted by the Constitution, have been fully exercised.

The strength of the Organized Militia, as reported by the officers of the regular army after the annual spring inspection of 1909, was 118,926 officers and enlisted men, which is an increase of 7985 over that reported after the spring inspection of last year. After the spring inspection had been made, there were organized 31 companies of coast artillery and plans were made in the several seaboard States and in the District of Columbia for the organization of 19 more during the ensuing year, making a total of 138 companies of coast artillery which will probably be in existence by the end of the fiscal year, 1910. The strength of the militia comprised the following bodies: Infantry: 141 regiments, 9 separate battalions, and 8 separate companies; cavalry, 69; field artillery, 48 batteries; coast artillery, 88 companies, including those organized since the inspection. The report of the regular army officers made in connection with instruction and manoeuvre camps and field exercises during the summer of 1909, indicate that there has been a material increase in the military efficiency of the Organized Militia. This increase in efficiency has been attributed in some part, at least, to the effects of the new law. As the militia in accordance with this law is, after January 21, 1910, to enjoy the benefits of the funds appropriated by Congress, and to have the same organization, armament and discipline as the regular army, it will be the duty of the War Department to note what departures, if any, are to be found among the State troops from the standard imposed by law. During 1909 the military authorities in the legislatures of the States have been actively engaged in endeavoring to meet the requirements of the law in regard to conformity with regular army standards. Such conformity has been satisfactorily established in all but two States. The States will, prior to the dates specified, pass laws which will accomplish conformity between their forces and those of the United States enjoined by the new law. The discipline of the State militia under the new standard will be the same as that of the regular army, but it is reserved to the States to have the authority of training the militia. The War Department may provide ways for training, make suggestions as to methods, and fix the standards that must be

attained, but it cannot directly conduct the training. With a view to meeting the full obligations of the Department in regard to instruction there has been organized in each division of military affairs an instruction branch for the object of placing at the disposal of the States every facility that can properly be extended under the law to assist the military authorities in imparting both theoretical and practical instruction to the State forces. Along these lines the War Department has encouraged the formation of correspondence schools for officers and enlisted men, and in connection with State encampments and special assemblages for field instruction has furnished commissioned officers and enlisted men to assist in giving practical instruction. Correspondence schools were pending organization during the year in the following States: Colorado, Florida, Georgia, Iowa, Kansas, Maine, Massachusetts, Michigan, District of Columbia, New York, Ohio, Pennsylvania, Tennessee, Texas, Vermont, Virginia, West Virginia, and Wisconsin.

The militia forces of all the States assembled in the camp for field manoeuvres or practice marches during the summer of 1909. In connection with these encampments, the War Department, in accordance with applications of the State military authorities, ordered a number of organizations of the several arms of the regular service to proceed to the localities designated by the States, and go into camp with the State forces with a view to assisting in their instruction in field duties.

Through mutual agreement of the military authorities, the States of Massachusetts, Connecticut, New York and New Jersey, and the District of Columbia were ordered by their own respective military authorities to undertake combined manoeuvres in the southeastern portion of Massachusetts, and in accordance with the request of these same authorities, and on the application of the commanding general of the Department of the East, the latter was authorized to conduct the usual manoeuvres of the regular forces in the same section. Through mutual arrangement an interesting and instructive manoeuvre problem was worked out in a practical way conjointly by those forces. The instruction of the auxiliary troops, Field Artillery, Cavalry, Signal Corps and Medical Corps was undertaken on the government reservation at Sparta, Wis., during the year. Three field schools of instruction for medical officers were also held at Antietam, Sparta and the Presidio of San Francisco. A battalion of regular field artillery was ordered to duty in June, and the military authorities of the States of Wisconsin, Michigan, Iowa, Indiana and Minnesota, were invited to order the field artillery of their respective States to the Sparta reservation, to go into camp there with the regular forces, and to receive such instruction as could be imparted in a ten-day period. Reports indicate that instruction received in this school was very helpful to those under instruction.

Considerable progress was made during the year in developing the policy of the War Department in regard to creating an adequate body of coast artillery troops for use in coast fortifications, and to supplement at these points the coast artillery of the regular troops. Many States have accepted the invitation of the War Department to have a part of their infantry or-

ganization participate with the regular coast artillery in coast defense exercises.

Forty-three militia teams attended the national rifle practice match at Camp Perry, Ohio, in 1909. The improvement in rifle firing at this contest over that of previous years was particularly noticeable. Past records were surpassed at almost every range.

The following table shows the strength (officers and enlisted men) of the Organized Militia, by branches of the service, as shown by the special inspections made by the United States inspecting officers specially assigned to the different States for this purpose during the spring of the year 1909:

War he participated in the actions at Fort Sumter, Fort McAllister and Fort Fisher, in the last as captain of the *Monadnock*. He was made commander in 1870, captain in 1881, commodore in 1894, and rear-admiral in 1897. In 1875 he made deep-sea soundings in the Pacific, and took official possession of the Hawaiian Islands on their annexation to the United States. From 1888 to 1891 he commanded the New York Navy Yard, and in the Spanish-American War organized the Naval Reserves of the Pacific Coast. At the close of that war he was retired.

MILLIGAN, ROBERT WILEY. A rear-admiral retired from the United States navy, died October 14, 1909. He was born in Philadelphia in

a No Organized Militia (mustered out, May 20, 1906).

MILLER, JOSEPH NELSON. An American rear-admiral (retired), died April 25, 1909. He was born in Springfield, Ohio, in 1836, and entered the navy at the age of 15. In the Civil

1843 and was educated in the public and high schools of that city. He entered the navy as third assistant engineer in 1863. He was promoted to assistant engineer in 1866, passed as

sistant engineer in 1874, chief engineer, 1892, commissioner, 1899, and captain, 1902. He served in some of the most important naval engagements of the Civil War and participated in the fall of St. Petersburg and Richmond. He was later on duty in the North and South Atlantic and Pacific squadrons and as instructor in the United States Naval Academy. He was chief engineer of the battleship *Oregon* on her famous run from the Pacific to the Atlantic Coast to take part in the blockade of the Spanish fleet at Santiago. In 1905 he was retired with the rank of rear-admiral.

MILLS, JOSEPH SMITH. An American bishop of the United Brethren Church, died September 16, 1909. He was born in Plymouth, Ohio, in 1848 and graduated from Illinois Wesleyan University. He was educated for the ministry under private teachers. He was pastor of Otterbein University from 1874 to 1880 and from 1885 to 1887. He occupied the chairs of English Literature, Rhetoric and Philosophy at Western College, Toledo, Iowa, from 1887 until 1893. During one year he was president of this institution. He traveled extensively abroad, visiting the universities of Berlin, Leipzig, Oxford and Cambridge in 1897, and again made a tour in Europe, Asia and Africa in 1903-4. In 1893 he was consecrated bishop. He was the author of *Mission Work in West Africa* (1898); *Manual of Family Worship* (1900); and *Holiness* (1902).

MINERALOGY. In mineralogical discoveries and investigations the year 1909 was characterized by progress, although there were no valuable finds of minerals equal to those of the preceding year or two, when several new diamond fields, including one in the United States, were brought to light. Further particulars of the new Arkansas field indicated the existence of two distinct peridotite intrusions quite similar in character to the South African pipes. Their development thus far has given satisfactory results. The discovery of diamonds at Orovile, Cal., and in Elliott county, Ky., was reported.

The recently opened diamond field in Lüderitzland, German Southwest Africa, has been described by H. Merensky. The deposits apparently are of unique type. Their source is a soft sandstone made up of chalcedony, jasper and white quartz. Owing to the dry climate the principal erosive agent in the region is wind which has worn down the surface and concentrated the coarser fragments of the sandstone in billowy ridges; the finer materials have been blown off and piled up in dunes. It is in the gravel ridges, especially near the summits, that the diamonds are mostly found. The fields are estimated by the writer to contain 1,500,000 carats that can be extracted at a profit. They extend along the coast from Lüderitz Bay to Angraas Juntas, half way to the mouth of the Orange River. The diamonds are generally small, but their average quality is unusually fine.

A new locality for moonstone was reported to have been found at Weragoda in the southern province of Ceylon. Practically the whole supply of the mineral for gem purposes has come hitherto from the Kandy district of that island. In the newly discovered district the moonstone occurs with white kaolin and is obtained by sinking pits and washing the extracted material.

The sources of jadeite, the favorite stone of

the Chinese art worker, were long a mystery to mineralogists. They have recently been described in detail by A. W. G. Bleeck. The jadeite is found in the Kachin hills of Burma at three localities—Tawman, Hwéka and Mammon, of which the first mentioned is the most important and interesting. It occurs there in a dike which intersects the serpentine country rock. It is regarded as a metamorphic product of albite and nepheline, the original components of the dike.

Several new minerals were described for the first time in 1909. *Delorenzite* is a titanate of yttrium, uranyl, tin and iron, of complex chemical structure. It occurs at Craveggia in Piedmont, sometimes associated with the rare mineral striloverite. Its crystallization is orthorhombic, color black, and its hardness about 5.5 on the Mohs scale. *Alamosite* is the name given to lead metasilicate, corresponding in formula to wollastonite with the calcium of the latter replaced by lead. It comes from near Alamos, Sonora, Mexico. It crystallizes in the monoclinic system in snow-white fibrous aggregates, closely related to the forms of wollastonite. *Taramellite* belongs to the silicates and contains ferrous and ferric iron and barium. It is found in the limestone of Candoglia, Valle del Toce, Italy. It builds columnar or radiating fibrous aggregates of brownish red color. The hardness is 5.5. *Rinneite* is a chloride of iron, potassium and sodium and is found in coarse aggregates in the potash salt deposits of the southern Harz. *Arizonite*, a ferric metatitanate discovered in pegmatite near Hackburg, Arizona, contains the rare elements yttrium, cerium and beryllium. It is dark steel-gray in color and of metallic lustre. *Georgiadesite* belongs to the secondary lead minerals that occur in the ancient mines of Laurion, Greece. In composition it is a chloro-arsenate of lead. The crystallization is orthorhombic, the prismatic crystals having hexagonal outlines. The color is white and the hardness 3.5. *Carlosite*, a supposedly new mineral, has been shown by further study to be referable to the species neptunite, which has been described previously as occurring in Greenland.

MINERAL PRODUCTION OF THE UNITED STATES. The summary of the mineral production of the United States in 1908, prepared by the United States Geological Survey, shows a decline in the value of the mineral output amounting to about \$467,000,000, or 23 per cent. The figures for 1907-8 are \$2,071,607,964 and \$1,595,670,186 respectively. This great loss is due to the decrease in the output of both metallic and non-metallic products. The most notable decrease among the metallic products was in the production of iron ores (see IRON AND STEEL). The production of bituminous coal decreased about 16 per cent. Gains were shown in the production of gold and in the quantity of copper produced, but this gain in quantity was accompanied by a loss in total value due to the lower prices of copper. Petroleum showed a gain of about 8 per cent. in quantity and value. Gains were made by several States, notably California, Florida, Louisiana, New Hampshire, and South Dakota. The losses, however, were out of proportion to the gains. Alabama, Florida, Illinois, Michigan, Montana, New Jersey, New York, Ohio, Pennsylvania, Virginia, and West Virginia lost. See paragraphs *Mining Production* under these States. The table

MINERAL PRODUCTS OF THE UNITED STATES IN 1907 AND 1908

(b) Barrels of 42 gal. (d) Flasks of 75 lb. (e) Includes zinc from foreign ore.

on preceding page gives detailed statistics of the production of minerals and metals in 1907-8. The accompanying preliminary statistics published by the *Engineering and Mining Journal*, though subject to revision, indicate very closely the output of the most important products of the year 1908, as compared with similar figures for 1907. Statistics of the individual metals and minerals will be found under their head in proper alphabetical order, as COAL, COKE, COPPER, GOLD, IRON AND STEEL, LEAD, NICKEL, SILVER, etc.

MINNESOTA. One of the North Central Division of the United States. Its total area

is 84,682 square miles. Its population in 1909, according to a Federal estimate made in that year, was 2,162,726.

MINERAL PRODUCTION. The chief mineral product of the State is iron ore, and in this the State ranks first in the point of production and value. There were produced in 1908, 18,652,220 long tons, valued at \$42,313,974. This, although far in excess of the production of any other State, was a marked falling off from the production of 1907, which was 28,989,658 long tons, valued at \$76,668,836. The chief source of production is the Mesabi range, from which were produced in 1908, 17,725,014 long tons. From the other important range, the Vermilion, was

828,415. 1904: 27,644,330 long tons; value at mines, \$43,186,741. 1905: 42,526,123 long tons; value at mines, \$75,165,604. 1906: 47,749,728 long tons; value at mines, \$100,597,106. 1907: 51,720,819 long tons; value at mines, \$131,996,147. 1908: 35,983,836 long tons; value at mines, \$81,845,904. Statistics for iron ore and for value of pig iron are collected by the Survey; statistics for output of pig iron are furnished by the American Iron and Steel Association.

b By "spot" value is meant value at the point of production.

c Long tons are tons of 2,240 avoirdupois pounds; short tons are tons of 2,000 avoirdupois pounds.

d Average price per troy ounce in 1906 was 67 cents; in 1907 it was 66 cents; in 1908 it was 63 cents.

e Prior to 1905, coining value, \$20.6718 per troy ounce; in 1905, coining value, \$20.671834; since 1905, coining value, \$20.671834625323.

f The products from domestic ores only.

g Of 76½ avoirdupois pounds net; of 75 avoirdupois pounds net since June, 1904.

h Consumption.

i Includes antimony smelted from imported ores and antimony contained in hard lead.

j Includes nickel in copper-nickel alloy and in exported ore and matte.

k Included under unspecified.

l Nineteen short tons of high-grade concentrates shipped to England from South Carolina in 1903. In 1904 about 142 short tons of concentrates from South Carolina, South Dakota, and Alaska shipped to England. In 1905 no production. In 1906, 2500 pounds of metallic tin, 55 short tons of concentrates from Alaska, and 14 short tons of concentrates from North Carolina and South Carolina. In 1907, about 89 short tons of concentrates. In 1908, no production.

m Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania. Coke—1902: 26,401,730 short tons; value at ovens, \$63,339,167. 1903: 25,274,281 short tons; value at ovens, \$66,498,664. 1904: 23,661,106 short tons; value at ovens, \$46,144,941. 1905: 32,231,129 short tons; value at ovens, \$72,476,196. 1906: 36,401,217 short tons; value at ovens, \$91,608,034. 1907: 40,779,564 short tons; value at ovens, \$111,539,126. 1908: 26,033,518 short tons; value at ovens, \$62,483,983.

n Of 42 gallons.

o Value of clay mined and sold as unmanufactured clay—1899: Census returns, \$1,645,328. 1900: \$1,840,377. 1901: \$2,578,932. 1902: \$2,061,072. 1903: \$2,594,042. 1904: \$2,320,162. 1905: \$2,768,006. 1906: \$3,245,256. 1907: \$3,448,548. 1908: \$2,599,986.

p Of 380 pounds net.

q Includes limestone for iron flux, but not grindstones.

r Of 280 pounds net. Value is for net product exclusive of cost of packages.

s Includes metallic paint, ochre, umber, mortar colors, sienna, ground slate, shales, sublimed blue lead, sublimed white lead, and zinc-lead.

t Includes pearls valued at \$264,500 in 1907.

u Included under unspecified.

v Includes, in 1907: Nitrate of soda, carbonate of soda, sulphate of soda, and alum clays used by paper manufacturers; and molybdenum, nickel and cobalt, tantalum, titanium, uranium, and vanadium, valued together at \$31,945. In 1908: Nitrate of soda, carbonate of soda, sulphate of soda, and alum clays used by paper manufacturers; nickel and cobalt, cadmium, arsenic, and bismuth, valued together at \$169,281.

produced 927,206 tons. The decline in the production and consumption of iron ore in 1908 was the result of the cutting down of operations due to financial conditions. Clay products were produced to the value of \$1,508,710, as compared with \$1,689,933 in 1907. Other important products are sand and mineral waters. The total value of the mineral products of the State for the year 1908 was \$4,524,022, as compared with a value of the product in 1907 of \$5,457,422.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 58,812,000 bushels, valued at \$28,818,000, from 1,690,000 acres; spring wheat, 94,080,000 bushels, valued at \$90,317,000, from 5,600,000 acres; oats, 90,288,000 bushels, valued at \$31,601,000, from 2,736,000 acres; barley, 31,800,000 bushels, valued at \$14,852,000, from 1,399,000 acres; rye, 2,280,000 bushels, valued at \$1,368,000, from 120,000 acres; flaxseed, 4,500,000 bushels, valued at \$6,750,000, from 450,000 acres; potatoes, 18,400,000 bushels, valued at \$6,440,000, from 160,000 acres; hay, 1,622,000 tons, valued at \$9,732,000, from 927,000 acres. In the production of spring wheat Minnesota stands first among the States. The crop in 1908 was very largely in excess of that of 1908, which was 68,557,000 bushels. The acreage, however, increased only slightly. The corn crop in 1909 was also larger than that of 1908, which was 46,835,000 bushels. The acreage increased from 1,615,000 to 1,690,000 acres. The oat crop increased very materially in 1909 over the crop of 1908, which was 59,004,000 bushels. As in the case of corn and wheat, however, the acreage increased but slightly. In the production of barley Minnesota stands first among the States, although the crop of 1909 was slightly less than that of 1908, 32,500,000 bushels. The acreage of 1909 was slightly increased. A small quantity of beet sugar is produced in the State. The farm animals on January 1, 1910, were as follows: Horses, 767,000; mules, 9000; dairy cows, 1,125,000; other cattle, 1,228,000; sheep, 482,000; swine, 1,003,000. The wool clipped in 1909 was estimated at 2,560,240 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$191,950. Of these the most important in point of value was German carp, of which 1,132,400 pounds, valued at \$26,320, were taken. Among other important fish taken were buffalo, 664,300 pounds, valued at \$22,460; fresh herring, 1,612,400 pounds, valued at \$20,880; salted herring, 1,165,200 pounds, valued at \$17,610. Other fish taken were pike, pickerel, sturgeon, lake trout and whitefish. There were 807 independent fishermen engaged in the fisheries of the State, with 127 wage-earning fishermen employed. There were four vessels engaged in the fisheries of the State, valued at \$12,814.

EDUCATION. The school attendance in 1909 was 435,282. There were 1613 male teachers and 13,146 female teachers. The average salary of the male teachers in high and grammar schools was \$107.66 and of female teachers, \$53.56. The total expenditure for education during the year was \$12,500,000.

FINANCE. According to a report of the State Treasurer for the fiscal year ending July 31, 1909, there was a balance in the treasury on

August 1, 1908, of \$2,968,282. The receipts for the fiscal year 1909, were \$12,521,986 and the expenditures were \$12,717,018, leaving a balance in the treasury on July 31, 1909, of \$2,773,250. The chief receipts were from county treasurers, from State institutions, and from railway companies. The chief disbursements were for education.

CHARITIES AND CORRECTIONS. The institutions under State control include the Insane Asylums of the State, School for the Blind, School for the Feeble Minded and School for the Deaf at Faribault, State Public School at Owatonna, State Training School at Red Wing, State Reformatory at St. Cloud and State Prison at Stillwater. New institutions provided for in 1907 and now occupied are detention hospitals at the various hospitals for the insane, a hospital for dangerous and criminal insane at St. Peter, a hospital farm for inebriates and a hospital for crippled and deformed children at St. Paul. A law passed in 1907 provides also for the appointment of State agents for the care of the insane after their discharge from hospitals.

POLITICS AND GOVERNMENT. Governor John A. Johnson (q. v.) died on September 21 and was succeeded by Lieutenant-Governor A. O. Eberhart, thus placing the State under a Republican executive for the first time in several years.

Governor Johnson was inaugurated on January 6, and in his annual message to the legislature he advocated State regulation of public utilities corporations, such as electric railways, telephones, telegraph, power and lighting companies. He declared that this was necessary both for the public good and in the interest of the stockholders of the corporations concerned. There is no question, he said, but that a public utility law like that of Wisconsin, New York, Massachusetts and other progressive States will be of great service to this State and to its municipalities in securing efficient service and just rates, as well as in settling disputes and grievances and adding to the security and attractiveness of investments in such enterprises.

On February 4 the legislature defeated by a vote of 73 to 44 a bill for county local option, thus preventing for the time being the spread of Prohibition in the State through legislative means. The only progress which the Prohibitionists have been able to make in the State in a legislative way is the local option act passed several years ago, which applies only to certain districts and towns. On March 10, village elections were held throughout the State and the result showed an advantage for the anti-saloon movement. Saloons were voted out in several of the larger towns. On April 10, Governor Johnson signed the Works bill, giving the cities in the State the right to establish the commission form of government. The bill passed both houses of the legislature with practically no opposition.

It was the declared intention of Governor Johnson to call a special session of the legislature to take action on the income tax, which was urged by President Taft, and to discuss certain measures declared unconstitutional by the Supreme Court. The call for the special session was not made, however, up to the time of Governor Johnson's death. The pure food law, passed by the legislature of 1908, was declared constitutional by the State Supreme Court, February 5. A bill to abolish capital punishment in the State was indefinitely postponed by the

legislature on March 9. See ELECTORAL REFORM.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those given below: A measure was enacted fixing maximum freight rates and a number of acts were passed regulating the operation of railroads. The granting of liquor licenses was restricted to one for every 500 of population. The sale of cigarettes in the State was prohibited. A law was passed prescribing the form of policy for accident insurance. Several new laws relating to labor were passed, among them measures requiring sanitary places for work and regulating the labor of women and children. A tax was levied, the proceeds of which was used to acquire land for purposes of reforestation. A commission was appointed to consider the matter of compulsory insurance of employees against accidents, etc.

OFFICERS: Governor, Adolph O. Eberhart, Rep.; Lieutenant-Governor, office vacant; Secretary of State, Julius A. Schmahl; Auditor, S. G. Iverson; Treasurer, C. C. Dinehart, Rep.; Attorney-General, Geo. T. Simpson, Rep.; Adjutant General, Fred B. Wood, Dem.; Superintendent of Education, C. G. Schultz, Rep.; Commissioner of Insurance, J. M. Hartigan, Dem.

JUDICIARY. Supreme Court: Chief Justice, Charles M. Start, Rep.; Associate Justices, Calvin L. Brown, Rep.; Edward A. Jaggard, Rep.; Charles L. Lewis, Rep.; Thos. D. O'Brien, Dem.; Clerk, C. A. Pidgeon, Rep.

The State Legislature of 1909 was composed of 44 Republicans, 18 Democrats and 1 Populist in the Senate, and 94 Republicans, 22 Democrats, and 3 Prohibitionists in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

MINNESOTA, UNIVERSITY OF. An institution of higher learning at Minneapolis, Minn., founded in 1869. The attendance in 1908-9 numbered 5066, with a faculty of 352. There were in the library 135,000 volumes. Five members of the faculty resigned during the year and sixteen were added. Provision was made for evening, extension and correspondence courses and the work was in operation in the autumn of 1909. The University is supported by the State. The president is Cyrus Northrop, LL. D.

MISSIONARY ASSOCIATION, AMERICAN. A society founded in 1846 which carries on mission work under the auspices of the Congregational denomination. It was founded with the object of spreading the Gospel wherever there was opportunity. Its work is educational and missionary, with especial attention to industrial training among the eight different classes included in the population of the United States. The widest field of the society is in the South. It includes also Porto Rico, the Indian reservations of the Northwest, Alaska, the Orientals on the Pacific Coast, and Hawaii. In the South are maintained four theological seminaries, 4 colleges, 28 secondary institutions, 12 elementary institutions and 22 negro schools. These institutions have 15,221 pupils, with 570 officers and instructors. The larger number of the schools are for negroes. At the head of the system of negro schools are six chartered institutions. These are: Fisk University in Tennessee; Talladega College in Alabama; Tougaloo University in Mississippi and Tillotson College in Texas. These institutions afford opportunity

for the higher education and seek to train leaders for the negro race. A marked feature of the work of the year 1908-9 was the extension of agricultural instruction and a more adequate equipment in some of the schools for the teaching of the industries. The society has one school with 159 pupils and eight instructors in Porto Rico. In that Island there are also ten churches, 22 out-stations, 16 missionaries and evangelists and 591 church members. In the Northwest, including Alaska, are 21 churches, 24 stations and out-stations, 16 missionaries and evangelists and 591 church members. In the Northwest, including Alaska, are 21 churches, 24 stations and out-stations, 1538 church members and 1187 Sunday school scholars. Indian missions are carried on in six reservations, and a normal school is maintained at Santee. In the Oriental missions in California there are ten churches and branch churches, 7 ministers and missionaries, and 521 church members. There are maintained 21 mission schools, with 2109 pupils. The total receipts of the society for the year ending September 30, 1909, were \$447,903.43, with expenditures of \$400,537.95, leaving a credit balance of \$47,365.48. In addition, there was received as income from the various funds about \$100,000. The official organ of the association is *The American Missionary*, issued in ten monthly numbers during the year. The officers are: Rev. Amory H. Bradford, President; Rev. Asher Anderson, Recording Secretary; Rev. A. F. Beard, D. D., Honorary Secretary and Editor. The central office is 287 Fourth Avenue, New York City.

MISSIONS, PROTESTANT FOREIGN. The year 1909 was remarkable in foreign missions in several particulars:

First, the cause of missions as an enterprise has gotten a better grip on the hearts of men of affairs at home. As illustrative of this is the fact that public men like President Taft have taken occasion repeatedly to speak out their approval of missionaries and their work. The great legacy of nearly \$10,000,000 left by Mr. John S. Kennedy, of which amount one-quarter is for the work abroad, is another proof. The great interdenominational Laymen's Missionary Movement, inaugurated in 1906, but which was brought strikingly to the attention of the public during 1909, is still another evidence. This movement is under the direction of a general committee which meets twice a year, and an executive committee of twenty-one members which meets once a month. Its sole purpose is to awaken the men of the churches to a sense of their responsibility for the evangelization of the world and to inspire them to much larger giving to this work through their respective boards or societies. A series of laymen's missionary conventions was held in the winter of 1909-10 in 75 of the leading cities of America, which were remarkably successful in accomplishing their object. These conventions will culminate in a grand national rally in Chicago in May.

Second, the cause of missions made striking advances, also, during 1909 in the different missionary lands. In Japan, the fiftieth anniversary of the beginning of Christian work has been celebrated with much rejoicing, not only by the 702 missionaries of all denominations, but by the native church of 80,000 members, which stands as a convincing testimony to the success of the work. An aggressive evangelistic move-

ment on the part of the Japanese churches characterized the year. In Korea the marvelous gathering continued as the Gospel spread like a wave over the land, making it impossible for relating to missions in the Protestant countries in 1909, including the number of missionaries from the different countries, the communicants and the adherents for the different missions:

STATISTICS OF THE PROTESTANT MISSIONARY SOCIETIES OF THE WORLD FOR 1909

	Home Income	Total Missionaries	Native Helpers	Force in the Field	Stations and Out- Stations	Communicants	Added in 1908	Adherents (Native Christians)	Schools
America	\$11,317,405	7,677	30,476	38,347	13,144	769,576	70,992	1,244,480	9,949
Great Britain	9,584,653	9,257	38,804	48,063	16,785	606,239	32,412	1,900,078	10,649
Germany	1,869,964	2,131	7,917	9,864	4,254	250,786	16,600	572,701	3,373
Other countries	1,852,053	2,481	16,025	18,856	9,761	472,366	15,137	1,179,402	5,219
Totals for Christendom.	\$24,624,075	21,834	93,272	115,130	43,934	2,097,963	135,141	4,866,661	29,120

the missionaries properly to care for the inquirers and converts. In China a revival swept the northern and central sections. Moreover, the almost universal desire for education has crowded the mission schools to overflowing and has impelled the different missionary agencies to join forces in their plans for schools to meet the present crisis. In India, while efforts for the upper classes have not abated, attention has been turned to the common people, the low castes, who have responded in an unexpected manner, and the missionaries now are face to face with the problem of industrial education to meet the needs of these converts, who are poor and degraded and who must be uplifted and given the opportunity of self-support. In Persia and Turkey the political revolutions have resulted in a spirit of freedom and a measure of religious liberty which have given a new outlook to work among the Mohammedans. But perhaps the greatest surprise of all has come from Africa, where great awakenings are reported among the natives. In both the western and eastern portions of Central Africa literally thousands crowded the churches, necessitating the removal of the walls of the building or of holding great outdoor services in order to afford the masses an opportunity to hear the Gospel.

Third, another significant feature of the year was the visits of prominent individuals to mission fields. Ex-President Roosevelt, before setting out for East Africa, obtained a list of mission stations in the regions through which he expected to travel. He visited that work as opportunity afforded and is writing of it in very warm terms. Mr. Robert E. Speer has made a tour of the mission stations in the principal countries of South America, including Brazil, Uruguay, Argentina, Chile, Bolivia, Peru and Colombia, and returned aglow with the need and the possibilities of the work which he saw. Dr. Arthur J. Brown, after a similar experience in Japan, Korea and China, came back not only amazed at the progress of the last decade, but with a profound sense of the opportunity now before the Church in each of those countries; while Mr. John R. Mott's visit to Russia and his work among the students there produced a powerful impression upon all classes, and is to be regarded as nothing short of an epoch-making event. Altogether, no year in the history of foreign mission work has been crowned with happier results than the year 1909.

The following table, taken from the *Missionary Review of the World*, gives various statistics

MISSISSIPPI. One of the South Central Division of the United States. Its total area is 46,665 square miles. Its population in 1909, according to a Federal estimate made in that year, was 1,786,773.

MINERAL PRODUCTION. The State is not important as a producer of minerals. The most important are clay products, which in 1908 were valued at \$828,739, as compared with a value of \$846,529 in 1907. The State produced in 1908, 257,200 gallons of mineral water valued at \$52,780. Other mineral products are coal products, sand and gravel, and sand-lime brick. The total value of the mineral products of the State for 1908 was \$974,518, as compared with a value of the products in 1907 of \$1,024,302.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 40,745,000 bushels, valued at \$33,003,000 from 2,810,000 acres; winter wheat, 11,000 bushels, valued at \$13,000 from 1000 acres; oats, 2,400,000 bushels, valued at \$1,632,000 from 150,000 acres; rye, 30,000 bushels, valued at \$24,000 from 1000 acres; potatoes, 783,000 bushels, valued at \$744,000 from 9000 acres; hay, 122,000 tons, valued at \$1,403,000 from 83,000 acres; tobacco, 50,000 pounds, valued at \$13,000 from 100 acres. In the production of cotton, Mississippi ranked fourth in 1909, being surpassed only by Texas, Georgia and South Carolina. The estimated crop for the year was 1,020,000 bales. The number of farm animals in the State has remained practically constant since 1900. The estimated wool clipped in 1909 was 477,840 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$556,180. Of these the most important in point of value was oysters, of which 1,067,600 bushels, valued at \$295,340, were taken. Next in importance were shrimp, 4,120,500 pounds, valued at \$80,540; buffalo, 1,663,900 pounds, valued at \$34,470; catfish, 502,100 pounds, valued at \$19,480; menhaden, 3,149,300, valued at \$3950; mullet, 1,035,400 pounds, valued at \$19,510. Other fish taken in considerable quantities were bass, trout, crabs and paddle fish. There were 989 independent fishermen engaged in the fisheries of the State, and 1048 wage-earning fishermen employed. There were 203 vessels engaged in these fisheries, valued at \$316,845.

EDUCATION. The latest report of the State Superintendent of Education available is for the biennium 1906-7. In the latter year there were 4068 white schools and 2951 colored schools. The number of white pupils enrolled was 174,782, and colored, 248,095. The number in average daily attendance was 110,623 white and 137,536 colored. The total number of white teachers employed was 5068, and colored, 2308. The average monthly salary of white teachers was \$39.50, and of colored teachers, \$20.52.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the State Charity Hospital at Vicksburg, the Confederate Hospital Annex at Vicksburg, the Natchez Hospital at Natchez, the Eastern Mississippi Insane Asylum, Deaf and Dumb Institution, and Institution for the Blind.

POLITICS AND GOVERNMENT. On May 19 the Railroad Commission decided by unanimous vote to permit the railroad passenger rate in the State to remain at three cents a mile. On August 4, fifteen members of the Mississippi branch of the Louisiana and Mississippi Retail Lumber Dealers' Association, who had been found guilty by the State courts for maintaining combinations in restraint of trade, each paid \$800 fine and the costs, the total in each case amounting to about \$1200; fifty-eight other members of the same branch who had been found guilty declined to make settlement, although they had been found guilty in the State courts, and appealed to the Federal courts, preferring this action to a settlement. On December 26, Senator A. J. McLaurin (q. v.) died and Colonel Joseph Gordon, a Confederate veteran of the Civil War, was appointed by the Governor to fill the vacancy until a successor to Senator McLaurin could be chosen by the legislature. On January 1, State-wide Prohibition went into operation. See **ELECTORAL REFORM**.

OTHER EVENTS. Boll-weevil ravages in the southwestern counties proved far more disastrous than was expected. An extensive migration of negroes followed and cotton planting will be greatly restricted in 1910.

On June 11 a statue of Stephen D. Lee was unveiled at Vicksburg.

OFFICERS: Governor, E. F. Noel; Lieutenant-Governor, Luther Manship; Secretary of State, J. W. Power; Treasurer, Geo. R. Edwards; Auditor, E. J. Smith; Superintendent of Education, J. N. Powers; Attorney-General, J. B. Stirling; Adjutant-General, Arthur Fridge; Land Commissioner, J. L. Gillespie; Commissioner of Agriculture, H. E. Blakeslee; Commissioner of Insurance, T. M. Henry—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, A. H. Whitfield; Associate Justices, Robert B. Mayes and Sidney M. Smith; Clerk of the Court, George C. Meyers—all Democrats.

The State Legislature of 1909 was wholly Democratic. The State representatives in Congress will be found in the section **Congress** of the article **UNITED STATES**.

MISSISSIPPI RIVER BRIDGE. See **BRIDGES**.

MISSOURI. One of the Central States of the United States. Its area is 69,430 square miles. Its population in 1909, according to a Federal estimate made in that year, was 3,491,397.

MINERAL PRODUCTION. Missouri is one of the

chief States producing lead and zinc. The production of lead in 1908 was 123,458 tons, which is almost exactly the production of 1907, 122,856 tons. The production of zinc in 1908 was 123,655 short tons, valued at \$11,623,570, as compared with the product of 1907 of 141,824 short tons valued at \$16,735,232. The coal production of 1908 was 3,317,315 short tons, with a spot value of \$5,844,907. This was a decrease of 680,621 short tons in quantity from the product of 1907, and of \$1,095,802 in value. The decrease was caused largely by the increased production and consumption of petroleum and natural gas in the mid-continent fields, while the general business depression affected the output to some degree. To the coal production in the State for the last few years should be added a considerable tonnage credited to Kansas. The workings of the mines at Leavenworth on the Missouri River extend under that river into Missouri territory, and the larger part of the production of Leavenworth county, Kansas, is in fact taken from beds underlying Platte county, Missouri. This amounts to probably a quarter of a million tons. In spite of the decreased production of 1908, there was a larger number of men employed during the year than in 1907. The total number was 8988, as compared with 8448 in 1907. Practically all the more important coal-mining operations in the State are conducted on the basis of the 8-hour day. There were during the year ten fatal and thirty-six non-fatal accidents in the coal mines of Missouri. The iron ore production in 1908 was 98,414 tons, as compared with 111,768 tons in 1907. The value of the product in 1907 was \$218,182, as compared with a value for the product in 1907 of \$226,286. The latter figures, however, include the product of Iowa. There is a considerable amount of copper mined. The State has important products of clay. These amounted in 1908 in value to \$5,631,456, as compared with a value of \$6,898,871 for the product of 1907. Among other mineral products are building stone, cement, lime-rock, gravel, glass-sand, mineral waters, natural gas, petroleum, sulphur and barytes. The value of the mineral products of the State in 1908 was \$41,499,835, as compared with the value of the product in 1907 of \$53,129,431.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 213,840,000 bushels, valued at \$126,166,000 from 8,100,000 acres; winter wheat, 28,562,000 bushels, valued at \$29,969,000 from 1,943,000 acres; oats, 18,630,000 bushels, valued at \$8,011,000 from 690,000 acres; barley, 50,000 bushels, valued at \$34,000 from 2000 acres; rye, 225,000 bushels, valued at \$184,000 from 15,000 acres; buckwheat, 42,000 bushels, valued at \$37,000 from 2000 acres; flaxseed, 202,000 bushels, valued at \$232,000 from 25,000 acres; potatoes, 7,480,000 bushels, valued at \$5,012,000 from 88,000 acres; hay, 3,719,000 tons, valued at \$30,868,000 from 2,755,000; tobacco, 4,425,000 pounds, valued at \$575,250 from 5000 acres. In the production of corn Missouri is surpassed only by Illinois and Iowa. The crop in 1909 was slightly larger than that of 1908, which was 203,634,000 bushels, while the acreage increased from 7,542,000 to 8,100,000 acres. The wheat crop of 1909 was also slightly larger than that of 1908, which was 22,260,000 bushels. The acreage,

however, slightly decreased in 1909. The oat crop increased from 13,510,000 bushels in 1908 to 18,630,000 bushels in 1909. The acreage decreased by 10,000 acres. The potato crop showed an increase of nearly 1,000,000 bushels, the product of 1908 having been 6,800,000 bushels. The number of farm animals in the State on January 1, 1910, were as follows: Horses, 1,005,000; mules, 344,000; dairy cows, 925,000; other cattle, 2,165,000; sheep, 957,000; swine, 2,714,000. The State ranks second in the number of mules, fourth in the number of swine, and fifth in the number of neat cattle. The wool clipped in 1909 was estimated at 5,125,680 pounds. The cotton crop of 1909-10 was estimated at 49,000 bales.

EDUCATION. The school enrollment for the year ending June 30, 1908, was 701,820, and the average daily attendance was 487,366. The number of male teachers for the year ending June 30, 1909, was 4831, and of female teachers, 13,298, or a total of 18,129. The average monthly salary of men teachers was \$61.26, and of women teachers, \$53.19, or a general average of \$56.37. There has been a great educational awakening in the State in the last few years. The last General Assembly adopted a law providing for efficient county school supervision in each county. The law has a number of very excellent features, and as a result the schools of the State have taken on new life. There are county school superintendents in each of the 114 counties, and all were engaged in 1909 in visiting the schools, in pressing a plan of better organizing the schools, the grading of rural schools, the graduation of pupils from the eighth grade into the high schools, etc.

FINANCE. The report of the State Treasurer showed a balance in the treasury on January 1, 1908, of \$947,149. The receipts for the fiscal year ending December 31, 1908, were \$7,703,604, and the disbursements were \$7,247,105, leaving a balance on December 31, 1908, of \$1,403,648. The chief receipts are from taxes, and the chief expenditures are for education. The State debt on December 31, 1908, amounted to \$4,398,839.

CHARITIES AND CORRECTIONS. The institutions under the supervision of the State Board of Charities and Corrections are as follows: School for the Blind at St. Louis; School for the Deaf at Fulton; Tuberculosis Sanatorium at Mt. Vernon; Confederate Soldiers' Home at Higginsville; Federal Soldiers' Home at St. James; five Insane Hospitals; the Feeble-Minded and Epileptic Colony at Marshall; Industrial School for Girls at Chillicothe; Training School for Boys at Booneville; State Penitentiary at Jefferson City, and county almshouses, hospitals, State prisons, and county jails. Juvenile courts are also maintained under the direction of the Board at St. Louis and Kansas City. The total number of persons under the care of the State on January 1, 1909, was 8777, of whom 5809 were in the charitable and 2968 in the penal institutions. Of this number 4324 were in the four State insane asylums, while in the St. Louis City Insane Asylum there were 647 inmates. On the same date there were 3295 paupers, 509 feeble-minded, 338 epileptics, 95 blind, 290 sick or crippled and 140 paralytics.

POLITICS AND GOVERNMENT. On January 7, Governor Joseph W. Folk sent his last message to the legislature. In this he reviewed his ad-

ministration's achievements, and dwelt upon ballot reform and regulation of the liquor traffic. He recommended disfranchisement of men who failed to vote, measures empowering wards of large cities to exclude saloons, and measures permitting counties to vote as a whole to exclude saloons, and to prohibit breweries and distilleries from owning an interest direct or indirect in saloons or mortgages on saloons. Governor Hadley, who was chosen Governor in the election of November, 1908, on the Republican ticket, was inaugurated on February 5. The contest for Lieutenant-Governor between Jacob F. Gmelich, Republican, and William R. Painter, Democrat, was so close that it was necessary to carry the election into the Assembly. The Assembly in joint session on February 1 declared, after the report of the recount committee, previously appointed, that Gmelich had received 340,642 votes, as against 346,465 votes for Painter. On January 20, William Jones Stone was reelected Senator, as a result of the primary election in November, 1908. In January the United States Supreme Court upheld the verdict of the State courts against the Waters-Pierce Oil Co., the Republic Oil Co., of New York, and the Standard Oil Co., of Indiana. For an account of developments in regard to the State and the Standard Oil Co., see the article STANDARD OIL CO.

On March 8, Judge McPherson, of the United States District Court, handed down a decision which annulled the railway rate laws passed by the legislature of 1907. These laws established a passenger rate of two cents a mile, in addition to certain definite freight rates. The railroads at once secured a court order, temporarily preventing the enforcement of the laws and thereafter agreeing not to obstruct the law until it was fairly tried. Following a test of several months a case was brought to trial, and eighteen railway lines operating in the State appeared against the law. The railroads protested that the law deprived them of adequate returns on the investment, while the State took the ground that the law did not interfere with legitimate profits. Judge McPherson ruled that the evidence in the case showed without question that the rates fixed by the law on traffic in the State did not allow a fair and reasonable profit over and above the cost of that traffic. The State on July 28 appealed the railway rate cases to the United States Supreme Court. (See RAILWAYS.) On August 24, the United States Circuit Court declared against the Interstate Commerce Commission in the so-called Missouri River rate case, and made permanent the injunction against the Interstate Commerce Commission, sought by certain Western railroads. The railroads in the Missouri River rate case sought to have the Interstate Commerce Commission enjoined permanently from enforcing an order of the Commission made on June 24, 1908, relating to joint rates from the Atlantic Seaboard to the Missouri River cities. This order sought to create a system of through rates from the Atlantic Seaboard to the Missouri River, that were a reduction from the sums of the total rates. This, according to the Western railroads, threw the burden upon them. See RAILROADS.

In the election held on April 6 in St. Louis, Frederick H. Kreismann, Republican, defeated William F. Woerner, Democrat, for mayor by about 10,000 majority. The entire Republican ticket was elected by safe majorities.

The legislature passed many stringent laws during this session, some of which are noted below. Among these was the anti-cigarette bill, which was signed by Governor Hadley on June 8. This prohibits the smoking of cigarettes in public places by persons between the ages of 10 and 18 years. Certain of these laws went into effect on August 15, and as a result a crusade against all games of chance in cigar stores was begun in St. Louis, and also the enforcement of stringent measures against liquor sellers. On November 4, the long and memorable blue-law crusade in Kansas City, instituted in 1908 by William H. Wallace, then Judge of the Criminal Court, against alleged violations of the so-called Sunday laws, which had resulted in more than 10,000 indictments by the grand jury against Kansas City theatre managers, actors and theatre employees, employees of pool and billiard halls, came to an end when Virgil Conkling, prosecuting attorney, entered a *nolle prosequi* in more than 4000 cases.

On December 16, the attempt of the Metropolitan Street Railway Company of Kansas City to obtain a 42-year franchise was defeated at the polls by a majority of 7091 votes. This was the first election ever held in Kansas City under the referendum law. The Metropolitan Street Railway Company was controlled by the Armour interests of Chicago. It has a monopoly of the streets in Kansas City, and still has a franchise with sixteen years to run. The Street Railway Company proposed to extend this to forty-two years, and in return offered six tickets for a quarter, sold on the cars, and twenty-five tickets for a dollar, sold in twenty-five drug stores in Kansas City, Mo., and Kansas City, Kan. The opposition to the franchise was headed by the City Clubs' Committee of 100, backed by the Kansas City Star. It was contended by the opponents of the extension that sixteen years was too far ahead for the city to vote a franchise, and especially one for so long a period. It was asserted also by leading attorneys for both political parties that the franchise was so worded that the Metropolitan Co. could not be forced to abide by the terms of the ordinance. The vote was the largest ever cast in the history of the State in comparison with the registration. This registration was reduced as the law did not allow a new registration, and 14,000 citizens out of a registration of 50,000 were disfranchised. See ELECTORAL REFORM.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: An act was passed providing for an amendment to the Constitution, permitting the use of the initiative and referendum in legislation. Measures were enacted providing for a bureau of dairying, and for extension courses in agriculture, under the direction of the State University. Columbus Day, October 12, was made a legal holiday. Measures were passed, providing that railroad employees are to be paid on or before the 15th of each month after the month in which the services are rendered. Judicial courts are provided for all counties having a population of over 50,000. Divorce advertisements are prohibited. A pure food law was adopted, and a comprehensive law for collecting and preserving vital statistics was enacted. Inn-keepers are regulated for purposes of sanitation. Many important amendments were made to the laws relating to education.

OFFICERS: Governor, Herbert S. Hadley;

Lieutenant-Governor, J. F. Gmelich; Secretary of State, Cornelius Roach; Auditor, John P. Gordon; Treasurer, James Cowgill; Attorney-General, Alexander Major; Superintendent Public Schools, Howard Gass; Adjutant-General, F. M. Rumbold; Commissioner of Insurance, Frank Blake—all Democrats except Hadley, Gmelich, Rumbold and Blake.

JUDICIARY. Supreme Court: Chief Justice, Leroy B. Valliant; Associate Justices, Henry Lamm, Walter W. Graves, James B. Gantt, A. M. Woodson, Govon D. Burgess, James D. Fox; Clerk, John R. Green—all Democrats except Lamm.

The State Legislature of 1909 was composed of 23 Democrats and 11 Republicans in the Senate, and 69 Democrats and 73 Republicans in the House. The State representatives in Congress will be found in the section *Congress of the article UNITED STATES.*

MITCHELL, HENRY. An American engraver, died August 1, 1909. He was born in New York City in 1836. At the age of ten he began to learn engraving. At nineteen years of age he engraved a medal for the Maine State Fair, and a year later he engraved the greater part of the national medal for Commodore Perry. In the same year he made all the seals for the Hawaiian government. He designed, also, the medal for the Centennial Exposition. In 1868 he became official engraver of dies for the stamped envelopes of the United States government, and he continued to hold this office until his death. He was one of the best known designers of coats-of-arms in the world.

MODERNISM. See ROMAN CATHOLIC CHURCH.

MODJESKA, HELENA. A Polish-American actress, died April 8, 1909. She was born in Cracow, Poland, in 1844. Her maiden name was Helen Opid, and she married, at the age of sixteen, Gustav Modrzejewski. This name, on her coming to America, she simplified to Modjeska. Mme. Modjeska had made her reputation as the greatest actress in her native country before she came to the United States. She was also conspicuous in the political movements against Russia in Poland, and in 1876 she, with a company of compatriots, which included Henryk Sienkiewicz, later the famous novelist, emigrated to the United States for the purpose of founding a colony in California. Mme. Modjeska had, following the death of her husband, become, in 1868, the wife of Count Charles de Bozena Chlapowski, one of the foremost opponents of Russian rule in Poland. The scheme of colonization failed, and Mme. Modjeska was compelled to return to the stage. She knew no English, and she was unknown as an actress, but through the aid of John McCullough she secured an engagement in San Francisco in 1877. She acted for a season in that city, and then went to New York, where at first her audiences received her with small favor, but later became enthusiastic. In 1879 she returned to Poland and acted with her compatriots for a year, and in 1880 she went to London where she was warmly received. From this time her fame as a tragedienne grew constantly, and she became the most eminent actress on the American stage. Her versatility was remarkable. She acted in practically the whole repertoire of Shakespearian plays, and was especially notable as Rosalind and Lady Mac-

beth. Great parts, too, were Camille and Mary Stuart. She appeared with great success, also, in modern plays. Although Mme. Modjeska never learned to speak English proficiently, so great was her dramatic power that, even in plays in that language, her audiences rarely felt the lack. In 1897 she went again to Poland, but she was refused permission to act because of a speech made by her at the Woman's Congress at the Chicago World's Fair. In 1905 Mme. Modjeska resolved to retire from the stage, although still in the fullness of her powers. She was given a testimonial at the Metropolitan Opera House in New York City on May 2 of that year. E. C. Stedman read an address and Richard Watson Gilder a poem on that occasion. After several performances in other cities, she retired to her farm, near Los Angeles, Cal. At the time of her death she was at work on a volume of memoirs.

MOHAMMED V. (Turkish form, MEHMED.) Twenty-ninth Sultan of Turkey, succeeded to the throne on the deposition of Abdul Hamid II. on April 27, 1909. His name before his accession to the Sultanate was Mohammed Rechad, and he is the brother of Abdul Hamid. He was born on November 3, 1844. In 1876, when Abdul Hamid ascended the throne as successor to Murad V., his brother, who had been declared insane, Mohammed Rechad was placed by the former in a detached pavilion of the Yildiz Kiosk, and there he was kept, a virtual prisoner, for over thirty years. As his intercourse with the outside world was practically cut off during this period, naturally but little was known of his personal characteristics when he was made Sultan by the Young Turks. It was known, however, that while he was not notably strong in intellectual attributes, he was more liberal in his political views than Abdul Hamid. He is supposed to have kept in touch with the progress of affairs in Europe, and to have sympathized, to some degree, at least, with the aims and purposes of the Young Turks. See **ABDUL HAMID; TURKEY.**

MOND, LUDWIG. A German chemist, died December 11, 1909. He was born at Cassel, Germany, in 1839, and attended the Polytechnic School in his native town. From there he went to study chemistry at Marburg, and under Robert Bunsen at Heidelberg. His first contribution to industrial chemistry was the method for recovering sulphur which was lost as calcium sulphide in the black ash waste of the Leblanc soda process. In 1862 he went to England, where he obtained a post in large chemical works, where he worked out the practical application of his patent. He returned to the Continent two years later and erected an alkali manufactory on the Leblanc system at Utrecht. He returned to England in 1867, and thenceforth made it his permanent home. In 1872 he introduced into England the process, invented by Ernest Solvay, of utilizing a reaction whereby, without the intervention of sulphur in any form, carbonate of soda is produced by the action of carbonic acid on brine saturated with gaseous ammonia. In 1873 he entered into partnership with Sir John Brunner in the manufacture of alkali under this process. As a result of his invention, the process was made practical. Among other problems which he solved, was that of recovering the chlorine lost in the form of chloride of calcium, and in 1896,

as a result of his improvements, he rendered the ammonia process an effective competitor with the Leblanc process in the production of bleaching powder. He invented a system of producing power-gas, which is known by his name. Dr. Mond made many other successful and useful inventions in chemistry. He became wealthy and was a munificent benefactor of scientific research. He was a collector of pictures, and his gallery of old Italian masters came to be one of the most important of the newer collections in England.

MONSON, SIR EDMUND JOHN. A British diplomatist, died October 29, 1909. He was born in 1834, the third son of the sixth Baron Monson. He was educated at Eton and Oxford. In 1858 he was elected a fellow of All Souls' College, and ten years later was appointed examiner in modern languages for the Taylorian scholarships. He began his diplomatic career in 1856, when he joined the staff of the British Legation in Paris. In 1858 he was sent to Florence, then Paris and in the same year he became private secretary to Lord Lyons when the latter was appointed British Minister to Washington. During the Civil War he saw much of President Lincoln and became friendly with him. On his return to England he left the diplomatic service and attempted unsuccessfully to enter Parliament. For a short time he wrote for weekly publications, and was then appointed to the Consular corps, and was sent as Consul to the Azores. After three years of service there he was made Consul-General to Hungary, and during the Turkish War of 1876-8, he was sent to Dalmatia and Montenegro. Following this he was Minister-Resident in Uruguay until 1884, when he was appointed Minister Plenipotentiary to Argentina and Paraguay. He was soon afterwards sent to Copenhagen as Minister, and was transferred to Athens in 1888. While at Copenhagen he acted as arbitrator in the Butterfield claim, which arose from the detention of two American ships at St. Thomas, on the ground that they had contraband of war for Venezuela. He served for a short period as Minister to Belgium, and was then promoted to Ambassador to Austria, and in 1896 succeeded Lord Dufferin as Ambassador to France. He was British representative in France in the Fashoda troubles, and the speech which he made at that time created much indignation in France. His action in the controversy, however, did much to maintain peace. He was retired in 1904, when he was given the Grand Cross of the Legion of Honor. He became Privy Councillor in 1903, and was created a baronet in 1905.

MONSTIERS-MERINVILLE, MARY GWENDOLIN (CALDWELL), Marquise des. An American philanthropist, died October 5, 1909. She was born in Kentucky, and was the daughter of William Shakespeare Caldwell, who made a large fortune building gas works. She was educated at the Convent of the Sacred Heart, Manhattanville, N. Y. Her father was originally a Protestant, and had been converted to Roman Catholicism by Archbishop Spalding. He left his fortune to his two daughters, intrusting it to the care of Bishop Spalding, of Peoria, Ill. About 1889 Mary Caldwell attracted public notice by her engagement to Prince Murat, grandson of the King of Naples. The engagement was broken because she refused to settle

on him half her fortune. She donated \$300,000 to found a Catholic University at Washington, giving 88 acres of land on the outskirts of the city and erecting three of the university's largest buildings. In 1896 she was married in Paris to the Marquis des Monstiers-Merinville, by Bishop Spalding. The marriage was unhappy, and she separated from her husband after her health had broken down. In 1904 she renounced the Roman Catholic Church, and published a sensational statement about her decision. The Pope in special audience endeavored to persuade her to reconsider this decision, but in vain. Before her death she became paralyzed below the waist, and partially blind and deaf.

MONTANA. One of the Northwestern Division of the United States. Its area is 146,572 square miles. The population in 1909, according to a Federal estimate made in that year, was 333,695.

MINERAL PRODUCTION. The aggregate value of the mineral products in the State in 1908 was \$46,803,841, which was a marked decrease from the value of the product of 1807, \$60,663,511, and this in turn was a considerable decline from the value of 1906, which was \$74,126,567. The most marked decrease was in the value of the product of copper, which greatly increased, however, in the quantity mined. The comparative figures are as follows: 1908, 252,503,651 pounds, valued at \$33,330,481; 1907, 224,263,789 pounds, valued at \$44,852,758. Montana ranks first among the States in the value and amount of copper produced. The silver mined in 1908 also showed considerable decrease in both quantity and value, the respective figures being as follows: 1908, 10,358,200 fine ounces, valued at \$5,539,500; 1907, 11,129,600 fine ounces, valued at \$7,345,500. Gold was produced to the amount of 152,865 fine ounces, valued at \$3,160,000, as compared with 167,987 fine ounces, valued at \$3,479,600 in 1907. The product of coal shared in the decrease shown by other minerals. The product in 1908 was 1,920,190 short tons, valued at \$3,771,248, as compared with 2,016,857 short tons, valued at \$3,907,082 in 1907. Lead decreased in value from \$215,710 in 1907 to \$194,880 in 1908. Zinc was produced in 1908 to the value of \$84,600. No zinc was produced in 1907. The other mineral products of the State are inconsiderable. They include clay products, lime, precious stones, and tungsten.

The production of gold in 1909 was estimated by the Director of the Mint at 174,123 fine ounces, with a value of \$3,599,400. The silver production was 12,000,000 fine ounces, valued at \$6,241,900. This is an increase of 1,643,800 fine ounces over the production of 1908.

The production of copper showed a large increase in 1909 and the State again took first rank, a place lost to Arizona in 1907. The production of 1909 nearly equaled the State's previous record output of 314,750,000 pounds made in 1905.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 175,000 bushels, valued at \$150,000 from 5000 acres; winter wheat, 6,012,000 bushels, valued at \$5,230,000 from 185,000 acres; spring wheat, 4,752,000 bushels, valued at \$4,134,000 from 165,000 acres; oats, 15,390,000 bushels, valued at

\$6,484,000 from 300,000 acres; barley, 1,900,000 bushels, valued at \$1,197,000 from 50,000 acres; rye, 58,000 bushels, valued at \$44,000 from 2000 acres; potatoes, 4,500,000 bushels, valued at \$2,295,000 from 25,000 acres; hay, 995,000 tons, valued at \$9,950,000 from 556,000 acres; flaxseed, 120,000 bushels, valued at \$192,000 from 10,000 acres. The wheat crop showed an increase in 1909 over 1908, the production in that year having been 3,703,000 bushels. The oat crop in 1909 was considerably larger than that of 1908, which was 10,566,000 bushels, while the acreage increased from 254,000 to 300,000. The potato crop in 1909 was nearly double that of 1908, which was 2,760,000 bushels, while the acreage increased from 20,000 to 25,000 acres. The hay crop of 1909 was slightly smaller than that of 1908, which was 1,050,000 tons. The acreage in flaxseed increased from 9000 to 10,000 acres, while the product increased from 104,000 to 120,000 bushels. The improvements carried on in the State by the United States Reclamation Service in recent years has resulted in great improvement in agricultural conditions. The number of farm animals in the State on January 1, 1910 was as follows: Horses, 319,000; milch cows, 80,000; other cattle, 842,000; sheep, 5,747,000; swine, 75,000. The increase in dairy cattle has been large since 1900, and sheep and swine have also increased materially, giving the State second rank in the production of wool and number of sheep. The wool clipped in 1909 was 31,818,240 pounds.

EDUCATION. The report of the Superintendent of Public Instruction for the year 1908 showed a school population in 1907 of 73,269, of whom 36,895 were boys and 36,374 were girls. The whole number enrolled during the year was 50,516. The average daily attendance was 34,699. There was an increase in the number of children of school age and in the enrollment, but a decrease in the average daily attendance. There is serious need of an amendment to the compulsory school law, so that the two and a half mile limit shall not be a subterfuge for allowing children to remain away from school. The rural school problem is the most difficult in the educational administration of the State. In an area of 146,000 square miles there are but 916 school districts. The disbursements for education for the year ending August 31, 1907, amounted to \$2,396,122.

FINANCE. The report of the State Treasurer for the fiscal years ending November 30, 1907, and 1908 showed a balance on hand December 1, 1906, of \$840,941. The receipts for 1907-8 were \$6,343,012, while the disbursements for 1907 were \$3,087,105 and for 1908 \$2,691,790, leaving a balance on hand November 30, 1908, of \$564,116. The chief receipts were from the general fund, school income and from the permanent school fund. The chief expenditures were on account of the general fund, permanent school fund, school income fund, and the School of Mines permanent fund.

POLITICS AND GOVERNMENT. Following the example of the California Legislature, there was introduced into the Montana Legislature on February 16 a bill providing for the segregation of the Japanese and Chinese children in the public schools of the State, and another bill was introduced which provided that hereafter no alien should own or be in possession of realty in the State. By the provisions of this bill, aliens must dispose of their holdings before the expiration

of five years, under penalty of its sale under judicial proceedings, the amount realized to be at the disposal of the owner or assignee after one year. If uncalled for within that time the funds so derived may revert to the school fund. This was practically the same measure as that introduced into the California Legislature. The bills failed of passage. On February 16 an intermarriage bill was rejected by the Assembly. As noted below, measures were passed removing judicial elections from partisan politics. On February 15 a bill prohibiting race track gambling in the State passed the legislature. On April 6 a decree was issued in favor of the government in the equity suit between the United States and the Northern Pacific Railroad Company, the Rocky Ford Coal Company and the Northwestern Improvement Company. This suit was instituted on July 13, 1908, to cancel the patents issued for 1120 acres of coal land. The Northern Pacific Railroad Company held title to this land in the Mount Rainier National Park, created by Act of March 2, 1899. Section 3 of the act provided that the Northern Pacific Railroad might deed to the government any lands held by it within either this National Park or the Pacific Forest Reserve and select in lieu thereof an equal quantity of non-mineral lands. Pursuant to this provision the Railroad Company selected the 1120 acres of land in controversy and received the patents therefor. At the time of such selections these lands were classified as non-mineral lands. It developed later, however, that they were valuable coal lands. This suit was instituted to cancel the railroad's patent for the lands on the ground that they were valuable coal lands, their value being alleged to be more than \$100,000,000. See ELECTORAL REFORM.

OTHER EVENTS. On March 30, the last spike in the new trans-continental railway, the Chicago, Milwaukee and Puget Sound, was driven at Missoula. The total length of the new road is 2436 miles. (See RAILROADS.) A severe blizzard occurred in the State on January 11 and caused much suffering. The railroads found it difficult to move coal to northern points in the State, where the thermometer stood, in some places, at over 50 degrees below zero. The strike of the railway switchmen which broke out in November was severely felt in the State, especially in the large smelter works at Butte and Anaconda, which for a time were obliged to shut down. See STRIKES.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: A measure passed providing for non-partisan judicial nominations. Lincoln's birthday and Columbus day were made legal holidays in the State. A measure was passed forbidding rebating and discrimination by life insurance companies, and measures were taken against tuberculosis and other communicable diseases. Operators of coal mines are made liable to employees in case of utter disability, regardless of the question of negligence. Measures were passed prohibiting to some extent trusts and monopolies.

OFFICERS: Governor, Edwin L. Norris, Democrat; Lieutenant-Governor, William R. Allen, Republican; Secretary of State, A. N. Yoder, Republican; Treasurer, Elmer E. Esselstyn, Republican; Auditor, H. R. Cunningham, Republican; Attorney-General, A. J. Galen, Republican; Adjutant-General, Philip Greenan, Democrat;

Superintendent of Education, W. E. Harmon, Republican.

JUDICIARY. Supreme Court: Chief Justice, Theodore Brantley, Republican; Justices, Henry C. Smith, Republican; William L. Holloway, Republican; Clerk, John T. Athey, Republican.

The State Legislature of 1909 was composed of 17 Republicans and 10 Democrats in the Senate, and 33 Republicans and 38 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

MONTENEGRO. A hereditary constitutional monarchy, constituting one of the Balkan States (constitution granted December 19, 1905). Area, 3486 square miles; population (diminished by emigration), 225,000 (Roman Catholics 14,000; Mussulmans, 13,000, the remainder Orthodox Slavs). Capital, Cettinje, population (1907) 5000, exclusive of a permanent garrison of 600. The Montenegrins belong to the Servian branch of the Slav race. Education is free and compulsory. The Greek Orthodox is the prevailing religion. A large portion of the country is uncultivable. Some small crops are grown for home consumption, and cattle are raised in large numbers (estimate of live-stock, 60,000 cattle, 500,000 sheep and goats, 3000 horses and 8000 swine). Tobacco (manufacture, sale, and export,) is a government monopoly. Coarse woolens are manufactured. The imports and exports in 1907 were valued, at £261,000 and £56,000 respectively, against £240,000 and £81,000 in 1906. The first railway (Antivari to Lake Scutari) was opened in December, 1908; length, 11 miles. There are excellent highways. Length of telegraph lines, 528 miles. The revenue and expenditure were estimated (1907) at 2,980,000 and 2,888,893 Austrian kroner respectively. The public debt is stated at £70,000. The Austrian government contributes annually 20,000 kroner to cover part of the postal expenditure, and Russia gives £40,000 towards the military, educational, and hospital expenditure. The army is on a militia basis. The reigning sovereign is Prince Nicholas I., born October 7 (September 25), 1841; married, November 8, 1860, to Milena Petrowna Vucotich, daughter of Senator Peter Vucotich. The heir apparent is Prince Danilo Alexander, born June 29, 1871. The members of the National Assembly (Skupština) are elected by universal suffrage. Prime Minister, Minister of Justice and of Foreign Affairs, M. Tomanovich.

ARMY. The army is a militia in which every sound Montenegrin is liable for service from his 18th to his 60th year. There are maintained two battalions of infantry in which 400 recruits receive instruction for four months, two field and mountain batteries where 100 men receive instruction for six months, and likewise a similar engineer organization with the same period of instruction. On Sundays and holidays the militia receive military training and the number of men who have received military instruction has been estimated at 36,000 in infantry and 1200 artillery. On a war basis there would be formed 12 brigades, including 11 brigades of infantry with 58 battalions and 1 artillery brigade with 12 batteries, the total strength being estimated between 50,000 and 60,000. The artillery is provided with 48 mountain guns, 36 field guns, 44 siege guns, and 20 machine guns.

The chief question affecting Montenegro which arose out of the Balkan crisis of 1908, was the status of Antivari. Montenegro desired the repeal of Article 29 of the Treaty of Berlin and negotiations carried on with the Powers to that end during 1909 resulted in a satisfactory adjustment. See BALKAN QUESTION.

MONTSERRAT. A presidency of the Leeward Islands (q. v.). Area, 32 square miles; population (1901) 12,215. Chief town, Plymouth, 1461 inhabitants. There are 1000 acres under lime trees; sugar, cotton, coffee, cocoa, papain, arrowroot and lime-juice are the chief products. Preserves, jams, pickles, etc., are put up for export. Imports and exports in 1908-9 were £40,132 and £45,304 (Sea-Island cotton £13,325) respectively, against £32,750 and £35,183 in 1907-8. Revenue and expenditure, 1907-8, £10,233 and £8016; 1908-9, £10,950 and £9026. Public debt (1909), £11,100. Commissioner and Treasurer (1909), Lieutenant-Colonel B. Davidson-Houston.

MOOR, Sir RALPH DENHAM RAYMENT. An English public official, died September 14, 1909. He was born in 1860 and was educated privately. He served as district inspector of the Royal Irish Constabulary from 1881 to 1889. In 1892 he was appointed deputy commissioner and vice-consul in the Oil Rivers (Niger Coast) Protectorate and adjoining native territory. From 1892 to 1895 he was acting commissioner and consul-general and from 1896 to 1900 he was commissioner and consul-general of the Niger Coast Protectorate. In 1900 he was appointed high commissioner of Southern Nigeria and held this position at the time of his death.

MORAN, JOHN B. An American lawyer and public official, died February 6, 1909. He was born in 1860 and graduated at Boston University. He practiced law in Boston until 1906, when after a sensational canvass he was elected district attorney of Suffolk county (Boston) on a "reform" ticket. His attempts to enforce the so-called "blue-laws" against liquor selling in Boston made a remarkable sensation, and Moran was, for a time, almost a national figure. He was nominated for Governor by the Prohibitionists, the Independence League and the Democratic parties in 1906, but failed of election by 27,000 votes. His exertions in this campaign were the indirect cause of his death.

MORAVIANS, called also the UNITED BRETHREN (Unitas Fratrum) and the MORAVIAN CHURCH. An evangelical denomination which had its beginning in Bohemia and Moravia, among the followers of John Huss. It was established in America in 1735 in Georgia, where a colony of Moravians had settled, but five years afterward removed to Pennsylvania, where they built the towns of Bethlehem and Nazareth. The Moravians had at the beginning of 1909 a total number of 17,951 communicants, of whom the American Moravian Church North included 13,932, and the American Moravian Church South, 4019. There were 122 churches and 141 ministers. In the Northern Province there are 40 missionary societies with a membership of 3984. In the Sunday schools of the church there were at the beginning of 1909, 14,379 scholars, and 1529 officers and teachers. Funds were maintained for retired ministers and widows of ministers. The church sustains missions in Africa, Alaska, Asia, Australia, Labrador, Nicaragua, South America, West Indies and Bohemia. A

Home for Lepers is supported in Jerusalem. Among the educational institutions under the auspices of the Moravians are the Moravian College and Theological Seminary at Bethlehem; the Moravian Parochial School for Boys, the Moravian Seminary for Girls, both at Bethlehem, Pennsylvania; Linden Hall Seminary for Girls at Lititz, Pennsylvania; an Academy for Girls at Salem, North Carolina; and the Nazareth Hall for Boys at Nazareth, Pennsylvania. The English official organ of the Church is *The Moravian*, and the German official organ is *Der Brüder Botschafter*. The Provincial Synod of the American Moravian Church North was held at Lititz, Pennsylvania, in September, 1908. The next Synod of this branch will be held in 1913. The General Synod of the Church throughout the world was held at Herrnhut, Saxony, Germany, in June, 1909.

MORFILL, WILLIAM RICHARD. An English scholar, died November 9, 1909. He was born about 1830 and was educated at Oriel College, Oxford, where he graduated with a first class in classics in 1855, and in 1880 became reader in Russian and other Slavonic languages. He was raised by decree of the University to the rank of professor in 1900, and was appointed curator of the Taylor Institute. His important works on Slavonic literature, language and history include grammars of Polish, 1884; Servian, 1887; Russian, 1889; Czech, 1898, and Slavonic Literature, 1883; *Story of Russia*, 1891; *Story of Poland*, 1893; and a *History of Russia from the Birth of Peter the Great to Nicholas II.*, 1902.

MORGANSTERN, LINA (BAUER). A German social reformer, died December, 1909. She was born at Breslau in 1830, the daughter of a merchant of that city. After a course in the common schools at Breslau and study at home, she became the wife of Theodor Morganstern, a physician. She early took an interest in sociological problems and formed a league to aid the poor school children of Breslau when she was but eighteen years old. Shortly after her marriage she formed a league to improve the condition of workingmen, and at this time founded also the Berlin Kindergarten Association, of which she afterwards became the president. The domestic distress that followed the war of 1866 led her to found the Berlin Public Kitchens, which proved to be the most notable of her economic achievements. These kitchens, which aimed to provide food for the poor, were immediately patronized by thousands, and they still continue to provide the means by which many of the poor inhabitants of Berlin are enabled to live. The plan of these kitchens was followed out in other large German cities. After three years spent in charge of these kitchens she founded the society for the protection of illegitimate children. She also brought into existence an academy for the instruction of young women who wished to learn the useful arts, the Berlin Workingwomen's Union and the Berlin Housekeepers' Union. The great rise in the price of food following the Franco-German War resulted in the founding of the last named society, which is still active and issues a magazine devoted to its interests. In addition to her work as a reformer in economic matters, Frau Morganstern was the author of many popular children's stories. She wrote also vari-

ous books connected with her philanthropic enterprises. She first awakened in the inhabitants of Berlin in her generation a desire to improve by economic aid the condition of the less fortunate.

MOROCCO. An independent Mohammedan empire in northwestern Africa. The area is estimated at 234,000 square miles; the population at about 8,000,000. A more recent estimate of the population, however, is between 4,340,000 and 4,580,000, the principal details being: Coast region, Tangier to Magador, 2,200,000; Atlas-Riff region, 1,500,000; Mulaya Valley, 200,000; Wad Draa, 100,000 to 250,000; Wad Ziz (with Taflet), 120,000 to 200,000. The inhabitants are chiefly Berbers, Bedouin and Mued Arabs and Tuaregs, and belong to the Malekite sect of the Sunnite Mohammedans. The Christian population amounts to only a few thousands, almost entirely in Tangier or other coast towns. Three cities are recognized as capitals of Morocco: Fez, with an estimated population of 140,000; Morocco, 50,000; Mequinez, 25,000. The principal port is Tangier, with about 55,000 inhabitants (10,000 foreign). Other towns, all on the coast, are: Rabat, 35,100 (100 foreign); Casablanca, 33,000 (8000 foreign); Mogador, 30,800 (800 foreign); Tetuan, 20,300 (300 foreign); Mazagan, 15,400 (400 foreign).

INDUSTRIES AND COMMERCE. The principal industries are agriculture and live-stock raising. The mineral resources are undeveloped. There is a limited manufacture of carpets and slippers. The principal crops include cereals, pulse, esparto, hemp and fruit. As complete records of the foreign commerce are not kept, only estimates, based on various data and approximating more or less to accuracy, can be made. For 1908 the total import value was placed at about \$12,305,000, and export value \$10,376,000. The share of Great Britain was stated at \$4,998,000 for imports and \$3,198,000 for exports; France and Algeria, \$4,397,000 and \$1,904,000, respectively; Germany, \$367,000 and \$1,603,000. The principal articles of import include rice, woolens, cottons, silks, tea, wines and spirits, sugar, candles and metal wares. The principal articles of export, in 1907, are stated as follows: Barley, \$2,150,000; hides and skins, \$966,000; eggs, \$828,000; wheat, \$801,500; almonds, \$491,500; beef cattle, \$459,000. Morocco has no railway.

ARMY. The regular army is composed of approximately 25,000 men, recruited from the various tribes, and composed of those between the ages of sixteen and sixty who have not purchased exemption, and for whom substitutes are not provided by the tribes. Each tribe furnishes one "Tabor," which should be composed normally of 500 men, and is named after the tribe. The most of the Tabor of the standing army are infantrymen only, but some contain mounted men and other foot artillery, the latter being a privileged class and numbering between 800 and 900, distributed at the capitals and sea coast towns. The field artillery numbers about 4000 cannoneers organized into two Tabors of extraordinary strength, and composed mainly of the Muchazina, the national military police. There are forty Tabors of infantry, each divided into five divisions. There is little organization in the army and it is far from being a homogeneous whole. The rifle is the Martini-Henry,

and the field artillery have about ten batteries of modern European field (Schneider), mountain (Krupp) and machine (Maxim) guns. European instructors, mostly French, have been employed, but they have brought little military efficiency to the army. The militia was composed of from 25,000 to 100,000 men, and was estimated of greater value than the regular army.

GOVERNMENT, ETC. Morocco is an absolute monarchy, with the Sultan nominally supreme in matters both civil and religious. His real power, however, depends largely upon circumstance and his own character. The Sultan in 1909 was Mulai-Abd-el-Hafid, who dethroned his brother, Mulai-Abd-el-Aziz. He was proclaimed Sultan at Morocco City, August 25, 1907; at Fez, January 4, 1908, and at Tangier, August 23, 1908, and was recognized by the Powers January 5, 1909. The annual customs revenue is estimated at about \$2,000,000. Further revenue accrues from internal taxes, which are often simply extortion, and from monopolies. The public debt includes French loans aggregating about 66,000,000 francs. The Sultan has about 3000 infantry and a guard of 2000 to 3000 negro cavalry. There is also a sort of mounted police, numbering perhaps 8000 or 10,000 men, and a few unorganized batteries of artillery, with about 800 men. In addition, there can be mobilized for active service about 40,000 irregulars, foot and horse. See foregoing paragraph.

HISTORY.

THE FRENCH OCCUPATION. Early in the year the situation in Morocco was changed by the recall of General d'Amade and the partial evacuation of Casablanca. The French did not feel warranted in the complete withdrawal of their troops, as the police organization was not complete and there was no guarantee for the preservation of order in the country. To withdraw the entire army of occupation might result in the return of conditions which France had made such heavy sacrifices to remove. Formal violation of the act of Algeciras through the intervention of France in Morocco had now been going on for more than a year with the tacit consent of the European Powers, and it was unlikely that they would protest if France continued to maintain a partial military occupation. General d'Amade was received in France with enthusiasm and decorated with the military medal, the highest honor that can be won by an officer. He was plainly the hero of the war, and was contrasted in the public press with his predecessor, General Drude, whose dilatory tactics won for him the nickname of "Drudus Cunctator." Early in May the French Minister, M. Regnault, was sent on a mission to Fez for the purpose of coming to an understanding with Mulai Hafid. All difficulties with Germany were apparently removed by a definite settlement between the two Powers in regard to Morocco which was signed on February 9. (See FRANCE, paragraphs on *History*.) The award of the Hague Tribunal in the affair of the Casablanca deserters was rendered on May 22. This blamed the German Consulate for exceeding its jurisdiction in trying to protect the German deserters, but disapproved the action of the French in not respecting the *de facto* protec-

tion by the Consulate as far as possible, for threatening the Consul with a revolver and for maltreating the Moroccan soldiers of the Consulate. There was a tendency in the press at first to applaud the energy and ability of Mulai Hafid, who was said to be progressive and favorably inclined toward the Europeans, but as time went on these opinions gradually changed. The Moroccan mission under El Mokri for arranging terms with France and also, it was said, for the placing of a loan was received by the French government on May 26. These negotiations, however, were prolonged throughout the year, and greatly tried the patience of the French authorities. The points at issue were still unsettled in November. In that month the French Foreign Minister, M. Pichon, declared that France must insist that some satisfactory arrangement be made and that the negotiations had already gone on too long. (See FRANCE, paragraphs on *History*.) At the same time the dilatory course of the Sultan had in a nearly equal degree tried the patience of Germany, which finally presented what amounted to an ultimatum, demanding payment of German creditors. Great Britain refused the Maghzen's proposal of a Moroccan mission, and the tone of the dispatches from Spain was very severe. There was evidence that the Powers were in complete accord in insisting upon their demands against Morocco. The French demands were for the reimbursement of their military expenses in the Shawia and on the Algerian frontier and reparation for offenses against the lives and property of French citizens. France refused to evacuate the Shawia and Casablanca until her demands were met. At the end of April it was announced that the French force in the Shawia region was to be cut down to 3000 men.

THE SULTAN'S DOMESTIC FOES. During the year Sultan Hafid was repeatedly engaged in conflicts with the tribesmen. Raisuli was apparently placated, having been appointed governor of some twelve tribes in the north. Bu Hamara, the pretender, was the chief cause of trouble, and his campaigns were at first attended with some success. He was reported to be encamped near Fez early in March. On April 21 Mulai Hafid's troops were defeated by Berbers and left a number of guns in the hands of the enemy. A little later two strong divisions of the Sultan's troops were sent against the Beni Mtir tribesmen, and by the close of May, after some sharp fighting, succeeded in gaining possession of the chief strongholds of the tribesmen. At that time the latter sent a deputation to the Sultan, who pardoned the tribe. On March 7 the Sultan's troops defeated one of the Berber tribes, the Ait Yussi, killing and capturing many of them and destroying several villages. Shereef Kittani, a descendant of the former dynasty, showed signs of disaffection and was thrown into prison. According to the confessions of a number of his followers, all had been made ready for his proclamation as Sultan. As a result of his treatment in prison he died on May 4. On June 15 the Sultan's troops were defeated by Bu Hamara about eight miles from Fez, and the latter was said to be ravaging the country in the vicinity. In August, however, the defeat and capture of Bu Hamara was definitely announced, and it was reported

that he and his followers had been taken to Fez, where special refinements of torture were devised by the Sultan himself. Meanwhile there had been many complaints of the Sultan's arbitrary and despotic government. Many of the people were thought to be not unwilling to see him defeated. There were signs of disaffection among the troops owing to his failure to pay them, and the European instructors in the army were not paid. Reports of the Sultan's cruelty were frequent and were the subject of complaints by the Europeans. He was reported to be at odds with his Viziers, who, however, afterwards were reconciled with him. The Europeans also complained of the Sultan's delay in carrying out Article 60 of the Algeciras act, which permitted the purchase of lands by Europeans. The Sultan's excuse for this was the primitive condition of the country's institutions and the danger of proceeding rapidly in making this change. Apart from the grounds of protest mentioned in the preceding paragraph, the Europeans were especially disturbed by the frequent reports of cruelty. The torturing of the prisoners of Bu Hamara caused a protest from the British Consul at Fez and the French Consul at Tangier in August and the Sultan was formally requested by the latter to observe the laws of humanity. The consular body at Fez visited Mulai Hafid on September 11 and presented a collective note against the cruelty practiced on El Rhogi's followers. The Sultan replied to the effect that he had supposed that he was inflicting mild punishments in depriving prisoners of their limbs rather than of their lives, that the country was half civilized and could not use European methods, but that he hoped the occasion for punishment would not arise again. The pretender, who was at first said to have been executed, was afterwards reported to be still alive, but confined in a cage. Fighting was reported on August 12 between Raisuli and the Benadirs with considerable losses on each side. The British mission was received by the Sultan on April 17. Meanwhile the Spanish Minister had entered Fez on March 8. The Southern Kaida acknowledged the Sultan's authority and were received by him in Fez on May 15.

SPAIN'S MOROCCAN CAMPAIGN. The most important feature of the year was the war of Spain against the Riff tribes in the region of Melilla. This part of the country was under the protection of El Roghi. Early in 1908 certain Spanish mining companies had begun work about fifteen miles from Melilla, but in October of that year the tribesmen revolted and raided the mines, which shut down. Spanish military posts were established at two points in that region, and, order being apparently restored, the mines resumed work at the beginning of June, 1909. The Moors attacked the mines and killed a number of the workmen. The Spaniards retaliated by a counter attack, in which they chased the enemy for a considerable distance and inflicted a heavy loss, losing on their own side a small number. Reinforcements were sent from Spain. In July a fierce attack on the Spaniards was made and a considerable number were killed. At that time the Moors outnumbered the Spaniards, but measures were taken in Spain for rapid reinforcement. In a battle at Melilla on July 23, in which it was estimated that

15,000 or 16,000 Moors were engaged, the Spaniards suffered heavily, losing 300 killed, including many officers. The Moors having destroyed part of the railway, two Spanish columns were sent against them at the end of July and again sharp fighting took place, resulting in serious Spanish losses, estimated at 200, including General Pintos and other officers. The number of the Spanish wounded was estimated at 800. The battle occurred along the railway in a rocky and mountainous tract of country which was intersected with ravines. Owing to the unevenness of the ground and the density of the undergrowth, observation was difficult, and the Spanish column ran into an ambush and encountered a murderous fire at close range. There were many instances of gallantry on the part of the Spanish troops, who made a number of bayonet charges. Early in August the troops in and around the old fortress at Melilla numbered about 24,000, under the command of General Marina. The promontory on which the town was situated was well adapted for defense. Besides the old fortress there was a ring of blockhouses and forts, which seemed, when competently equipped, able to stand against any infantry attack. To the west lie the two peaks of Gurugu, divided by a deep gorge, and to the east is the land-locked sea called Mar Chica. Some fighting occurred on August 9 at the Spanish fort near Ceuta, but the Moors were repulsed with loss. Fighting occurred also on August 18, but without serious loss to either side. The fortress at Melilla was reported at that time to be practically impregnable, and the Spaniards, feeling secure in their position, planned an advance. The advance movement of the Spaniards on September 20 resulted in giving them control of the peninsula. The Spanish casualties were nineteen killed including three officers, and 106 wounded including thirteen officers. Zeluan was captured by two columns under General Marina. By October 1 it seemed that the Spanish success was assured. In October the Moors attacked the Spanish positions at Zeluan and Nador, but were easily repulsed. Soon after the Riffs asked for a suspension of hostilities in order that they might confer with Mulai Hafid as to the terms of an adjustment. The objects of the campaign being practically attained, Spain was now ready to concede the terms of settlement. Negotiations between the tribesmen and an envoy of Mulai Hafid were going on in November with favorable prospects for the conclusion of the war. The beginning of the Moroccan war was marked in Spain by a serious revolt in Barcelona. When the troops were sent to the front, crowds collected at the railway stations, women attempted to detain the troops ordered to the front, and many demonstrations were made against the war. The riot at Barcelona occurred on July 27 and resulted in the killing of eleven persons and the wounding of fifty, in the making of wholesale arrests and in the placing of the disaffected districts under martial law. (See SPAIN, paragraphs on *History*.) France had shown sympathy with Spain in her Moroccan campaign. Cordial feeling between the two countries was enhanced in the latter part of the year by the dispatch of a military delegation from the Oran

division of the French army to Melilla to honor the Spanish soldiery who had fallen in battle and by the restoration to the Spaniards of property which had fallen into the hands of the French. Toward the end of November delegates of the tribesmen were in conference with the Spanish General Marina. Meanwhile it was announced that the Moors of Nador had unconditionally submitted, and many of the tribesmen were now coming to terms. An advance of the Spaniards, achieved without casualties, was regarded as the last act in the military campaign, and by November 30 the war was declared to be over. See ARBITRATION, INTERNATIONAL.

MORRIS, MARTIN FERDINAND. An American jurist, died September 12, 1909. He was born in Washington, D. C., in 1834, and graduated from Georgetown University in 1854. He pursued philosophical studies with the intention of becoming a Jesuit priest, but was obliged, to support dependent relatives, to enter the law. He was counsel for John H. Surratt, accused of being one of the conspirators for the death of Lincoln, and secured the acquittal of his client. He was appointed by President Cleveland to the Court of Appeals of the District of Columbia, and he retired in 1905 as Chief Justice.

MORRISON, WILLIAM RALLS. An American lawyer and public official, died September 29, 1909. He was born in Monroe County, Illinois, in 1825, and was educated at McKendree College. He served throughout the Mexican War and at its close he went, in 1849, to California, but returned to Illinois in 1851, where he was admitted to the bar. In 1852-4 he was clerk of the Circuit Court of Monroe county. From 1854 to 1860 he was a member of the State Legislature and Speaker in 1859-60. At the outbreak of the Civil War he was one of the first to enlist, and organized and was colonel of the Forty-ninth Illinois Volunteers. He was wounded at Fort Donelson and was left for dead on the field, but recovered in a Confederate hospital. In 1863 he was elected a member of Congress and was again elected to Congress in 1873, serving until 1887, and from 1875 to 1877 he was Chairman of the Committee on Ways and Means. His most important work in Congress was the introduction in 1884 of the tariff bill, known as the "horizontal" or Morrison Tariff Bill. In 1886 he was defeated for re-election to Congress. In 1885 he was defeated for the United States Senate in the Illinois Legislature by John A. Logan. From 1887 to 1897 he was a member of the Interstate Commerce Commission, being chairman from 1891. Colonel Morrison was one of the strongest figures of the Democracy when he was active in politics. His famous tariff bill was defeated by only four votes, with the assistance of Democrats.

MOTOR BOATING. See YACHTING and MOTOR BOATING.

MOULTON, JAMES EGAN. An Austrian educator and missionary of the Methodist Episcopal Church, died in June, 1909. He was born near Newcastle, England, in 1841, and went to Tonga as a missionary about 1864. In 1889 he was chosen president of Newington College at Sydney, N. S. W., in which position he remained for many years. Dr. Moulton's great work was the translation of the Bible into the Tonga tongue, a task

which occupied him about twenty-five years. He also compiled other volumes in that language.

MOZAMBIQUE. See PORTUGUESE EAST AFRICA.

MUNICIPAL GOVERNMENT. During the past few years the United States has been converted into a vast proving field for various theories of municipal government. Reduced to practice, these theories have turned into such markedly contrasting systems as: (1) The commission plan, in which the mayor and council are merged into a virtual board of directors which exercises all legislative and executive functions; and (2) the most complete separation between the powers and duties of the mayor and council and an equally complete separation of executive and legislative functions. Again, we see the very small, single-bodied council being tried in one city, while in another a very large council of one or two bodies is being continued or newly established. Still again we have as intermediate between the mayor and council in some cities an administrative and budget-making body, like the Board of Estimate and Apportionment in New York City. Or, shifting from a broad view of the theory and framework of municipal administration as a whole, we see such contrasting plans for gauging municipal efficiency, checking extravagance or detecting corruption and fraud as the Commissioners of Accounts in New York City, appointed by and responsible to the mayor, and the newly-created Finance Commission in Boston, appointed by the Governor of the State and with authority to report findings and recommendations to him, to the State Legislature, to the mayor or to the council of Boston. In a wholly extra-legal way we see like investigations being carried on effectively by bureaus of municipal research, city clubs, civic associations and committees of chambers of commerce or of merchants' associations. Besides all this, the municipal ferment of the day includes experiments with direct primaries for the nomination of municipal officials; the abolition of all party caucuses, conventions and primaries and the substitution of nomination by petition; election by pluralities giving place to requirements of clear majorities, and failing such, either a second election or a system of preferential voting, under which each voter indicates his second choice, third choice, etc.; abolition of party symbols, columns or other means of party identification on ballots and arrangement of all candidates for each office in alphabetical order; the "short ballot," or a reduction in the number of elective officers, secured by appointing instead of electing executive officers other than the mayor by reducing the size of city councils, and by separating city from State and national elections; choosing councilmen at large, or by the vote of the entire city, instead of by wards; the recall, or compelling any elected official to stand for re-election on petition of a certain percentage of the voters; the initiative and referendum, by means of which the people can either propose legislation and bring it to vote or be insured of an opportunity to vote on all ordinances which originate in the city council; and last but not least, the cities of a few States have gained considerable freedom from legislative domina-

tion, chiefly by power to frame their own charters.

THE COMMISSION PLAN. Primarily the commission plan of city government, as applied to Galveston, Texas, in 1901, had as its notable feature the placing of all the affairs of the city in the hands of five men. As the plan was adopted elsewhere there was associated with it one departure after another from the old-time ideas of municipal government until now it frequently includes either direct primaries or else nomination by petition and the abolition of the party system, together with the election of the commissioners or councilmen by wards; the initiative, the referendum and the recall; and very stringent provisions for the granting of franchises to public service corporations. While all these accessory features have gradually come to be regarded as integral parts of the commission plan and are in a measure necessary safeguards against the abuse of the supreme power vested in the commission or council, yet they are found in cities which have not adopted the commission plan, and are perhaps quite as practicable in one case as in the other. It is difficult to learn just how many cities have adopted the commission plan on any given date, so frequent are the elections for its approval or disapproval. The following list of fifty-eight cities, arranged in geographical order, has been compiled from various sources. It probably includes nearly all the cities that had adopted the commission plan up to the close of 1909, but neither its completeness or accuracy can be vouched for:

Chelsea, Mass., Gloucester, Mass., Haverhill, Mass., Bluefield, W. Va., Huntington, W. Va., Charlotte, N. C., Bristol, Tenn., Clarkesville, Tenn., Memphis, Tenn., Richard City, Tenn., Burlington, Ia., Cedar Rapids, Ia., Des Moines, Ia., Keokuk, Ia., Anthony, Kan., Coffeyville, Kan., Hutchinson, Kan., Independence, Kan., Kansas City, Kan., Leavenworth, Kan., Parsons, Kan., Topeka, Kan., Wichita, Kan., Sioux Falls, S. D., Bismarck, N. D., Grand Forks, N. D., Mandon, N. D., Minot, N. D., St. Joseph, Mo., Austin, Tex., Beaumont, Tex., Corpus Christi, Tex., Dallas, Tex., Dennison, Tex., El Paso, Tex., Fort Worth, Tex., Galveston, Tex., Greenville, Tex., Houston, Tex., Marshall, Tex., Orange, Tex., Palestine, Tex., San Antonio, Tex., Sherman, Tex., Waco, Tex., Ardmore, Okla., Enid, Okla., Sapulpa, Okla., Tulsa, Okla., Colorado Springs, Colo., Grand Junction, Colo., Roswell, N. M., Taos, Wash., Boise, Idaho, Lewiston, Idaho, Berkeley, Cal., Riverside, Cal., San Diego, Cal.

Sixteen States are included in the foregoing list. In addition it is reported that the commission plan has been authorized for more or less extensive adoption in Mississippi, Michigan, Wisconsin and Oregon, making twenty States in all. In some States the authorization applies to one or more specified cities, while in others it extends to all cities of one or more classes. A commission plan charter has been drawn for Buffalo, N. Y., and at the November election of 1909 the people voted in favor of asking the legislature to enact such a charter. A similar vote was recorded at Mt. Vernon, N. Y., at the same time. Several cities voted down the commission plan when first presented, but adopted it on a second vote. The most notable instance of this sort was Kansas City, Kan., which defeated the plan by 822 majority in

1908, but adopted it by a much larger majority in 1909. Cities reported as having voted no without reversal as yet are Davenport and Sioux City, Ia., Mankato, Minn. (only 24 negative majority), Winfield, Kan., and Portland, Ore. (5740 majority against in a total vote of 15,612). Under the Kansas State law the larger cities have five commissioners, as is usual elsewhere, but the smaller cities have only three. The smaller number appears to be unusual. It was proposed as an alternative and voted down at the adoption of the commission plan by Grand Junction, Colo., in 1908, but Colorado cities enjoy the privilege of framing their own charters. In Kansas each commissioner must give a bond in the sum of \$10,000 to protect the city from financial loss on account of his incompetence, neglect or dishonesty. A marked variation in the Houston commission is the veto power possessed by the mayor over the acts of the commission or council of which he is a member. As a rule the mayor takes one of the commissionerships or heads of municipal departments. In Grand Junction, Colo., the various candidates are nominated for specific commissionerships, but elsewhere it appears to be the practice of the commission to elect its members to various commissionerships. References to other features of government of some of the commission-plan cities are given below.

MUNICIPAL HOME RULE. In many States municipal affairs are subject to legislative control down to the minutest detail of such purely local matters as salaries paid to subordinate executive officials and the procedure to be followed in opening or grading a street. The slightest change in local administrative measures, under such conditions, can be made only after obtaining specific legislative sanction. Such petty meddling with local matters is not practiced by all legislatures, but as a rule there is nothing but public opinion to prevent it, although many legislatures have been prohibited from special legislation or the passing of acts applying to a single city. Beginning in 1875, the constitution of Missouri was amended so as to enable St. Louis and Kansas City to frame and amend their own charters. California, Oregon, Washington, Minnesota, Colorado, Oklahoma, Michigan and other States have since given some or all of their cities varying degrees of power to make charters to suit local ideas. The Michigan constitutional amendments of 1908 not only gave this power to the cities of that State, but also went farther and authorized the legislature to delegate its own powers to the municipalities except as limited by the constitution and by general statutes. It was left to the legislature, also, to outline the general character of home-made city charters and the powers of municipalities thereunder, together with the charter-making and amending procedure. But the constitutional amendments seem to be broad enough and at the same time specific enough to give the cities of Michigan a much greater measure of local self-government than has ever been enjoyed by the cities of any American State before. This opinion may require modification after the new plan has stood the test of time, the courts, and the possible attempts of the legislature to interfere in local affairs through its powers of general legislation. The necessary legislative act to make the constitutional amendments effective was passed in

1909. Among other things it provides that home-made charters must be approved by the Governor of the State before they become effective. This was considered necessary on account of the delegation of State legislative powers to local bodies. The constitutional amendments, a digest of the State legislation which puts them into effect and a critical analysis of both are given in the 1909 *Proceedings of the National Municipal League*.

CHANGES IN THE OHIO MUNICIPAL CODE. In striking contrast to the home rule granted to Michigan cities in 1908 and 1909 is the legislative control still exercised in Ohio. But present conditions in Ohio are a vast improvement over what they were in 1902. Up to that time there was virtually special legislation for each city. A constitutional prohibition against special legislation was evaded by adopting a minute classification of cities according to population. This was declared illegal in 1902, and for a time Ohio cities had only a *de facto* government. A special session of the legislature enacted a municipal code which divided all incorporated municipalities into two classes, those above 5000 being made cities and those below villages. A uniform system of government for all places in each class was provided. The abolition of minute classification and the prevention of further special legislation were in many respects highly advantageous, but the new form of government was a backward step for such of the municipalities as were enjoying a fairly clear-cut separation of legislative and executive functions, with highly centralized executive power vested in the mayor. Cleveland was in that class and was forced back into the old mixed system, with an elective board of public service consisting of three or five members, and a bi-partisan board of public safety of two or four members, appointed by the mayor. There was a division of responsibility between the boards, the mayor and the council. By recent amendments the executive powers and responsibilities of the mayor are increased, and he appoints a single director of public service and a single director of public safety to displace the old boards. The mayor also appoints the heads of the sub-departments under these two directors. The director of public service has charge of all public works and undertakings, and the directory of public safety is in charge of the fire, police, charity, correction and building departments. The mayor and the two directors form a board of public control, which awards all contracts in excess of \$500. Civil service provisions of the amended code include a commission of three members, appointed by the presidents of the boards of education, sinking fund commission and the council; also a classified and unclassified service. Village councils consist of only seven members, but city councils are larger, particularly in the more important cities, for they are elected partly by wards and partly at large.

CHARTER REFORM. Aside from the commission-plan charters no changes in the framework of city government have been more radical than the amendments to the charter of Boston, made by the State Legislature of 1909. See **ELECTORAL REFORM** and **MASSACHUSETTS**.

Commission-plan charters framed on the home rule plan and adopted by popular vote at Berkeley, Cal., and Grand Junction, Colo., may per-

haps be taken as typical of the most advanced charters of this type. The Berkeley charter commission was headed by President Benjamin Ide Wheeler of the University of California. It had as another member Mr. William Carey Jones, professor of jurisprudence in the same institution. Under the Berkeley charter all nominations are by petitions, which require only twenty-five signatures. A majority of all the votes cast is required for an election, failing which the first election becomes a primary so far as the unfilled office is concerned, and a second election is held three weeks later to decide between the two highest candidates. The ten elective officers are a mayor, an auditor, four councilmen and four school directors, elected at large. The mayor is also a member of the council, and the councilman who becomes commissioner of finance and revenues is a member of the board of education. The mayor is paid \$2400 a year; the other four councilmen \$1200 each. School directors receive \$5 for each regular meeting attended, but not over \$15 in any one month. The mayor and auditor are elected for two years and the other eight officers for four years each, two places in each body becoming vacant yearly. The four councilmen elected as such are chosen by the whole council to serve, respectively, as commissioners of finance and revenue, public health and safety, public works and public supplies. The council elects a city clerk, assessor, treasurer, collector, attorney, engineer, chief of police, fire chief, street superintendent, health officer, and also five library trustees, and may create and fill other offices or consolidate two or more existing offices at any time. Any appointed officer is subject to removal by the council. Any elected officer is subject to the recall on petition signed by 20 per cent. of the number of votes cast at the last mayorality election. Any citizen or body of citizens may frame an ordinance and submit it to the city council, provided the proposed ordinance is accompanied by a petition signed by at least 5 per cent. of the number of votes cast at the last election. In such an event the council must either enact the ordinance or refer it to popular vote. If the percentage of signers is fifteen, then a special election may be demanded. Referendum votes, or popular notification, may be required by proper petition, on ordinances originating in the council. Franchise grants are subject to stringent conditions and must be awarded to the highest bidder after public advertisement. Eight hours constitutes a day's labor for both city and contract work.

The home-drawn commission-plan charter of Grand Junction, Colo., adopted in September, 1909, provides for only five elective officers, to serve for four years at a salary of \$125 each per month. These officers are nominated by twenty-five petitioners. The ballots call for second, third, etc., choice, so that if no candidate receives a majority over all others as first choice, second choice, etc., votes may be added until a majority results. At the election held in November, 1909, there were six candidates for mayor. The man who had the plurality of votes (603) under the ordinary plan was fourth under the preferential plan (739 votes). The successful candidate, whose name came last on the alphabetically arranged list, was third on first choice (362 votes), but on adding second and third choice votes he

received a total of 1051 votes. Contrary to what appears to be usual practice, the Grand Junction charter requires that the five councilmen shall be nominated and elected to the specific commissionerships which they are to hold as department heads, and at the same time gives some of the councilmen several executive offices. The commissioner of public affairs is mayor, head of the police and fire departments, supervisor of all privately owned public utilities, judge of the municipal court unless otherwise provided by ordinance, and has other responsibilities as well. The commissioner of finance and supplies is also city collector, city treasurer and purchasing agent for all departments. The commissioner of highways has charge of streets, ditches, and public buildings. The commissioner of health and civic beauty is *ex-officio* city clerk and auditor, inspector of weights and measures, has charge of parks, shade trees, and the "architectural beauty" of the city. The commissioner of water and sewers appears to have his hands full with the duties indicated by his title. The charter abolishes wards and saloons. Eight hours constitute a working day and \$2.50 the wage of all day laborers unless otherwise determined by council, but these provisions do not apply to paving and water works extensions (no substitute given). The charter prohibits carrying out paving, sewerage or water works extensions or new construction by contract. A peculiar provision is that save the five elective officers all other men who serve the city must be called employees, including, it appears, the city attorney and the health officer. Religious or political opinions or political service are to have no effect on appointments or removals. Municipally owned public utilities must show by proper accounts whether they result in profit or loss to the city. These accounts must include allowances for interest, depreciation, insurance and lost taxes on the one hand, and for services rendered to other city departments on the other hand. Sweeping provisions for municipal ownership are made and careful regulations for franchise grants are provided. A civil service commission must be created by January 1, 1913.

A charter revision committee submitted a new charter for New York City to the State Legislature of 1909, but the proposed charter was referred to a legislative committee for investigation between the 1909 and 1910 sessions. The commission provided for many radical changes in the existing charter and for its curtailment and simplification. Besides this, many purely local administrative features were embodied in an administrative code in the hopes that the charter proper would by this means require less frequent and extensive amendment than heretofore. The code was longer than the charter, but the two combined were much shorter than the old charter.

At St. Louis, Mo., a charter revision commission, legally known as the Board of Freeholders, was created in 1909 under the home rule provision of the State constitution. It held two public hearings during each week from April to December, after which it began to draft a new charter, for submission to popular vote in 1910.

The Bureau of Municipal Research continued its work of investigating administration efficiency and of establishing accounting reform

in New York City in 1909. Similar bureaus were at work during the year in Philadelphia, Cincinnati and Memphis, and special studies by members of the staff were made in Buffalo and Chicago. The work done is extra-legal, and its cost is met by voluntary private contributions.

MUNICIPAL ACCOUNTING reforms were continued during 1909. A notable achievement in this field was the publication of a "Manual of Accounting and Business Procedure for the City of New York," by the department of finance of that city, under the direction of Mr. Herman A. Metz, comptroller. The "Manual" is based on several years' work of the Bureau of Municipal Research. Information regarding the progress of uniform municipal accounting and on the art of municipal accounting itself is given in the reports on "Statistics of Cities," published yearly by the United States Bureau of the Census.

Important books on municipal government published during 1909 included Deming's *The Government of American Cities* (New York); Goodnow's *Municipal Government* (New York); Munro's *The Government of European Cities* (New York); Merriam's *Primary Elections* (Chicago); Robbins's *Selected Articles on the Commission Plan of City Government* (Minneapolis), and Fowler's *Socialism in Local Government* (second edition; London and New York). The 1909 *Proceedings of the National Municipal League* (Philadelphia), contains important discussions of practically all the topics treated in this article and others besides. See also **MUNICIPAL OWNERSHIP** and various articles on municipal engineering and sanitation.

MUNICIPAL LEAGUE, NATIONAL. An organization formed in 1894 for the purpose of multiplying the numbers, harmonizing the methods and combining the forces of all who realize that it is only by united action and organization that citizens can secure the adoption of competent laws and the selection of men of trained ability and proved integrity for municipal business, and to prevent the success of incompetent or corrupt candidates for public office. Through a series of committees it has promoted the thorough investigation and discussion of the conditions and details of civic administration. Among the committees at work in 1909 were the following: Committee on Coördination of University and Collegiate Instruction in Municipal Government; Committee on Municipal Health and Sanitation; Committee on Instruction in Municipal Government in Elementary Schools; Committee on Municipal Accounting; Committee on City Clubs; Committee on Electoral Reforms; Committee on City Finances and Budgets; Committee on Police; Committee on Legislative Reference Libraries. The League also serves as a clearing house between organizations and individuals working at the various phases of the municipal problem. Annual meetings are held in the largest cities of the country. The proceedings of each meeting have been published in a bound volume, and these have had pronounced influence on the thought and deliberations of municipal affairs generally. The annual meeting of 1909 was held in Cincinnati, November 15-18. Among the questions discussed were instruction in civics in elementary and high schools and in colleges; the prosecution of graft; im-

migration and the municipal problem; the police problem; taking municipal contracts out of politics; the essential principles of a building code; the elimination of party designations in municipal elections, the operation of the initiative, referendum and recall; municipal budgets and expenditures; and municipal research and franchise questions. In 1909 there were 1570 annual members, 91 contributors, and 181 affiliated members with an enrolled membership of 181,096. The officers of the League in 1909 were, Hon. Charles J. Bonaparte, Baltimore, President; Dr. A. Lawrence Lowell, Harvard University, George McAneny, New York, Charles Richardson, Philadelphia, Hon. George W. Guthrie, Pittsburg, Walter L. Fisher, Chicago, Hon. Henry L. McCune, Kansas City, and Thomas N. Strong, Portland, Oregon, Vice-Presidents; George Burnham, Jr., Philadelphia, Treasurer; Clinton Rogers Woodruff, Philadelphia, Secretary.

MUNICIPAL OWNERSHIP. The tendencies towards a change from private to public ownership of municipal public utilities which has become notable in recent years, continued during 1909, particularly as regards water-works. The San Francisco vote of November 12, 1908, in favor of municipal water-works was followed by considerable preparatory work to that end during 1909. Owing to complications regarding rights-of-way for conduits and land for a reservoir site in the famous Hetch-Hetchy Valley, which is a part of the Yosemite National Reservation (not to be confused with the Yosemite Valley), and also owing to the opposition of the Spring Valley Water Co., which owns the works on which the city now depends for a water supply, comparatively little progress towards municipal ownership was made. The Hetch-Hetchy complications included a determined fight by John Muir and others against the acquisition of water-supply rights in the Hetch-Hetchy Valley or on any part of the Tuolumne River within the reservation named. Mr. Muir and others urged that the flooding of a portion of the valley named for water storage purposes would ruin one of the most notable stretches of natural scenery which the country possesses. The fight was carried to Congress, in connection with some desired transfers of government land and related matters. The opponents of the scheme were so far successful as to prevent Congressional action in 1909, but the city proceeded with other preliminaries to the development of this supply. Near the close of 1909 the Spring Valley Water Co. made an offer to sell its works to the city, and an election was called for January 14, 1910, to give the voters a chance to decide whether to (1) accept that offer; (2) go on with the complete Tuolumne project, or (3) buy out the company and carry out only a part of the Tuolumne project. The elimination of the Company would end a prolonged conflict over water rates. The latter are fixed annually by the city authorities, but the legality of the rates established for most of the years in the present decade is before the State and United States courts for adjudication. For an extended discussion of both sides of the Hetch-Hetchy controversy see *Engineering News*, January 7 and 21 and February 4 and 11, 1909; and for comments on water-rate litigation in Oakland and San Francisco see the same journal for May 27 and August 12, 1909.

Both Denver, Colo., and Omaha, Neb., took

steps toward municipal ownership of water-works in 1909, each in continuation of earlier efforts. Omaha voted \$6,500,000 of bonds to buy out the Omaha Water Co.; at Denver engineer-appraisers fixed the valuation of the property of the Denver Union Water Co., at \$14,400,000. Kansas City voted about \$1,100,000 to buy the works of the Metropolitan Water Co., and \$400,000 for extensions. See also WATER-WORKS for municipal and private ownership in France, Belgium and Switzerland.

MUSEUM OF FINE ARTS. An institution incorporated in Boston in 1870. Until May 2, 1909, the Museum occupied a building in Copley Square, but on November 15, the new and imposing group of buildings, was occupied. These buildings were completed at a cost of over \$1,500,000. Work was begun on April 11, 1907. Among the notable collections in the new building are the Collections of Egyptian Department, Collections of the Department of Classic Art, Collection of Pictures, the Print Department, the Collections of Western Art, Collections of the Department of Chinese and Japanese Art, Collection of Casts and the Library. The interior arrangements were perfected after a careful study of all the chief museums in Europe and the United States. Collegiate courses in the history and observation of fine arts were carried on and the museum class-rooms and lecture hall are open for single lectures or courses of instruction. The income of the museum is \$110,000, and the annual expenditures about \$75,000. The visitors number annually about 275,000. The president of the board of trustees is Gardner M. Lane; the director, Arthur Fairbanks, and the secretary, Benjamin Ives Gilman.

MUSIC. Rivalry between the Metropolitan and Manhattan companies brought, in 1909, the vexed question of excessive salaries to a culmination, even if no immediate solution of the difficulties is in sight. By the close of the year this rivalry had become a matter of international importance. André Messager, the director of the Paris Grand Opéra, ascribes the general demoralization of European artists and the abnormal conditions of matters musical, and especially operatic, on both sides of the Atlantic to the extreme competition of the two powerful New York institutions. The efforts of the trust formed two years ago by Italian and South American managers for the purpose of fore-stalling the present situation have resulted in utter failure. Not only has the luring away of the best singers in large numbers seriously impaired the artistic efficiency of all the opera houses of Italy, but the excessive salaries that had to be paid to the artists remaining at home have caused heavy financial losses. Not one Italian or South American opera reported a successful season. In France conditions were almost as bad; while Germany was scarcely affected, if at all. The directors of both the New York houses seem to be fully aware of the seriousness of the situation, for in the closing days of the year rumors of a possible opera merger were current. Mr. Hammerstein admitted that financially the year had been very poor. On the other hand, the presence of the world's greatest artists, arrayed against one another in two rival companies animated by the sense of keenest competition, is responsible for the unusually high level of artistic excellence. As regards the public, the mere craze for high-

priced stars seems to have passed its zenith. Strong popular interest has not declined by any means, but this interest now seems to spring from a saner and more intelligent appreciation of the art, if the offerings of musical organizations be a true index of the popular demand. It may safely be asserted that music is no longer a mere fad in the United States, but is beginning to assert its place as an integral factor in the national life. That such is really the case is proved by the assiduous and wide-spread cultivation of absolute music and the ever increasing number of symphony orchestras throughout the country.

THE UNITED STATES

ARTISTS. The tour of Paderewski aroused special interest. While this artist has always exerted a remarkable power of attracting vast audiences, it had become apparent that his ambition to attain distinction as a composer interfered with the amount of practice necessary to maintain himself in the class of the greatest pianists. After a decade and a half of earnest striving, Paderewski has evidently come to realize that it is better to be a prince among interpretative artists than a mediocrity among composers. As a matter of fact, his playing during the last year revealed to their fullest extent his extraordinary powers. Among the newcomers the début of the Spanish boy Pepito Ariola was watched with intense interest. Reports of his stupendous achievements as a pianist had reached the United States, and when he was actually heard, it was evident at once that those reports had not been exaggerated. The boy's mental grasp of the compositions is that of the matured artist. The unanimous opinion regarding his achievements was briefly summed up in the verdict: "a second Mozart." The distinguished Russian composer Rachmaninoff revealed himself as an excellent interpreter of his own works. As soloist with the New York Symphony Orchestra he played, for the first time, his new piano concerto in C minor, a work full of real inspiration. In Yolanda Merö we made the acquaintance of a splendid young pianiste of wonderful temperament. She seemed a little too fond of exhibiting her truly brilliant technic. Germaine Schnitzer of Vienna and Germaine Arnaud of Paris were both recognized as excellent pianists. Of Gabrilowitsch and Lhévinne, Carrefio and Samaroff, nothing need be said beyond the fact that their art added brilliancy to a brilliant musical season. Among violinists Jascha Bron was the only newcomer. He is a young man with a reliable technic, and a true musician. Kreisler, Petschnikoff, Elman, Hartmann and Spalding are well established favorites. The Russian 'cellist, Josef Malkin, impressed his audiences as a most serious artist and consummate master of his instrument. Besides this new artist only Leo Schulz, an established favorite, claimed the attention of lovers of the 'cello. Among the singers an event of the first importance was the celebration by Mme. Sembrich of the twenty-fifth anniversary of her appearance on the operatic stage in New York. This event attained a special significance by the fact that the distinguished artist chose this occasion to bid farewell to the operatic stage. All the artists of the Metropolitan Opera House participated in a grand farewell performance. However, Mme. Sembrich has

not entirely withdrawn from the musical world. She still continues to appear on the concert-stage. The retirement of Mme. Eames, though not made the occasion of a special celebration, was sincerely regretted by the large number of her admirers. For almost twenty years she has been among the foremost operatic singers. Among the new vocalists two at once attracted special attention, the famous Dutch contralto Tillie Koenen and the French dramatic soprano Blanche Arral. The former is one of the most intensely emotional singers, with a magnificent voice, the technical manipulation of which, however, is at times not quite above criticism. But her interpretation amply counterbalances any minor defects. The variety of her programmes attests the versatility of her artistic scope. Mlle. Arral's is a voice of great purity and flexibility, particularly adapted to intense dramatic accents. Her "recitals" consisted entirely of operatic excerpts. Blanche Marchesi was recognized as a dignified and artistic exponent of the vocal art. Ludwig Wüllner's tour was a repetition of his triumphs of the preceding year. Mme. Nordica appeared in numerous concerts and recitals, but her joint recitals with Mme. Carreño were real "events." Without the artistic contributions of David Bispham and Mme. Schumann-Heink the musical season would have been incomplete.

ORCHESTRAL CONCERTS. The Philharmonic Society of New York began its sixty-eighth season, not only under a new conductor, but practically as a new organization. The original policy of self-government has been abandoned. Several wealthy music-lovers offered the society a guarantee fund of \$100,000 for three years, on condition that they should be represented on the board of directors, and should have a voice in determining the methods by which the orchestra could be established on a permanent basis. It was generally recognized that, if the society were to continue at all, a much higher standard would have to be maintained than had been possible on the old basis. The new society is governed by a board of directors, in which both the guarantors and the players are represented. Gustav Mahler was appointed conductor for three years; and, in order to insure the carrying out of some necessary reforms, he was invested with almost autocratic power. The first step Mr. Mahler took was to test the efficiency of each individual player, with the result that some of the older members were retired on a pension. From 125 the orchestra was reduced to 100 players. The regular season now consists of 23 weeks, during which time the orchestra is rehearsed daily. Four series of concerts were given. The first series comprised the customary eight evening and eight afternoon concerts; but only the days have been changed from Friday afternoons and Saturday evenings to Thursday evenings and Friday afternoons. The second series, called "Historical Cycle," presented on six Wednesday evenings, in chronological order, representative works from Bach to the present day. The third series, consisting of five concerts on Friday afternoons, was devoted exclusively to the works of Beethoven. The concerts of the fourth series took place on five Sunday afternoons. The opening concert of this series, which afforded miscellaneous programmes, contained only works of Beethoven and Wagner. Besides the regular New York concerts the orchestra also gives

regular series in other cities. The players no longer receive a share of the net proceeds, but are engaged on a fixed salary. The eminent violin virtuoso, Theodore Spiering, is the concert master of the new organization. Mr. Mahler conducted with his usual brilliancy.

The New York Symphony Society, under Walter Damrosch, gave besides its regular concerts a cycle of six concerts devoted to the works of Beethoven, and one of five concerts presenting the principal works of Tchaikowski. The last concert of the Beethoven cycle was unique. Its programme contained nothing beyond the Ninth Symphony. This work was played twice in its entirety, with an intermission of fifteen minutes between the two performances. In order to obtain a greater volume of tone from the vocal quartet in the last movement Mr. Damrosch employed a quadruple quartet consisting of sixteen picked soloists. The effect was splendid. The two renditions were not identical. The first time Mr. Damrosch made the usual pause between the Adagio and final Presto; the second time this pause was omitted, and the opening chord of the Presto crashed with telling effect upon the Olympic repose of the Adagio. To the Symphony Society also belongs the credit of having observed the centenary of Mendelssohn's birth more worthily than any other musical organization. See FESTIVALS.

All the other famous orchestras had a successful year. The Boston Symphony Orchestra (Max Fiedler) greatly increased the number of its outside concerts, so that now it appears in more than one hundred concerts during the year. Likewise The Philadelphia Symphony Orchestra (Carl Pohlig), the Theodore Thomas Orchestra of Chicago (Frederick Stock), and the Pittsburg Symphony Orchestra (Emil Paur) increased the number of concerts on tour. For the Minneapolis Symphony Orchestra (Emil Oberhoffer) a guarantee fund of \$250,000 for five years was raised. The object is to increase the orchestra numerically, and also to extend the scope of its artistic activity. After the dissolution of the Cincinnati Symphony Orchestra (Frank van der Stucken) two years ago, Cincinnati has been dependent upon the visits of outside orchestras. During the past year the efforts of some public spirited citizens resulted in the establishment of a new orchestra bearing the old name. The new organization number seventy players under the direction of Leopold Stokovsky. The first concert in December was an emphatic success. The steady increase in interest and growth of intelligent appreciation of serious music is best attested by numerous reports from minor cities of the establishment of symphony orchestras.

The Dresden Orchestra of seventy performers, under the direction of Willy Olsen, made a spring tour of the United States without arousing special attention. Presenting no less than five soloists (Nordica, Bispham, Spalding, Landendorff, Schnitzer) at the opening concert in New York was a sad mistake. Attention was diverted from the orchestra to the stars. The reason for this tour was not apparent.

OPERA. At the Metropolitan Opera House 160 performances were given from a repertoire of 41 operas by 21 composers. According to nationality these were divided as follows: Italian, nineteen works by nine composers; German, sixteen works by eight composers (but Mo-

**FOUR ARTISTS PROMINENT IN 1909
MUSIC**

zart's *Nozze di Figaro*, Gluck's, *Orfeo et Eurydice*, and Flotow's *Marta* in Italian); French, five works by four composers; Bohemian one work, Smetana's *Bartered Bride* (in German); Wagner, represented by nine works, led with thirty-five performances. Next in order came Verdi, of whom six works had twenty-nine performances. Puccini, who for two years had predominated, was reduced to the third place; four of his works aggregated twenty-one performances. Smetana's *Bartered Bride* was given most frequently, nine times. Next came Mozart's *Nozze di Figaro* and Puccini's *Madama Butterfly*, each with eight performances. Wagner's *Tannhäuser*, Verdi's *Aida*, and Massenet's *Manon* were each given seven times. A superficial comparison of these statistics with those of the two preceding years might seem to indicate the reestablishment of normal conditions. Wagner has once more come into his own. As the greatest dramatic composer in the history of music his works naturally ought to occupy the first place in the repertoire. Unfortunately only an accident, not natural causes, restored Wagner's works to their proper position in the repertoire of the Metropolitan Company. Before the closing of the spring season an affection of the throat compelled Caruso to withdraw. This was the primary cause for reducing the Puccini performances. But the tenor's return in the fall did not mark a return to the former policy; and it is this fact upon which the hope of returning normal conditions is based. Of the novelties announced only two were given. Catalani's *La Wally* (January 6) was a distinct disappointment; but Smetana's *Bartered Bride* (February 19), a work written more than forty years ago, was received with unequivocal approval. On the other hand the year was marked by some important revivals of older works. That Massenet's *Manon* still is heard with pleasure is attested by the fact that it was given seven times. The return of Verdi's immortal master-works *Otello* and *Falstaff* was hailed with enthusiasm. The performance of Gluck's *Orfeo* was a revelation. This was due chiefly to the genius of Toscanini.

The past year witnessed an increase, not only in the list of the principal singers, but especially in the numbers of the orchestra and chorus, the former numbering 150, the latter 200 members. The greatest improvement, however, was noticeable in the stage-management. All factors combined to make the year a most notable one from an artistic standpoint. The evident desire for artistic results led to the establishment of a branch, so to speak, of the Metropolitan Company at the New Theatre, which opened its doors in the fall. It had been found that certain works were ill suited to the dimensions of the vast opera house, and would greatly gain if presented in the intimacy of a smaller theatre. To present such works adequately, performances were given at the New Theatre on alternate Tuesday and Friday evenings and alternate Wednesday and Thursday afternoons. The series was opened on November 16 with Massenet's *Werther*; the other works given were Smetana's *Bartered Bride*, Rossini's *Il Barbiere di Siviglia*, Lortzing's *Zar und Zimmermann*, Paér's *Il Maestro di Cappella*, Masagni's *Cavalleria Rusticana*, Lecocq's *La Fille de Mme. Angot*, and Donizetti's *Don Pasquale*. Paér's work is a century old, and a typical Italian opera buffa. The chief reason for its

production was to show the bass Signor Pini-Corsi in one of his best rôles. But the work in itself was charming, and was received as a welcome novelty. Besides the regular performances and usual Sunday night concerts all the artists of the company volunteered their services for two special occasions: one, a concert for the benefit of the sufferers in the terrible Sicilian earthquake; the other, an operatic performance for the benefit of the pension and endowment fund of the employees of the Metropolitan Opera Company. Among the artists who contributed to the signal success of the season were the following: *Sopranos*: Mmes. Nordica, Gadski, Destinn, Fremstad, Farrar, Morena, Fornia, Nielsen, Novia, Alda; *Contraltos*: Mme. Flahant, Homer, Meitschik, Mattfeld, Niessen-Stone; *Tenors*: Caruso, Slezak, Bonci, Jörn, Burrian, Anthes, Martin; *Bari-tones and Basses*: Amato, Goritz, Scotti, Mühlmann, Sooner, Whitehill, Witherspoon, Blass, Didur, Pini-Corsi, Hinckley, Segurola; *Conductors*: Mahler, Hertz, Toscanini, Tango, Podesti, Bendix.

At the Manhattan Opera House 110 performances were given from a repertoire of 32 operas by 21 composers. According to nationality these were distributed as follows: Italian, 14 works by 7 composers; French, 16 works by 11 composers; German, 2 works by 2 composers (both in French); Belgian, 1 work. Massenet led with 18 performances of 5 works; Verdi followed with 17 performances of 5 works. Four novelties were produced: Richard Strauss's *Salomé* (in French) (January 28); Blockx's *La Princesse d'Auberge* (March 10); Massenet's *Hérodiade* (November 8) and the same composer's *Sappho*. Of these *Salomé* proved a sensational success, but for reasons other than purely musical. Of all the works performed it achieved the greatest number of performances: nine. In Philadelphia the work aroused so much opposition, also for reasons other than musical, that Mr. Hammerstein thought it wise to withdraw it from the repertoire of his Philadelphia house. The work of the Belgian composer divided musical opinion into two camps. This is rather strange, as the opera contains nothing of a startling nature. It has weaknesses, but the positive virtues overbalance. The composer makes extensive use of leading motives, whose merit is their pregnancy and melodiousness and whose weakness their lack of musical development; they always recur without the slightest variation. On the whole, the opera is quite effective. Either of Massenet's works would have made a deeper impression, if the public had not had a surfeit of this composer; both are characteristic of Massenet's suave and graceful style. *Hérodiade*, while extremely beautiful as music, is too meliluous; the text calls for poignant, dramatic accents. The music of *Sappho* is more characteristic of the dramatic situations, but is far less melodious. With the performance of *Tannhäuser*, which was given in French and in the Paris version, Mr. Hammerstein ventured for the first time into Wagner opera. The attempt was not very successful, because the new conductor, Enriquez de la Fuente, seems to lack the temperamental qualities required. In his leading of French scores he showed himself to much better advantage. He had his forces well in hand, and proved himself a musician of refined sensibilities. But it also became quite evident that as a conductor he is not in the

same class with his illustrious predecessor Campanini, whose absence was sorely felt. The exact cause of Campanini's resignation has never become known. This much is certain: the loss of any other artist would have meant less as far as general efficiency is concerned. Now that the general public has come to understand and appreciate the conductor's art, the manager can no longer insure success by presenting only an array of stars, no matter how excellent these be. Among the principal artists were the following: *Sopranos*: Mmes. Garden, Tetzrinni, Cavalieri, Labia, Trentini, Carmen-Melis; *Contraltos*: Mmes. Gerville-Réache, Doria, Bayard; *Tenors*: Dalmore, Zenatello, McCormack, Constantino; *Baritones and Basses*: Renaud, Gilibert, Dufranne, Sammarco. At the Philadelphia house conditions were such at the beginning of the year that Mr. Hammerstein threatened to close the house permanently, unless a guarantee fund was raised. This guarantee was assured.

During the months of September and October Mr. Hammerstein gave a season of summer opera at his Manhattan Opera House. An entirely new company of singers was engaged, while Mr. Sturani, the regular conductor of the Philadelphia opera, directed the regular Manhattan orchestra and chorus. The season opened with a revival of Meyerbeer's *Le Prophète*. Another revival was Halévy's *La Juive*. While the performances were in every respect adequate, the public showed unmistakably that it had outgrown that style of opera. Artistically this attempt at summer opera was successful, financially it resulted in a deficit of \$50,000. Another unsuccessful venture of Mr. Hammerstein was his experiment with French Opéra Comique, which he gave on Tuesday and Saturday nights during his regular season with a complete company distinct from that of his Grand Opera. After eight performances the project was abandoned.

On November 8, the new Boston Opera House was opened with a performance of Ponchielli's *La Gioconda*. Up to the end of the year 45 performances of Italian and French works were given. Verdi had 16 performances of 4 works. Among the artists known also to frequenters of opera in New York are Nordica, Nielsen, Boninsegna and Constantini. By an arrangement with the Metropolitan Opera Company there is to be an exchange of artists between the two managements. A special feature of the Boston Opera Company, and one that promises to exert a most important influence upon the musical life and conditions of America, is the simultaneous establishment of the Boston Opera School, the chief purpose of which is the training of native talent for grand opera. American singers are to be assured a début in their own country. Saturday nights are known as "débutant nights." The principal parts are filled only by young aspirants. This policy was carried into effect immediately, and the operas given on these débutant nights were *Aida*, *Lakmé*, *La Bohème*, *Caratteria Rusticana*, *Pagliacci*, *Rigoletto* and *Madama Butterfly*.

After an intermission of five years New Orleans had once more its own opera company under the conductorship of M. Tartanac. Naturally the works of French composers preponderated. The Metropolitan Company of New York gave a two-weeks' season in Chicago with such satisfactory artistic and financial results,

that arrangements were completed for a more extended season during 1910. Besides the two great companies New York heard also several minor companies. Of these the Italian Grand Opera Company, which opened a season early in September, gave some really excellent performances at the old Academy of Music. But when, after five weeks, the deficit had amounted to about \$10,000, the organization was disbanded.

FESTIVALS. Throughout the country the centenary of Mendelssohn's birth was fittingly observed. The most elaborate celebration was that arranged by Mr. Damrosch with the Symphony and Oratorio Societies, assisted by Gabrilowitsch and Mme. Bloomfield-Zeisler. A special feature of this four days' festival was a production of Shakespeare's *Midsummer Night's Dream* by the Ben Greet players with Mendelssohn's incidental music performed by the Symphony Orchestra. The most important of the year's festivals was the triennial prize contest for the "Kaiser-Preis" held by the Northeastern Sängerbund in New York. The prize, founded by Emperor William in 1900, consisted of a beautiful silver statue of a minnesinger of the thirteenth century. No less than 13,000 singers took part. The prize song "The Warning of the Rhine" was composed by Mathieu Neumann. The judges were Prof. Meyer-Olbersleben of Würzburg, Gustav Wohlgemuth of Leipzig, Arthur Mees of New York, and Cornelius Rübner, professor of music at Columbia University. Julius Lorenz and Carl Hein were the festival conductors. The prize was divided between the *Kreutzer Quartet Club* (F. Albeke, conductor) of New York, and the *Junger Männerchor* (L. Koemmenich, conductor) of Philadelphia. Each society is to keep the statue for eighteen months. At the fifty-second annual Worcester Music Festival, held in September under the leadership of Arthur Mees and Gustav Strube, Liszt's *Missa Solemnis* was heard in its entirety for the first time in America. The thirteenth annual Maine Music Festivals were held in October under the direction of William R. Chapman, with programmes far too miscellaneous to be called festival programmes. A most important event was the Bach festival given in May in the open-air theatre at Berkeley, Cal., by Frederick Wolle, who in former years attracted so much attention with his Bach festivals at Bethlehem, Pa. The work performed was the great Mass in B minor. Atlanta, Ga., had a May Festival with the assistance of the Dresden Philharmonic Orchestra. Philadelphia showed its pride in its local musicians by giving a festival at which works by twelve local composers were performed.

NOVELTIES. Among many new works Paderewski's Symphony in B minor, played by the Boston Symphony Orchestra under Max Fiedler, attracted perhaps the most attention. It is programme music, and owes its inspiration to the fortieth anniversary of the Polish revolution of 1863-4. Although it contains some fine music, the work is not convincing as a whole. The enormous orchestral apparatus is handled with consummate skill, and a great variety of tonal color is obtained. The Pittsburg Symphony Orchestra gave a fine interpretation of a Symphony in A major by its conductor, Emil Paur. The work bears the title "In der Natur." It proved to be a really fine composition, picturesque, sane and inspired. Rachmaninoff's Second

Symphony was heard from the Russian Symphony Orchestra, under Modest Altschuler. The work is of inordinate length, requiring more than an hour for its performance. It is too prolix, and the several portions often lack connection; but in spite of these defects it is full of superb ideas. The orchestration is skillful and very effective. With the Philharmonic Society Gustav Mahler conducted his *First Symphony*. In all the movements extensive use is made of folk melodies, which afford the composer opportunity for a great variety of moods. The work exhibits the same excellencies and the same faults that characterize his later and more ambitious symphonies. The inspiration is not evenly maintained.

EUROPEAN COUNTRIES

GERMANY. The event of the year was the première of Richard Strauss's *Elektra*, which occurred on January 25, at the Royal Opera of Dresden under the direction of Ernst von Schuch. As far as outward appearances went, the performance was an enormous success. But the consensus of opinion among prominent musicians did not endorse the popular demonstration. In its essential features the style of *Elektra* is that of *Salomé*. Superb orchestra coloring, at times enchanting, at others bewildering, constitutes the chief merit of the extremely complicated and difficult score. The musical themes and their treatment are brutal. Mere noise and cacophony run riot. In the seething orchestral whirlpool the human voices were relentlessly swallowed. The performances of this work under Leo Blech at the Royal Opera of Berlin were received rather coldly. The composer did not conduct *Elektra* himself until October; and then he conducted it in so sensational a manner, that the attention of musicians became centred solely upon the incredible virtuosity of the orchestra. Strauss took all the tempi much faster than either Schuch or Blech had done. At the Berlin Royal Opera two of the foremost singers, the baritone, Rudolf Berger, and the contralto, Edyth Walker, surprised their admirers by appearing in tenor and soprano rôles respectively. The transformation seems to have been an absolute success. Berger appeared as Lohengrin, Mme. Walker as Isolde and Brünnhilde. For the first time in its history the German capital had a season of summer opera worthy of the city's reputation. Herman Gura brought together a company of the best singers for a ten weeks' season, and presented the works of Wagner, Mozart and some modern Italian composers. Strauss's *Salomé* was also included. Among the regular singers were Kraus, d'Andrade, Van Rooy, and Mmes. Kaschowska, Langendorff, and Walker. Lilli Lehmann and Marcella Sembrich appeared as guests. Brecher and Stransky were the regular conductors, while Mottl and Lohse conducted some of the Wagner performances by invitation. The only novelty brought forward, Zumpe's *Sacitri*, proved a horrible fiasco. In the fall Dr. Alfieri established a new "Volkssoper" for the purpose of giving opera at popular prices. Many previous attempts in this line had ended in failure, because managers relied upon two or three singers with a reputation, but whose voices were no longer in their prime. Dr. Alfieri followed a new plan. He engaged a number of young and unknown singers together with an excellent orchestra and chorus under

efficient conductors, with the result that the progress of the season witnessed a steady increase in the attendance. Throughout Germany few operatic novelties were given. Outside of *Elektra* D'Albert's *Izeyl* was heard for the first time in Hamburg. It proved a great and deserved success, for it is regarded as the composer's best work, one in which the inspiration flows uninterrupted. At Dresden *Dame Kobold* was heard, which turned out to be nothing else than Mozart's *Cose fan tutte*. The original text of Mozart's opera has through its coarseness become so offensive to modern taste that it has proved a serious drawback to musical performances. Scheidemantel took Oalderon's *Dama Duende*, of which he made a German vision adapted to Mozart's music. The experiment was successful, and the adaptation was immediately secured by a number of German opera houses. At the Bayreuth festival (July 22-August 20) *Lohengrin*, *Parsifal* and the *Nibelungen* dramas were given with splendid success. The conductors were Richter, Muck, Balling, and S. Wagner. The festival performances of the Wagner-Mozart cycle at the Prinzregententheater in Munich were of very uneven merit. The opinion was expressed that the representations of the regular season were superior. Cologne was the scene of a very successful operatic festival (June 10-29). The works performed were Götz's *Taming of the Shrew* (Mottl), *Nozze di Figaro* (Mottl), *Meistersinger* (Nikisch), *Fidelio* (Steinbach), *Elektra* (Lohse).

Among the many festival concerts the great Brahms Festival held in September in Munich was the most important event, if for no other reason than the fact that it was the first Brahms festival ever held anywhere. The great Hamburg master has always been regarded as the composer of a small select circle; no one ever thought of using his name to attract a large gathering. But scarcely had the project been announced, when it became evident that the name of Brahms possessed some magic, for early in July the last seat had been sold. To meet the great demand for admission the final rehearsals were made public rehearsals. The works performed were the immortal German *Requiem*, *Schicksalslied*, *Triumphlied*, all four symphonies, the Violin concerto and the Haydn Variations. Two concerts were devoted to the master's chamber music, and Dr. Wüllner gave a recital of those songs which are seldom heard. The orchestra consisted of the Meiningen Hofkapelle and the Munich Tonkünstler Orchestra; the vocal works were rendered by the famous Görzenich Society of Cologne. Fritz Steinbach of Cologne was the festival conductor. In all respects this first Brahms festival was a signal success. The annual festival of the Allgemeiner Deutscher Musikverein, which was held in Stuttgart in June, proved a complete failure. Not one of the works—all novelties—was worth the trouble of performing. The Dresdener Lehrergesangverein (conductor Römhild) celebrated the twenty-fifth anniversary of its foundation by a splendid performance of Wagner's *Liebesmahl der Apostel* in the Frauenkirche, the very place in which the first performance of the work took place in 1843. Two chamber-music festivals, one at Darmstadt, the other at Bonn, were unqualified successes. The centenaries of Haydn's death and Mendelssohn's birth, and the semi-centenary of Spohr's death were generally ob-

served in the programmes of the various concert institutions.

AUSTRIA. Owing to the celebration of the diamond jubilee of the accession to the throne of Franz Josef and the centenary of Haydn's death the musical offerings of the entire year assumed something of a festival character. The Haydn celebration took place at the end of May. All of the master's famous works, and many that nowadays are seldom or never performed, were heard. The climax was a magnificent performance of *The Creation* under the direction of Ferdinand Loewe. Vienna also had Strauss's *Elektra* with Lucile Marcell, an American artist selected by the composer himself, in the title rôle. The reception of the work was not over-enthusiastic. Two other novelties brought out by Weingartner at the Royal Opera turned out failures. The Vienna Philharmonic Society abandoned its policy of inviting guest-conductors, and elected Weingartner as its permanent director. Bruckner still maintains his strong hold on the Viennese public, as is shown by performances of six of his eight symphonies. The famous conservatory of the "Gesellschaft der Musikfreunde" passed under state control, and is henceforth known as "Kaiserlich-Königliche Akademie der Tonkunst."

ENGLAND. An innovation in the operatic life of London was a four weeks' season of grand opera in English on a most elaborate scale at Covent Garden. The works performed were Wagner's Ring-dramas and *Meistersinger* and Puccini's *Madame Butterfly*. The artists were all English and American. The Brünnhilde of Mrs. Saltzmann-Stevens, an American, was regarded as one of the finest ever heard in London. Dr. Richter conducted. The success of the new venture was so pronounced that the management, yielding to the popular demand, gave another four weeks' season in October with the same artists. *Tannhäuser* and *Tristan und Isolde* were added to the repertoire. During the regular season (April-July) only French and Italian operas were given; but two extra performances of *The Valkyr*, with Mrs. Saltzmann-Stevens as Brünnhilde, were added by request. The season was opened most brilliantly with a superb performance of Saint-Saëns's *Samson et Dalila*, with the composer present in the audience. It was, moreover, the first performance of the work as an opera in England. Of the novelties Debussy's *Pelléas et Mélisande* made little impression, and was withdrawn after three performances. Charpentier's *Louise* aroused considerable diversity of opinion. Camille Erlanger's *Tess* proved a pleasing work, and met with success. The Moody-Manners Company gave their usual season of opera in English at the Lyric Theatre in August. Alick Maclean conducted the première of his one-act opera, *Maitre Sciler*, which was well received. Wagner's *Rienzi* had its first performance in English; the work had not been heard in England since 1882. At the Coronet Theatre the Castellano Company gave twenty-four performances of Italian operas, in the course of which Leoncavallo's *Zaza* was heard for the first time in England, and proved a dismal failure. Considerable attention was attracted by "The Children's Opera Company of Rome," which is composed entirely of children from southern Italy. Vittorio Gamba, a fourteen-year-old boy, was the principal tenor, and Dora Theor, sixteen years of age, the prima donna. Very remarkable per-

formances of *Lucia*, *Sonnambula*, *Il Barbiere di Siviglia*, and *The Geisha* were given at Terry's Theatre.

Thomas Beecham organized a new symphony orchestra of 85 players, which immediately took its place among the great English orchestras. The programmes were remarkable for their wide range, although not a single work by Beethoven or Brahms was performed. English composers were well represented. Mr. Wood's series of 60 promenade concerts was the most successful he has ever given. Not less than 42 novelties, many by English composers, were produced. The London Philharmonic Society ended the year in very bad condition. The venerable organization, which in former years relieved Beethoven from financial embarrassment in his last days, and later was one of the earlier champions of Wagner, seems to be hopelessly moribund. Even the great conductors by whom it was directed during the past year failed to attract a sufficient number of supporters. The general impression prevails that the society will only be kept together for another year, which will be the one hundredth of its existence, and that then it will be dissolved. The Société des Concerts Français made active propaganda for the works of the new French school. One concert was devoted entirely to works by Debussy. But English audiences maintain their attitude of indifference towards the new art. Even the personal appearance of Debussy with the Queen's Hall Orchestra could not arouse enthusiasm. Elgar's *Symphony*, which was accorded such an enthusiastic reception on its first hearing in the fall of 1908, has already lost its hold on English audiences in spite of performances led by such men as Wood and Nikisch. A matter of interest was the discovery in the British Museum of a concerto for string quintet, two oboes and piano by an unknown English composer, John Hendon (1690-1755). The work was immediately performed, but proved to be of little value. The Mendelssohn centenary was observed in conjunction with a Handel festival at the Crystal Palace, and the programme was typical of the state of music in England of half a century ago. At the Three Choirs' Festival in Hereford Schubert's *Lazarus* had its first performance in England. The *Messiah*, *Creation*, *Elijah*, *Apostles*, and Elgar's *Symphony*, were given, besides excerpts from *Parsifal* and new works by Davies, Bantock, and Delius. On the programmes of the Birmingham Festival were *Elijah*, *Judas Maccabaeus*, *The Dream of Gerontius*, Berlioz's *Faust*, Cherubini's *Mass in C*, and Brahms's *Schicksalslied*. The Newcastle Festival had the assistance of the distinguished Busoni, who conducted his own concerto for piano. Brahms's *Trumpflied* was also heard. The novelty was Rimski-Korsakoff's *Ballad of the Door of Olg*.

FRANCE. Almost all the important operatic institutions were seriously affected by the prolonged absence of some of their best artists in America. The Paris Grand Opéra reports a deficit of 300,000 francs, due partly to the New York opera war, partly to the trouble incident to a double directorship. The latter difficulty was ended by placing M. Messager in absolute control. The principal artistic event of the year was the first production of Wagner's *Rheingold* in December under the baton of Messager. It was an overwhelming success. At last all of the Wagner dramas, except *Parsifal*,

have found their way into the repertoire of the Opéra. Another noteworthy event, that proved a great artistic and financial success, was a gorgeously mounted performance of Spontini's *La Vestale*, presented by the full personnel, including the orchestra and chorus of La Scala of Milan. Massenet's latest opera, *Bacchus*, was a distinct disappointment; but *Monna Vanna*, by Février, was received with favor. At the Théâtre Châtelet a season of Russian opera with Russian artists was given during May and June. The works performed were Rimski-Korsakoff's *Ivan*, Borodin's *Prince Igor*, Glinka's *Ruslan and Ludmilla* and several ballets. At Monte Carlo Russian works played an important part in the repertoire. Glinka's *Life for the Czar*, Rubinstein's *Demon*, and Dargomishki's *Rusalka* were frequently mounted. At Lyons the great event was the local première of Wagner's *Flying Dutchman*. At the Théâtre Lyrique de la Gaîté a season of opera at popular prices was well patronized. A new work, *Quo Vadis* by Nougès, aroused great enthusiasm. The same composer scored another marked success with his *Chiquito*, produced at the Opéra Comique. At the same institution de Séverac's *Le Coeur du Moulin*, a typical work of the newest French school, achieved more than an ordinary success.

For the benefit of the Beethoven Monument Fund a festival concert, consisting exclusively of works by Beethoven, was given at the Opéra. It not only added materially to the fund, but aroused a regular Beethoven fever. The Colonne and Lamoureux orchestras played all nine symphonies in chronological order; the Touche and Rouge orchestras performed all the other orchestral works, also in chronological order; the Quatnor Capet rendered all the string quartets; the Quatnor Parent the master's entire output of chamber-music; Pugno and Ysaye all the sonatas for violin and piano; and last, but by no means least, Risler played all the sonatas for piano.

ITALY. All operatic managers report heavy financial losses, which they ascribed to the opera war in New York, and the failure of almost every novelty put forward. Some of these new works, it is claimed, would have been successful if the artists now in America had been available at home. The absence of Gatti-Casazza and Toscanini from La Scala in Milan resulted in the withdrawal of all the Wagner works, just now the most profitable works in all Italian opera houses. Strauss's *Elektra* was given at La Scala in March under the direction of the composer, but met with an icy reception. Both Strauss and Debussy are much discussed, but their works throughout the country encounter violent opposition.

NAGEL, CHARLES. An American lawyer and Cabinet officer. He was born in Colorado county, Texas, in 1849. His early education was obtained in the public schools, and he graduated from the St. Louis Law School in 1872. In the year following he studied at the University of Berlin, and in the same year was admitted to the bar. He began practice in St. Louis, where he became one of the foremost members of the bar. In 1881-3 he was a member of the State Legislature and from 1893 to 1897 was president of the St. Louis City Council. From 1886 he was a member of the faculty of the St. Louis Law School. Early in 1909 he accepted the invitation of President Taft to become Secretary of Commerce and Labor in his Cabinet.

NATAL. A British colony in South Africa. Capital, Pietermaritzburg.

AREA, POPULATION, ETC. Estimated area, 35,371 square miles (inclusive of Zululand, 10,461 square miles, and the northern districts, 6931); coastline, about 360 miles. Population, according to the census of April 17, 1904, 1,108,754 (including 3774 British troops and their families). Estimated population, December 31, 1908 (exclusive of military), 1,206,386 (91,443 whites, 7386 mixed, 116,679 Asiatics, 990,878 natives). Estimated population of Pietermaritzburg, December 31, 1908, 31,230; of Durban, or Port Natal, 60,244. There are 41 primary schools, 2 government high schools, 2 art schools, 5 Indian schools, and 2 government schools for colored children; beside 472 private government-aided schools for the several classes. European children in regular attendance (1907), 12,504; others, 14,708.

AGRICULTURE. The highly fertile coast region produces corn, sugar, coffee, arrowroot, ginger, tobacco, bananas, and pepper. The midland district is adapted for cereals, and the upland region for sheep-farming and cattle-raising. Tea is cultivated, and wattle bark is stripped (11,846 tons in 1907) for export. The area under corn increased 15 per cent. in 1907-8. In 1907, 347,900 acres were under cultivation by Europeans (corn, 117,750; sugar, 13,549; Kaffir corn, 6768); by natives, 455,000; by Indians, 30,671. The live-stock owned by Europeans numbered (1907) 227,748 cattle, 30,344 horses, 661,466 sheep, 131,811 goats, 24,922 pigs. The wool clip (1907) was 1,979,099 lbs., against 1,884,615 lbs. in 1906.

Mining. The coalfields are extensive, and are connected by rail with the seaport of Durban. The 1908 output was 1,669,774 tons, against 1,530,043 in 1907. Enormous quantities of iron ore exist near Pietermaritzburg, and mining operations have been begun on a paying basis. Asbestos, copper, fireclay, gold, graphite, gypsum, lead and silver, limestone and marble, manganese, molybdenum, nickel, nitrate, tin, and phosphate are found in varying quantities.

COMMERCE. The value of the commerce for three years is given below:

	1906	1907	1908
Imports	£9,705,256	£8,704,222	£7,903,412
From Gt. Brit.	4,293,536	3,709,670	3,640,918
Exports	10,405,707	10,049,132	9,622,474
To Gt. Brit.	1,487,508	1,779,089	1,663,794

Board of Trade returns give the principal domestic imports from Great Britain in 1908 as follows: Metals, £441,681; apparel, £476,277; machinery, £377,549; cottons, £386,821. Exports to Great Britain: Wool, sheep, £638,546; dye stuffs, £157,325; hides, etc., £153,771; corn, etc., £70,518.

COMMUNICATIONS. Total length of railways December 31, 1907, 976 miles, all constructed or worked by the government. Total cost of construction to end of 1908, £13,989,202; receipts for 1908, £1,832,862; expenditure, £1,240,319. There were (1907) 1964 miles of telegraph lines (wires, 6779 miles), and 181 miles of telephone lines (wires 2315); telegraph offices, 213; post-offices, 380. The registered shipping (1907) showed vessels of 3334 tons. Shipping entered (1907), 1008 vessels of 2,540,596 tons (British, 792 of 2,139,756 tons); cleared, 1007 of 2,513,463 tons (British, 790 of 2,110,310).

FINANCE. The revenue, expenditure, and debt for three fiscal years are given as follows:

	1906	1907	1908
Revenue	£3,665,089	£3,471,932	£3,510,850
Expenditure ..	3,673,972	3,681,914	3,689,752
Debt	19,484,143	20,760,992	21,135,534

The principal sources of revenue (1907) were as follows: Railway, £1,881,551; customs, £539,900; stamps and licenses (including poll and hut tax), £414,937; posts and telegraphs, £173,925; port, harbor, and wharf dues, £108,626; excise, £60,470; land sales, £56,203. Items of expenditure: Railways, £1,385,620; police and gaols, £294,151; public works, £182,186; posts and telegraphs, £157,080; education, £102,033; militia, £69,234.

The Natal police and an active militia formed the defense of the colony and in 1909 were as follows: Natal police (mounted) 857 of all ranks exclusive of native and Indian constables; militia, 2432, of which 1356 were mounted and 255 were in the artillery. The colony also had 122 rifle associations with a total strength of 5005, 235 senior cadets, and 3277 school cadets.

GOVERNMENT, ETC. The colony is administered by a governor (1909, Lieut.-Col. Sir Matthew Nathan, governor and commander-in-chief) assisted by a council and an assembly, both legislative; the latter elected by popular vote. By the South African act Natal is to be made a member of the Union of South Africa. See *SOUTH AFRICA, BRITISH*.

HISTORY. On March 3, the long trial of Dini-zulu came to an end. The court sentenced him to five years imprisonment dating from his arrest fifteen months before, on the charge of harboring rebels. The other charges against him were dismissed. A serious railway strike (see *STRIKES AND LOCKOUTS*) occurred in April. The strikers found little sympathy in the public, their course being regarded as aggressive and their demands as unjustified. They refused the government's offer to investigate and threatened to oppose South African Union if their demands were not complied with. The chief ostensible cause of the strike was the objection to piece-work. The strike ended in the following month. The leaders were not reinstated. On the opening of Parliament on June 16 the Governor congratulated the country on the good prospects of Union, a large majority being in its favor. (See *SOUTH AFRICA, BRITISH*.) A new Council for Native Affairs was appointed in the summer, consisting of four native commissioners, three members of the Legislative Assembly, and the Permanent Secretary for Native Affairs. It was designed in the interest of the natives to whom it supplied the means of making their wishes known to the government. On November 3, the Legislative Assembly rejected a land expropriation bill which empowered the government to take possession of lands for purposes of closer settlement. In November the report of the Commission on Indian immigration was published. It recommended the complete exclusion of free but not of indentured labor. The arguments currently urged against Indian labor, namely, that it was virtually servile in character and tended to demoralize the people and that it replaced both native and white labor, were declared to be ill-founded. A large body of evidence was offered to the Com-

mission as to the untrustworthiness of native labor. The existence of certain industries depended on indentured Indian labor.

NATIONAL ACADEMY OF DESIGN. A society of artists, originated in 1825 as the New York Drawing Association. It took its present name in 1828. The originators chose from their number 15 artists, who chose 15 others, these 30 constituting the new society. The aim of the Academy is to further the arts of design and it has maintained schools since its foundation with this object in view. On its rolls are found the names of nearly all the most eminent artists of America. The schools are free to its accepted students, the one limitation being that none but students who are going to follow art as a profession and who are under thirty years of age, are eligible. The students admitted, after passing an examination sufficient to demonstrate a reasonable fitness for the vocation, are afforded the advantages of study under the instructors of the Academy. The atelier system, by which each student from his entrance and during his progress through the school remains under the direction of one and the same instructor, except in special classes, is in force in the schools of the Academy. The schools are in session from the beginning of October to about the middle of May of each year. In 1906 the Society of American Artists was united with the Academy, all the members of the American Artists becoming members of the National Academy of Design. There are various prizes and medals awarded at the Annual Winter Exhibitions of the Academy of oils, pastels and sculpture. The Carnegie prize of \$500 awarded for the most meritorious oil painting in the exhibition by an American artist, portraits only excepted, was awarded in 1909 to Gardner Simons for his painting entitled "An Opalescent River, Deerfield Valley." The Thomas R. Proctor prize was awarded to Montague Flagg. The Isidor Memorial prize for the best figure composition was awarded to Frederick Ballard Williams, and the Helen Foster Barnett prize for the best piece of sculpture shown in the Winter Exhibition, the work of an artist under thirty years of age, was awarded to Chester Beach. John W. Alexander was chosen president of the Academy in 1909 to succeed Frederick Dielman. The Academy is made up of Academicians and Associates. Of the former there were in 1909 about 150, and of the latter, about 115. The officers in 1909 were President, John W. Alexander; Vice-President, Herbert Adams; Corresponding Secretary, H. W. Watrous; Recording Secretary, Kenyon Cox; Treasurer, Francis C. Jones. These, with Will H. Low, J. Alden Weir, Frederick W. Kost, Edwin H. Blashfield, Frederick Dielman and Cass Gilbert, made up the Council.

NATIONAL ACADEMY OF SCIENCE. See SCIENCES, NATIONAL ACADEMY OF.

NATIONAL BANKS. On September 1, 1909, national banks numbered 6977, as compared with 6865 on November 27, 1908. Their aggregate resources were \$9,573,954,000. The loans and discounts amounted to \$5,128,882,000, of which 18 per cent. were credited to New York City banks, 7.5 per cent. to those of Chicago and St. Louis combined, and 26.7 per cent. to those of other reserve cities. Over 41.5 per cent. of the loans and discounts of New York City banks were classed as "on demand, se-

cured by stocks, bonds, and other personal securities," as against 13.6 per cent. for all other national banks. This difference is largely due to the stock exchanges. On the other hand, only 15 per cent. of the loans and discounts of the New York City banks were time loans secured by two-name paper, as against over 37 per cent. for all other banks.

National banks had on deposit, October 31, 1909, a total of \$679,545,740 of United States bonds to secure circulation and \$52,341,800 of the same to secure government deposits, besides about \$23,000,000 such bonds on hand. These banks thus owned about 80 per cent. of the interest-bearing bonded debt of the United States. In addition, national banks held a total of \$898,388,000 of other bonds, of which 38 per cent. were railroad bonds, 17 per cent. were State, county and municipal bonds, and 18 per cent. were the bonds of public service corporations other than railroads. The money held by national banks included \$519,440,000 gold and gold certificates; \$146,957,000 silver coin and silver certificates, and \$187,673,000 legal tender notes.

The aggregate capital, September 1, was \$944,642,000; surplus, \$597,981,800, and undivided profits, \$203,756,000. Circulation outstanding November 1, was \$703,940,000, an increase of about 6 per cent. over the amount reported for November, 1908. This included \$25,595,000 secured by lawful money. The increase was partly due to the organization of new banks, but mainly due to the withdrawal of government deposits. That is, the government reduced its deposits with national banks from \$111,802,000 in November, 1908, to \$35,226,900 in September, 1909; the banks used the bonds thus released as the basis for increased circulation. Not only was the circulation greater than ever before, but it bore a larger ratio to capital (69.6 per cent.) than at any time since 1881. Of the circulation about 42 per cent. was ten-dollar notes, 28 per cent. in twenties, 20 per cent. in fives, and most of the remainder in fifties and one hundreds. An important item in computing the net earnings of banks on circulation during 1909, was the decline in the value of the 2 per cent. consols, which comprise about 90 per cent. of the bonds deposited to secure circulation. Their market value in November, 1908, was 103.752; in October, 1909, 101.052.

During the year 149 national banking associations voluntarily liquidated; of these 25 were absorbed by other national banks; 14 were absorbed by other kinds of banks; 83 reorganized as State banks; 2 became new national banks; and 25 quit business. Almost all of those reorganized as State banks were in Oklahoma and desired to take advantage of the deposit guarantee law.

In September, 1908, the National Monetary Commission (see BANKS AND BANKING) sent out a circular letter of inquiry to national bankers throughout the country with reference to administrative changes deemed desirable. Thereafter the Comptroller, his official staff and the Secretary of the Treasury held a hearing at which members of the American Bankers Association presented views on desirable reforms. A point much emphasized was the proposal to limit the amount of a single firm's paper that any one bank may discount, in the same manner that loans to one person or firm

are now limited. The circular letter, and the hearings have been published. Early in the year the Comptroller, in continuation of the policy begun in 1908 of increasing the efficiency of bank examinations, required examiners to give bond in the sum of \$20,000, and to take an oath of office. He also appointed an examiner at large, whose duty it shall be to visit banks reported to be in bad condition and remain with them until their status is satisfactory. At the same time the Comptroller forbade examiners being stockholders or borrowers of any bank in the system, thus rooting out a condition that had aroused criticism. This last order followed an extensive inquiry by the Comptroller, which showed that most of the examiners were borrowers at national banks, many were stockholders and a few were even officers.

It was in continuance of this policy of correcting abuses and extending proper control that late in November the Comptroller called attention of bankers to the practice of making overloans, and stated that should this continue he would require the forfeiture of the charters of offenders. About three years ago investigation showed that more than 60 per cent. of the banks were violating that provision of the law fixing the maximum loan at 10 per cent. of capital. The law was subsequently amended, now permitting a loan to any one client equal to 10 per cent. of the combined capital and surplus, but not in excess of 30 per cent. of the capital. Even this liberal provision has been violated by more than 15 per cent. of the banks. At the same time the Comptroller requested banks to hold directors' meetings at least once each month. To enforce such request is not within the power of the Comptroller, but he solicited the co-operation of the banks to this end. Effort will be made to have included in the by-laws of banks hereafter chartered a provision of monthly directors' meetings for the approval of loans, before the charter is granted. See BANKS AND BANKING, CURRENCY, and FINANCIAL REVIEW.

NATIONAL MONETARY COMMISSION. This Commission was provided for by the Aldrich-Vreeland Emergency Currency Act of May 30, 1908, and consists of nine Senators and nine Representatives. Since its organization, with Senator Aldrich as its chairman, it has made extensive studies of banking and currency conditions in all parts of the world. It has employed experts for numerous lines of research and has not spared expense in the furtherance of its inquiries. It has determined not to urge legislation before the winter of 1910-11, and has, meanwhile, begun a publicity campaign for the purpose of winning favor for the central bank idea. To this end it has organized a press bureau for the distribution of news-

paper material. At the same time the Commission has announced that it will publish somewhat more than fifty monographs and documents prepared for it by economists and special investigators. Among these are the following: *The First Bank of the United States*, by Dr. J. T. Holdsworth; *The Second Bank of the United States*, and *The History of State Banks before the Civil War*, by Davis R. Dewey; *The Safety-Fund Banking System in New York*, by Dr. R. E. Chaddock; *The Origin of the National Banking System*, by Andrew M. Davis; *History of Crises under the National Banking System*, by Dr. O. M. W. Sprague; *A History of the National Bank Currency*, by A. D. Noyes; *The Use of Credit Instruments*, and *The Development of the Independent Treasury System*, by Dr. David Kinley; *Seasonal Variations in the Demand for Currency and Capital*, by Dr. E. W. Kemmerer; *The Foreign Balance of the United States*, by John E. Gardin; *Clearing House Methods and Practices*, by J. G. Cannon; *The History of Banking in Canada*, by R. M. Breckenridge; *The Canadian Banking System*, by Dr. J. F. Johnson; *The English Banking System*, by Hartley Withers; *The History of Banking in England*, by H. S. Foxwell; *The Evolution of Credit and Banks in France*, by André Liesse; *The Bank of France in its Relations to Credit*, by Maurice Patron; *The French Banking System*, by Albert Aupetit; *The Great German Banks*, by Dr. J. Rieser; *Banking in Italy*, by Carlo F. Ferraris; *The Swedish Banking System*, by A. W. Flux; and *The National Bank of Belgium*, by Charles A. Conant. See BANKS AND BANKING; FINANCIAL REVIEW; CENTRAL BANK; and other articles on kindred topics.

NATIONAL MUSEUM, UNITED STATES. See UNITED STATES NATIONAL MUSEUM.

NATURAL GAS. The total production of natural gas in 1908 was 402,140,730,000 cubic feet, valued at \$54,640,375 as compared with 400,406,622,119 cubic feet in 1907. The value remained practically the same. This slight increase continues the remarkable increase in the growth of this industry from 1882, when the value of the production was only \$215,000. The production of natural gas has become one of the great established industries of the country. Its development is shown by the extension of the gas districts in the Appalachian fields, by the development of the Mid-Continent and Gulf fields, which has practically only begun, and by the systematic efforts made to conserve the consumption of this fuel. The history of the industry shows an increasing quantity consumed for industrial purposes and an increased price for the gas. Pennsylvania is first among the States in the production of natural gas, with West Virginia second, and Kansas third.

NATURAL HISTORY, AMERICAN MUSEUM OR. An institution established in New York City in 1869 for the purpose of maintaining a museum and library of natural history, and advancing knowledge of kindred subjects. Admission to the museum is free, as pay days were abolished in 1907. In 1909 the State appropriated for the maintenance of the museum \$180,000, while there was appropriated by the trustees and others for collections, expeditions, publications, etc., \$176,008. The permanent endowment on December 31, 1909, was \$2,195,645. The new installations during

the year included several new habitat bird groups, a group of Rocky Mountain sheep, various cetaceans, three new meteorites and the rearrangement of the Jesup wood collection. Exploring parties representing the museum were maintained during the year in the Congo, British East Africa, Tahiti and the South Sea Islands, Arctic America, Mexico, Central America, British Columbia, Alaska, Wyoming, Montana, Southwestern United States, Florida, Massachusetts, Philippines, Borneo and Celebes. Mr. Carl E. Akeley has been commissioned to prepare an African elephant group and was in Africa during the year collecting material for this group. Several animals were contributed by Mr. Roosevelt, whom Mr. Akeley met in British East Africa.

Among the special exhibitions held at the museum during the year were the Tuberculosis Exhibition; the "Indians of Manhattan Island and Vicinity," arranged in connection with the Hudson-Fulton celebration, and the zoölogical and ethnological material brought from the Arctic regions by Commander Peary. Among the gifts, in addition to those mentioned above, were a large collection of anthropological specimens from the Fiji Islands, a specimen of the Dinosaur *Trachodon* with epidermal impressions, and the Cape York, or Peary Meteorite, including Ahnighito, the largest known meteorite. All of these were the gift of Mrs. Morris K. Jesup. The principal contributions to the endowment fund during the year were bequests of \$10,000 each from William R. Sands and Phebe Anna Thorn. The total membership of all classes on December 31, 1909, was 2372, a net increase of 224 for the year. The president is Henry F. Osborn.

NATURAL RESOURCES, CONSERVATION OF. See FORESTRY, LANDS, PUBLIC and UNITED STATES, paragraphs Administration.

NAVAL PROGRESS IN 1909. The increase in the naval strength of the great Powers of the world continued unabated in 1909, and the struggle to be in a position of naval supremacy was largely in evidence in the budgets and government policies of the different nations. The accompanying tables indicate clearly and concisely the strength of the naval forces of the world Powers and show the important increases that are being made, especially in the more powerful battleships.

The construction of a powerful navy by Germany continued to excite great anxiety in England and it was stated in the House of Commons that the Admiralty must be placed in a position to give the preliminary orders for the armament and equipment of four more *Dreadnaughts*. It was announced in July that those needed would be laid down at the end of the financial year independently of the programme adopted for the ensuing year. A comparison of the budgets for new construction and armament in Germany and Great Britain in 1908 showed a difference of only half a million pounds, the German vote being £10,751,466. In 1909 the total vote for the maintenance and expansion of the German fleet was £21,704,411, of which £12,177,500 was exclusively for construction and armaments. Thus it will be seen that the provision of a great navy is a serious financial undertaking and that it was Great Britain's policy to force Germany to reduce her shipbuilding pro-

gramme by the triumph of British competition and armaments and by the financial embarrassment likely to be experienced in connection with her great army and her increased naval strength, which was becoming second only to that of Great Britain. Great Britain's position further was strengthened by the co-operation of the dominions abroad. Evidences of important progress are to be seen in the armored vessels building in England, which were battleships of the *Dreadnought* type, and armoured cruisers of the *Invincible* type. Both classes were all-big-gun, one calibre ships; but, in the cruisers, the speed was increased about 25 per cent. and the armament and armor correspondingly reduced. Six armored ships were begun in 1909; seven were building, of which four were completed, and are in commission with the home fleet.

In 1909 the *Dreadnought* programmes of England and Germany were the same. Three battleships and one armored cruiser were provided for on each side, while, in addition, there was the "conditional" British programme of 4 ships, to be commenced on April 1, of 1910. It was supposed that the first three battleships would resemble the *Neptune*; while the "conditional" three would mount the new 13.5 inch gun. The cruisers probably would each carry 10 12-inch guns, and steam some 28 or 29 knots. The 1909 German vessels would, it was believed, be the same as these of 1908, except that they all were to be equipped with turbines.

Dreadnoughts	Great Britain	Germany
Completed	8	2
Launched	4	7
Building	4	4
Ordered	14	•4

† The four ordered are the "conditional" ships; they include the one provisionally ordered from the Thames Ironworks.

* These ships (3 battleships, and 1 armored cruiser) belong to the 1910-1911 programme.

The 13 German ships built or building were to mount 150 guns of 11 inch and 12 inch calibre, to 152 of the 18 British ships; while the Germans have a considerable superiority in secondary armaments.

For the design and construction of the battleships themselves and their armament the reader is referred to the article BATTLESHIPS.

ORGANIZATION. Changes in character of fighting ships and their armament led to new methods of organization in several important navies, all with the object of securing increased military and administrative efficiency. In the United States, the Newberry plan was succeeded by the Meyer plan. The first (January 25, 1909), made the naval constructor at navy yards the principal technical assistant of the Commandant responsible for the efficiency of the manufacturing force. The second again put line officers in control in the navy yards; it also gave the Secretary of the Navy four aids as advisers, to be, as far as practicable, flag officers, for personnel, operations, material, and inspections; the Bureaus were to conduct business with the Secretary through the proper aid. The Marine guard, withdrawn by President Roosevelt, were returned to ships, in accordance with provisions of the Appropriation Bill. (See UNITED STATES section *Navy*.) In France, the Minister of Marine, Admiral de Lapeyrière, reorganized the Navy Department; and appointed four admirals as inspectors of the fleet. A corps of Naval Engineers was created on November 6; the anomaly of having naval guns designed by the Colonial Artillery has therefore ended. The British Navy War Council was established in October to study naval strategy, and work out naval war plans. All its members are *ex-officio*: President, First Sea Lord, as Chief of Staff; the Heads of the Naval Intelligence Department, and of the Naval Mobilization Department.

DISTRIBUTION OF FORCES. The United States Pacific Fleet was separated into a Pacific and an Asiatic Fleet; the former consisting of eight armored cruisers; the latter, of one coast defense ship, protected cruisers, gunboats, and one torpedo flotilla. The British Home Fleet was also reorganized: The Channel Fleet became part of it; and there was a rearrangement of the cruiser squadrons and torpedo flotillas. The distribution was 16 fully manned battleships, in two divisions, with 6 battleships of the Atlantic Fleet associated with them (the Atlantic Fleet was to use both Dover and Berehaven as bases), making 22 fully manned battleships in home waters. Ten fully manned armored cruisers, in two squadrons; associated with them was the squadron of 4 armored cruisers of the Atlantic Fleet, making a total

* The Admiral of the Navy.

(a) Includes 3,267 men of Coast Guard.

(b) Includes pharmacists and apothecaries.

(c) Includes adjutants, maitres, and premier maitres of all branches.

(d) The United States has now temporarily, as extra numbers, due to promotion for war service, 9 flag officers, 10 captains, 9 commanders, 11 lieutenant-commanders, and 4 lieutenants.

of 14 fully manned armored cruisers in home waters, exclusive of 5 armored cruisers employed at sea on training service. There were also in the fully manned division 10 attached cruisers and scouts, 48 destroyers, and various auxiliary vessels. The nucleus crew ships, including the remainder of the destroyers, the submarines, and the special service vessels with reduced nucleus crews are organized as two additional divisions of the Home Fleet under a vice-admiral. In October, the French Mediterranean force became the First Squadron; the Northern Squadron became the Second Squadron. Each squadron consists of 6 battleships, 4 armored cruisers, 1 first class protected cruiser, and a flotilla of 12 destroyers. A battleship and an armored cruiser, with half crews, were assigned as a reserve for each squadron. Neither squadron was permanently attached to any port, as was previously the case.

DOCKS. The construction of improved *Dreadnoughts* necessarily required new and larger docks. The United States contracted for a dry dock at Pearl Harbor, Hawaii; to be 600 ft. long, and 140 ft. wide outside coping. See **DRY DOCKS.**

Japan laid the corner stone of a third dry dock at Kure, to be completed in 1911; length, about 200 m.; to take vessels of 30,000 tons. France had 4 dry docks that could barely take in a vessel of the *Danton* class, 18,350 tons, but their entrances were to be enlarged and six new, larger dry docks were to be built. The Brazilian government ordered a floating dock, of the bolted sectional self-docking type, from Vickers Sons and Maxim, to take the *Minas Geraes* class. The pontoon was to be in three sections; total length, 550 ft. 6 in.; clear width at entrance of 100 ft.; to take battleships drawing 36 ft., and displacing 22,000 tons. The construction of two docks, similar to that ordered by Brazil, was also decided upon by the British Admiralty. In reply to a question involving only the countries named, the British First Lord of the Admiralty stated during the year that the number of docks actually capable of taking a *Dreadnought* was: British Empire, 23; German Empire, 6; France, 5 (should be 4); United States, 5.

ORDNANCE GUNS. A 12 inch, 50 calibre gun, of new design, was completed and tested in the United States. In proof, it gave an initial velocity of 3030 feet a second; muzzle energy, 52,500 foot tons. In five rounds, fired at 17,000 yards range, the dispersion was less than 100 yards. A new type of 14 inch, 45 calibre gun was also made, and initially tested on December 21; projectile, 400 lbs.; charge, 365 lbs.; initial velocity, 2600 f. s.; muzzle energy, 65,600 f. t.; weight, about 63 tons. A mount for this gun has been designed. The British Mark XI, 12 inch, 50 calibre gun was not satisfactory on its trials. The Mark X. was an all wire gun; but, in Mark XI., the wiring was not continued over the chase end of the barrel; and, on proof, this portion of the gun showed weakness. The wiring, it was determined, should be continued to the muzzle. A 13.5 inch gun was made at Woolwich; and was mounted on board the *Excellent*. An improved 4 inch, breech-loading rifle, with high velocity, was introduced into the British service. During 1909, the older types of 12 inch mountings were being brought up to date; and ships carry-

ing them are generally being fitted with modern sights, and elevating and training control gear. The *Invincible* was the only ship in the British Navy using electrical control for her 12-inch guns and turrets, the British having clung to hydraulic power, in spite of the success of electrical control in the American Navy. At the *Invincible's* trials, her electric control gear proved a comparative failure, increased speed of working as against hydraulic gear not being realized. Nevertheless, electric control met with much favor among the younger gunnery officers.

GUNPOWDER. In the United States, powder was made more uniform; its safe life having been prolonged by the addition of a very minute quantity of a substance found to protect stability. A new government powder factory was established at the Torpedo Station, Newport, R. I., and was in operation at the close of the year. In France, after the *Jena* disaster, it was decided to isolate the black powder; and lower the temperature of all ammunition rooms. It was claimed that the French 12-inch gun could fire 300 rounds; the Italian, only 80; the British, 100; the difference being due, not to the gun, but to the French powder, which contains no nitroglycerine. "B" powder was good as to stability, preservation of the gun, and uniform ballistics. Accidents aboard ship have been due to neglect of the regulations, not to "B" powder.

PROJECTILES. In the United States, improvements in form gave a very material increase in range, with a corresponding flatness of trajectory, increase in danger space, striking velocity, and penetration. A change in the rotation band was expected to prolong the life of the gun by insuring true flight of the projectile after the tube was worn.

FIRE CONTROL. The American lattice or skeleton fire control mast did not meet with favor in other navies. The observers are entirely exposed; and it was claimed that vibration of the mast will prevent accurate observations. All the battleships of the United States Atlantic Fleet were fitted with them, after a thorough test on the Monitor *Florida*. During the year, there were notable improvements in range finders; and several new types of instruments for the transmission of range and deflection were under consideration. In England, extensive experiments were carried out in the effort to perfect a system for automatically controlling the fire of all the guns of a ship from one station. The British retained the tripod mast, usually two to a ship; but it was probable that in future ships there would be only one fire control mast. There was a tendency to control gun fire from behind armor. The *Neptune* had her fire control station amidships, between the two funnels and tripod masts. It was said that the *Lion* will have an armored tower as a fire control station.

WIRELESS TELEGRAPH. The United States scouts *Birmingham* and *Salem* were equipped with a system capable of sending and receiving for at least one thousand miles under all conditions, and of sending and receiving for three thousand miles under favorable conditions. Extensive experiments at sea, at long distances, were carried out with these ships. A high power station at Washington was contracted for, with a radius of 3000 miles by day and night, capable of overcoming inter-

* Battleships having a main battery of all big guns. (11 inches or more in calibre.)

** Battleships, first-class are those of (about) 10,000 or more tons displacement.

† Includes smaller battleships and monitors.

†† Armored cruisers having guns of larger calibre in main battery and capable of taking their place in line of battle with the battleships. They have an increase of speed at the expense of carrying fewer guns in main battery and a decrease in armor protection.

† All unarmored war ships of more than 1,000 tons are, in this table, classed according to displacement as cruisers. Scouts are considered as cruisers in which battery and protection have been sacrificed to secure extreme speed. The word "protected" has been omitted because all cruisers except the smallest and oldest now have protective decks.

The following vessels are not included in the tables:

Those over twenty years old, unless they have been reconstructed and rearmed since 1900.

Those not actually begun, although authorized.

Transports, colliers, repair ships, torpedo depot ships, converted merchant vessels, or yachts.

Vessels of less than 1000 tons, except torpedo craft.

Torpedo craft of less than 50 tons.

ference and static discharges; and insuring secrecy of operation. See WIRELESS TELEGRAPHY.

MOTIVE POWER. In the United States, electric propulsion was discussed; two methods have been proposed, the "combination drive," and the "electric drive." In the first, use is made of both electric motors and low pressure steam turbines for driving the propeller shafts; in the latter, this propulsion is wholly by electric motors. Liquid fuel is now used in the United States navy as an auxiliary of coal after many thorough tests. Water tube boilers had been, or were being, installed in all British armored vessels in course of completion, or under construction. Oil burning appliances had been completed in 10 armored vessels; and all armored vessels under construction were being fitted to burn oil in conjunction with coal in the boilers as an alternative fuel, the full power being obtainable in these vessels by the use of coal alone. The turbine has been proved best for all kinds of naval vessels, needing little attention, and no great skill in operating, a small engine and fireroom force; full power is easily maintained; it can be worked at any proportion of full power; the machinery lies low in the ship; and weight is saved. See STEAM TURBINE.

NAVARRO, JOSÉ FRANCESCO DE. A Spanish-American engineer and financier, died February 3. He was born in Spain in 1833. He was educated for the navy, but when a mere youth he went to Havana, Cuba, and engaged in the study of mechanics and railroading. In 1852 he went to Philadelphia, but returned soon to Cuba, where he formed the Mercantile Company of Cassanova and de Navarro. He came to New York in 1855, where he founded the first line of steamers plying from New York to Brazil. He established later the Commercial Warehouse Company, and the Ingersoll Rock Drill Co. Among the important constructions carried on by Mr. de Navarro was the Metropolitan Elevated Railroad. He built also the first modern apartment house in New York City. A son of Mr. de Navarro married Mary Anderson.

NEBRASKA. One of the North Central Division of the United States. Its area is 77,530 square miles. Its population in 1909, according to a Federal estimate made in that year, was 1,069,579.

MINERAL PRODUCTION. Although there are deposits of several minerals of importance in Nebraska the resources of the State are in process of development. One fairly good coal mine is operated and others are projected. There are deposits of silica, and sand and gravel exist in large quantities. There is also a considerable amount of good building stone. The clay products are of considerable importance, amounting in 1908 in value to \$956,516 as against \$953,432 in 1907. During 1908 boring for oil was carried on in several localities. The total value of the mineral products of the State in 1909 was \$1,425,388 as compared with a value of the product of 1907 of \$1,383,916.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to the figures of the United States Department of Agriculture, were as follows: Corn, 194,060,000 bushels, valued at \$97,030,000 from 7,825,

000 acres; winter wheat, 45,590,000 bushels, valued at \$40,675,000 from 2,350,000 acres; spring wheat, 4,060,000 bushels, valued at \$3,613,000 from 290,000 acres; oats, 61,825,000 bushels, valued at \$21,639,000 from 2,473,000 acres; barley, 2,640,000 bushels, valued at \$1,135,000 from 120,000 acres; rye, 1,320,000 bushels, valued at \$803,000 from 80,000 acres; flaxseed, 136,000 bushels, valued at \$166,000 from 16,000 acres; potatoes, 8,190,000 bushels, valued at \$4,914,000 from 105,000 acres; hay, 2,325,000 tons, valued at \$13,957,000 from 1,550,000 acres. The corn crop of 1909 was considerably smaller than that of 1908, which was 205,767,000 bushels. The winter wheat crop increased in 1909 by about 5,000,000 while the crop of spring wheat was slightly larger than in 1908. The oat crop in 1909 was considerably larger than in 1908, which was 56,078,000 bushels. The rye crop, however, fell off slightly in 1909. The potato crop increased by about 1,000,000 bushels, while the hay crop decreased by about 1,000,000 tons. The farm animals of the State on January 1, 1910, were as follows: Horses, 1,045,000; dairy cows, 879,000; other cattle, 3,040,000; sheep, 393,000; swine, 3,201,000. The wool clipped in 1908 was estimated at 2,172,240 pounds.

EDUCATION. The pupils enrolled in the public schools of the State in 1908 numbered 280,581. This was 26.24 per cent. of the population. The average daily attendance was 191,152. The number of teachers was 10,355. A law was passed in 1907 which raised the standard for private and denominational schools permitted to grant certificates, and raised the minimum entrance requirements of State normal schools to two years of high school education. Other laws passed in the same year provided for four years of free high school opportunity for every child completing the elementary work, tuition to be paid by districts not having four-year high schools.

FINANCE. The report of the State Treasurer for the biennium 1906-8, showed a balance on December 31, 1908, of \$331,900. The receipts from December 1, 1906, to November 30, 1908, inclusive, amounted to \$12,685,147, while the disbursements were \$12,632,610, leaving a balance on hand November 30, 1908, of \$384,437. The trust funds of the State are invested in the permanent school fund, university fund, agricultural college endowment fund and the normal college endowment fund.

POLITICS AND GOVERNMENT. On January 7, A. C. Shallenberger was inaugurated Governor of the State. In his address he advocated a bank deposit guaranty law, by which a tax of one per cent. was to be levied on all bank deposits, the sum to be collected in four equal installments within eighteen months, after which an annual tax of one-tenth of one per cent. will be collected as additional security. An assessment of not to exceed two per cent. may be levied to meet any emergency. The one per cent. tax will raise a fund of \$642,000, which is to be deposited in the banks that will furnish surety bonds for its safety. Such a bill was introduced into the legislature and was passed. It was signed by Governor Shallenberger on March 25. The bill as finally signed by the Governor is a limited guaranty as distinguished from the Oklahoman law, where all the assets of all the banks are back of the guaranty. In Nebraska only a small portion is

utilized. Four semi-annual assessments of one-fourth of one per cent. each are to be levied by the banking board upon the deposits of the banks, and after the accumulation of this fund it shall be maintained by the assessment every six months of one-twentieth of one per cent. If an emergency arises an assessment not exceeding one per cent. a year may be made. If this is insufficient to pay losses, depositors in failed banks must await the accumulation of the money necessary to pay them off, receiving a certificate as evidence of claims. (See BANKS AND BANKING.) Municipal elections were held during the year on the question of license or no license. On April 8, 25 towns voted license and 20 no-license, and on April 14, 82 of the 150 cities and villages voting, voted for license and 68 against. A bill was passed by the legislature and signed on April 8 by Governor Shallenberger forbidding the sale of liquor except between 7 A. M. and 8 P. M. The bill went into effect July 8.

The Republican State Convention was held at Lincoln on July 27. The Convention unanimously endorsed the action of Senators Brown and Burkett in voting against the Aldrich tariff bill, which was denounced as a betrayal of the party's pledge and faith. President Taft was called upon to veto the bill if not remodeled according to his wishes. The amendment adopted by Congress, submitting to the several States for their action a proposed constitutional amendment empowering the Federal government to lay and collect taxes on incomes, was indorsed. By common consent the temperance issue was laid aside until 1910. Nominations for local officers were made. The Democratic State Convention was held upon the same date and a platform was adopted which denounced the tariff bill and accused the Republicans of stealing the income tax plank of the Democratic national platform. Governor Shallenberger was asked to call a special session of the legislature to adopt the amendment. Other planks favored a national constitutional amendment for the election of Senators by direct vote and a State constitutional amendment for the adoption of the initiative and referendum. Like the Republicans, the Democrats postponed action on the temperance question. There was no lack of agitation in regard to temperance in the State, however, and a union of all State temperance organizations was undertaken in August for the purpose of taking a vigorous hand in the politics of the State and ensuring the more complete enforcement of the liquor laws. The new organization is to be known as the State Temperance Union and while it will be quasipolitical in nature, the question of the party will not be considered in the selection or endorsement of candidates. In the elections on November 2, the Republicans elected their entire tickets in Douglas and Lancaster counties, in which Omaha and Lincoln are respectively situated. In South Omaha the Democratic city ticket was elected. On July 13, the election law, under which elections have been held, was declared unconstitutional. See ELECTORAL RE-
FORM.

OTHER EVENTS. On February 21 there were serious riots in South Omaha, incited by inflammatory speeches against the Greeks of the city. Previous to the outbreak a mass meeting of citizens was held to protest against the

presence of the Greeks in the city, and at the appointed time, 10,000 men, mostly packing house men, thronged the streets, and immediately after the meeting adjourned started for the Greek quarter. Many Greeks were injured and some thirty buildings occupied by or belonging to them were wrecked. The hostility towards the Greeks was occasioned by the murder of a policeman by a Greek.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those given below: A measure was passed establishing a compulsory system of guaranty of bank deposits. An occupation tax was levied upon corporations. The election laws were amended to secure "a more certain selection for the people's choice of United States Senators." A pure food law was enacted and measures were passed regulating the sanitation of hotels. The sale of liquor on Sunday and between the hours of 8 P. M. and 7 A. M. on any week day is forbidden. Provision was made for the care of indigent consumptives. Railroad companies are penalized for delay in settlement of claims and provision is made for the physical valuation of all railroad properties. An act was passed looking to the abolition of secret fraternities in public schools.

OFFICERS: Governor, A. C. Shallenberger, Dem.; Lieutenant-Governor, M. R. Hopewell; Secretary of State, George C. Junkin; Treasurer, L. G. Brian; Auditor, Silas A. Barton; Attorney-General, W. T. Thompson; Superintendent of Education, E. C. Bishop; Secretary of Agriculture, W. R. Mellor; Commissioner of Public Lands, E. B. Cowles—all Republicans, except Shallenberger.

JUDICIARY. Supreme Court: Chief Justice, Manoah B. Reese; Justices, Chas. B. Letton, Jesse L. Root, Jacob Fawcett, William B. Rose, John B. Barnes, and Samuel H. Sedgwick; Clerk, H. C. Lindsay—all Republicans.

The State Legislature of 1909 was composed of 13 Republicans and 20 Democrats in the Senate and 31 Republicans and 69 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

NEBRASKA, UNIVERSITY OF. An institution of higher learning at Lincoln, Nebraska, founded in 1869. The attendance in 1908-9 was 3611, with a faculty of 225. There were 85,000 books in the library. There were many important changes in the faculty during the year. The most important was the inauguration of Samuel Avery (q. v.) as Chancellor to succeed Benjamin Andrews, resigned. Robert H. Wolcott was made acting dean of the medical college to succeed Henry B. Ward, resigned. William G. Hastings was appointed dean of the college of law to succeed George P. Costigan, resigned. Legislation of 1909 changed organization from five colleges to seven. They are: Graduate college; college of arts and science; college of agriculture; college of engineering; a teachers' college; college of law; and a college of medicine. The University is supported by the State.

Moore, James W. American physicist. Died February 28; born 1844.

* Moran, John B. American lawyer and public official.

* Morfill, William Richard. English scholar.

* Morganstern, Lina (Bauer). German reformer.

* Morris, Martin Ferdinand. American jurist.

Morrison, Charles. English financier. Died May 26; born 1817.

* Morrison, William Ralls. American lawyer and public official.

* Moulton, James Egan. Australian educator.

Mullen, John. American soldier and explorer. Died December 28; born 1830.

Myers, Elijah E. American architect. Died March 6; born 1832.

* Navarro, José Francesco de. Spanish engineer and financier.

Naville, Jules Ernest. Swiss philanthropist and educator. Died May 27; born 1816.

* Nehring, Wladislav. German Slavic scholar.

* Neumayer, Georg von. German meteorologist.

* Newcomb, Simon. American astronomer.

Nichols, Starr Henry. American traveler and writer. Died May 29; born 1834.

Nimo, Joseph. American statistician. Died June 16; born 1831.

* Noailles, Emmanuel, Marquis de. French diplomat.

Noel, Edme Antony Paul. French sculptor. Died October; born 1845.

Normand, Alfred Nicolas. French architect. Died March; born 1823.

Norrie, Gordon. American merchant and philanthropist. Died November 9; born 1837.

* Norton, Charles Ledyard. American author and editor.

O'Brien, Denis. American jurist. Died May 18; born 1837.

Olcott, Frederic P. American financier. Died April 15; born 1841.

Olmstead, William Adams. Roman Catholic priest and soldier. Died March 8; born 1833.

* Ordway, John Morse. American chemist and educator.

* Osgood, Henry Brown. American military officer.

* Osthoff, Herman. German comparative philologist.

* Otis, Elwell Stephen. American military officer.

* Packard, William Alfred. American scholar and educator.

* Palmer, William Jackson. American railway official.

* Pardon, William O'Brien. American Jesuit priest.

Parker, Abraham. American scientist and educator. Died August 10; born 1831.

* Parloa, Maria. American author and domestic economist.

Parville, Henri François P. de. French scientist and editor. Died July 11; born 1839.

Passage, Comte de. French artist. Died March; born 1839.

* Patterson, Raymond Albert. American journalist.

Pearson, Leonard. American veterinarian and educator. Died September 20; born 1868.

Pease, Frederick H. American musician. Died November 22; born 1839.

* Peckham, Rufus Wheeler. American jurist.

* Penfield, William L. American lawyer.

* Petrosino, Joseph. Italo-American detective.

Phelan, Thomas. Irish-American patriot and soldier of fortune. Died September 13; born 1833.

Philpot, Herman. Anglican missionary. Died October; born 1835.

Phisterer, Frederick. American soldier. Died July 13; born 1836.

Pierce, Elijah S. American inventor. Died January 13; born 1830.

Pinard, Ernest. French politician. Died September; born 1822.

Pinner, Adolf. German chemist. Died June; born 1843.

Pitcairn, Robert. American railway official. Died July 25; born 1836.

* Poe, John Prentiss. American lawyer.

* Poire, Emmanuel. French artist and caricaturist.

* Pope, Albert Augustus. American manufacturer and capitalist.

* Post, George Edward. American Presbyterian medical missionary.

- Potter, William Appleton. American architect. Died February; born 1844.
- Poynter, William A. Governor of Nebraska, 1899-1901. Died April 5; born 1848.
- * Prang, Louis. American art publisher.
 - * Price, Thomas. American public official.
 - * Prout, Ebenezer. English musician.
 - * Pulliam, Henry Clay. American baseball official.
- Putney, Henry M. American public official. Died July 30; born 1840.
- Radin, Adolf Moses. Jewish rabbi. Died February 5; born 1848.
- * Raines, John. American politician.
- Rand, William Wilberforce. American Dutch Reformed clergyman and author. Died March 3; born 1817.
- Ranke, von, Heinrich. German biologist. Died May 12; born 1830.
- Ranli, Frederic Salomon. French metaphysician. Died February 26; born 1861.
- * Raum, Green Berry. American soldier.
 - Reade, T. Millard. English geologist. Died May 27; born 1832.
 - Reamy, Thaddeus. American gynecologist. Died March 11; born 1829.
 - * Red Cloud. Indian chief of the Sioux tribe.
 - * Reid, Sir John Watt. English physician.
 - * Remington, Frederic. American artist.
 - * Reyer, Ernest. French composer.
- Reynolds, John Phillips. American physicist and educator. Died October 10; born 1826.
- Reynolds, Robert J. Former Governor of Delaware. Died June 10; born 1844.
- Rhodes, Joshua. American financier. Died January 5; born 1824.
- Rice, Lewis Frederick, Major. American architect and engineer. Died April 12; born 1840.
- Richard, James William. American Lutheran theologian. Died March 7; born 1844.
- * Richards, John Kelvey. American jurist.
 - * Richardson, Henry Brown. American engineer.
 - * Rigg, James Harrison. English Wesleyan clergyman.
- Riggs, James Willoughby. American financial writer. Died July 13; born 1828.
- * Ripon, George Frederick Samuel Robinson, Marquis of. English nobleman and public official.
 - * Robertson, James Patrick Bannerman. Scotch jurist and member of Parliament.
 - * Rochester, William Beatty. American army officer.
- Roemaet, Charles. Chancellor of Belgian Consulate in New York. Died August 1; born 1852.
- * Rogers, Henry Huttleston. American financier.
- Römer, Albert. German author and editor.
- Rothschild, Oscar, Baron. Jewish financier.
- Rotter-Dissenbach, Joanna. Austrian-American opera singer. Died July 24; born 1833.
- * Rozhdestvensky, Zinovy Petrovitch. Russian admiral.
- Salant, Samuel. Jewish rabbi. Died August 16; born 1816.
- * Salting, George. English art collector.
 - * Sanchez y Hervas, Cyriacus Mary. Cardinal. Archbishop of Toledo and Primate of Spain.
 - * Sanderson, John H. American contractor.
- Schell, Francis H. American artist. Died April 1; born 1830.
- * Schneider, Jerome. American educator. Died May 30; born 1824.
 - * Schultz, Alwin. German art critic and historian.
 - Schytter, Ludwig. Danish composer. Died November; born 1850.
 - * Scott, Guy Charles. American jurist.
 - Scott, Ralph. American inventor. Died April 27; born 1883.
 - * Seeley, Harry Govier. English geologist and mineralogist.
 - * Selby, William Court Gully, Viscount. British public official.
 - Seligman, Henry. American banker. Died February 20; born 1829.
 - Selinger, Jean Paul. American artist. Died September 13; born 1850.
 - * Senden-Bibran, Gustav E. O. E. von. German admiral.
 - * Sepp, Johannes Nepomuk. German Catholic historian.
 - * Sergiev, Ivan Ilytch. Russian priest.
 - Shackelford, James. American soldier. Died September 7; born 1827.
 - * Shanley, John. American Roman Catholic prelate.
 - Sharp, Richard Bowlder. English ornithologist. Died December 25; born 1847.
 - Simpson, Marcus D. L. American brigadier-general. Died April 7; born 1824.
 - Slatter, Carlos. American educator. Died July 19; born 1825.
 - Slingerland, Mark Vernon. American entomologist. Died November 10; born 1864.
 - * Smillie, James David. American artist.
 - * Smith, Charles Stewart. American banker and art connoisseur.
 - * Smith, Clement Lawrence. American scholar and educator.

Smith, James Dickinson. American banker and yachtsman. Died September 21; born 1832.

 - * Smith, W. Saumarez. Archbishop of Sydney and Primate of the Anglican Church in Australia.
 - * Smith, William Thayer. American physician and educator.

Snell, Simeon. English ophthalmist. Died April; born 1852.

Solomon, Jacob. American lawyer and editor. Died May 26; born 1838.

 - * Sonnenthal, Adolf Ritter von. Austrian actor.
 - * Speed, John Gilmer. American editor and writer.
 - * Starin, John Henry. American capitalist.
 - Stearns, Richard H. American merchant. Died August 16; born 1824.
 - * Sterling, James Hutchinson. An English metaphysician.

Stern, Philipp. German author and editor. Died September; born 1844.

Stevenson, Sarah Hackett. American physician and philanthropist. Died August 14; born 1843.

 - * Stewart, William Morris. United States Senator.
 - * Stocker, Adolf. German theologian and politician.
 - * Stoddard, Charles Warren. American author, poet and educator.
 - * Stokes, Whitley. English scholar and scientist.

Story, Edwin Bruce. American musician and educator. Died July 27; born 1849.

- * Strong, Edward Trask. American rear-admiral.
 - * Sturgis, Russell. American architect and writer.
 - * Suleiman, Effendi. Turkish prince.
 - Sullivan, Timothy P. American politician. Died December 22; born 1865.
 - Sweatman, Arthur. Canadian archbishop; Primate of all Canada. Died January 24; born 1834.
 - * Swinburne, Algernon Charles. English poet.
 - * Synge, John Millington. Irish dramatist and poet.
 - * Tabb, John Bannister. American educator and poet.
 - * Talcott, Alfred Bissell. American journalist and lecturer.
 - Taylor, Charles Bell. English ophthalmist. Died April; born 1829.
 - Taylor, Isaac. American engineer. Died April 20; born 1835.
 - * Thacher, John Boyd. American publicist and educator.
 - * Theodor Karl, Duke in Bavaria. German prince and eye specialist.
 - Thierry, Stephen. Founder of the Roman Catholic Holy Name Society. Died June 12; born 1832.
 - * Thomas, George C. American capitalist.
 - Thomas, Hiram Washington. American clergyman. Died August; born 1832.
 - Thome, François. French composer. Died November 11; born 1850.
 - Thompson, Phil. American lawyer, former Representative to Congress from Kentucky. Died December 14; born 1844.
 - Thompson, Samuel G. American jurist. Died September 10; born 1837.
 - * Thomsen, Julius. Danish chemist.
 - * Thomson, William Judah. American rear-admiral.
 - Thorpe, David Franklin. American scientist and philanthropist. Died March 25; born 1836.
 - * Tilford, Wesley Hunt. American capitalist.
 - Tillinghast, Caleb Benjamin. American librarian and public official. Died April 18; born 1843.
 - * Timby, Theodore Ruggles. American inventor.
 - * Toth, Alexis G. Ecclesiastic of the Orthodox Greek Church.
 - Tourgée, Aimée. American writer and illustrator. Died April 19; born 1871.
 - * Trask, Spencer. American banker and philanthropist.
 - * Tufts, Frank Leo. American scientist.
 - * Turpie, David. United States Senator.
 - * Tweedmouth, Edward Marjoribanks, Baron. English cabinet officer.
 - * Tyrrell, George. Roman Catholic priest.
 - * Tyssen-Amherst, William Amherst. English nobleman and bibliophile.
 - Vailati, Giovanni. Italian mathematician and philosopher. Died May 14; born 1863.
 - Van Arsdale, Robert N. American editor. Died November 23; born 1848.
 - Vandyke, John Henry. American lawyer and insurance official. Died March 9; born 1824.
 - * Vaughan, Lawrence J. Roman Catholic clergyman.
 - Vidaver, Falk. Jewish rabbi. Died October 5; born 1845.
 - * Vladimir, Grand Duke of Russia.
 - Voules, Horace St. George. English editor. Died May 4; born 1844.
 - Wagner, Albrecht. German educator and critic. Died March; born 1850.
 - Waite, Charles Burlingame. American linguist and public official. Died March 26; born 1824.
 - Waite, Henry Randall. American clergyman. Died May 6; born 1837.
 - * Ward, Seth. American bishop.
 - * Warner, Charles. English actor.
 - Warren, Samuel Edward. American scientist. Died July 8; born 1831.
 - * Watson, Henry Chapman. American author.
 - Weeks, Stephen Holmes. American physician. Died September 1; born 1835.
 - * Weil, Henri. German-French scholar.
 - Wells, Calvin. American iron manufacturer and newspaper publisher. Died August 2; born 1827.
 - * Werner, Reinhold von. German rear-admiral.
 - West, Caleb Walton. Former Governor of Utah. Died January 24; born 1844.
 - * West, Max. American economist.
 - * Wharton, Joseph. American ironmaster and philanthropist.
 - * Whiteaves, Joseph Frederick. American paleontologist.
 - * Whitehouse, William Fitzhugh. American traveler and explorer.
 - * Wiggins, Benjamin Lawton. American educator.
 - * Wildenbruch, Ernst von. German dramatic poet.
 - Will, Sir Frederick. English financier. Died February 18; born 1839.
 - * Wilson, Arthur. English shipping merchant.
 - * Wilson, Augusta Jane (Evans). American author.
 - Wilson, Thomas Padon. American homeopathist. Died June 23; born 1831.
 - Wingate, Charles Frederic. American engineer and writer. Died August 31; born 1847.
 - * Withrow, John Lindsay. American clergyman.
 - Wolfsohn, Henry. American musician and impresario. Died May 31; born 1841.
 - Womack, Robert. Discoverer of Cripple Creek, Colo. Died August 10; born 1843.
 - * Woodward, David A. American educator.
 - * Worthington, Henry C. American soldier and public official.
 - * Wright, Carroll Davidson. American economist and educator.
 - * Wright, Charles Henry Hamilton. English scholar.
 - * Wyllie, Sir William Hutt Curzon. English East Indian official.
 - * Wyse, Lucien Napoleon Bonaparte. French engineer.
 - Yates, Arthur Gould. American capitalist. Died February 6; born 1843.
 - * Yi Wan Yon. Prime Minister of Korea.
 - * Zalinski, Edmund Louis Gray. American military officer.
 - * Zerrahn, Carl. A German musician.
- NEGATIVE CATALYSIS.** See CHEMISTRY.
- NEHRING, VLADISLAW.** A German Slavic scholar, died February, 1909. He was born at Kletzko in 1830, and was educated at the University of Breslau, where in 1868 he was appointed professor of Slavic languages and literature. Among his published works are: *Kurs literatury polskiej* (1866); *Study a literacki*

(1884); and *Altpolnische Sprachdenkmäler* (1887).

NEON. See CHEMISTRY.

NETHERLANDS, THE; or HOLLAND. A constitutional monarchy of western Europe. Capital, The Hague.

AREA AND POPULATION. Area, 12,648 square miles. Population (census of 1899), 5,104,137; estimated, December 31, 1908, 5,825,198. The number of marriages in 1908 was 41,951; births (inclusive of still-born), 178,882; deaths (with still-born), 93,955; still-born, 7019; showing an increase of births over deaths of 84,927, against 88,156 for the preceding year. Emigration is given at 3030, against 4393 in 1907. The population of Amsterdam and Rotterdam (the chief commercial cities) was given, December 31, 1908, at 565,589 and 411,635 respectively; The Hague, 259,012; Utrecht, 116,783; Groningen, 75,370; Haarlem, 70,348; Arnhem, 63,987; Leide, 57,919; Nimeguen, 54,735; Tilburg, 49,319; Dordrecht, 45,723.

EDUCATION, ETC. Primary education is compulsory, and free in public schools, maintained jointly by the state and the communes. The state encourages primary instruction in state-aided private rather than in public schools. The number of both public and private elementary schools (exclusive of infant) is given in the government returns for 1906-7 as 5043, with 27,281 teachers and 866,750 pupils; middle class schools, 90 (teachers 1405, pupils 13,462); navigation schools, 11 (82 and 1062); schools for working people, 291 (2401 and 33,632); classical schools, 30 (447 and 2082); one technical university (68 and 1174); and 4 public universities, with 297 teachers and 3465 students. There are special schools of agriculture, horticulture, fine arts, music, etc.

Entire liberty and social equality are extended to all religions. The census of 1899 divides the population according to religions as follows: Dutch Reformed, 2,471,021; other Protestant, 598,111; Roman Catholics, 1,790,161; Jansenists, 8754; Jews, 103,988; others, 132,102.

AGRICULTURE. The cultivable area was divided in 1907 into arable land, 861,672 hectares; pasture, 1,201,037; gardens and orchards, 73,345; forest, 257,611. The areas in hectares under the principal crops in 1907, and the average yield per hectare in hectolitres for 1906 and 1907, are given in the following table:

Crop	Hectares 1907	Yield 1906	Yield 1907
Rye	220,392	22.5	23.1
Oats	139,290	47.7	52.9
Wheat	54,411	30.7	34.5
Winter barley	23,379	41.8	49.1
Summer barley	7,563	35.7	38.8
Potatoes	158,223	209.0	210.0
Beetroot	44,144	32,135.0 kilos	29,586.0 kilos
Forage plants	32,970
Peas	30,560	30.3	23.0
Beans	29,301	29.7	28.0
Buckwheat	18,272	18.4	17.8

Quantities of bulbs, shrubs, trees, and vegetables are grown for export.

MANUFACTURES, ETC. The principal manufactures are shipping, bricks, margarine, cocoa and chocolate, linen, damask, cotton and woolens, cigars, candles, confectionery, earthen ware and pottery, chemical and pharmaceutical products,

sugar, vehicles, oils, and liquors. Diamond cutting is an important industry with Amsterdam for centre. There were in 1907 551 distilleries, 453 breweries, 82 vinegar manufacturers, 37 salt works, 11 sugar and 28 beet-sugar refineries. No official figures are given for other manufacturing industries.

The state owns most of the coal mines; output (1907), 722,822 metric tons, valued at 4,919,000 guilders (1 guilder=40.2 cents).

The fisheries employed, in 1907, 5454 vessels and 20,692 men. The value of the North Sea herring catch was 10,394,336 guilders; 2,463,677 kilos of oysters were taken.

COMMERCE. The total imports and exports in 1908 were valued at \$2,823,700,000 and 2,181,000,000 guilders respectively, against 2,671,700,000 and 2,212,100,000 in 1907. The main classes and their value in guilders for 1908 are given below:

	Imports	Exports
Raw materials	1,097,800,000	748,200,000
Foodstuffs	657,300,000	649,800,000
Manufactured articles	514,300,000	424,100,000
Various	539,400,000	312,900,000
Total merchandise	2,808,800,000	2,171,000,000
Precious metals	14,900,000	10,000,000
Total	2,823,700,000	2,181,000,000

The principal articles of import in 1907 were: Cereals and flour, 495,043,000 guilders; iron and steel, 294,355,000; textiles, 161,120,000; copper, 149,070,000; coal, 91,457,000; wood, 84,144,000; rice, 75,900,000; coffee, 51,857,000. Exports: Cereals and flour, 297,802,000; iron and steel, 189,194,000; copper, 129,808,000; wood, 64,807,000; paper, 62,610,000; sugar, 53,355,000; margarine, 45,640,000; skins, 31,773,000. The principal countries of origin and destination and the value in guilders of the special trade in 1908 are given below:

Countries	Imports	Exports
Germany	694,600,000	1,082,100,000
Dutch East Indies	405,300,000	89,100,000
United States	322,200,000	81,100,000
Great Britain	294,400,000	476,300,000
Russia	250,100,000	13,100,000
Belgium	270,800,000	280,500,000
British India	73,600,000	1,500,000

The country is practically free-trade, the few duties levied being for fiscal and not for protectionist purposes. Records are kept of the transit trade only by weight and not by value. The weight in kilos of the transit trade for 1907 was 9,505,000,000.

COMMUNICATIONS. There were, January 1, 1908, 1934 miles of railway; length of canals, 1907 miles; of roads, 2943; of state telegraph lines, 4405 (wires, 21,360). of telephone lines, 1745 (wires, 26,500). The railways are privately owned, and carried (1907) 40,972,000 passengers; goods, 15,208,000 metric tons. Revenue and expenditure, 54,106,000 and 47,936,000 guilders respectively. There were 1445 post-offices. The merchant marine had, January 1, 1908, 435 sailing vessels, of 49,560 tons; 292 steamers, of 398,604 tons. In 1907, 14,404 vessels, of 13,819,806 tons (Dutch, 3957, of 3,544,956 tons) entered, and 14,500, of 13,842,462 tons (Dutch, 4058, of 3,562,656 tons), cleared.

FINANCE. The unit of value is the guilder, or florin, worth 40.2 cents. The revenue and expenditure for three successive years were as follows:

	1907	1908 (estimated)	1909 (estimated)
Revenue.....	183,085,026	183,077,171	184,728,351
Expenditure..	182,913,729	194,768,959	200,576,140

The budget for 1910 gives revenue 188,326,473 guilders, and expenditure of 207,187,207 guilders. The principal sources of revenue and items of expenditure were given as follows:

Revenue	Guilders
Excise	57,490,000
Direct taxes	44,345,000
Stamps, etc.	27,551,000
Posts and telegraphs	18,589,000
Import duties	12,622,500
Railways	4,188,140
Pilot dues	2,800,000
Domains	1,629,000
Lottery	654,000
Various	18,457,833
Total	188,326,473

Expenditure	Guilders
Public debt	36,334,256
Interior	35,086,283
Internal administration	32,763,776
Finance, etc.	26,911,004
War	28,637,096
Marine	20,136,907
Justice	9,771,701
Agriculture, etc.	8,104,829
Railways	3,548,615
Colonies	3,051,345
Foreign affairs	1,225,092
Legislative body and Royal Cabinet....	756,222
Civil list	800,000
Total	207,187,207

The expenditure of the Colonial Department is for central administration only. A separate budget is voted each year by the States-General for the principal colonies. The public debt stood (1910) as follows: Funded debt, 1,122,433,750 guilders; interest, 30,698,147; floating debt, 500,000; annuities, 168,109; sinking fund, 4,958,000. The condition of the Bank of the Netherlands, the only bank of issue, was (March 31, 1908) as follows: Notes in circulation, 265,947,760 guilders; total exchanges, 658,854,720; stock of gold (July), 92,500,000; stock of silver (July 1), 50,500,000; capital, 20,000,-000; reserve fund, 5,500,000. The postal savings bank had total deposits at the end of 1907, 145,496,000 guilders. Other savings banks, numbering 242 (1906), had 93,171,000 guilders of deposits.

NAVY. The effective navy, as reported in 1909, is as follows: 16 armored or protected battleships and cruisers, aggregating 70,031 tons; 3 armored monitors, 6713 tons; 3 river gunboats, 1144 tons; 11 gunboats, 2960 tons; 38 torpedo boats (one submarine), 3938 tons; total, 84,786 tons. In addition there were several school-ships, etc. The personnel consisted of 6697 officers and men. An armored battleship was under construction in 1909.

ARMY. The active army of Holland, which is really a militia organization for home defense,

is recruited by voluntary enlistment and conscription. On a permanent peace footing the strength of the active army in 1909 was stated at 1836 officers, 509 officers of the reserve and of the militia, 32,826 non-commissioned officers and men, and 5605 horses. In the reserve, officers and non-commissioned officers and men to the number of 392 and 5896 respectively were maintained for the cadres or skeleton organizations to be expanded in time of war. The army is organized in four divisions, with headquarters at The Hague, Arnhem, Breda and Amersfoort. Provision is made for a war organization which would produce a strength estimated at 108,000. The Netherlands contingent for 1910 was fixed at 17,500, the maximum number authorized by law. Of this number 400 were drafted into the navy, 11,900 were called out for a complete period of 8½ months for dismounted, or 18 months for mounted troops, and 5200 for a reduced period of 4 months. The number of youths on the rolls amounted to 52,387, out of a population of about 5,700,000. There were 12 regiments of infantry, 4 regiments of hussars, 4 regiments of field artillery, 1 division of horse artillery, 4 regiments of fortress artillery, besides engineers and other technical troops. In addition there were the cadres in the reserve for 48 battalions of infantry from the "landweer," 44 companies of fortress artillery, and a full force of technical troops. On July 1, the cavalry was reorganized and four regiments of 4 squadrons were formed from the four regiments, where previously there were two of five squadrons, one of four, and one of two squadrons. On April 1, two cyclist companies were formed and attached respectively to the 3d and 4th infantry divisions, and two more were to be formed in 1910. The artillery was organized with six field batteries in a division.

GOVERNMENT. The executive authority is vested exclusively in the sovereign, acting through a responsible Ministry; the legislative power devolves upon the States-General, divided into the Upper or First Chamber of 50 members, and the Second Chamber of 100 deputies, directly elected. The sovereign (1909), Queen Wilhelmina Helena Paulina Maria, was born August 31, 1880. She succeeded her father November 23, 1890, was enthroned September 6, 1898, and married, February 7, 1901, Prince Henry of Mecklenburg-Schwerin. Heiress-apparent, Princess Juliana Louisa Emma Maria Wilhelmina, born April 30, 1909. The Ministry in 1909 (constituted February 12, 1908) was composed as follows: Minister of the Interior, Dr. Th. Heemskerk; Foreign Affairs, Jhr. Dr. R. de Marees von Swinderen; Finance, Dr. M. J. C. M. Kolkman; Justice, Dr. A. P. L. Nelissen; War, Major-General W. Cool; Marine, Vice-Admiral J. Wentholt; Waterways, Dr. L. H. W. Regont; Agriculture, Industry and Commerce, A. S. Talma; Colonies, J. H. de Waal Malefijt.

HISTORY. The Dutch Social Democratic party at its congress at Deventer early in the year decided to expel the editor of a Socialist paper, the *Tribune*, as part of its policy of ridding itself of the Marxist element, which was critical and obstructive and prevented the party from presenting a solid opposition to the Clericals and Liberals. The second ballot of the general elections on June 23 returned 60 members of the Right (Clerical coalition), and 40 of the Left. In some quarters the results of the elections

were regarded as marking the downfall of Dutch Liberalism. Dr. Kuyper, the founder of the anti-Revolutionary party, was especially active in the campaign, publishing many aggressive papers against the so-called revolutionary programme, and insisting that all other issues should be subordinated to its overthrow. He classified political parties into the two groups of "Christians" and "Heathen," the former comprising the solid Conservative opposition. The 60 members of the Right included 25 Catholics, 23 Anti-Revolutionaries, and 12 Historic Christians; the Left included 25 Liberals, 8 Democrats and 7 Socialists. A bill for a ten-hour day (60 hours a week) passed the Lower House in March. On March 19 the Regency bills were brought in. Queen Emma was to be Regent, and if she died the Regency was to fall to the Prince Consort during the heir's minority. The birth of the heir, a daughter, on April 30, was hailed with great national rejoicing.

According to the protocol signed with Venezuela in the spring, Venezuela was to pay an indemnity of 20,000 bolivars for the seizure of five merchant vessels in 1908, and the Dutch government was to restore the coastguards seized in December of that year. In June some trouble occurred on account of a misunderstanding with the Venezuelan representative at The Hague, Dr. Paul, who was alleged to have said that the protocol need be signed only by the President, whereas it required ratification by the Venezuelan Congress. Dr. Paul was dismissed. Venezuela demurred to the provision that any concession to British Trinidad should apply of its own force to the Dutch Antilles. The new Parliament opened on September 21. The budget showed a considerable deficit for the coming year, to meet which it demanded the retention of the present additions to the property tax, income tax, and tax on trading profits, increase of the tax on native alcohol, and of the duty on imported alcohol, and increase of customs duties. In addition to these extraordinary measures it proposed as permanent measures an increase of the death duties, the revision of the customs tariff, and a general income tax. In October a ship's pinnace was destroyed by an explosion, on the coast between Waterweg and Scheveningen, and six men and a first lieutenant were killed.

NEUMAYER, GEORG VON. A German meteorologist and hydrographer, died in May, 1909. He was born at Kirchheimbolanden, Bavaria, in 1826, and was educated at the Polytechnic and the University of Munich. In 1857 he was sent by Maximilian II. to Australia to make magnetic observations. There he remained until 1864. He founded the Flagstaff Observatory in Melbourne. On his return to Germany he became interested in polar exploration, and assisted in forming several expeditions to the North and South poles. He founded, also, the German African Company. After a long connection with the hydrographic bureau in Berlin he became, in 1876, director of the Imperial Marine Observatory at Hamburg, and continued in this position until 1903. His writings include, among other works, *Results of the Observations at the Flagstaff Observatory* (1858-63); *Die deutsche Expedition und ihre Ergebnisse* (1890-91), and *Auf zum Sudpol!*

NEVADA. One of the Western Division of the United States. Its area is 110,590 square

miles. The population in 1909, according to a Federal estimate made in that year, was 42,335.

MINERAL PRODUCTION. The value of the mineral production of Nevada in 1908 showed a slight decrease from the value of the product of 1907. In the former year it was \$19,043,820, and in the latter, \$22,088,700. The chief decline was shown in the production of gold, of which there were produced in 1908, 565,475 fine ounces, valued at \$11,689,400, as compared with 745,507 fine ounces, valued at \$15,411,000, in 1907. The silver production showed also a decrease in value, but an increase in the quantity mined. The comparative figures were as follows: 1908, 9,508,500 fine ounces, valued at \$5,086,100; 1907, 8,280,500 fine ounces, valued at \$5,465,100. The only other mineral product produced in considerable quantities was lead, of which the product in 1908 was valued at \$318,864, as compared with a value of the product of 1907 of \$358,280. The falling off in the production of gold was caused by the decreased production in the fields in Esmeralda and Nye counties, which include Goldfield and Tonopah. Several new fields have been discovered during the year, but they have thus far proved of no great importance. Other minerals produced in some quantities are precious stones, salt and zinc.

The gold production in 1909 was estimated by the Director of the Mint at 721,195 fine ounces, valued at \$15,908,400. The silver production was 8,953,000 fine ounces, valued at \$4,657,000. This was a decrease of 555,500 fine ounces from the production of 1908.

The copper output of 1909 showed a considerable increase over that of 1908.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Spring wheat, 1,033,000 bushels, valued at \$1,074,000, from 36,000 acres; oats, 280,000 bushels, valued at \$1,165,000, from 75,000 acres; barley, 304,000 bushels, valued at \$228,000, from 8000 acres; potatoes, 540,000 bushels, valued at \$459,000, from 3000 acres; hay, 194,000 tons, valued at \$5,187,000, from 210,000 acres. The yield of spring wheat in Nevada is the largest in any of the States with the exception of Colorado and Montana. Many important irrigation projects are being carried on which will in time greatly increase the agricultural development of the State. (See IRRIGATION.) Large numbers of sheep are raised. They numbered in 1909, 1,585,000. The wool clipped in the State in 1909 was estimated at 8,754,720 pounds.

EDUCATION. A school census was taken in April, 1908, in which there were reported 12,025 children of school age, 6 to 14 years. The total enrollment was 10,440, and the average daily attendance was 7312. In the year ended August 31, 1908, there were employed 449 teachers. There was spent for school purposes during the summer period \$601,993. The average salary of male teachers was a little over \$112.57 for a month of twenty days, and for female teachers, a little less than \$60.96. The average length of the school year was 8.1 months. The State Legislature of 1907 passed a school law abolishing the office of county superintendent, and divided the State into five educational districts, each having a deputy State superintendent to supervise the schools.

POLITICS AND GOVERNMENT. The chief political interest of the year centred in the attempt to pass legislative measures against the Japanese in the State. A remarkable resolution was introduced by Speaker Giffen, which attacked the President's attitude on the question of immigration, and recommended the legislature of California to pay no attention whatever to the domination of the President in this respect. This resolution asserted also that "We must have war with the Japanese Empire sooner or later, and now is the best time to lay down terms to that Empire." The paragraphs assailing President Roosevelt were eliminated, and after the resolution had been further modified it was passed by the Assembly in a form comparatively harmless, beyond having a tendency to inflame jingo sentiment in the United States and Japan. On February 5, the Assembly passed an anti-alien bill providing that no Asiatics should own land or land mortgages in the State. These measures were laid on the table by the Senate, and no further action was taken on them. On February 24, however, the Senate passed a bill which had previously been adopted by the Assembly, providing that all aliens and foreigners shall be excluded from Federal and State grazing lands. The legislature passed a stringent anti-gambling bill, which is to go into effect on October 1, 1910. This measure not only prevents race-track pool selling, but will put an end to all forms of public gambling, as poker, faro, roulette, etc. On January 26, United States Senator Francis G. Newlands, who had been chosen by a popular vote to succeed himself, was re-elected by both houses of the legislature voting separately. On January 4 the Esmeralda county grand jury returned indictments against the officials of the Pittsburg Silver Peak and the Florence Gold Mines, on the charge of conspiring to defraud the State of its bullion tax. These indictments were later dismissed by the State, upon the agreement of the company to pay the amount of tax and costs.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: A measure was enacted prescribing eight hours as a day's work in mines and in plaster and cement work. It was made unlawful for employers to receive or demand any consideration for hiring or retaining employees. A parole system of prisoners was adopted, and provision is made for the care of dependent, neglected and delinquent children. Measures were passed in the endeavor to suppress "wildcat" mining promotion. A new and elaborate banking law was enacted. Provision is made for nomination by primaries instead of by conventions, and faro and other forms of gambling are prohibited after October 1, 1910.

OFFICERS: Governor, vacancy; Lieutenant-Governor and Acting Governor, D. S. Dickerson; Secretary of State, W. G. Douglass; Treasurer, D. J. Ryan; Auditor, W. Ligon; Comptroller, Jacob Eggers; Superintendent of Public Instruction, Orvis Ring; Attorney-General, R. C. Stoddard—all Democrats except Eggers, Ring, and Douglass, Republicans.

JUDICIARY. Supreme Court: Chief Justice, Frank H. Norcross, Republican; Justices, George F. Talbot, Democrat, James Sweeney, Democrat; Clerk, W. G. Douglass, Republican.

The State Legislature of 1909 was composed of 12 Democrats and 7 Republicans in the

Senate, and 34 Democrats and 14 Republicans in the House. The State representatives in Congress will be found in the section *Congress* of the article *UNITED STATES*.

NEW BRUNSWICK. A maritime province of Canada. Area, 27,985 square miles. Population (1901), 331,120. Capital, Fredericton (7117); largest town, St. John (40,711). The executive authority rests in a lieutenant-governor, appointed by the Governor-General of Canada and acting through a responsible Executive Council. There is a unicameral Legislative Assembly of 48 members elected by popular vote for four years. The Lieutenant-Governor in 1909 was Lemuel John Tweedie; the Premier and Attorney-General, J. Douglas Hazen. For statistics and other details, see *CANADA*.

NEW CALEDONIA. An island in Melanesia, which with its dependencies constitutes a French penal colony. No convicts have been sent there since 1898. The dependencies are the Isle of Pines, the Wallis Archipelago, the Loyalty Islands, the Huon Islands, and Futima and Alafai. Total area, 7200 square miles; total population (1906), 55,886. In 1907, the population was estimated by principal divisions as follows: 13,000 free white persons; 11,000 of convict origin; 29,000 blacks; the remainder is made up of French, Javanese, Tongkinese, Indians, etc. Capital, Nouméa, with (1901) 6968 inhabitants, of whom 4010 were free. In 1906 there were 40 primary schools, with 1974 pupils, and a college at Nouméa. The area is divided into the State domain, the penal settlement, and the native reserve. About 1600 square miles are cultivated, 1600 are pasture land, and 500 forest. The chief products are coffee, corn, tobacco, sugar, manioc, and fruits. There are about 45,000 cattle and 2000 sheep. About 516,140 hectares are under mineral exploitation. In 1907 the output of the mines was as follows: Nickel ore, 111,075 metric tons; cobalt ore, 4470; chrome ore, 28,280; copper ore, 432. The total imports in 1907 (mainly farinaceous foods and beverages) were valued at 9,410,485 francs (France, 4,927,000); exports (chiefly minerals), 8,504,164 francs (France 2,625,301). A railway under construction from Nouméa to Bourail (90 miles) was open to traffic (1908) to Dumbéa (about 10 miles). There were 39 post-offices in 1907. Length of telegraph (1907), 633 miles. A steamer from New South Wales touches at Nouméa monthly. Harbor improvements are under way. The budget for 1907 balanced at 3,974,000 francs; the debt stood at 7,560,000. The expenditure of France on the colony (budget of 1909) amounted to 3,318,624 francs, of which 1,582,100 was for the penal settlement. The military force numbered (1909) 436 Europeans. The colony is administered by a governor, assisted by a privy council and an elective council-general.

NEWCOMB, SIMON. An American astronomer, died July 11, 1909. He was born at Wallace, N. S., in 1835. His father, John Newcomb, a teacher, undertook the boy's early education. The older Newcomb came to the United States in 1852, and the younger, who taught for several years in Canada in his early manhood, followed in 1853. He taught for two years in Maryland, and made the acquaintance of Joseph Henry, Secretary of the Smithsonian Institution, and of Julius E. Hilgard, Superintendent of the United States Coast and Geodetic Survey.

These scientists were so impressed by young Newcomb's ability in mathematics that they secured his appointment as a computer on the *United States Nautical Almanac*, then published at Cambridge, Mass. The educational opportunities afforded at Cambridge were eagerly seized by Newcomb, and he graduated from the Lawrence Scientific School in 1858, remaining for three additional years for graduate study. During his stay in Cambridge, he undertook some of the most advanced astronomical work attempted up to that time. This included a computation of the orbits of the asteroids, and his report, delivered before a meeting of American scientists, won for him immediate recognition. Still greater scientific fame came from the publication, in 1860, of a general mathematical theory on the same subject.

In 1861 Newcomb was appointed professor of mathematics at the United States Naval Academy. He was assigned to special duty at the Naval Observatory in Washington. In 1870 he was sent to take observations of an eclipse of the sun, visible from the Mediterranean. A station was established at Gibraltar, and although clouds obscured the sun at its eclipse, Professor Newcomb utilized the opportunity by making observations on the minor movements of the moon, and these studies were carried on in many European observatories. This problem, over which many great astronomers had worked in vain, Professor Newcomb finally solved, and he developed formulæ for the construction of accurate lunar tables. The chief work on which he was engaged at this period was the accurate determination of the elements of the solar system, including measurements relating to the major planets, the larger asteroids, and the planetary satellites. In 1867 was published his final memoir on the secular variations of the orbits of the asteroids, and in 1874 this was followed by a report on his investigations on the orbit of the planet Uranus. His final publications on the motions of the moon appeared in 1876.

In 1877 Professor Newcomb was made senior professor of mathematics at the Naval Academy. From this time until 1897 he was director in the office of the *American Ephemeris and Nautical Almanac*. He was retired in the latter year. From 1884 to 1894 he was also professor of mathematics and astronomy at Johns Hopkins University. After his retirement Professor Newcomb continued the production of astronomical treatises, as well as works of other sorts, including belles-lettres. In 1905 he began, for the Carnegie Institution, an extensive work on mathematical astronomy. He wrote also many popular works on astronomy. These from their lucid and simple style are eminently readable. He was a contributor to encyclopedias on astronomical subjects.

A list of the honorary degrees which Professor Newcomb received would form a list of nearly all the great institutions of learning and learned societies in the world. He was made an associate of the Institute of France in 1893, an honor which he shared alone with Benjamin Franklin among Americans, and which has belonged to but eight persons outside France. He was, at various times, president of the Society for Psychical Research, of the American Association for the Advancement of Science, of the American Mathematical Society and of the Astronomical

and Astrophysical Society of America. He was a member of every scientific, astronomical, and mathematical society of first rank in the world. Professor Newcomb was recognized both at home and abroad as the most eminent scientist of America. It was asserted by Professor Pickering, of Harvard, that Professor Newcomb was recognized as the greatest astronomer of his time. A ballot taken by the Carnegie Institution several years ago placed him at the head of American scientists. His published books comprise over 300 titles, and include a novel of considerable merit. Among them are the following: *Secular Variations and Mutual Relations of the Orbits of the Asteroids* (1860); *Investigations of the Orbit of Neptune* (1874); *Researches on the Motion of the Moon* (1876); *Popular Astronomy* (1878); *Calculus* (1884); *A Plain Man's Talk on the Labor Question* (1886); *Principles of Political Economy* (1887); *Elements of Astronomy* (1900); *His Wisdom the Defender* (novel, 1900); *The Stars* (1901); *Reminiscences of an Astronomer* (1903); *Spherical Astronomy* (1906); *Side-lights on Astronomy* (1906). His tables of the movements of the planets, stars and moon form the basis of computations by which the vessels of the world are navigated.

NEWFOUNDLAND. An island off the northeast coast of North America; the oldest of the British colonies. Capital, St. John's.

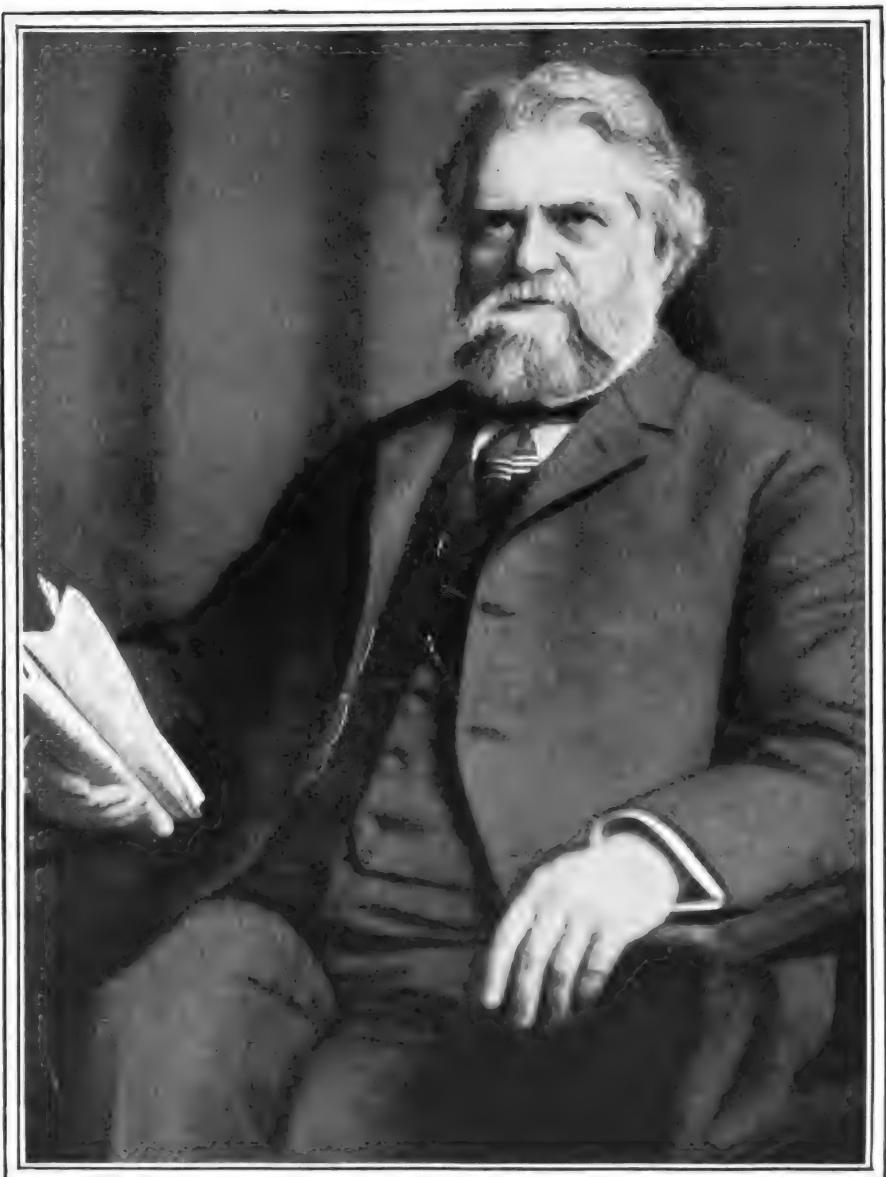

AREA, POPULATION, ETC. Area, 42,734 square miles. Population (1901), 217,037 (Roman Catholics, 75,989; Anglicans, 73,008; Methodists, 61,388; Presbyterians, 1497; others and unknown, 9009); estimated, at end of 1907, 230,139. Labrador, a dependency, has 119,000 square miles and (1901) 3634 inhabitants (estimate, 1907, 4024). St. John's had (1901) 31,501 inhabitants; Harbour Grace, 5184. There were (1907) 918 denominational schools, with 43,811 pupils.

INDUSTRIES. Fishing is the principal occupation of the people (62,674 in 1901), and the annual catch is valued at nearly ten million dollars (1907, \$9,942,688). Agriculture occupies an increasing number (2475 in 1901). Cultivated area (1901), 85,533 acres, producing root crops, hay, barley, and oats. There were 32,767 cattle, 8851 horses, 78,052 sheep and 34,679 swine. Saw mills have been set in operation in the northern forests, and large pulp and paper mills are being established. Extensive deposits of iron, silver and lead ore, copper, and pyrites exist, and mines are in operation. Coal is found, and, in the eastern part of the island, gold-bearing quartz.

COMMERCE. The imports and exports for three successive fiscal years are given as follows:

	1905-6	1906-7	1907-8
Imports.....	\$10,414,274	\$10,426,040	\$10,428,919
Exports.....	12,086,276	12,101,161	12,102,956

The details of the trade for 1906-7 are as follows: Articles of import: Flour, \$1,529,025; textiles, \$1,540,921; coal, \$565,208; machinery, \$444,323; salt pork, \$431,418; hardware, \$415,853. Exports: Codfish, \$7,873,172; copper and copper ore, iron pyrites and other minerals, \$1,353,760; cod, whale, and seal oil, \$1,011,426; tinned lobsters, \$383,767; sealskins, \$194,300. Imports from Canada, \$3,669,098; United States, \$3,447,359; Great Britain, \$2,669,934;

Courtesy of the "Review of Reviews"

SIMON NEWCOMB

exports to Brazil, \$2,063,444; Portugal, \$1,841,-968; Canada, \$1,611,480; United States, \$1,-394,269; Great Britain, \$1,492,795.

COMMUNICATIONS. There are 638 miles of railway, government-owned. Length of telegraph lines (1907), 3088 miles; of telephone wires, 350. Communication between coast towns and with the mainland is maintained by a fleet of eight first-class steamers. Tonnage entered and cleared in 1907-8, 1,834,000.

FINANCE. The revenue, expenditure and debt, for three successive fiscal years, are given as follows:

	1905-6	1906-7	1907-8
Revenue.....	\$ 2,574,069	\$ 2,837,142	\$ 2,837,200
Expenditure.....	2,443,814	2,711,788	2,765,600
Debt.....	22,043,838	22,371,867	22,431,000

GOVERNMENT. The colony is administered by a governor (1909, Sir Ralph Champneys Williams), aided by a responsible executive council of nine and a legislative council (appointed for life). The House of Assembly has 36 members, elected by popular vote.

HISTORY. The general elections of November having given each party eighteen seats, threatened to cause a deadlock. Sir Edward Morris formed a new Ministry early in March, but Parliament was prorogued, and a new general election was ordered and held in May. By this the Opposition under Sir Edward Morris retained its fifteen seats and gained ten more. The argument against the Bond Ministry had been in general its failure to gain for the country the promised benefits, and the low price of fish was cited as a result of the government's policy. Against the Opposition it was said that its success meant confederation with Canada. The legislature was opened on June 1 by the Governor, Sir William MacGregor, who announced that the Fisheries Dispute with the United States would be referred to The Hague, and the Labrador boundary question to the Privy Council. The government programme included among other features, tariff revision, old age pensions, railway improvements, grants to education, improved steamship service with Labrador and on the coast, and a campaign against tuberculosis. In July trouble arose with the crews of French steam trawlers on the Grand Banks, resulting in the killing of one of the men. The new Governor, Sir Ralph Williams, arrived at St. John's early in September. In a speech delivered in the following month, he referred to the opening of the mills of the Anglo-Newfoundland Development Company on October 9, and to the prosperity that was likely to result from the development of the paper industry, for which Newfoundland with its inexhaustible supplies of food was well fitted. It was announced that the *modus vivendi* in the Fisheries matter was to remain in force pending the Hague settlement. See EXPLORATION.

NEW GUINEA. The largest of the East Indies. It consists of British, Dutch, and German dependencies. See DUTCH EAST INDIES; GERMAN NEW GUINEA; PAPUA, TERRITORY OF; EXPLORATIONS.

NEW HAMPSHIRE. One of the North Atlantic Division of the United States. Its area is 9341 square miles. Its population in 1909, according to a Federal estimate made in that year, was 443,140.

MINERAL PRODUCTION. The most important mineral product of the State is granite, of which the product in 1908 was valued at \$867,028, as compared with a value of the product of 1907 of \$647,721. The clay products of the State in 1908 were valued at \$371,640, as compared with a value of the product of 1907 of \$510,599. Other mineral products of less value are coal products, mineral waters, mica, pottery, precious stones and whetstones. The total value of the mineral products of the State in 1908 was \$1,614,277, as compared with a value of the product of 1907 of \$1,390,360.

AGRICULTURE AND STOCK RAISING. The acreage, value and production of the principal farm crops of the State in 1909, according to the figures of the United States Department of Agriculture, were as follows: Corn, 1,053,000 bushels, valued at \$800,000, from 30,000 acres; oats, 441,000 bushels, valued at \$282,000, from 14,000 acres; barley, 50,000 bushels, valued at \$40,000, from 2000 acres; buckwheat, 44,000 bushels, valued at \$33,000, from 2000 acres; potatoes, 2,730,000 bushels, valued at, \$1,747,000, from 21,000 acres; hay, 621,000 tons, valued at \$11,116,000, from 640,000 acres; tobacco, 170,000 pounds, valued at \$25,500, from 100 acres. The acreage and production of farm crops has changed but little for the last few years. All kinds of farm animals, except neat cattle, have increased slightly.

EDUCATION. The biennial report of the Superintendent of Public Instruction for the fiscal year ended July 15, 1908, showed 2127 schools, 1234 graded schools, and 54 high schools. There were in the State on the same date 37,204 boys of school age, 5 to 16, and 36,861 girls, or a total of 74,065. The average attendance was 49,398. There were 126 men teachers with an average salary of \$41.83, and 2529 women teachers with an average monthly salary of \$36.01. The total revenue for the support of the schools during the year was \$1,683,535, and the total expenditures amounted to \$1,540,123.

FINANCE. According to the report of the State Treasurer for the year ended August 31, 1909, the balance at the end of the fiscal year 1908 was \$149,998. The income for the fiscal year 1909 amounted to \$1,926,212, and the expenditures amounted to \$1,994,697, leaving a balance for the fiscal year 1909 of \$81,513. The chief sources of revenue are from the State tax, railroad tax, insurance tax and legacy tax. The chief disbursements are for the legislature and for State institutions. The bonded debt at the end of the fiscal year amounted to \$831,700. Nearly one-half the actual receipts are not revenue, and more than \$750,000 of the disbursements are not expenses. A savings bank tax of nearly \$500,000 all goes back to towns. It is not revenue when it comes in, and is not expense when it is paid out.

CHARITIES AND CORRECTIONS. Among the charitable and correctional institutions of the State are the following, with number of inmates in 1908: New Hampshire Industrial School, at Manchester, 176; New Hampshire School for Feeble-Minded Children, at Laconia; New Hampshire Soldiers' Home, at Tilton, 70. There are also orphans' homes and homes for dependent children and other similar institutions. The juvenile court law which went into effect July 1, 1907, has attracted much attention in the State, and is regarded with favor by those in charge of the institutions.

POLITICS AND GOVERNMENT. On January 7, Henry B. Quinby, of Laconia, Republican, was inaugurated Governor. On January 19, the legislature voted to re-elect United States Senator Jacob H. Gallinger, Republican, for the full term of six years from March 4, 1909. The joint ballot of the House and Senate stood 258 for Senator Gallinger and 108 for Oliver E. Branch of Manchester, the Democratic candidate. Political legislation was enacted providing for the nomination of all candidates for political offices by direct primaries on the first Tuesday of September, 1910, and biennially thereafter; a drastic law prohibiting free railroad transportation of public officials or private persons, except railroad officers and employees and their families; an anti-legislative lobby law; the office of State auditor was created; January 1 made a legal holiday; \$1,000,000 appropriated for the improvement of highways; and provision made to take the sense of the voters at the November 10 election of 1910 as to the expediency of calling a convention to revise the State constitution. Legislation looking to a revision of the tax laws of the State and the creation of a permanent tax commission was defeated. The principal questions to be considered by a constitutional convention, if called, are the reduction of the size of the House (now about 400 members and to be increased by the 1910 census), and permitting the taxation of intangibles at a lower rate than other property. See ELECTORAL REFORM.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: A direct primary nomination law was enacted and a forestry commission was established. An appropriation of \$1,000,000 for the employment of three main highways was made. A State flag was adopted. Dispensaries for the prevention and treatment of tuberculosis were established, and provision was made for indeterminate sentence and parole of prisoners.

OFFICERS. Governor, Henry B. Quinby; Secretary of State, Edward N. Pearson; Treasurer, Solon A. Carter; Auditor, William B. Fellows; Adjutant-General, Harry B. Cilley; Attorney-General, Edwin G. Eastman; Superintendent of Education, Henry C. Morrison; Commissioner of Agriculture, Nahum J. Bachelder; Commissioner of Insurance, George H. Adams—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Frank N. Parsons, Rep.; Associate Justices, Robert J. Peaslee, Dem.; Reuben E. Walker, Rep.; John E. Young, Rep.; George H. Birmingham, Dem.; Clerk, A. J. Shurtleff, Rep.

The State Legislature of 1909 was composed of 20 Republicans and 4 Democrats in the Senate, and 272 Republicans and 117 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

NEW HEBRIDES. A group of Melanesian islands in the Pacific Ocean, northeast of Australia, jointly administered by France and Great Britain. Area, 5106 square miles; population, 70,000. By the conclusion of a convention signed October 20, 1906, the group of the New Hebrides, including the Banks and the Torres Islands, form a region of joint influence under the administration of two high commissioners appointed one by each of the two

nations. There are French and English courts, with a judge foreign to both nations. Corn, coffee, vanilla and cocoanut trees are grown. Sulphur is abundant in several regions. A severe earthquake occurred in May, wrecking the Tongoa mission and killing four persons.

NEW JERSEY. One of the Middle Atlantic Division of the United States. Its area is 8224 square miles. The population in 1909, according to a Federal estimate made in that year, was 2,352,522.

MINERAL PRODUCTION. The products of clay are the most important of the mineral resources of New Jersey. In 1908 these amounted in value to \$12,313,696, as compared with \$16,005,460 in 1907. Of these products, brick and tile amounted in value to \$6,363,705, and pottery to \$5,949,991. The value of the brick and tile decreased nearly \$3,000,000, as compared with 1907, and the pottery about \$1,000,000. The State ranks third in the value of these products, being surpassed only by Ohio and Pennsylvania. In the manufacture of Portland cement New Jersey—up to 1908—ranked second, being surpassed only by Pennsylvania. In 1908, however, there was a heavy decrease in this production and heavy increases in some of the Middle Western States, which gave to New Jersey fifth place. The value of the product in 1908 was \$2,416,009 from 3,208,446 barrels, while in 1907 the value was \$4,738,516 from 4,449,896 barrels. There are three plants in the State producing Portland cement. The production of pig iron in 1908 amounted to 225,372 long tons, valued at \$3,370,000. This was a marked decrease from the production of 1907, which was 373,189 long tons, valued at \$7,554,000. In 1908 there were 11 blast furnaces in the State, of which three were in blast and eight out. The State has large areas of stone and also produces considerable quantities of zinc. Among other mineral products are sand and gravel, lime and glass-sand. The total value of the mineral products of the State in the year 1908 was \$21,315,631, as compared with the value of the product of 1907 of \$32,800,299.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to the figures of the United States Department of Agriculture, were as follows: Corn, 9,483,000 bushels, valued at \$6,733,000, from 290,000 acres; winter wheat, 1,969,000 bushels, valued at \$2,146,000, from 110,000 acres; oats, 1,530,000 bushels, valued at \$765,000, from 60,000 acres; rye, 12,888,000 bushels, valued at \$1,018,000, from 79,000 acres; buckwheat, 283,000 bushels, valued at \$209,000, from 13,000 acres; potatoes, 7,200,000 bushels, valued at \$5,904,000, from 80,000 acres; hay, 546,000 tons, valued at \$9,009,000, from 437,000 acres. The tendency in recent years has been to replace staple farm products by vegetable and garden products for the supply of numerous markets near which much of the farm land of the State is advantageously situated. Fruit and garden truck is largely produced. Among farm animals, dairy cows are the most numerous. The estimated wool clipped in 1909 was 176,000 pounds.

FISHERIES. The total value of the products of the fisheries of the State for the year ending December 31, 1908, was \$3,068,590. Of these products the most important in point of value

were oysters, of which there were taken for market purposes 919,500 bushels, valued at \$883,880, and for seeding purposes, 1,666,900 bushels, valued at \$484,620. Next in point of value were clams, of which 305,800 bushels, valued at \$336,500, were taken. Other important fish taken were shad, 3,004,200 pounds, valued at \$229,490; squeteague or trout, 11,814,000 pounds, valued at \$341,600; sea bass, 3,160,600 pounds, valued at \$123,350; cod, 3,766,700 pounds, valued at \$129,930; bluefish, 1,802,500 pounds, valued at \$96,850. There were engaged in the fisheries of the State 4041 independent fishermen, while 3190 wage-earning fishermen were employed. The number of vessels engaged in the fisheries of the State was 428, valued at \$590,044.

EDUCATION. The report of the Superintendent of Education showed a total enrollment in the public schools in 1908 of 402,866 and an average daily attendance of 289,167. The teachers numbered 10,279, of whom 9173 were women. There were 558 teachers employed in evening schools in nine cities. The average yearly salary of all teachers was \$697,006. The average duration of the school term was 9.1 months. The total receipts for public schools during 1908 was \$17,693,858, of which \$1,909,957 was the balance from the preceding year. The total expenditures amounted to \$14,951,775. The total value of the school property is \$28,582,358.

FINANCE. The report of the State Treasurer showed a balance on November 1, 1908, of \$2,818,276. The total receipts for the fiscal year ended October 31, 1909, were \$8,637,221, while the total disbursements were \$7,774,615, leaving a balance on October 31, 1909, of \$3,680,082.

CHARITIES AND CORRECTIONS. The legislature of 1908 made an appropriation for the year ended October 31, 1909, of \$1,282,525 for charities, \$666,042 for corrections and \$105,850 for soldiers' home, an aggregate of \$2,054,489. There were under institutional care in the State 6408 in charitable institutions, 2646 in criminal institutions and 733 in soldiers' homes. The legislature of 1907 passed a law requiring societies and individuals bringing into the State dependent children to obtain permission of the Superintendent of Charities and Corrections, with whom a bond of \$1000 must be filed that the children shall not become public charges.

POLITICS AND GOVERNMENT. The legislature met in its annual session on January 12. The Senate elected Samuel K. Robbins of Burlington county President, and Professor John D. Prince of Columbia University, a member of the Passaic delegation, was elected Speaker. Governor Fort in his annual message renewed many of his recommendations contained in his inaugural address of 1908 which failed to receive favorable consideration at the hands of the legislature of that year, and added several suggestions for future legislation based upon the reports of investigating committees which he had appointed and his years of experience as chief executive of the State. Among the topics of most vital public interest which he discussed were the constitutional amendments providing for the reorganization of the judiciary; the election of members of the Assembly by districts instead of counties, and increasing the term of Governor and Senators

from three to four years, and of the Assemblymen from one to two years. All of these amendments were overwhelmingly defeated at a special election held on September 14. He discussed also the excise question, the regulation of motor vehicles, the enactment of a public utilities law, the consolidation of State departments and the establishment of an ocean boulevard extending along the Atlantic coast from one end of the State to the other. In dealing with the excise question Governor Fort declared that there was no sentiment in the State to justify Prohibition legislation. He asserted that the Republican party could not, except in bad faith with the people, repeal the so-called "bishop's law," which regulates the issuing of liquor licenses in the State. He made an urgent appeal for greater uniformity in granting licenses, holding that a board composed of character and independence, free from removal at local behests, would work out a solution of the whole problem on lines conforming with public sentiment. Several modifications of the excise law were suggested. In urging the passage of the public utilities law, which had failed in 1908, Governor Fort said: "An intelligent conservative board of public utilities commissioners, with adequate powers, will strengthen public confidence in the securities of all such companies and prevent harm to any interests. There is absolutely no reason not founded in cupidity against a public utilities commission." He also urged various changes in the registration and primary laws and in the methods of voting and recommended the enactment of an employers' liability act, and the conservation of the State's natural resources. On January 19 Governor Fort sent a special message to the legislature urging the need for prompt and decisive action for relieving the State from the threatened treasury deficit. He estimated at the close of the fiscal year 1909, on October 31, that this deficit would be approximately \$750,000. This condition was brought about by the increase in the cost of operating the State government in recent years. During the fiscal year 1909 this cost was in round figures \$4,300,000. It results from the natural increase from the growth of the State and the extension of its functions in various directions. Governor Fort suggested two means of meeting the situation, first, the repeal or modification of the laws of 1906, which limited the amount of taxes for State purposes to one-half of 1 per cent. of the taxes assessed against the right of way, tangible personal property and franchises of railroad companies; second, the repeal of all the railway tax laws and throwing the railroad property into the general property of the State for taxation locally, and hereafter to have a direct State tax for the support of the State. Governor Fort, personally, did not favor the direct tax plan, and pointed out that unless radical changes were made in the present administration of the State's finances it would follow as a necessary consequence. The Governor disapproved the policy of the State adopted in 1906, which turned back to the local municipalities toward the payment of school taxes all but one-half of 1 per cent. of the railroad taxes, reserving the remainder for the State. He pointed out that this plan made no provision for the increased needs of the State government resulting from the in-

crease of population and the constantly increasing demands of State interests. He showed that while the taxes of the railroads had greatly increased since 1884, the State was obtaining no larger share for government purposes than it was twenty-four years ago. On April 6 a bill was introduced by Senator Frelinghuysen increasing the franchise taxes of the larger miscellaneous corporations incorporated in the State and taxed upon the basis of their issue and outstanding capital stock. This bill was applicable only to corporations having more than \$5,000,000 of outstanding stock, the taxes on stock up to that amount remaining as formerly. The bill increased from \$50 to \$150 per million the State tax imposed on stock exceeding that amount. This made the bill applicable to about 200 of the larger corporations of the State upon an outstanding capital stock aggregating approximately \$5,000,000,000. This bill failed to pass the Senate.

The chief measures passed at this session of the legislature are noted in the paragraph *Legislation* below. For the most part, important recommendations of Governor Fort were not acted upon favorably by the legislature.

The excise commission appointed by Governor Fort on January 18 submitted a draft of the proposed law to take the place of existing legislation on the liquor question. This measure contemplated a complete revision of the present laws, which provide for the election of excise boards. Licensees are to be divided into five classes: Class A, retail; Class B, wholesale; Class C, beer bottlers' license; Class D, licenses for selling liquors on cars and steamboats; Class E, license for clubs to sell to members only. The bill limited the number of licensed places to one for every 500 inhabitants. The selling of liquor on Sunday was absolutely forbidden. This bill failed to be enacted into a law.

On March 6 the Court of Errors and Appeals handed down an important corporation decision affecting the device of finance commonly known as the "holding" company. The decision had the effect of greatly restricting the operation of the holding company principle under the New Jersey general corporation act, which was generally accepted as giving to the corporations of the State almost unlimited rights in the matter of acquiring, selling, pledging or voting the securities of other corporations. The case in question was that of the State against the Atlantic City and Shore Railroad, which owns a line of railroad from Egg Harbor to Atlantic City, and undertook, through stock ownership and lease, to exercise the franchise rights of the Central Passenger Railway Company, a trolley road running in and about Atlantic City, and several other contiguous trolley lines which are considered feeders for the Atlantic City and Shore Railway. The latter road is controlled by the Pennsylvania Railroad. The State challenged the right of the Atlantic City and Shore Railway to acquire and own stocks and bonds of the Central Company or to operate cars over its roads on the ground that such powers were not conferred upon it under the railway act and cannot be derived from Section 51 of the general incorporation act. This position was upheld by the highest court of the State in an opinion rendered by Chancellor

Pitney, and a judgment was ordered ousting the Atlantic City and Shore Railway from the trolley franchises it had acquired and requiring it to dispose of the stocks and bonds.

Primary elections for the nomination of officers to be voted for in the election of November 2 were held on September 28. Nominations were made for 60 Assemblymen and eight State Senators, together with a number of local and municipal officers. Mark M. Fagan, one of the most prominent exponents of the New Idea in New Jersey in politics, received the Republican nomination for the mayoralty of Jersey City, while H. Otto WittPenn was re-nominated by the Democrats. In several counties the contest was bitter between the New Idea forces and the regular party organizations. The primary elections in general resulted in a defeat for the New Idea Republicans. They won in Hudson county and carried an occasional ward or district, but as a whole they were decisively beaten. In Essex county particularly, the stronghold of Senator Colby, the leading advocate of the New Idea, the regulars were in overwhelming majority. In the election held on November 2 Mayor WittPenn defeated Fagan, his Republican opponent, by a majority of about 7500. The Democrats won also in Trenton, re-electing Dr. Walter Madden by about 3000 plurality. The Democrats carried Hudson county by a majority of about 10,000. The election was a comparatively quiet one.

The diversion of the subterranean waters in New Jersey to supply Staten Island was vigorously opposed by Governor Fort, who in October expressed his intention of calling a special session of the legislature for the purpose of passing a law to prevent such action. From custody on furnishing \$5000 bail, and matter was left to the legislature of 1910.

OTHER EVENTS. The enforcement of the Sunday closing law at Atlantic City, which resulted in much confusion in 1908, was also a source of contention in 1909. On September 4 Mayor Franklin P. Stoy of Atlantic City was arrested on a warrant charging him with misdemeanor in having failed to close the bar-rooms on Sundays, as ordered by the Attorney-General of the State. Mayor Stoy was released from custody on furnishing \$5,000 bail, and the case never came to trial.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: Columbus day, October 12, was made a legal holiday throughout the State. Measures were enacted requiring seats for female employees in shops and stores. The liability of the employer for the death of the employees is extended. Cities are empowered to establish and maintain plants for the treatment of sewage and steps were taken to protect oyster beds from pollution. Provision was made for art, science and industrial museums in cities. Rebating in life insurance is forbidden and a commission of uniform legislation was appointed. Provision is made for sanitary conditions in the preparation of food. A board of protectors for the "prevention of drunkenness" is established, and saloonkeepers are prohibited from displaying in their saloons the particular brands of liquor they dispense.

OFFICERS. Governor, John Franklin Fort; Secretary of State, S. D. Dickinson; Treasurer, Daniel S. Voorhees; Auditor, William E. Drake;

Comptroller, Henry J. West; Attorney-General, Edmund Wilson; Adjutant-General, Wilbur F. Sadler, Jr.; Superintendent of Education, C. J. Baxter; Secretary Board of Agriculture, Franklin Dye; Commissioner of Insurance, Vivian M. Lewis—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, W. S. Gummere, Rep.; Justices, Charles W. Parker, Rep.; T. W. Trenchard, Rep.; Alfred Reed, Dem.; C. G. Garrison, Dem.; James J. Bergen, Dem.; Willard P. Voorhees, Rep.; James F. Minturn, Dem.; F. J. Swayze, Rep.; Clerk, William Riker, Jr., Rep.

Court of Errors and Appeals: Judges, J. W. Bogert, George R. Gray, Elmer E. Green, W. H. Vreedenburgh, G. D. W. Vroom, Peter V. Voorhees; Chancellor, William J. Magie, and the Supreme Court Justices.

The State Legislature of 1909 was composed of 13 Republicans and 8 Democrats in the Senate, and 45 Republicans and 15 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article **UNITED STATES**.

NEW MEXICO. A Territory in the Southwestern part of the United States. Its area is 122,834 square miles. Its population in 1909, according to a Federal estimate made in that year, was 226,835.

MINERAL PRODUCTION. The aggregate value of the mineral production of the State in 1908 was \$4,937,890, a marked decrease from the value of the product of 1907, which was \$7,517,843. The decline was brought about chiefly by the closing of many copper, lead and zinc mines on account of adverse conditions in 1908. The most valuable of the mineral products of the State is coal, of which 2,467,937 tons, valued at \$3,368,753, as compared with 2,628,959 tons, valued at \$3,832,128 in 1907. Copper produced in 1908 showed a very considerable decline, being scarcely more than one-half the product of 1907. The comparative figures are as follows: 1908, 4,991,135 pounds, valued at \$658,858; 1907, 10,140,140 pounds, valued at \$2,028,028. Gold was produced to the amount of 14,817 fine ounces, valued at \$306,300, as compared with 15,964 fine ounces, valued at \$330,000 in 1907. The production of silver in 1908 was 400,900 fine ounces, valued at \$214,500 as compared with 599,500 fine ounces, valued at \$395,700 in 1907. The other mineral products of the State are comparatively unimportant. Clay products in 1908 amounted to \$140,671; lead, \$49,224; precious stones, \$72,100 and stone, \$15,955. Mineral waters, sand and gravel, and zinc are produced in small quantities.

The production of gold in 1909 was estimated by the Director of the Mint at 133,464 fine ounces, valued at \$278,300. The silver production was 329,200 fine ounces, valued at \$171,200.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1908, according to figures of the United States Department of Agriculture, are as follows: Corn, 2,128,000 bushels, valued at \$1,915,000, from 68,000 acres; spring wheat, 1,004,000 bushels, valued at \$1,175,000, from 41,000 acres; oats, 960,000 bushels, valued at \$334,000, from 24,000 acres; barley, 40,000 bushels, valued at \$40,000, from 1000 acres; potatoes, 85,000 bushels, valued at \$86,000 from 1000 acres; hay, 481,000 tons,

valued at \$5,339,000, from 185,000 acres. The number of sheep in the State is large. The wool clipped is estimated at 21,828,720 pounds. New Mexico ranking third in its production. See **STOCK RAISING**.

The dry farms of the State produced in forage and grain crops \$30,000,000, while the truck gardens and cantaloupe and vegetable crops swelled the total agricultural production for the year to almost \$50,000,000. Under beneficial irrigation legislation, 142 irrigation and power projects were filed in the office of the territorial engineer during 1909. These provided for an expenditure of \$7,004,017 to reclaim 1,174,203 acres, and an expenditure of \$9,828,205 to develop 133,220 horse power. These were, in addition to the three great Federal projects, that of the Rio Hondo, which was completed; the Carlsbad project, in part completed, and under which 20,000 acres are now receiving water, and the Engle project, which is to cost \$7,000,000, under which 20,000 acres are already under cultivation. The great immigration movement to the dry farming sections of the territory, which began four years ago, continued in 1909, and 17,000 homesteads were filed upon the public lands, many of them under the new 320-acre act. Fully 3,000,000 acres are now under cultivation by scientific farming and 150,000 people live on the so-called dry farms.

EDUCATION. A law was passed by the legislative session of 1909, making instruction in English compulsory in all public schools. The legislature also created a Spanish-American Normal School at El Rito, at which the children of Spanish speaking parents are trained to teach school. The school attendance in 1909 was 46,005. There were 484 male teachers and 774 female teachers.

FINANCE. The report of the State Treasurer showed a balance from the fiscal year ended June 1, 1907, of \$345,125 and the receipts for the fiscal year 1908 were \$754,800, while the expenditures were \$721,272, leaving a balance on June 1, 1908, of \$378,653. The principal source of revenue was the property tax. The territorial debt on July 1, 1908, amounted to \$1,003,000, as compared with \$803,000 in 1907.

CHARITIES AND CORRECTIONS. Extensive permanent additions and improvements were made to the State Penitentiary, Insane Asylum, the Deaf and Dumb School and the School for the Blind.

POLITICS AND GOVERNMENT. The legislative assembly, which met during the first three months of the year, devoted itself chiefly to constructive legislation, although, in anticipation of early Statehood, few measures of a radical nature were adopted. In addition to those noted in the paragraph below, measures were enacted providing for the acceptance of the Carey act for the Territory. Provision was also made for the extension of irrigation and the securing of water rights, and for the vigorous prosecution of good roads work, for which purpose a good roads commission was created and a liberal appropriation was made. Acts were passed providing for the strengthening of the militia and for improving public education. An attempt to pass a local option law, recommended by Governor Curry, failed in the legislative Council after it had passed the Assembly. The county of Curry was created out of parts of Quay and Roswell counties, with the county seat at Clovis, a town which

has grown in two years from an unoccupied section of the dry farming country to a city of 5000 people. Various other changes were made in county boundaries. A new good roads law resulted in work being begun on three magnificent roads, one from Santa Fe to Albuquerque; another from Silver City to Mogollon, and the third from Carrizozo to Roswell, while the road from Raton to the Colorado boundary was completed by convict labor, and forty miles of the superb scenic highway over the Pecos National Forest and Sangre de Cristo Range between Santa Fe and Las Vegas were finished during the year.

The Territory during the year completed a \$30,000 Executive Mansion, built a \$50,000 addition to the Capitol, and completed six National Guard Armories.

Shortly after the adjournment of the legislature Governor Curry resigned his office, feeling that the constructive work he had set out to accomplish had been done and that his personal business affairs demanded his attention, but upon the urgent wish of President Taft he remained in office, but will retire on March 1, 1910. President Taft named as his successor Chief Justice William J. Mills and at the same time William H. Pope of Roswell was appointed Chief Justice.

Upon the plea of Senator Beveridge, chairman of the Senate Committee on Territories, at the close of the last session of the Sixtieth Congress, the Statehood enabling act, which had passed the House by a large majority, and for the passage of which President Roosevelt had worked assiduously, was not acted upon. The Senate leaders asked for time to investigate conditions in the Territories and desired that their admission be put off to the new administration. Requests of Governor Curry and the territorial legislature for a Congressional investigation of conditions in the Territory were not acted upon, and President Taft upon his visit to New Mexico in the fall renewed his promise to assist in the admission of New Mexico as a State, and urged its admission in his annual message to Congress in December.

On July 1, 1909, the Seventh Judicial District was organized with headquarters at Socorro, and President Taft appointed M. C. Mechem as presiding judge. Alford W. Cooley was appointed presiding judge of the Sixth Judicial District, with headquarters at Alamogordo. During the year there were no failures in national or territorial banks, no strikes or lynchings and no riots or serious coal or railroad accidents within the Territory.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: Measures were passed looking to the suppression of contagious disease among livestock. Holding companies are authorized, and provision is made for indeterminate sentence and parole. Women are prohibited from loitering about the saloons and a conservative commission for national resources is created.

OFFICERS: Governor, William J. Mills, Rep.; Secretary of Territory, Nathan Jaffa, Rep.; Treasurer, Miguel A. Otero, Rep.; Auditor, W. G. Sargent, Rep.; Adjutant-General, R. A. Ford, Rep.; Attorney-General, Frank W. Clancy, Rep.; Supt. Education, J. E. Clark, Rep.; Com. of Insurance, Jacobo Chavez, Rep.; Com. of Agriculture, Robert P. Ervien.

JUDICIARY: Supreme Court, Chief Justice W. H. Pope; Associate Justices, John R. McFie, Ira A. Abbott, A. W. Cooley, M. C. Mechem, and F. W. Parker; Clerk, José D. Sena—all Republicans.

The territorial legislature of 1909 was composed of 9 Republicans and 3 Democrats in the Senate and 20 Republicans and 4 Democrats in the House. The territorial representatives in Congress will be found in the section *Congress* of the article **UNITED STATES**.

NEW ORLEANS ANT. See **ENTOMOLOGY**.

NEW SOUTH WALES. A State of the Australian commonwealth. Area, 310,372 square miles. Estimated population at end of 1908, 1,605,009. Capital, Sydney (population, 127,460; with suburbs, 592,100). The executive authority rests with a governor appointed by the Crown and acting through a responsible ministry. The legislative power devolves upon a parliament of two houses, the Legislative Council (consisting of appointed life members, 57 in 1909) and the Legislative Assembly (90 members elected for three years by male and female suffrage). The Governor in 1909 was Lord Chelmsford; the Premier and Attorney-General, Charles Gregory Wade. For statistics and other details, see **AUSTRALIA**.

HISTORY. The programme of the government party as outlined in May included the vigorous execution of the closer settlement policy, encouragement of immigration, irrigation, railway development, and the adoption of effective administrative measures to prevent strikes and lockouts. Considerable progress had already been made under the Wade Ministry in internal improvements. Important public works had been undertaken; bids had been made for the great reservoir at Barren Jack near the capital, and the third section of the railway in the north coast region had been begun. As to closer settlement, the area resumed or in process of resumption within the past four years amounted to 1,413,342 acres (1896 farms); and private owners had been encouraged to dispose of 1,500,000 acres (1500 farms) for closer settlement in addition to the 11,000,000 acres of Crown lands applied to that purpose by the Lands Department. At the opening of Parliament on June 29 the Governor, Lord Chelmsford, spoke of a possible extension of the Crown Lands act to meet the necessities of closer settlement, referred to the great prosperity of the past year, resulting in a financial surplus, and promised that the government would carry on a much more active immigration policy. In October the Legislative Assembly passed a Closer Settlement bill authorizing the government to take possession after six months' notice of estates valued at £10,000 or more, situated in towns or within five miles therefrom, which restricted closer settlement unless arrangements were made with the owners for subdivision on terms to be agreed upon. In the budget speech of September 29 a surplus for the coming year was anticipated. Since the Australian commonwealth agreed to do its full share in Imperial defense, the New South Wales *Dreadnought* fund was no longer needed for its original purpose and it was decided to apply it to the founding of a naval college near Sydney for the training of the Australian squadron officers and with the balance to establish farms for the training of

young British immigrants. On November 8 the coal mines of the Newcastle and Maitland districts went on strike. The strikers numbered about 12,000. Their demands included the minimum wage, an eight-hour day, the decision of questions between masters and men in open conference and increased pay. Many workingmen in other trades were thrown out of employment and the effects were so serious that the question of nationalization was raised. In the Legislative Assembly the government was urged to try and induce the owners to hold an open conference and if its attempt failed to assume temporary control of the mines. The Premier, Mr. Wade, promised to try and bring about the resumption of work and secure the open conference, but said that it was not the time to consider the plan of nationalization. A motion of the Labor party for the nationalization of enough mines to supply the needs of the community was defeated by 39 to 25. About December 1, the number of miners out was estimated at 12,300 and of those thrown out of employment in other occupations at 14,300. It was difficult to deal with such a mass of strikers and there was fear of provoking a general strike. The intervention of the Governor-General, Lord Dudley, was considered. At the close of November the government secured the appointment of a compulsory wage board, arrested three officials of the Northern Miners' Confederation on the charge of conspiracy, and received from the Industrial Court authority to prosecute other officials under the Industrial Disputes act. See **STRIKES AND LOCKOUTS**.

NEW YORK. One of the North Atlantic Division of the United States. Its area is 49,204 square miles. The population, in 1909, according to a Federal estimate made in that year, was 8,706,039.

MINERAL PRODUCTION. The mineral industry of the State has grown steadily since 1904. This growth has been shown particularly in iron mining. There were mined in 1908 897,473 tons, which, although a considerable decrease from the product of 1907, 1,375,020 tons, largely brought about by the business depression, is a great advance over the production of the previous ten years. The value of the product in 1908 was \$2,098,247, as against a value for the product of 1907 of \$2,820,135. The clay products in the State in 1909 were valued at \$8,929,224, of which brick and tile were valued at \$7,270,981, and pottery at \$1,658,243. This was a considerable decrease in production, as compared with 1907, when the value of the product was \$11,772,874. This decrease is largely due to a smaller demand for building materials. The State has large deposits of stone and this constitutes an important portion of the mineral production. In the production of salt the State ranks second, being surpassed only by Michigan. There were produced in 1908 9,016,743 barrels, valued at \$2,136,738, as compared with a production of 9,842,178 barrels in 1907 valued at \$2,335,150. Other mineral products of importance are gypsum and petroleum, of which 1,160,128 barrels, valued at \$2,071,533, were produced in 1908, natural gas, pyrite, talc, garnet and crystalline graphite. The value of the mineral products of the State in 1908 was \$45,669,861, as compared with a value of the product in 1907 of \$68,762,815.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 24,120,000 bushels, valued at \$17,894,000 from 670,000 acres; winter wheat, 8,820,000 bushels, valued at \$9,790,000 from 420,000 acres; oats, 37,365,000 bushels, valued at \$18,309,000 from 1,325,000 acres; barley, 1,910,000 bushels, valued at \$1,318,000 from 77,000 acres; rye, 2,720,000 bushels, valued at \$2,176,000 from 160,000 acres; buckwheat, 7,512,000 bushels, valued at \$5,183,000 from 313,000 acres; potatoes, 52,560,000 bushels, valued at \$26,280,000 from 438,000 acres; hay, 5,002,000 tons, valued at \$71,028,000 from 4,764,000 acres; tobacco, 7,050,000 pounds, valued at \$564,000 from 6,000 acres. In the production of potatoes New York far surpasses any other State. The crop in 1909 was largely in excess of that of 1908, which was 34,850,000 bushels. The acreage, however, increased but slightly. New York ranks first also in the production of hay. The hay crop, however, decreased slightly in 1909, the production for 1908 having been 5,717,000 tons. The acreage remained practically the same. The tobacco crop of 1909 was slightly smaller than that of 1908, which was 7,250,975 pounds. The State ranks first in the production of buckwheat, and the crop of 1909 was considerably larger than that of 1908, which was 6,827,000 bushels. The number of farm animals in the State on January 1, 1910, was as follows: Horses, 717,000; dairy cows, 1,771,000; other cattle, 880,000; sheep, 1,177,000; swine, 656,000. The wool clipped in 1909 was estimated at 5,428,800 pounds.

FISHERIES. The value of the products of the fisheries of the State for the year ending December 31, 1908, was \$4,592,440. Of these products the most important in point of value was oysters, of which 1,845,800 bushels, valued at \$2,171,400 were taken for market purposes, and 614,100 bushels, valued at \$380,700, for seeding purposes. Next in point of value was squalene or trout, 11,151,100 pounds, valued at \$451,170; clams, 187,600 bushels, valued at \$291,970; bluefish, 3,191,500 pounds, valued at \$290,660; flounders, 4,629,300 pounds, valued at \$141,110; scallops, 72,300 gallons, valued at \$98,170, and butterfish, 1,228,800 pounds, valued at \$64,480. There were engaged in the fisheries of the State 3,270 independent fishermen and 3505 wage-earning fishermen were employed. There were 590 vessels, valued at \$1,380,196 engaged in the fisheries of the State.

EDUCATION. According to the report of the Commissioner of Education, the school attendance for the State in 1909 aggregated 1,840,909. This included 1,284,729 children in the common elementary schools; 101,987 in the common high schools; 6494 in the normal schools; 36,287 in universities, colleges and professional schools; 42,802 in academies, and 225,000 in private schools. The teachers numbered 50,788, of whom 37,152 were in the common elementary schools. The value of the property of these institutions was \$329,533,991, of which \$157,811,999 is used by the common elementary schools, \$26,146,619 by the common high schools and \$112,990,676 by the universities, colleges and professional schools. The total expenditures for these educational institutions in 1909

aggregated \$76,696,217, of which \$47,146,722 was spent for the common elementary schools, \$6,816,160 for the common high schools, \$16,456,213 for the universities, colleges and professional schools, and \$83,928 for evening schools. During the year the attendance increased 47,356 and the number of teachers increased 1,688. The Commissioner in his annual report devotes considerable space to the progress made in the establishment of vocational schools and the problems connected with their further development, to which he is giving special attention.

CHARITIES. The Psychiatric Institute of the State Hospitals for the Insane is situated on Ward's Island, in connection with Manhattan State Hospital, and is under the directorship of Prof. Adolf Meyer, M. D. The number of inmates in the various hospitals at the close of the fiscal year, September 30, 1909, was as follows: Utica, 1388; Willard, 2377; Hudson River, 2943; Middletown, 1763; Buffalo, 1955; Binghamton, 2238; St. Lawrence, 1887; Rochester, 1380; Gowanda, 1006; Kings Park, 3108; Long Island, 778; Manhattan, 4515; Central Islip, 4025; Matteawan, 759; Dannemora, 368; total, 30,490. There were also 1051 patients in the private hospitals licensed by the Commission in Lunacy, making a grand total of 31,541 patients. The total expenditure for maintenance was as follows: Officers' salaries, \$275,043; employees' wages, \$1,830,458; provisions and stores, \$1,821,716; ordinary repairs, \$102,481; farms and grounds, including live-stock, \$126,678; clothing, 191,720; furniture and bedding, \$126,883; books and stationery, \$30,589; fuel and light, \$481,641; medical supplies, \$34,244; miscellaneous, \$161,352; transportation of patients, \$27,105; making a total of \$5,210,810. The receipts from partly or fully reimbursing patients, stewards' sales and miscellaneous sources amounted to \$381,169. The commissioners are Albert Warren Ferris, M. D., Sheldon T. Viele and William L. Parkhurst.

POLITICS AND GOVERNMENT. Charles E. Hughes, who on November 3, 1908, was re-elected Governor of the State by a plurality of about 70,000 over Lewis S. Chanler, the Democratic candidate, was inaugurated on January 1. In his inaugural address his most important utterance was in regard to the centralization of power in the Governor. He urged that the Governor should have direct control over the heads of the administrative departments of the State, as the President of the United States has of the great executive departments of the Federal government. The address dealt mainly with the executive arm of the State government, its powers and limitations. In his annual message sent to the legislature on January 6, Governor Hughes dealt with many topics of State and local interest. Three topics, however, stood out as the most important, in his opinion, to be considered by the legislature. These were the questions of primaries, elections and the centralization of power in the hands of the Governor. In regard to the primary law, he recommended a system of direct nominations by all parties for all elective offices other than those of Presidential electors, filled at the November elections or at special elections called to fill vacancies in such offices. He recommended also the adoption of a simplified form of ballot

without the party column in which the names of the respective candidates appear but once, grouped under the names of the offices. In addition to these measures, Governor Hughes urged economy of administration and the passage of measures to protect the pollution of streams and for forest preservation. The majority of the legislature was not in sympathy with the chief measures proposed by Governor Hughes and it adjourned without passing any of his important recommendations. In this he found himself weaker than in the legislature of 1908, in which he forced the passage of laws prohibiting gambling at race tracks in the State. A bill for direct nominations was killed on April 8 in the Assembly by a vote of 112 to 28, and at the same time an important bill desired by the Governor which would have brought telegraph and telephone companies under the jurisdiction of the Public Service Commission was also defeated by a vote of 98 to 37. The vote in each case was taken on a motion to sustain the adverse report of a committee. A commission to investigate the subject of direct nominations by an examination of its workings in other States was appointed by the legislature, but as its members were, with one exception, opposed to the enactment of such laws it was considered to be rather a move by the opponents of Governor Hughes than an honest attempt to determine the utility of passing such a measure. A discussion of this proposed law will be found in the article ELECTORAL REFORM. Perhaps the most important measure passed in the legislature was that authorizing additional railroad subway construction in New York City, either by the city or by private capital. The session of the legislature of 1909 was, as a whole, notable for the things that it did not do rather than for those it accomplished. Its enactments were almost entirely of a local character.

The action of Governor Hughes on January 1, in approving a resolution adopted by the State Civil Service Commission on December 31, 1908, at his instance, making subject to the provisions of the State civil service law and rules the position of county superintendent, and other officers connected with the highways, was a severe blow to the politicians of the State. The Governor's action withdrew from the patronage of the local Republican machines in 52 counties of the State over one hundred salaried positions.

In 1908 Governor Hughes made two unsuccessful attempts to remove Otto Kelsey from the position of Superintendent of Insurance. The Senate voted twice against his recommendation, although Governor Hughes himself had held a public hearing at which he had questioned Mr. Kelsey severely on the administration of his office, and made it clear that he was unfamiliar with many of the duties which he had to perform. In the latter part of 1908, however, Mr. Kelsey resigned to become Assistant State Comptroller, and on February 5, 1908, Governor Hughes appointed William Horace Hotchkiss of Buffalo State Superintendent of Insurance.

On January 20, Elihu Root (q. v.) was elected United States Senator to succeed Thomas C. Platt, whose term was to expire on March 4. Mr. Root's plurality in the two Houses was 95. On March 23 Governor

Hughes signed a bill passed by the legislature designating October 12 as a legal holiday to be known as Columbus Day.

On September 9 an important and significant meeting of many of the leading Democrats of the State was held at Saratoga. The object of this conference was for the purpose of finding, if possible, some method of restoring the strength of the party in the State and Nation. The call was made by Thomas M. Osborne of Auburn and Edward M. Shepard of Brooklyn and other conspicuous Democrats. Although the conference disavowed any enmity to any Democratic organization in the State, it was notable that no representative was asked to attend from Tammany Hall. Indeed, Mr. Shepard, in an address, warned Tammany that it would only injure the party in State and Nation if it should give offense in the character of the men it was about to nominate for State offices to be filled in the election of November 2. The conference adopted a platform which included strict construction of the Constitution, support of legitimate Federal activities, resistance to Federal encroachment, tariff for revenue, economy, the popular election of United States Senators, nominations and election reforms, anti-imperialism, a Federal income tax and the confinement of the creation and regulation of corporations to the State. An organization was perfected, called the Democratic League.

At an election held on April 6, 1909, the rural communities of Long Island, Nassau and Suffolk counties, voted for license for the next two years. At the election on November 2, the Prohibitionists made substantial gains in Wayne county, but lost in Westchester county. In the latter county only one town voted against the saloons.

Several important judicial decisions were rendered during the year. On March 17, Justice Spencer held that the mortgage tax law passed in 1907 was unconstitutional. The State attempted to collect \$2000 in taxes alleged to be due on a mortgage given by the Union Bag and Paper Co. to the Trust Company of America. The Union Bag Company demurred to the complaint, contending that as applied to them the law was unconstitutional. Justice Spencer sustained the demurrer. On June 1, Justice Betts of the Supreme Court handed down a decision as to the constitutionality of the State labor law which provides semi-monthly payment of wages. He declared that the law was constitutional. On November 9, the Court of Appeals decided that oral betting is not a crime. The decision related to the laws against race-track gambling passed in 1908. Two bookmakers were indicted in Kings county on the charge of bookmaking, and especially with orally laying and publishing odds and accepting a bet as a basis for such odds. The court decided that in such a case the betting was not a crime. A decision which especially affected New York was handed down by the United States Supreme Court in January declaring the constitutionality of the eighty-cent gas bill passed in 1906. This decision will be found discussed in the article GAS.

NEW YORK CITY. On March 8 the commission appointed by Governor Hughes in 1908 to prepare a new charter for New York City, made its report. The proposed charter contained many modifications from the one now

in force in that city. It is much briefer in form, including only 70,000 words, while the former instrument contains half a million. The changes proposed are in general in the direction along which municipal government has moved in the last few years. The principle is followed of reducing the number of elective administrative officers and of putting into separate hands the power to appropriate and the power to spend money, and to concentrate power and responsibility in as few hands as possible. The commission proposed that the borough presidents, of which there are five, shall cease to have administrative functions and shall devote their entire time to the financial work on the Board of Estimate and Apportionment. The administrative work is to be given to the heads of departments, responsible to the Mayor and to bureaus, some of which are to be under the Board of Estimate and Apportionment and some under the various departments. The Board of Aldermen is to be supplanted by a council of thirty-nine members to serve without pay. Perhaps the most radical feature proposed is the abolition of the street cleaning department and the placing of the work of that department, as well as the work of repairing the streets, care of sewers and the like, which has been under the charge of the borough presidents, under a newly created department of street control. The powers of the Council are in many respects to be more limited than those possessed by the Board of Aldermen, although in some respects they are greater. The power to grant franchises is to rest exclusively in the hands of the Board of Estimate and Apportionment, and the Council is to have extended ordinance-making authority. The keeping of the State accounts is greatly simplified. The office of coroner is abolished and many minor changes are made, among them the creation of a uniformed Superintendent of Police subject to removal by the Police Commissioner. Certain provisions of the proposed charter met with severe criticism, especially those relating to the abolition of the Board of Aldermen. No action was taken during the year toward its acceptance or rejection. See MUNICIPAL GOVERNMENT.

The committee appointed in 1908 by Governor Hughes to inquire into Wall Street methods made its report on June 16. A discussion of this report will be found in the article EXCHANGES. On March 23, Governor Hughes dismissed the charge brought in 1908 against District Attorney William Travers Jerome for malfeasance in office and neglect of duty. The Governor based his decision entirely on the report and recommendations of Judge Richard L. Hand, whom he had designated to take testimony in the case. Commissioner Hand presented his report in the latter part of 1908. He declared that he found the charges not sustained in any particular. Governor Hughes agreed with this report that nothing was found to warrant sustaining the charges.

A new building code for the city, prepared by engineers and architects, was passed on July 24 by the Board of Aldermen by a majority vote of one. The code was, however, vetoed by Mayor McClellan. See CONCRETE.

Perhaps the most sensational incident in the history of the city during the year was the removal of Police Commissioner Bingham by Mayor McClellan on July 1. The action of

the Mayor was based directly on Commissioner Bingham's refusal to dismiss two of his subordinates in office at the request of the Mayor. The disagreement arose originally, however, over the action of the Commissioner in refusing to remove from the Rogues' Gallery the picture of a boy who was declared to have never been indicted for crime, but who had several times been arrested by the police and discharged. Commissioner Bingham insisted that the retention of the picture in the gallery was justified, while Mayor McClellan, after a careful hearing, declared that it was not. In the course of the hearing it was charged by the Mayor that the subordinates of the Commissioner referred to above had made attempts to discredit Justice Gaynor, through whose efforts the original demand for the removal of the picture was made. The Mayor appointed William F. Baker, previously First Deputy, Commissioner of Police to succeed General Bingham.

In September Louis F. Haffen, president of the Borough of the Bronx, was removed from office by Governor Hughes for official misconduct and neglect of duty. This action was the result of an investigation into the administration of Mr. Haffen undertaken by the Commissioners of Accounts during the year. Among the charges which Governor Hughes held to be substantiated were waste of public funds by the loading of payrolls, political jobbery in the purchase of granite for the borough courthouse, the continuance in this as a public architect a politician without professional qualifications for such work, and the acquisition by the city at a cost of \$240,000 for use as a bathing beach, of the shore property on which the assessed valuation was \$43,000, and which was situated at the mouth of a great sewer. Mr. Haffen had been borough president since the first election of the newly created Greater New York and for many years had been a strong political power in the Borough of the Bronx.

The election on November 3 for municipal officers was one of the most closely contested in the history of the city. Opponents of Tammany Hall took as the basis of their campaign the extravagance and waste in the city departments under Tammany rule and the general incompetence of the Tammany officials. A coalition was formed between a number of independent organizations and the regular Republican party. Otto T. Bannard, a banker and also well known in municipal affairs, was nominated for Mayor. The nominations for other officers were made from the regular Republican organization and from the independent organizations. They were, in general, men of higher character than are usually nominated for office in New York City. Tammany nominated for Mayor Justice William J. Gaynor of the Borough of Brooklyn. He had for many years bitterly opposed nearly everything for which Tammany Hall has stood, but that organization was obliged to find for its candidate a man who could draw votes from all elements of the Democratic party, and by this action the Democratic organizations of Manhattan and Brooklyn were brought into alliance. Justice Gaynor had been on the bench of the Supreme Court for fifteen years. Through his efforts, as noted above, was brought about the removal of Police Commissioner Bingham. He had long been notable for his opposition to many of the measures advocated and carried out by the Police Department. By developments unexpected

by the Democrats, William Randolph Hearst was nominated in October as candidate for Mayor of the Civic Alliance. This nomination was thought by many to be a shrewd move on the part of the leaders of the Republican and Independent organizations to draw votes from Justice Gaynor. Mr. Bannard made a strong and dignified campaign and showed great ability as a speaker. The campaign in general was one of great bitterness; Justice Gaynor was assailed in severe terms by his opponents and he retorted in kind. The result of the election was in general a surprise. Justice Gaynor was elected by a vote of 250,378 as compared with 177,304 for Mr. Bannard and 154,187 for Mr. Hearst. With this exception, the entire Republican-Fusion ticket was elected, including comptroller, all the borough presidents and the president of the Board of Aldermen. Majorities were cast for this ticket in all the boroughs and the candidates were elected by substantial majorities.

The city budget for 1910 amounted to \$163,049,480, an apparent increase over the budget of 1909 of about \$6,500,000. The increase was in part made up for by new items. The entire net increase was about 2.66 per cent.

On July 18 the lower tubes of the McAdoo system of tunnels connecting New Jersey with New York were opened by appropriate ceremonies in which officials of New York and New Jersey took part. In these tunnels trains will carry passengers to and from New York in less than half the time formerly required by the ferry boats (see TUNNELS). During the year the new Queensborough Bridge was formally opened and the Manhattan Bridge was nearly brought to completion (see BRIDGES). The Pennsylvania tunnels across the North and East rivers were completed and the Pennsylvania Station was finished as to the exterior. The great works undertaken by the Pennsylvania Railroad in Long Island City went forward steadily during the year and preparations were made to run trains through the tunnels on April 1, 1910.

There were no great disasters or any fires of the first magnitude in the city during the year.

For accounts of the Hudson-Fulton, Lake Champlain, and other like celebrations in the State in 1909, see CENTENARIES AND ANNIVERSARIES.

STATE OFFICERS: Governor, Charles E. Hughes; Lieutenant-Governor, Horace White; Secretary to the Governor, Robert H. Fuller; Secretary of State, Samuel S. Koenig; Comptroller, Clark Williams; State Treasurer, Thomas B. Dunn; Attorney-General, Edward R. O'Malley; State Engineer and Surveyor, Frank M. Williams; Commissioner of Education, Andrew S. Draper; Superintendent of Insurance, William H. Hotchkiss; Superintendent of Banking Department, Orion H. Cheney; Superintendent of State Prisons, Cornelius V. Collins; Superintendent of Public Works, Frederick C. Stevens; President, State Commission in Lunacy, Albert Warren Ferris; Public Service Commission, Chairman First Division, William R. Wilcox; Chairman Second Division, Frank W. Stevens.

NEW YORK, COLLEGE OF THE CITY OF. An institution of higher learning in New York City founded in 1847. The attendance in 1909 was 3736 and the instructors numbered 232. About one-eighth of the students are of college

grade. The library contained in 1900, 30,400 volumes. The college is a part of the educational system of New York City and is supported by appropriations from the city. In 1908 the new buildings of the University on Washington Heights were dedicated. These buildings were constructed for the college by the city. The president is John H. Finley.

NEW YORK ACADEMY OF SCIENCES. A learned society incorporated in 1818 as the Lyceum of Natural History in the City of New York. In 1876 the change was made to the present name. The Society was empowered by legislative enactment in 1902 to obtain funds to erect a building for scientific uses. Annual meetings are held in December of each year. The Academy has in its keeping the Esther Hermann Building Fund and the John Strong Newberry Fund for the encouragement of scientific research. The Academy's library is at the Museum of Natural History and is free to the public. The membership is about 450. The president is Charles F. Fox, the recording secretary, E. Otis Hovey, and the corresponding secretary, Henry E. Crampton.

NEW YORK BARGE CANAL. See CANALS.

NEW YORK PUBLIC LIBRARY. A public institution founded in 1895 by the consolidation of the Astor Library, the Lenox Library, and the Tilden Trust. The library includes forty branches in different parts of the city, which form its circulation department. Among the buildings occupied by these branches are thirty-two erected from the Carnegie Fund. Four of these were added during 1909, all in the Borough of Manhattan. Among the features of the branch libraries are roof reading rooms, which in the last few years have become a feature of four of the branches situated in the more crowded portions of the city. In the branches of the library there were circulated during the year 7,013,649 volumes, an increase of 509,247 over 1908. In the reference branches, which are in the main library building, the readers and visitors during 1909 numbered 265,912. The total number of volumes available for readers in 1909 was 799,854, with 295,078 pamphlets in the Reference Department, while in the Circulation Department there were 755,406 volumes, making an aggregate of 1,844,338 pieces in the whole library. Progress on the new central building on Fifth Avenue and 42nd Street continued during the year. The greater part of the work has been completed. In 1909 the library lost one of its most useful officers, John Stewart Kennedy (q. v.), second vice-president. The library is to receive from his estate an amount estimated at not less than \$2,250,000. Arthur E. Bostwick, chief of the Circulation Department since 1901, resigned on October 1, 1909, to become librarian of the St. Louis Public Library, and Benjamin Adams was appointed in his place. The director is John S. Billings.

NEW YORK SCHOOL OF PHILANTHROPY. See CHARITY ORGANIZATION.

NEW YORK UNIVERSITY. An institution of higher learning in New York City, founded in 1830. The total enrollment in 1909 was 4000 students. The faculty numbered 251. The University includes colleges of arts, law, commerce, medicine, pedagogy, graduate, applied science, summer school and a women's law class. The College of Arts is situated on Uni-

versity Heights, the Medical College at First Avenue between 25th and 26th streets and the other colleges in the University building at Washington Square, the original site of the University. Among the changes in the faculty in 1909 was the resignation of Professor J. G. Stevenson, professor of geology, and the appointment of Professor Joseph Edmund Woodman, Sc. D., as his successor. Professor Herman Harrell Horne, Ph. D., was appointed professor of the history of education and history of philosophy, to succeed Professor J. P. Gordy, deceased. The University received in gifts during the year \$25,000. It was also one of the beneficiaries of the bequest made by John Stewart Kennedy (q. v.). This bequest will amount to from \$750,000 to \$1,000,000. It was announced by Chancellor McCracken that this sum would be used to extinguish the debt of the University. There were about 98,000 volumes in the library. The productive funds of the University amount to about \$1,200,000 and the annual income to about \$365,000. The chancellor in 1909 was H. M. McCracken.

NEW YORK ZOOLOGICAL SOCIETY. A private scientific society organized for the purpose of establishing a zoölogical park for the preservation of American animals in New York City. The Society, on March 24, 1897, entered into a contract with the city of New York to establish and maintain a zoölogical park in a portion of the south end of Bronx Park, consisting of 264 acres of land which comprised open glades, forest lands and lakes. This area constitutes the New York Zoölogical Park. In area and in the elaborateness of its buildings, it is without doubt the largest and most highly developed zoölogical park in the world. The collections maintained belong to the Society. They comprised on July 15, 1909, 1146 species and 5528 specimens of mammals, birds and reptiles. The attendance at the park in 1909 was 1,614,953. The total attendance from 1899 to 1909 inclusive was 10,913,530. The Society also manages and controls the New York Aquarium at the Battery, and through its efforts has developed the largest and most complete aquarium in the world. It is the only institution of its kind that attempts to maintain in a temperate zone tropical collections by means of heated sea water, which is brought in from the open ocean, filtrated, aerated and heated in a large receiving tank. The attendance at the aquarium during 1909 was 3,803,501. The Society has taken an active part in the protection of American animals and especially in the preservation of the American bison, of which it maintains at its park an excellent herd. The membership at the end of 1909 was 1764. The president of the executive committee of the Society is Professor Henry Fairfield Osborn, and the director of the Park, William T. Hornaday.

NEW ZEALAND, DOMINION OF. A self-governing dependency of Great Britain; a group of islands in the South Pacific, including the North and South (the largest two) islands, Stewart, and some small outlying islands. Capital, Wellington.

AREA AND POPULATION. Total area, 104,751 square miles (North, 44,468; South, 58,525; Stewart, 665). Up to March, 1908, 26,462,809 acres had been alienated. Population (1906), 936,309 (North, 476,732; South, 411,340; Stewart 304), including 47,731 Maories, 3938 half-casts, and 2570 Chinese; estimated, June

30, 1909, 1,029,417. The number of marriages (1908) was 8339; births, 25,940; deaths, 9043. The population of the chief towns with their suburbs was estimated in 1909 as follows: Wellington, 73,697; Auckland, 93,544; Dunedin, 61,279; Christchurch, 76,709; Invercargill, 13,700.

EDUCATION, ETC. Primary education is free, secular, and compulsory. There were (December, 1908) 1998 public elementary schools, with 3989 teachers and 147,428 pupils; 309 private schools, with 18,367 pupils; and 97 village schools for the Maoris. There are 331 endowed colleges and grammar schools. The University of New Zealand confers degrees.

The State supports no creed. The Protestants numbered (1908) 719,087; Roman and other Catholics, 127,227; Jews, 1867; Pagans, 1452; others or unclassed, 24,325.

PRODUCTION. In 1906, 13.32 per cent. of the population were classed as agricultural, pastoral, and mineral producers, 13.99 per cent. industrial; 9.04 per cent. commercial. Total area (1909) of land under crops or broken for crops, 1,890,630 acres; under sown grasses, 13,623,528. About 20,000,000 acres are under forest. Area under wheat (1907-8), 193,031 acres, yield 5,567,139 bushels; barley, 36,177 and 1,163,406; corn, 8880 and 503,301; potatoes, 27,035 and 142,990. Live-stock (1908): 1,816,299 cattle, 20,983,772 sheep, 1,352,832 horses, 241,128 swine. Wool clip (1906), 175,752,317 pounds. The output of coal for the year 1908 was 1,860,975 tons. The aggregate production of the important minerals to the end of 1907, the aggregate values, and the value of the output for the year, are given below:

	Aggregate production	Aggregate value	Value for 1907
Gold.....	18,218,680 ozs.	£71,528,978	£2,027,490
Coal.....	25,247,542 tons	13,485,259	965,766
Silver.....	9,439,396 ozs.	1,090,751	169,484
Copper....	1,477 tons	18,825	595
Iron.....	3 tons	281	101
Other.....		14,398,994	612,399
Total.....		£100,523,086	£3,775,835

The manufactories numbered 4186 in 1906, with 56,359 employees, and a collective output valued at £23,755,132. The principal were meat freezing and preserving plants, tanneries, wool scouring, etc., establishments, saw and grist mills, butter and cheese factories, iron and brass works.

COMMERCE. The imports and exports for 1908 were valued at £17,471,284 and £16,317,494 respectively, (wool £5,332,781; frozen meat, £3,188,515; gold, £2,004,799; butter and cheese, £1,954,601), against £17,302,861 and £20,068,957 for 1907. The Board of Trade returns give the following list of articles of trade with Great Britain in 1908:

	Imports
Iron	£1,341,567
Cottons	858,348
Woolens	611,608
Ships	582,251
Apparel	477,405
Machinery	459,490
Leather	260,723
Spirits	239,473
Paper	189,204
Various	680,592
Total	£8,767,003

	Exports
Wool	£5,941,765
Mutton	3,452,584
Butter	1,250,211
Cheese	801,131
Skins	596,189
Tallow, etc.	590,457
Beef (fresh)	541,600
Kauri gum	419,415
Hemp	410,535
Total	£14,664,331

Other principal countries of origin and destination are the Australian States, the United States, Pacific Islands, India, and Ceylon.

COMMUNICATIONS. In March, 1909, there were 2674 miles of government and 29 miles of private railroads in operation; 10,404 miles of telegraph lines (wires, 32,564 miles); number of post-offices, 2133. Exclusive of coasting vessels, the total number of vessels entered in 1908 was 658 of 1,361,647 tons; cleared, 656 of 1,331,305 tons.

FINANCE. The total revenue and expenditure for the fiscal year 1909 were £9,001,185 and £8,785,513, against £9,063,989 and £8,213,965 for the preceding year. The expenditure from loans, including moneys spent under the Land for Settlements acts, amounted in 1907-8 to £3,318,650; in 1908-9, to £4,294,727. The gross public debt stood, March 31, 1909, at £70,938,534; accrued sinking fund, £3,156,989. There were (December, 1907) five banks of issue in operation, with total average liabilities £25,334,348, assets £26,584,239; 568 postal and other savings banks, with 364,422 depositors and £12,825,063 deposits at end of year.

GOVERNMENT. The Dominion is administered by a governor (1909, Lord Plunkett), aided by a responsible ministry, and a legislative council appointed by the Governor for seven years (45 members). The House of Representatives has 80 members (4 Maoris) elected by the popular vote of both sexes. The government of the Cook Islands, annexed in 1901, is administered locally, under the direction of New Zealand.

HISTORY. In January there was a serious labor dispute between the miners on the one hand, and the mine owners and insurance companies on the other, on the question of insurance without medical examination. Insurance was required by Parliament. The insurance companies and mine owners insisted upon medical examination, but the men refused. Even the Government Insurance Department at first refused the risk on pneumoconiosis without examination, but on January 11 it agreed to assume it and finally, toward the close of the month, the difficulties were adjusted and the Minister of Mines announced that the trouble was at an end. The numbers of the unemployed were considerable and many were emigrating to Australia. A small amount was available in 1909 for relief work and in the summer the Minister of Finance proposed a measure for insurance against unemployment on the model of the Churchill scheme in Great Britain. (See OLD AGE PENSIONS). For relief work the government had been spending £2,400,000 and was now spending only £1,400,000. It was estimated that 130,000 workmen were dependent upon the government works, which were now being reduced. Between April and November, 1908, 450,000

acres were selected for settlement. The policy of promoting desirable immigration, that is to say, the immigration of farmers, domestic servants and farm hands was again proposed by the Minister of Immigration. To carry on public works, promote the settlement policy and make advances to settlers, a loan was necessary. In October, the Premier, Sir Joseph Ward, announced that a loan of one million pounds had been obtained for these purposes and later in the month it was given out that the government would introduce measures for a State-Guaranteed Advances Department for the purpose of advancing money to settlers, working men, local bodies and mining companies. As to the government's railway policy, the Premier announced in October that railway building would henceforth not be undertaken if it was not likely to pay, except on condition that the people guaranteed earnings up to three per cent. Early in May, the Premier declared that the finances were in good condition, showing a surplus of £184,000 and a reduction of the floating debt. As to the *Dreadnought* fund, he said he would propose a plan whereby the cost should be met within the present generation. Public sentiment was strongly in favor of the *Dreadnought* gift, which was approved by both houses in June. At a meeting of the Auckland Brewers' and Licensed Victualers' Association, it was decided to abolish the practice of employing barmaids and of keeping private bars and to raise the age of minors to whom liquor could be sold, from eighteen to twenty years. This association represented the entire wholesale trade and nearly all the retail trade. The decision arose from a poll on the question of Prohibition or reducing the facilities for getting liquor, which resulted in a large "moderate" vote. As a result of the liquor option vote, 107 hotels lost their license on June 30. It was decided that the Premier should attend the Imperial Defense Conference. There was some opposition to the defense movement, especially to compulsory military training, but it came from a small minority, mainly Socialists. The budget was presented on November 10. For the past year the revenues were £9,001,185 and the expenditures £8,785,513. For the construction of the promised *Dreadnought*, a loan of not more than £2,000,000 at 3½ per cent. was proposed. The government's scheme for the reconstruction of the military was based on the decisions of the Defense Conference. Its chief features were as follows: Elementary progressive training between the years of twelve and eighteen; two years compulsory training between eighteen and twenty-one, including drill on certain fixed days and two weeks of camp duty; the maintenance of a volunteer force of 20,000. The cost of the new system was estimated at £352,000. An increase in the death duties was proposed and the government was said to be considering an increase in the income tax and the tax on bank note issues. For the coming year the revenue was estimated at £9,020,000 and the expenditure at £9,015,078. On the night of February 12, the steamship *Penguin* of the New Zealand Steamship Company's line, bound from Picton to Wellington, ran aground off Cape Terawhati in Cook's Straits. The crew and passengers, who numbered about a hundred, embarked in small boats and rafts, but only twenty-six reached the shore. The volcano

Aegauruhoe was in eruption in the spring, throwing ashes and débris to a greater height than ever before, estimated at eight thousand feet. Some disturbances took place in the Cook group of islands early in the year and in March it was reported that a British warship had been sent to the seat of the disorder and that the leader and others implicated had been sentenced to imprisonment. See **GREAT BRITAIN**.

NICARAGUA. A Central American republic between Honduras and Costa Rica. The capital is Managua.

AREA AND POPULATION. The area is stated at 49,552 square miles. The estimated population is about 600,000, mainly Indians and mestizos. There are some mulattoes and negroes, but persons of unmixed white race are few in number. The principal cities, with estimated population, are: León, 63,000; Managua, 35,000; Granada, 25,000; Matagalpa, 16,000; Masaya, and Bluefields, 15,000 each; Chinandega, 12,700. There are reported 356 elementary schools and 10 so-called colleges. The former universities of León and Granada are now consolidated. Roman Catholicism is the prevailing form of religion.

INDUSTRIES. Agriculture is the principal industry, and the leading crops are coffee and bananas. In recent years the cultivated area has been extending, and this development would doubtless proceed more rapidly but for the scarcity of labor. Various metal and minerals occur, including gold, silver, copper, precious stones, coal, and petroleum, but the mining industry is largely restricted to gold. There are vast forests containing rubber trees, dye woods, medicinal plants, and valuable cabinet woods, including cedar and mahogany. The coffee yield for the agricultural year 1908 was about 14,000,000 pounds, and the estimate for 1909 was 16,800,000 pounds. Nicaraguan coffee is of superior quality. In Matagalpa and Jinotega the cultivation is carried on by colonies of Americans and Germans. Banana culture, especially in the Bluefields region, is increasing, the annual production amounting to about 2,000,000 bunches. Sugar, tobacco, cacao, and rubber are important products. The live-stock industry has reached considerable proportions, the estimated number of cattle being 1,200,000. There are over 500 registered mines, of which 494 are gold producing. The annual gold output amounts to about \$1,000,000.

COMMERCE. In 1908 imports were valued at about \$3,452,000, and exports, about \$2,881,000. The United States has first place in both branches of trade. According to American statistics, in 1908 Nicaragua received from the United States shipments valued at \$1,297,163, and sent thither goods valued at \$1,034,131. The banana export from Bluefields to the United States amounted to 1,298,000 bunches, worth \$531,133. In 1906, the latest year for which full commercial details are available, the imports and exports were valued at \$3,408,830 and \$4,231,048 respectively. Of these amounts \$1,914,961 and \$2,492,961 respectively were credited to the United States; to Great Britain, \$776,133 and \$452,142; Germany, \$400,389 and \$458,718; France, \$193,661 and \$480,502. The chief exports in 1906 were: Coffee, 19,378,216 pounds, valued at \$1,375,679; bananas, 1,401,595 bunches, \$700,069; gold bullion and amalgam, \$870,969; rubber, \$385,472; mahogany, \$284,320.

COMMUNICATIONS. There are about 200 miles public. The railway, 171 miles, is operated in connection with steamers on the lakes. Since 1903 it has been leased to a company, and notable improvements have been made. There are about 20 miles of privately owned railway on the Atlantic coast. Other lines are projected. From San Miguelito, on Lake Nicaragua, a line is under construction to Monkey Point, 116 miles distant, on the Caribbean Sea. A line is projected from the Pacific port of San Juan del Sur to Lake Nicaragua. There are 135 post-offices and about 1800 miles of telegraph line, with over 3100 miles of wire.

FINANCE. Reported revenue and expenditure, in paper pesos of about 16 cents each, were 12,065,115 and 10,556,450 respectively in 1906, and 13,173,890 and 15,832,742 respectively in 1907. At the beginning of 1909, the external debt amounted to about £463,000. In May of that year the government obtained a foreign loan of £1,250,000, issuing 6 per cent. gold bonds, part of the proceeds of which were to pay off the English loan of 1886 (about £245,000) and the American loan of 1904 (about \$1,000,000). The sum of £430,000 was to be set aside for the construction of the railway from San Miguelito to Monkey Point. The internal debt in 1909 amounted to about \$5,128,000.

GOVERNMENT. Under the present constitution, dating from March 30, 1905, the executive authority is vested in a president, who is elected by direct vote for a term of six years and is assisted by a cabinet of five ministers, responsible both to himself and to the Assembly. The legislative power devolves upon the National Assembly (unicameral), whose members are elected for six years. The President in 1909 (for the term of 1908-12) was José Santos Zelaya. On December 16 of that year he resigned. Zelaya had served as chief executive for the three four-year terms 1894-1906 and since 1906.

HISTORY. President Zelaya had long been a disturbing factor in Central American politics, owing to his aggressive policy toward his neighbors, and had caused indignation among his own people by his concessions and monopolies. Early in the year the friction between him and President Cabrera of Guatemala for a time threatened war. Difficulty arose with the United States in regard to the settlement of a claim of certain American citizens, and on March 17 the United States demanded its submission to arbitration. About the same time three American cruisers were sent to Nicaraguan waters. The claim was referred to arbitration in May. There were reports of revolutionary risings during the summer. In October the revolt assumed formidable dimensions under General Juan J. Estrada, who in the early part of that month was declared provisional President. The Atlantic coast towns surrendered to the Revolutionists. An engagement took place on the San Juan River October 24, resulting in a loss of 100 killed and 400 wounded to the Zelayans. The latter, however, defeated the Revolutionists on November 2. In an engagement on November 4, both sides claimed the victory. On November 8 the Zelayans fell into an ambush, losing 100 killed and wounded. On November 30, 1000 of the Zelayans were attacked by the Revolutionists and defeated with a loss of 80 killed. The cause of Estrada rapidly strengthened and he was proclaimed provisional President of the whole re-

of railway. The report (on November 18) of the shooting of two American citizens, Groce and Cannon, by the order of President Zelaya, led to a vigorous declaration by Secretary Knox, on November 22, that the government would demand reparation. On December 1, Secretary Knox recognized the Estrada government and dismissed Zelaya's representative at Washington, informing him that the United States would hold those who had ordered the execution of Groce and Cannon personally responsible. The danger of serious difficulties between the two countries was averted by the resignation of President Zelaya on December 16. See the article UNITED STATES, paragraph on *Foreign Affairs*.

NICHOLS, ERNEST FOX. An American educator, inaugurated October, 1909, president of Dartmouth College. He was born at Leavenworth, Kansas, in 1869, and graduated from the Kansas Agricultural College in 1888 and from Cornell University as Master of Science in 1893, and as Doctor of Science in 1897. He carried on graduate studies in physics at Cornell University, 1889-92, University of Berlin, 1894-6, and at Cambridge University, 1904-5. He was appointed Fellow in Physics at Cornell University in 1891-2, and in 1892 was chosen professor of physics at Colgate University, serving in that position until 1898. In the latter year he was called to the same position at Dartmouth College, where he served until 1903. From that year until 1908 he was professor of experimental physics at Columbia University. He was given the Rumford medal by the American Academy of Political and Social Science in 1905. He has contributed papers to various scientific journals, especially on radiation.

NIGER, MILITARY TERRITORY OF THE. A French territory of French West Africa (q. v.), divided into two districts (Timbuktu and Zinder). Area, 534,124 square miles; population unknown. Each district is under a lieutenant-colonel responsible to the colonel of the territory. The territory is administered under the authority of the Lieutenant-Governor of Upper-Senegal-Niger (q. v.), and its budget forms an annex to the budget of that colony.

NITROGEN OF SODA. See FERTILIZERS.

NOAILLES, EMMANUEL, Marquis de. A French diplomat, died February 16, 1909. He was born in 1830, the son of Duke Paul de Noailles. His early life was spent in study, but on the declaration of the Republic he entered the diplomatic service. He was appointed Minister to the United States in 1872, but was transferred in the following year to Italy, where he served until 1882. From 1882 to 1886 he represented France in Turkey, and from 1896 to 1902 in Germany.

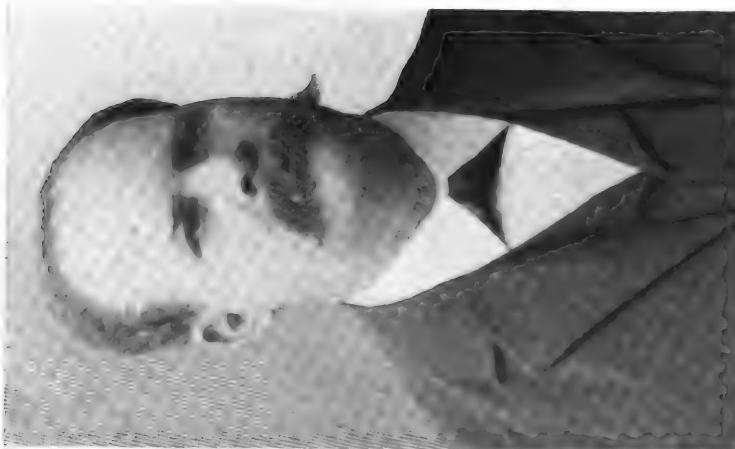

NOBEL PRIZES. A system of awards established from a fund of \$8,400,000 bequeathed by Dr. Alfred Bernhard Nobel in 1896 for the purpose of awarding annual prizes to "those persons who shall have contributed most materially to the benefit of mankind" in the year immediately preceding. Prizes are distributed in accordance with a statute signed by King Oscar of Sweden January 29, 1900. The value of the prize now amounts to about \$38,000,

JOSÉ SANTOS ZELAYA
President, resigning in 1909

a considerable portion of the income being absorbed in the administrative expenses and scientific investigations of the committees. The stipulation that the awards should be for some achievement of the preceding year has been, to a large extent, disregarded, as in many cases the life work of the recipients had been accomplished and its value recognized by the world long before the establishment of the foundation. The prizes in science and literature are given at Stockholm, and the prize for peace at Christiania, on the anniversary of the death of the founder, on December 10, from nominations submitted before February 1, preceding. The right to make nominations is bestowed upon members of the Swedish Academies and of corresponding academies of other countries, professors holding proper chairs in Scandinavian and certain foreign universities, previous recipients of Nobel prizes and other persons of distinction. Notices of those who received the prizes in 1909 are given in the table below:

THE RECIPIENTS OF THE NOBEL PRIZES

Name	Year	Nationality
Physics		
Wilhelm Konrad Röntgen....	1901	German
H. A. Lorentz.....	1902	Dutch
P. Zeeman	1902	
Henri Becquerel	1903	French
Pierre Curie	1903	French
Madame Skłodowska Curie.	1903	Polish
Lord Rayleigh	1904	English
Philip von Lenard	1905	German
Joseph J. Thompson.....	1906	English
Albert A. Michelson	1907	American
Gabriel Lippman	1908	French
William Marconi	1909	Italian
Ferdinand K. Braun.....	1909	German
Chemistry		
Jakobus H. van't Hoff.....	1901	Dutch
Emil Fischer	1902	German
Svante Arrhenius	1903	Swedish
Sir William Ramsay	1904	English
Adolph von Baeyer	1905	German
Henri Moissan	1906	French
Edward Büchner	1907	German
Ernest Rutherford	1908	English
Wilhelm Ostwald	1909	German
Medicine		
Emil Behring	1901	German
Ronald Ross	1902	English
Niels R. Finsen	1903	Danish
Ivan Petrovitch Pavlov	1904	Russian
Robert Koch	1905	German
Camille Golgi	1906	Italian
Santiago Roman y Cajal..	1906	Spanish
Charles Alphonse Laveran..	1907	French
Paul Ehrlich	1908	German
Elie Metchnikoff	1908	Russian
Theodor Kocher	1909	Swiss
Literature		
Armand Sully-Prudhomme...	1901	French
Theodor Mommsen	1902	German

Élie Ducommun	1902	Swiss
Albert Gobat	1902	Swiss
William R. Cremer	1903	English
Institute of International Law	1904	International
Bertha von Suttner	1905	Austrian
Theodore Roosevelt	1906	American
Louis Renault	1907	French
Ernesto T. Moneta	1907	Italian
K. F. Arnoldson	1908	Swedish
M. F. Bajer	1908	French
d'Estournelles de Constant	1909	Danish
Auguste M. Beernaert	1909	Belgian

NOMINATION REFORM. See ELECTORAL REFORM.

NORTH CAROLINA. One of the South Atlantic Division of the United States. Its area is 52,426 square miles. The population in 1909, according to a Federal estimate made in that year, was 2,142,084.

MINERAL PRODUCTION. The value of the mineral products of the State in 1908 was \$2,145,947 as compared with a value of the products in 1907 of \$2,961,381. The most important of the products are those of clay, which were valued in 1908 at \$943,968, as compared with \$1,315,822 in 1907. Next in point of value is stone, \$800,177 in 1908, as compared with \$932,209 in 1907. Mica was produced in 1908 to the value of \$127,870, as compared with \$225,206 in 1907. The production of monazite and zircon is important. In 1908 the product was valued at \$37,244, as compared with the value of the product in 1907, \$54,870. Other products of considerable importance are talc, and soapstone, lime, mineral waters, and sand-lime brick.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 48,686,000 bushels, valued at \$41,383,000 from 2,898,000 acres; winter wheat, 5,415,000 bushels, valued at \$6,877,000 from 570,000 acres; oats, 3,234,000 bushels, valued at \$2,134,000 from 196,000 acres; rye, 122,000 bushels, valued at \$126,000 from 13,000 acres; buckwheat, 99,000 bushels, valued at \$79,000 from 5,000 acres; potatoes, 1,850,000 bushels, valued at \$1,498,000 from 25,000 acres; hay, 242,000 tons, valued at \$3,485,000 from 175,000 acres; tobacco, 144,000,000 pounds, valued at \$13,680,000 from 240,000 acres. In the acreage, production and value of tobacco North Carolina far surpasses any other State except Kentucky. The tobacco crop of 1909 was considerably larger than that of 1908, which was 134,000,000 pounds. The acreage decreased from 200,000 to 240,000 in 1909. The cotton crop in 1909 was estimated at 615,000 bales, as compared with 619,000 bales in 1908. The maximum of the cotton crop was 712,218 bales in 1904-5. The cultivation of rice has practically ceased in North Carolina and larger areas are being devoted to early gardening for northern markets. The number of farm animals in the State on January 1, 1909, was: Horses, 192,000; mules, 181,000; dairy cows, 297,000; other cattle, 449,000; sheep, 215,000; swine, 1,356,000. The wool clipped in 1909 was 633,600 pounds.

FISHERIES. The value of the products of the fisheries of the State for the year ending December 31, 1908, was \$1,776,020. Of these products the most important in point of value was shad, of which 3,942,300 pounds, valued at \$372,920, were taken. Next in point of value was oysters, of which there were taken 807,700 bushels, valued at \$235,940. Following in order of rank of value of the products were mullet, \$14,760; alewives, \$140,380; hard clams, \$81,790; crabs, \$34,340; Spanish mackerel, \$34,210; kingfish, \$27,710. Other important fish taken were black bass, bluefish, butterfish, croaker, mullet and perch. There were 4803 independent fishermen engaged in the fisheries of the State, and 4878 wage-earning fishermen were

employed. The number of vessels engaged was 290, valued at \$220,944.

EDUCATION. The latest figures available for public instruction in the State are those for 1908, when there was a total school population of 715,718. Of this number 483,915 were white, and 231,801 colored. The total enrollment in all schools in 1907 was 497,716. Of this number 346,575 were white and 151,141 colored. The total number of teachers employed was 10,550, of whom 7775 were white and 2775 colored. The average salary of all white teachers per month was \$35.34 and of colored teachers \$24.32.

FINANCE. The report of the State Treasurer for the biennial period of 1907-8 showed receipts for the fiscal year 1908 of \$2,886,439 and disbursements of \$2,605,594. The largest receipts are from taxes on insurance companies, from dividends of the North Carolina Railroad, from the railway property tax, from State prison earnings and from county taxes. The chief disbursements are for education, for the State prison, interest on debt, and for pensions.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State in 1909, with their population on November 30, 1909, are as follows: State Hospital for the Insane (white), Raleigh, 603; State Hospital for Insane (white), Morganton, 1166; State Hospital for Insane (colored), Goldsboro, 680; Dangerous Insane Department, wards for both races (penitentiary), 50; School for the Blind (white), Raleigh, 172; School for the Colored Blind and Deaf, Raleigh, 182; School for Deaf (white), Morganton, 239; Soldiers' Home (Confederate), 101; Oxford Orphanage for white children, 324; Oxford Orphanage for colored children, 150; Stonewall Jackson Training School (Reform School), Concord, 48; North Carolina Tuberculosis Sanatorium, Montrose, (opened for six months, 32 in charge, closed for extensive additions, was opened for patients at the close of the year); Epileptic Colony, State Hospital, Raleigh, was completed at the close of the year, but not opened for patients; State's Prison, Raleigh, prisoners distributed at prison, State Farm and railroad camps, 710. There are also a number of county camps where prisoners are retained to work the highways and do not go to the State's Prison, the counties having entire charge of them. The two orphanages at Oxford and the Training School are not entirely under State control. They receive a large part of the support from the State and there are directors representing the State on the board, but the Masons control the Oxford Orphanage for whites, the colored Baptists the colored orphanage, and a corporation of philanthropic persons the Training School.

POLITICS AND GOVERNMENT. On January 19, Lee Slater Overman was elected United States Senator to succeed himself. He received every Democratic vote in both Houses, having no opposition in his party. Spence B. Adams, the Republican State Chairman, received the Republican vote. As a result of the election held on May 26, 1908, which ratified the law passed at a special legislative session in 1908, Prohibition went into effect on January 1, 1909. The legislature passed on March 8 a measure providing for strict inspection of all illuminating oils offered for sale in the State. A child labor law introduced into the legislature

was killed by the action of that body on March 6.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: Acts were passed providing for the protection of forests, permitting the cultivation of oysters, and regulating the sale of food-stuffs and the packing and selling of fish. Provision was made for the appointment of inspectors of electric, gas and water metres. Seats for female employees were prescribed. Measures were passed prohibiting blacklisting in the State. It is forbidden to evade the exemption laws. The practice of optometry is regulated and provision is made for the free treatment of indigent persons having diphtheria.

OFFICERS: Governor, W. W. Kitchin; Lieutenant-Governor, W. C. Newland; Secretary of State, J. B. Grimes; Treasurer, B. R. Lacy; Auditor, B. F. Dixon; Attorney-General, T. W. Bickett; Superintendent of Education, J. Y. Joyner; Commissioner of Agriculture, W. A. Graham; Commissioner of Insurance, J. R. Young; Adjutant-General, J. F. Armfield—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Walter Clark, Dem.; Justices, George H. Brown, Dem.; William A. Hoke, Dem.; James S. Manning, Dem.; P. D. Walker, Dem.; Clerk, Thomas S. Kenan, Dem.

The State Legislature of 1909 was composed of 40 Democrats and 10 Republicans in the Senate, and 96 Democrats and 24 Republicans in the House. The State representatives in Congress will be found in the section *Congress* of the article **UNITED STATES**.

NORTH DAKOTA. One of the North Central Division of the United States. Its area is 70,837 square miles. The population in 1909, according to a Federal estimate made in that year, was 536,103.

MINERAL PRODUCTION. The mineral products of the State are not important. They include clay products, coal, natural gas and stone. Of these coal is the most important, the total production in 1908 being 320,742 short tons, valued at \$522,116. The total value of the mineral products of the State in 1908 was \$738,818, as compared with a value of the product in 1907 of \$875,180.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 6,045,000 bushels, valued at \$3,325,000 from 195,000 acres; spring wheat, 90,672,000 bushels, valued at \$83,501,000 from 6,625,000 acres; oats, 49,600,000 bushels, valued at \$16,368,000 from 1,550,000 acres; barley, 20,727,000 bushels valued at \$8,913,000 from 967,000 acres; rye, 478,000 bushels, valued at \$272,000 from 26,000 acres; flaxseed, 14,229,000 bushels, valued at \$22,340,000 from 1,530,000 acres; potatoes, 4,400,000 bushels, valued at \$1,980,000 from 40,000 acres; hay, 266,000 tons, valued at \$1,330,000 from 194,000 acres. In the production of spring wheat North Dakota is surpassed only by Minnesota. The crop of 1909 was greatly in excess of that of 1908, which was 68,428,000 bushels. The acreage also materially increased. In the production of barley this State is among the first. The crop of 1909 was slightly larger than that of 1908, which was 18,330,000 bushels. In the production of

flaxseed North Dakota by far surpassed any other State. The crop of 1909 was considerably larger than that of 1908, which was 13,770,000 bushels. The area devoted to flax has more than doubled in the last five years. The number of farm animals in the State on January 1, 1909, was as follows: Horses, 712,000; dairy cows, 247,000; other cattle, 616,000; sheep, 621,000; swine, 206,000. The estimated wool clipped in 1909 was 3,260,400 pounds.

EDUCATION. The enumeration of school children between the ages of six and twenty years in 1909 was 149,000. Of this number 135,000 were enrolled in the public schools, with an average daily attendance of 92,000. The number of men teachers was 1166 and of women 5198. The average monthly salary paid to teachers was \$49.75. The total expenditures during 1909 for educational purposes, including cost of common schools and institutions of higher learning, was \$4,200,000. The educational institutions of the State are prospering greatly, and the graded and high schools are increasing in efficiency, vocational education being given a permanent place in the course of study. The one educational interest which fails to move forward as rapidly as the others is the rural school, and the efforts of the school authorities are being directed to improvement. During 1909 provision has been made for increased supervision, and a vigorous campaign was made to meet the conditions of the rural school. The introduction of elementary agriculture into all the rural schools took place during the year.

FINANCE. The balance at the end of the fiscal year 1908 was \$582,905. The income for the fiscal year 1909 was \$4,588,010, while the expenditures were \$3,636,053, leaving a balance at the end of the fiscal year of \$1,494,862. The chief sources of revenue are general taxation and corporation taxes, and the chief disbursements are for legislative appropriation, State institutions, and general expenses incident to State government. The bonded debt at the end of the fiscal year was \$692,300.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the insane asylum at Jamestown, penitentiary at Bismarck, School for the Deaf at Devil's Lake, Reform School at Mandan, Institution for Feeble Minded at Grafton, Soldiers' Home at Lisbon, the Blind Asylum at Bathgate, and the Industrial School at Ellendale. A law of 1907 provided for the parole of certain classes of prisoners under suspended sentence.

POLITICS AND GOVERNMENT. Senator Martin N. Johnson, who was elected Senator as a result of the election in November, 1908, died October 21, 1909. Fountain L. Thompson was appointed his successor. Several important measures were passed at the legislative session of 1909, and these are noted in the paragraph below. On March 1 the Senate passed the House resolution granting a popular vote on the constitutional amendment to provide equal suffrage. See **ELECTORAL REFORM**.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: An act was passed authorizing the issuance of bonds and warrants to secure seed grain for needy farmers. A public tuberculosis sanatorium was established. The capital of the State was fixed at Bismarck. The sale

of cigarettes to minors was prohibited, as well as the solicitation of orders for intoxicating liquors and advertisements of liquors. Measures were passed providing for the sanitation of hotels. Provisions were made for the regulation of child labor. A pure food law was enacted. Cities are authorized to fix the rates for gas and provide for a non-partisan judiciary and for a legislative reference department.

OFFICERS: Governor, John Burke; Lieutenant-Governor, R. S. Lewis; Secretary of State, Alfred Blaisdell; Treasurer, G. L. Bickford; Auditor, D. K. Brightbill; Attorney-General, Andrew Miller; Superintendent of Education, W. L. Stockwell; Adjutant-General, A. P. Peake; Commissioner of Agriculture, W. C. Gilbrath; Commissioner of Insurance, E. C. Cooper; Commissioner of Public Lands, Alex. Macdonald—all Republicans, except Burke, Dem.

JUDICIARY. Supreme Court: Chief Justice, David E. Morgan; Justices, Charles J. Fisk, B. F. Spalding, John Carmody, S. E. Ellsworth; Clerk, R. D. Hoskins—all Republicans, except Fisk and Carmody.

The State Legislature of 1909 was composed of 40 Republicans and 7 Democrats in the Senate, and 89 Republicans and 6 Democrats in the House. The State representatives in Congress will be found in the section **Congress** of the article **UNITED STATES**.

NORTHERN NIGERIA. A British protectorate in Western Africa. Area, 256,400 square miles; population, estimated (1907) at 7,164,751. The Fulani, the Hausas, and other prominent tribes are Mohammedans; in various parts of the country paganism prevails. Slave caravans still journey to Bornu, Zola, and Muri from German Adamawa, in spite of the efforts of the British government to suppress the trade. Mission schools only are maintained. The chief products are rubber, ground-nuts, shea butter, ivory, hides, live-stock, palm-oil and palm-kernels. Cotton and tobacco are grown. Salt and soda deposits exist; tin, iron, and silver ore are mined. The importation of spirits is prohibited. The trade is mostly by caravans, which make use of Kano as an emporium. A railway runs from Barjuko to Zungaru (22 miles). A light railway is under construction from Baro, on the Niger, to Kano (400 miles). This line will connect with the Southern Nigeria Railway. There are 2107 miles of telegraph lines. Revenue and expenditure (1907-8), £508,005 and £498,302, respectively. Imperial grant-in-aid (1907-8), £290,000; 1909-10, £273,000. Governor and Commander-in-Chief (1909), Sir H. Hesketh Bell, with headquarters at Zungaru.

HISTORY. On May 11 it was announced that a native police force, while making its way toward Gussoro under British officers, fell into an ambush and eleven of the men, one officer and a native chief were killed. A rising occurred at Kuta and a force was dispatched to the point on May 9. In July the Myelem tribe attacked the British Assistant-Resident. The work on the Baro-Kano railway, though delayed by rains, continued actively, and early in the autumn the completion of the 145th mile was announced. Native labor was readily secured.

NORTHWESTERN UNIVERSITY. An institution of higher learning at Evanston, Ill.,

founded in 1851. The College of Liberal Arts, College of Engineering, School of Music, Evanston Academy, and the School of Oratory are at Evanston, twelve miles from Chicago. The Law School of Pharmacy, Dental School, and School of Commerce are in Chicago. The attendance in 1909 was 4808 and the faculty numbered 384. There were 127,905 volumes in the library. The College of Engineering was established in 1907 and the School of Commerce in 1908. New buildings for the Engineering Department and a new gymnasium were completed during the year. The protective funds of the University amounted in 1909 to \$3,013,616 and the total income was \$1,070,052. The receipts from benefactions during the year amounted to \$403,101. The president is Abram Winegardner Harris.

NORTON, CHARLES LEDYARD. An American journalist and author, who died December 15, 1909. He was born in Farmington, Conn., in 1837 and graduated from Yale College in 1859. He continued his studies at the Sheffield Scientific School until the outbreak of the Civil War, when he enlisted in the Seventh Regiment of the New York National Guard. He served throughout the war and was mustered out in 1866 as colonel of the Seventy-eighth Regiment of the United States colored troops. He acted for a year as manager of a cotton plantation in Southern Louisiana, but was forced by ill health to turn to literary pursuits. From 1868 to 1878 he edited the *Christian Union*, and was subsequently connected editorially with the *Domestic Monthly, Our Continent and Outing*. His published works include *Canoeing in Kanuckia* (with John Habberton, 1878); *A Handbook of Florida* (3d ed., 1892); *Political Americanisms* (1890); and *Jack Benson's Log* (1895).

NORWAY. A constitutional monarchy of northern Europe; capital, Christiania.

AREA AND POPULATION. The monarchy covers an area of 124,122 square miles. The population in 1900 was 2,240,032, and was estimated December 31, 1907, at 2,330,364. The total emigration in 1907 was 22,135; in 1908, 8497; and during the first six months of 1909 was estimated at 19,757—more than twice the number for the entire preceding year. There were, in 1907, 13,953 marriages, 80,722 births, and 32,789 deaths. Christiania had, in 1900, 227,626 inhabitants; Bergen, 72,251 (80,000 in 1905); Trondhjem, 38,180; Stavanger, 30,613.

EDUCATION. Primary education is compulsory. In 1905 the pupils in public elementary schools numbered 358,539; those in secondary schools, 16,227; in commercial and private schools, 4522; in normal schools, 955. The University of Christiania had, in 1907, 1557 students. The national church and the only one endowed by the state is the Evangelical Lutheran, with a clergy nominated by the King. All religions (except Jesuitism) are tolerated.

INDUSTRIES. The fisheries constitute one of the most important of Norway's industries. Some 85,000 men with 19,000 craft of various kinds and dimensions, are annually engaged in the Norwegian winter cod fisheries. The results of the cod fisheries of all Norway during the last three fishing years, ending the latter part of June in each year, were as follows:

	1907	1908	1909
Fish, pounds....	104,720,000	106,040,000	124,300,000
Steamed medicine oils, gal..	1,242,676	1,566,256	1,336,196
Raw livers, gal.	577,676	677,976	733,963

The Finmark fishery had, in 1909, one of the best seasons on record, the aggregate catch of cod amounting to 114,400,000 pounds. The canning of sardines is a rapidly increasing industry on the western coast. There are now about forty factories, employing several thousand men, women and children, and turning out during a good season 50,000,000 tins of from 20 to 44 fish each. In 1906, 14,150 persons were engaged in herring fisheries, and 4608 in mackerel fishery.

The total area under cultivation is estimated at 3724 square miles; under forests, 26,230 square miles. (See FORESTRY.) For its cereals Norway is mainly dependent on imports, and home production is declining. In 1907 the total wheat production was 200,000 bushels, against 303,000 bushels in 1906; oats, 1907, 6,000,000, against 9,297,000 in 1906. The census of livestock December 3, 1900, was as follows: Horses, 172,999; cattle, 950,201; sheep, 998,819; goats, 214,504; swine, 165,348; reindeer, 108,784.

The various mining establishments (about 50) gave employment in 1906 to 5347 persons, against 4500 in 1905. The total value of mineral products in 1906 was 9,848,000 kroner; of smelting products, 2,862,000 kroner. Silver (485,000 kroner in 1906), copper ore (2,314,000), pyrites (5,171,000), iron ore (1,043,000), feldspar (380,000), and apatite (174,000) are the chief mineral products. Of the smelting products in 1906 silver was valued at 500,000 kroner, copper at 2,182,000.

FOREIGN COMMERCE. The total imports of 1908 amounted to 376,129,000 kroner (1 krone = 26.8 cents) against 385,707,800 in 1907; the total exports, to 240,077,000 kroner, against 253,100,900 in 1907. The principal imports for home consumption and exports of domestic produce were (1908) as follows:

Imports	Kroner
Cereals	67,800,000
Textiles	35,200,000
Coal	31,100,000
Oils	27,700,000
Colonial products	26,300,000
Mineral products	24,700,000
Metal manufactures	22,200,000
Metals (raw)	16,100,000
Animal products	15,900,000
Hides and leather	13,300,000
Raw fibre	11,000,000

Exports	Kroner
Animals and animal products	72,600,000
Wooden manufactures	45,300,000
Timber	34,500,000
Minerals	25,000,000
Paper and products thereof	18,800,000
Hides and leather	9,500,000
Oils	7,900,000
Cereals	3,400,000
Metals	3,100,000
Textiles	1,500,000
Drugs and colors	300,000

Of vegetable oils the imports in 1908 were 10,211,020 kilos, against 9,122,870 kilos in 1907. Imports of flour in 1908 amounted to 56,251 long tons; of meal (chiefly rye) to 29,535 tons. Imports of bread-stuffs and packing-house prod-

ucts from Argentina are increasing on account of the direct steamship service now established between the two countries. Germany furnished (1908) imports to the value of 111,583,000 kroner, and received exports to the value of 37,482,000 kroner; Great Britain, 94,400,000 and 91,730,000; Sweden, 41,468,000 and 12,361,000; Denmark, 27,324,000 and 9,806,000; Russia and Finland, 26,914,000 and 6,868,000; United States, 18,104,000 and 6,162,000; Netherlands, 16,690,000 and 21,477,000.

COMMUNICATIONS. The total length of railways at the end of the fiscal year 1908 was 1605 miles, of which 1354 miles were owned by the state. The state lines had a capital of 199,700,000 kroner, and a gross income of 16,815,312, the net earnings being about 2½ per cent. on the capital; total expenditure, 11,871,741 kroner; goods carried, 3,908,363 metric tons; passengers, 9,696,102. Private companies owned 251 miles; capital invested, 7,205,000 kroner; total receipts, 3,230,747; expenditures, 2,295,057; goods carried, 1,100,858 metric tons; passengers, 1,402,237. Loss of life in collisions on all lines, 12. Great strides are being made in railway extension throughout the country. In 1909 King Haakon opened the Rjukanbane, a short line intended mainly as a commercial outlet for the factory town of Notodden. Before the end of the year the short remaining piece of the Bergen and Christiania line (from Gulsvik to Roa) was expected to be open to traffic. The Dovrebane, another important line, crossing the Dovrefjeld and joining the Gudbrandsdal line (which at present goes only to Otta), is shortly to be begun. When this link between the Gudbrandsdal line and the already existing line to Stren is complete, it is expected that traffic will be diverted from the old line via the Osterdal. The new line is of the usual Continental width, while the old is narrow-gauge. The total length of telegraph and telephone lines and wires at the end of the fiscal year 1908 was 12,120 miles of line, 77,049 of wires. State telegraph offices (1907), 969; number of paid messages, 2,724,908. Receipts and expenditures, 1907-8, 4,543,485 and 3,196,127 kroner respectively. The total mercantile marine comprised, on January 1, 1908, 5773 sailing vessels, of 750,765 tons; steam, 2089, 819,436 tons: total, 7862 vessels, 1,570,201 tons.

FINANCE. The unit of value is the krone, worth 26.8 cents. The revenue for the year ending March 31, 1907, was 114,209,000 kroner; expenditure, 108,708,000. In accordance with Act of Constitution, June 8, 1907, the budget term is altered from April 1-March 31, to July 1-June 30; the transitional budget 1908-9 had to be granted for fifteen months. For 1907-8 the estimated revenue and expenditure balanced at 114,936,824 kroner; for 1908-9, at 135,625,000. The principal sources of revenue for 1908-9 were estimated as follows: Customs, 51,700,000 kroner; railways, 22,244,000; post-office, 9,300,000; income tax, 6,550,000; telegraphs, 5,906,000; excise on spirits, 5,750,000; on malt, 3,100,000; state property, 5,588,000; tamps, 1,838,000; judicial fees, 1,375,000; succession tax, 1,150,000; mines, 738,100; railway loan, 7,735,000. The principal estimated expenditures were: State railways (traffic), 19,334,000; army, 17,098,000; post-office, telegraph, etc., 15,761,000; church and education, 14,896,100; interest on debt, 14,686,000; amortisation

of debt, 5,480,000; justice, 10,399,000; navy, 6,467,000; finance and customs, 5,972,000; roads, canals, ports, etc., 5,649,000; interior, 4,944,000; ministries, 2,147,000; foreign affairs, 1,112,000; civil list, 947,000; mines, 813,000; Storthing, 625,000. The national debt on March 31, 1908, stood at 328,401,345 kroner.

The "Norges Bank" at the end of 1907 showed assets, 110,541,020 kroner; liabilities, 87,963,861. The "Kongerige Norges Hypothekbank" had a capital of 20,000,000 kroner, a reserve fund of 1,000,000, and a delcredere fund of 220,000; the total bonds issued amounted to 159,086,680, and the loans on mortgage to 164,682,118. In addition to these two State banks there were at the end of 1907 92 private joint-stock banks reported, with a collective subscribed capital of 90,281,067 kroner and a paid-up capital of 41,008,160; reserve funds, 25,984,251; deposits and withdrawals during the year, 934,097,708 and 899,842,811 respectively; deposits at end of year, 372,702,422. The savings banks, chartered by royal permission and controlled by the Ministry of Finance, numbered at the end of 1907 460; depositors, 868,616; total deposits, 430,128,724 kroner.

NAVY. The effective navy in 1909 included: 4 armored coast-defense vessels, aggregating 14,720 tons; 2 protected small cruisers, 3500 tons; 4 gunboats; one destroyer; 36 torpedo boats. There were also several transports, schoolships, and obsolete gunboats. Two torpedo-boat destroyers and one submarine were building. The personnel is 2574 officers and men.

ARMY. The army is a national militia in which service is obligatory, certain fixed periods of service being demanded of each citizen. A reorganization of the army voted by the Chamber in 1909 provided for two laws, a regular or active army "linie" and a militia or "landvaern." The former was divided into 5 brigades, each with the three arms, unattached companies, and fortress artillery. It included 16 regiments of infantry, 3 regiments of light cavalry, 3 regiments of field artillery (27 batteries each with 4 rapid fire guns), 6 4-gun batteries of mountain artillery, 1 regiment of heavy artillery (8 batteries), 5 companies of telegraphers, 5 companies of sappers and miners, 3 battalions (14 companies) of engineers; 6 companies of sanitary troops, 6 companies of train, and 14 machine gun detachments. There is a military school and a war college in addition to schools for non-commissioned officers for the various brigades and separate arms. The organization is a skeleton one, which in time of war can be readily expanded, the regular army under such conditions having an effective total of 86,000 men, to which may be added the "landvaern" to bring the total up to 110,000 men. The actual establishment is maintained with a strength of about 1700 officers, 2700 non-commissioned officers and 18,000 men.

GOVERNMENT. Norway is a constitutional monarchy, the royal succession being in direct male line in the order of primogeniture. The King is the executive, acting through a council of state, consisting of a minister and at least seven councillors. The legislative power is vested in the representative Storthing, assembling annually and divided into two houses, the Lagting, comprising one-fourth of the members; and the Odelsting, three-fourths. Women were granted the franchise in 1907. The

present King, Haakon VII., was Prince Carl of Denmark, born August 3, 1872, and elected King of Norway November 18, 1905, by the Storthing. His marriage to Princess Maud, third daughter of Edward VII., of England, took place July 22, 1896. The Crown Prince, Olav, was born July 2, 1903. The Council (1909) was composed as follows: President of the Council, Minister of State, and Minister of Finance and Customs, Gunnar Knudsen; Foreign Affairs, W. Christoffersen; Commerce, Navigation and Industry, Lars Abrahamsen; Army and Marine, Colonel A. G. Spoerck; Justice and Police, J. Castberg; Agriculture, L. K. Foosnaes; Public Works, N. C. Ihlen; Worship and Public Instruction, K. J. Hougen; Secretary of State, N. O. Hesselberg.

HISTORY

PARLIAMENT. The work of reorganizing the army, which was before the Storthing in 1908, was completed at the beginning of August, 1909. Its chief aim was to insure prompt mobilization by changing the distribution of the conscription districts and to organize the infantry battalions into regiments. The results were not satisfactory to the Minister of Defense, M. Lovzov, who, on the Storthing's completion of its work, resigned his post to take charge of the cavalry and was succeeded by Colonel Spoerck. (See preceding paragraph). The session of the Storthing was unusually long, extending into September. Among the measures passed, in addition to the defense plan above mentioned, were a modification of the election laws, fixing October as the month for holding elections, and imposing more stringent conditions on the permission to vote by writing in case of sickness or other cause necessitating absence from the polls; and a divorce law permitting the dissolution of marriage upon the demand of both husband and wife after a civil authority has attempted to mediate and permitting under certain conditions the dissolution upon the demand of either the husband or the wife. Other measures in which progress was made were the bills for the regulation of the concession of waterfalls and mines, the amendment of the industrial inspection law, and insurance against sickness. The first of these limited the concession of water power and mines, to foreigners, providing that they should revert to the State after periods ranging from 60 to 80 years, and that so far as possible Norwegian labor should be employed. The amendment of the industrial inspection law aimed to extend its application to the small shops and to provide for a woman inspector. The project for insurance against sickness applied only to temporary sickness, the maximum being 26 weeks, after which invalidism insurance would be necessary, though no measure of that nature was yet formulated. It is to be obligatory on all employees, and the cost is to be borne by the employees, the employers, and the state.

POLITICAL PARTIES. It was still too early to determine the effect of woman suffrage, introduced in 1907, on political parties, though it was generally believed that the Conservatives, (Right) and Socialists would be the gainers. The Conservatives held their congress at the beginning of May and adopted their programme. There was a division on the *Landsmaal* and liquor questions and a majority representing the Conservatives in the western departments se-

ceded. The Liberal Left's programme as set forth at its meeting in March differed little from that of the Conservatives and the two parties were united in the electoral campaign. The "consolidated" Left, the government party, held its congress at the end of June, but made little change in its programme. The Socialist programme, announced at their meeting during Easter, forbade any co-operation with other parties. Among its features were: Universal woman suffrage; the referendum; substitution of taxes on fortunes, incomes and inheritances for indirect taxes; the eight-hour day; old age pensions; state assumption of the cost of caring for the sick; and complete disarmament. The government was defeated in the general elections of October. The results were: Conservatives (Right) and Liberal Left, 63; Government Left, 47; Socialists, 11; Independents, 2. In the previous Storthing the respective strength was: Government Left, 59; Conservatives and Liberal Left, 54; Socialists, 10.

FOREIGN RELATIONS. An agreement was signed with France whereby the latter secured a reduction of the duty on imports on French wines into Norway and the fixing of the existing duty on French spirits as the maximum, and Norway secured in return the admission of Norwegian loans into the French *bourse*. For the Hague decision in the frontier dispute with Sweden, see SWEDEN, paragraphs on *History*. A European Conference was proposed to consider the status of Spitzbergen, but was postponed. A meeting between the Kaiser and the King of Norway occurred at Bergen on July 20. See also ARBITRATION, INTERNATIONAL.

NOVA SCOTIA. A maritime province of Canada. Area, 21,248 square miles. Population, in 1907, 457,574. Capital, Halifax, with 40,832 inhabitants in 1901 and about 50,000 in 1909. The executive authority rests with a lieutenant-governor, appointed by the Governor-General of Canada and acting through a responsible Executive Council. The legislature consists of two houses, the Legislative Council (21 appointed members) and the House of Assembly (38 elected members). The Lieutenant-Governor in 1909 was Duncan Cameron Fraser (appointed March, 1906). The Provincial Secretary (Premier) in 1909 was George W. Murray. For statistics and other details, see CANADA.

NUTRITION. See Food and NUTRITION.

NYASSALAND PROTECTORATE. A dependency of Great Britain, lying round the shores of Lake Nyassa, and including all British Nyassaland as well as the Shiré Highlands and the greater part of the Shiré River basin. Area, 43,008 square miles. Population (estimated 1908), 587 Europeans; 515 Asiatics; and about 947,168 natives, nearly all Mohammedans. Blantyre, with about 200 Europeans and 6000 natives, is the chief town, Zomba the government headquarters. Trade is mostly with Great Britain. Imports and exports (exclusive of transit) in 1907-8 were valued at £189,541 and £68,604 respectively; 1908-9 £140,916, and £122,644. Coffee (£16,253 in 1907-8), cotton (£13,999 in 1907-8), tobacco, strophanthus, beeswax, rubber, chillies and ground-nuts are the chief articles of production and export. Steamers ply the lake and the rivers. A railway (113 miles) connects Port Herald with Blantyre, and it is proposed to extend it to Lake Nyassa.

via Zomba. Telegraph lines connect with the Cape, Chinde, Quilimane, and Ujiji. There are 24 post-offices. A hut tax is levied on the natives, which, with customs, tolls, licenses, etc., yielded (1906-7) £35,619; (1907-8) £36,805. Governor and Commander-in-Chief (1909), Sir Alfred Sharpe.

OATS. The growth of the oats crop in 1909, while at first not so promising, was in general very satisfactory and resulted in a record production. In the spring, floods, dry weather, and windstorms injured the crop to some extent locally, but the areas affected were not large enough to influence the total production very materially. The acreage was somewhat increased as a result of poor fields of winter wheat in certain localities which were plowed up and used for oats. As a rule other oat-producing countries of the world also secured satisfactory yields. The Russian Empire, which frequently produces more oats than the United States and did lead in the world's production in 1908, is estimated to have produced in 1909 a crop about equal in quantity to our own.

The oat crop of 1909 is the first in the history of the United States to exceed the billion bushel mark. As reported by the Department of Agriculture, the total production for 1909 was 1,007,353,000 bushels and the acreage 33,204,000 acres, which is also a record figure. The price of oats November 1, 1909, was 41 cents which, with the exception of 1907 and 1908, is the highest price for any year since 1890. The total value of this large crop at the high price is \$408,174,000, a sum which has never before been reached. As compared with the 5-year average this amount is greater by about 30 per cent. The total production is nearly 15 per cent. greater than the 5-year average. Only eleven States produced less than one million bushels. The acreage, yield and value of the crop in the principal oat-growing States of the Union in 1909, as reported by the United States Department of Agriculture, are given in the following table:

States	Acreage Acres	Production Bushels	Farm value
			Dec. 1, '09 Dollars
Illinois	4,346,000	159,064,000	60,444,000
Iowa	4,300,000	116,100,000	40,635,000
Minnesota	2,736,000	90,288,000	31,601,000
Wisconsin	2,280,000	79,800,000	31,122,000
Nebraska	2,473,000	61,825,000	21,639,000
Ohio	1,730,000	56,225,000	23,052,000
Indiana	1,820,000	55,510,000	21,649,000
North Dakota	1,550,000	49,600,000	16,368,000
South Dakota	1,450,000	43,500,000	14,790,000
Michigan	1,420,000	43,310,000	17,757,000
New York	1,325,000	37,365,000	18,399,000
Kansas	964,000	27,185,000	11,690,000
Pennsylvania	998,000	26,948,000	12,974,000
Missouri	690,000	18,630,000	8,011,000
Oklahoma	550,000	15,950,000	7,337,000
Montana	300,000	15,390,000	6,464,000
Texas	615,000	11,500,000	7,130,000
Oregon	288,000	10,886,000	5,661,000

All other States produced less than 10 million bushels. In average yield per acre the leading States ranked as follows: Montana 51.3 bushels, Washington 49 bushels, Utah 46.1 bushels, Idaho 44.5 bushels, and New Mexico and Nevada 40 bushels. The average yield per acre for the entire country was 30.3 bushels, which has often been exceeded.

The oats crop of the world for this year is estimated by the Hungarian Ministry of

Agriculture at 4,417,524,000 bushels, or an increase of 857,000,000 bushels over last year. Germany's yield is estimated at 590,000,000 bushels, the French yield at 329,243,000 bushels, and Canada's production at 209,944,000 bushels. In many European countries the average yield per acre is much higher than in the United States. In Germany, for instance, this difference often amounts to 20 bushels.

BERLIN COLLEGE. An institution of higher learning at Oberlin, Ohio, founded in 1833. The attendance during the year 1909 was 2040 students, with 133 members, in the faculty. There were received in gifts and endowments during the year \$125,000. The books in the library number 125,000. The endowment of the college is about \$1,725,000 and the total assets, including endowments, buildings and grounds, is \$3,540,000. The president is Henry Churchill King.

OBESITY, ELECTRICAL TREATMENT OF. The difficulty under which most obese persons labor, that of taking enough muscular exercise in order to increase their organic elimination, has been met by the French physician named Bergonie, who obtains artificially intense muscular activity by causing an electrical current of 8 to 12 volts and of an intensity of 50 milliamperes, to pass through the body of the patient at the rate of 40 to 100 per second. The patient reclines between two large electrodes, covering the greater part of the anterior and posterior surfaces of the body. The passing of the current is absolutely painless, yet under its influence the large muscular masses of the thighs, calves, buttock, back and shoulders are caused to contract with sufficient energy to elevate the body even when weighed down by 88 pounds or more. According to Dr. Bergonie, this treatment causes rapid diminution of the fat, and increases the strength and resistance to fatigue, if the patient will maintain his diet at a ratio inferior to that which corresponds to his muscular outlay.

OCEANIA, FRENCH ESTABLISHMENTS IN. A number of separate islands and groups of islands in the Eastern Pacific, united to form a homogeneous French colony. The establishments consist of the Society Islands (the most important, Tahiti and Moorea), the Marquesas Islands, the Tuamotu group, the Leeward Islands, and the Gambier, Tubuai, and Rapa Islands. Total area, 1,183 square miles; population (1906) mostly Polynesians, 30,563. The most important of the islands is Tahiti, whose chief town is Papeete (population 3617, of whom 1908 are French). There are 6 primary schools, each with about 100 pupils, in the various islands, besides mission schools, and a higher primary and a normal school at Papeete. The preparation of copra, rum, and sugar constitutes the chief occupation of the people. Fruits and vegetables are grown; the cultivation of cotton, coffee, and tobacco has fallen off, until the output has become a negligible quantity. The pearl fisheries are valuable. A French company capitalized at 6,000,000 francs has begun operations for the development of the phosphate mines on the island of Makatea. In 1907 the imports (textiles, 778,849 francs; wheat-flour, 354,255; metal work, 204,699) amounted to 3,331,810 francs (United States, 1,527,640; New Zealand, 802,678; France, 404,240); exports (copra, 1,388,965 francs; mother-of-pearl, 828,015; va-

milla, 706,425), 3,639,954 (United States, 1,794,496; Great Britain, 537,413; France, 457,416). The islands have steamship connection with San Francisco, New Zealand, and Australia. There are ten post-offices. In 1907, 33 vessels of 59,616 tons entered, and 32 of 59,591 cleared. For all the islands the local budgets balanced (1908) at 1,322,010 francs; French subventions (1909), 204,000 francs. The colony is administered by a governor, with a privy council and a council of administration.

OHIO. One of the North Central States of the United States. Its area is 41,040 square miles. The population in 1909, according to a Federal estimate made in that year, was 4,594,240.

MINERAL PRODUCTION. The mineral products of Ohio are second only to Pennsylvania in quantity and value of production. The coal produced in 1908 amounted to 26,270,639 short tons, with a spot value of \$27,897,704. This is a falling off from the production of 1907, which was 32,142,419 short tons, valued at \$35,324,746. The coal market of 1908 was affected during the early part of the year by the uncertainty of manufacturers as to conditions following the panic. The labor supply was ample, as is shown by the fact that, notwithstanding the decreased tonnage, there was an increase of nearly 600 men employed during the year. These numbered 47,407. There were suspensions of operations in a number of the mines during the spring on account of a contention as to the length of time that the agreement between the operators and the miners should extend, the operators contending for two years, while the miners desired the agreement for only one year. The scale was finally signed for a period of two years. Ohio leads all the other coal producing States in the percentage of total product that is mined by the use of machines. In 1908 there were 1343 machines in use. There were killed in the mines of the State during the year 113 men, while 598 were injured. Ohio is second only to Pennsylvania in the production of pig iron. The amount produced in 1908, 2,861,325 long tons, was, however, a great reduction from the amount produced in 1907, which was 5,250,687 long tons. There were 73 blast furnaces in the State on January 1, 1909, of which 35 were in blast and 34 were out. There were manufactured in 1908, 159,578 tons of coke, which was a marked decrease from the product of 1907, 270,637 short tons. Ohio ranks first among the States in the value of its clay products. These in 1908, were valued at \$26,622,490, as compared with a value for the product of 1907 of \$30,340,830. In the production of petroleum, Ohio ranks fifth. There were produced in the State in 1908, 10,858,797 barrels, as compared with a product of 12,207,448 barrels in 1907. The value of the product in 1908 was \$14,178,502, while that of 1907 was valued at \$14,769,888. In the production of salt, Ohio ranks third, being surpassed only by New York and Michigan. In 1908 there were produced 3,427,478 barrels, valued at \$864,710. In 1907 the production was 3,851,243 barrels, valued at \$979,078. In the production of Portland cement, Ohio is also among the leading States. There were produced in 1908, 1,521,764 barrels, valued at \$1,305,210, as compared with a production in 1907 of 1,151,176, valued at \$1,377,155. Other important mineral products are grindstones, coal products, building

stone, sand and gravel, oilstones and whetstones, iron ores, pyrites, gypsum, natural cement and metallic paints. The value of the mineral products of the State in the year 1908 was \$134,499,335, as compared with a value of the product in 1907 of \$207,657,339.

The controlling influence in the production of coal in Ohio in 1908, was the competition of the West Virginia coals with the domestic product.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 153,062,000 bushels, valued at \$85,715,000 from 3,875,000 acres; winter wheat, 23,532,000 bushels, valued at \$26,056,000 from 1,480,000 acres; oats, 56,225,000 bushels, valued at \$23,052,000 from 1,730,000 acres; barley, 829,000 bushels, valued at \$506,000 from 32,000 acres; rye, 980,000 bushels, valued at \$745,000 from 57,000 acres; buckwheat, 318,000 bushels, valued at \$248,000 from 15,000 acres; potatoes, 16,926,000 bushels, valued at \$0,479,000 from 182,000 acres; hay, 4,033,000 tons, valued at \$43,960,000 from 2,820,000 acres; tobacco, 83,250,000 pounds, valued at \$8,741,250 from 90,000 acres. In the corn crop the State showed a large increase in 1909 over 1908, when the product was 136,675,000 bushels. The acreage increased about 300,000. The wheat crop was considerably less in 1909 than in 1908, when it amounted to 33,328,000 bushels. The acreage also considerably decreased. Ohio ranks third in the production of oats, being surpassed only by Illinois and Iowa. The oat crop of 1909 was decidedly larger than that of 1908, when it was 38,554,000 bushels. The acreage increased about 300,000. The tobacco crop is about three times as large as in 1908. In the latter year it was only 33,768,000 pounds. The acreage nearly doubled in 1909. Farm animals on January 1, 1910, were estimated as follows: Horses, 977,000; mules, 22,000; dairy cows, 947,000; other cattle, 978,000; sheep, 3,203,000; swine, 2,047,000. The wool clipped in 1909 was estimated at 15,923,200 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$839,580. Of these products the most important in point of value was pike perch, of which 8,625,100 pounds, valued at \$288,380 were taken. Next in point of value was herring, of which 4,792,200 pounds, valued at \$146,920 were taken. Following in order of the value of the production was German carp, \$128,730; pike and pickerel, \$70,270; whitefish, \$60,010; catfish and bullheads, \$24,580. Other fish taken in considerable quantities were mullet, yellow perch, sturgeon, white bass; also frogs and turtles. There were engaged in the fisheries of the State 830 independent fishermen, with 1234 wage-earning fishermen. The number of vessels engaged was 54; with a value of \$186,630.

EDUCATION. The report of the State Superintendent of Education for the year 1909 showed the attendance of male pupils in the State to be 331,913, and female pupils, 324,870. The male teachers numbered 7118, and the female, 17,070. The average monthly salary for male teachers in elementary schools was \$51, and for female teachers, \$46; for male teachers in the high schools \$82, and for female teachers, \$62. The total expenditures for education during the

year were \$25,011,361. During the year the college of agriculture and domestic science arranged for the extension of its teaching throughout the State. Boards of education were authorized to maintain agricultural, vocational and trade schools. Boards of education in city districts were authorized to provide for medical inspection of pupils.

CHARITIES AND CORRECTIONS. The State institutions include a State Hospital at Athens, State Hospital at Cleveland, State Hospital at Columbus, State Hospital at Dayton, the Longview Hospital, State Hospital at Massillon, State Hospital at Toledo, Hospital for Epileptics, Madison Home, Soldiers' and Sailors' Home, Orphans' Home, School for the Blind, School for the Deaf, Institution for Feeble-Minded, the Ohio Penitentiary, State Reformatory, Boys' Industrial School, and the Girls' Industrial Home. The total expenditures for the maintenance of these institutions for the fiscal year 1908 was \$43,323,327.

POLITICS AND GOVERNMENT. On January 12, Theodore E. Burton, of Cleveland, was elected Senator by the Assembly in joint session. The complete Republican strength went to Senator Burton, and the Democratic strength to former Governor James E. Campbell. One Independent vote was cast for Governor Judson Harmon. Elections by counties were carried on during the year on the question of license or no-license. On March 29, 93 saloons and three breweries were put out of business as a result of the carrying of Clark county for local option by a majority of 91 votes. This county contains Springfield, and there the vote was 1846 in favor of license. This was, however, overcome by the large no-license vote in the county. On April 28, Ross county was carried by the license forces after a bitter election fight during which the local company of State militia was called out to insure a fair contest in the city of Chillicothe. In this city there were frequent clashes on the streets, and many of the anti-saloon workers were attacked at the polls. The county was carried for license by a majority of 2000, most of which were obtained in the city of Chillicothe. On June 9, the license forces gained another victory by carrying Mahoning county, in which is the city of Youngstown. The majority for license was 1969, the greater portion of which were cast in Youngstown.

The year saw what will probably prove to be an end of the nine-year agitation for lower street railway fare, which was inaugurated by Tom L. Johnson, mayor of the city. In April, 1908, the mayor had begun the experiment of operating the lines of the Cleveland Railway Company on a three-cent basis, with free universal transfers. Owing to various influences his experiment proved unpopular and the franchise under which the lines were operated was defeated upon a referendum vote in October of that year. This brought the experiment to a sudden halt. Financial troubles intervened and late in the year Judge Robert W. Tayler of the district Federal court was named receiver of the company. This was the situation at the beginning of 1909. Mayor Johnson renewed his fight for lower fares by putting through the council the so-called Schmidt franchise, granting rights on Payne Avenue, S. E., for a three-cent ride. This grant was intended to be the basis for further franchises to take in the entire city, as the various franchises of the Cleveland Rail-

way Company should expire from time to time during the next two years. This grant was defeated upon a referendum vote on August 3, this year. Meanwhile Judge Tayler had enunciated a new plan of settlement, patterned after the Federal Supreme Court dictum in the New York gas case, by which the fares should be put upon a sliding scale guaranteed to return 6 per cent. to stockholders, and no more to be allowed. The Mayor and Company being unable to agree upon the terms under the Tayler plan, they finally agreed, in October, to refer the several disputed points to the judge himself, to decide and to abide by his decision as referee. He made his decision and the council passed the so-called Tayler ordinance upon December 18. A referendum will be held upon this grant, probably in February, 1910, and indications are that it will be approved.

On September 7, Tom L. Johnson was re-nominated for Mayor of Cleveland in the Democratic primary election. The Republican nominee was Herman C. Baher. Dr. Louis Schwab was nominated by the Republicans for Mayor of Cincinnati, and John W. Peck by the Democrats. Brand Whitlock, the Independent candidate, was renominated for Mayor of Toledo. In the elections held on November 2, Mayor Johnson was defeated by a plurality of about 3500. The Republicans carried nearly every other office and gained control of the city government. In Cincinnati, Dr. Schwab was elected Mayor by a plurality of about 10,000. Mr. Whitlock was elected Mayor of Toledo by about 300 majority. This is his third term in this office. At a special election on April 21, James H. Cassidy was elected Congressman from the twenty-first district (Cleveland) to succeed Theodore E. Burton.

OTHER EVENTS. On April 21, eight persons were killed and seven fatally hurt, and at least seven seriously injured, and property valued at \$1,000,000 was destroyed by a tornado, which swept over Cleveland and Northern Ohio. On May 7 a verdict of guilty was rendered by the United States District Court in the "bucket shop" case in which the defendants were John M. Gorman, Louis W. Foster, Edwin C. Heil, John M. Scott, Arthur C. Baldwin and John C. Campbell. The formal charge was using the United States mails to defraud. On June 15 a bomb, which was aimed to kill William C. Niven, Mayor of Bellefontaine, was thrown through a window of his residence. Mr. Niven had received several anonymous letters within a few months which threatened his life. On September 11, a special grand jury in session at Youngstown returned 47 indictments against 17 men, officials of Youngstown and Mahoning counties. A special grand jury was called as a result of the movement in which leading citizens, irrespective of party, combined and employed detectives to ferret out charges of official crookedness. The jury returned a scathing arraignment of conditions in Youngstown. It charged that gambling dens and dives had been protected. Ten of the indicted men, confessing graft, were given fines and forever disfranchised by the Court, December 24. On November 1, five new indictments in connection with the failures in Norwalk of the Ohio Trust Company and the Norwalk Savings Bank Company, were returned by the grand jury. There were two joint indictments against James G. Gibbs, former president, and Jay F. Laning, former

vice-president of the Ohio Trust Company and former Congressman, for writing letters to defraud; one against James G. Gibbs, for aiding and abetting perjury; one against W. Christian, former secretary of the Ohio Trust Company, for perjury, and one against Pay Kies, former treasurer of the Norwalk Savings Bank Company, for perjury. These indictments are the third list returned against Laning and Gibbs, and the second against Christian and Kies. All of the old indictments, with the exception of one against Laning, for embezzlement, were quashed. Laning was tried on the embezzlement indictment in Fremont and was acquitted.

LEGISLATION. The session of the legislature was a special one. The most noteworthy acts were those providing for the medical inspection of schools and for the regulation of the liquor traffic. See **PROHIBITION**.

OFFICERS: Governor, Judson Harmon; Lieutenant-Governor, Francis W. Treadway; Secretary of State, Carmi A. Thompson; Treasurer, David S. Creamer; Auditor, Edward M. Fullington; Commissioner of Education, John W. Zeller; Attorney-General, Ulysses G. Denman; Adjutant-General, A. B. Critchfield; Commissioner of Insurance, S. J. Vorys—all Republicans, except Harmon and Creamer.

JUDICIARY. Supreme Court: Chief Justice, James L. Price; Associate Justices, A. N. Summers, W. B. Crew, John A. Shauck, William Z. Davis, William T. Spear; Clerk, John S. McNutt—all Republicans.

The State Legislature of 1909 was composed of 20 Republicans and 14 Democrats in the Senate, and 71 Republicans, 45 Democrats and 1 Independent in the House. The State representatives in Congress will be found in the section *Congress* of the article **UNITED STATES**.

OHIO STATE UNIVERSITY. An institution of higher learning at Columbus, Ohio, founded in 1870. There were in attendance in 1908-9, 3012 students, with 224 members of the faculty. The number of volumes in the library was 88,656. The University received in gifts during the year \$29,450. The productive funds of the University amount to about \$835,000, with a total income of about \$615,000. The president is W. O. Thompson, D. D., LL. D.

OKLAHOMA. One of the South Central States of the United States, formed in 1907 by the union of Oklahoma and Indian Territory. Its area is 70,057 square miles. The population in 1909, according to a Federal estimate made in that year, was 1,592,401.

MINERAL PRODUCTION. The development of the petroleum fields of Oklahoma has been one of the important features in the mineral history of the country in the last few years. The field of which Oklahoma is a part includes also Kansas, but in the last year or two the production of the Kansas territory has decreased while that of Oklahoma has increased. The State in 1908 ranked first in the production of petroleum. There were produced 45,798,765 barrels, valued at \$17,694,843. Although Oklahoma surpasses all other States in production, in the value of its product it is surpassed by California and Illinois. In 1908, 145 wells were drilled, of which 39 were dry, 99 were oil, and seven were gas wells. In Osage county there were approximately 100 oil-producing properties. While the coal production of the State has increased greatly in the last few years, the

production of 1908 showed considerable decrease from that of 1907. In the former year there were produced 2,948,116 short tons, valued at \$5,976,504, while in 1907 there were produced 3,642,658 short tons, valued at \$7,433,914. While part of the decrease in production was due to financial depression and also to the unusually warm weather which prevailed during the winter months, both at the beginning and end of the year, the main cause of the decrease was the increased consumption of oil and natural gas throughout Texas, Oklahoma and Louisiana. In spite of the decrease in the production, the number of men employed in the coal mines of the State increased from 8398 in 1907 to 8651 in 1908. From April 1, extending into June, there was a general suspension of operations pending an agreement in regard to the wage scale. There were 44 fatal and 120 non-fatal accidents in the coal mines of the State during the fiscal year ending October 31, 1908. The clay products of the State in 1908 were valued at \$562,929, a considerable decrease from the value of the product of 1907, which was \$664,512. Among other mineral products are coal products, gypsum, lime, mineral waters, salt, stone, sand and gravel. The value of the mineral products of the State in 1908 was \$26,586,751 as compared with the value of the product in 1907 of \$26,908,968.

The production of coal in 1909 was about the same as in 1908.

The strong efforts of the Producers' Association to suspend drilling operations were successful to the point of reducing the production of petroleum in 1909. The transportation facilities improved throughout the year. In September an exceptionally large gusher was developed five miles north of Okmulgee.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 101,150,000 bushels, valued at \$55,632,000 from 5,950,000 acres; winter wheat, 15,680,000 bushels, valued at \$15,837,000 from 1,225,000 acres; oats, 15,950,000 bushels, valued at \$7,337,000 from 550,000 acres; barley, 890,000 bushels, valued at \$448,000 from 30,000 acres; rye, 54,000 bushels, valued at \$50,000 from 4000 acres; potatoes, 1,890,000 bushels, valued at \$1,796,000 from 27,000 acres; hay, 810,000 tons, valued at \$5,913,000 from 900,000 acres. The corn crop in 1909 was considerably smaller than in 1908, when it amounted to 122,239,000. The acreage decreased by about 1,000,000 acres. The winter wheat crop was about the same in 1909 as in 1908. The oat crop was considerably larger than in 1908, when 11,250,000 bushels were produced. The acreage increased by about 100,000 acres. The potato crop in 1909 was considerably smaller than in 1908, which was 2,106,000 bushels. The acreage remained the same, 27,000 acres. The hay crop also suffered a considerable reduction, as there were produced in 1908 1,305,000 tons. The acreage of hay likewise remained the same. Fruit cultivation has increased notably within the last few years. Broom corn and Kaffir corn are extensively raised. The number of farm animals in the State on January 1, 1910, were as follows: Horses, 804,000; mules, 191,000; dairy cows, 355,000; other cattle, 1,637,000; sheep, 108,000; swine, 1,302,000. The wool clipped

in 1900 was estimated at 470,400 pounds. The cotton crop of 1900-10 was estimated at 617,000 bales.

EDUCATION. The school attendance in 1909 was 375,000. The number of male teachers was 3191, and female teachers 6383. The average salary of teachers was about \$60 a month. There are in the State about 500,000 children of school age, and under the new compulsory education law the attendance greatly increased. County normal institutes are held in every county of the State during the vacation season. The public schools consist of primary schools, giving the first four years of instruction; grammar schools, giving the next four years; and high schools, giving the last four years. In Guthrie, Oklahoma City, Shawnee, Enid, Muskogee, Magnum, McAlester, Alva, Vinita, and many other large cities kindergarten schools are maintained and supported at the expense of the city. The State Superintendent supervises the educational work of the State and acts as president of the State Board of Education.

FINANCE. The report of the State Treasurer for the fiscal year beginning November 16, 1907, and ending November 30, 1908, showed receipts during that period of \$251,045 and expenditures of \$218,290, leaving a balance on November 30, 1908, of \$32,124. The chief receipts were from the general revenue fund, common school fund, public building fund and common school indemnity.

CHARITIES AND CORRECTIONS. As Oklahoma is a new State, most of her charitable and correctional institutions are either in course of construction or contemplation. The Eastern Hospital for the Insane is to be constructed from plans already accepted. An appropriation of \$200,000 for buildings and \$150,000 for maintenance was made by the last legislature. The Hospital for the Insane at Supply had a population in 1909 of 479, and had an appropriation of \$352,348 for improvement, support and maintenance. There are in the Insane Asylum at Norman 553 patients. A school for the feeble-minded has been established and an appropriation of \$25,000 for buildings and \$25,000 for maintenance has been made. No steps have as yet been taken towards building this institution. At present all grades of imbeciles, idiots, feeble-minded and epileptics are cared for in the insane hospitals. The State penitentiary at McAlester is now in process of construction and there are 1235 convicts. An appropriation of \$400,000 for buildings and \$173,000 for maintenance has been made. The prison when completed will cost a million dollars. A State Reformatory has been established at Granite, and an appropriation of \$50,000 has been made. The total cost will be \$750,000. Among other institutions already established or about to be established are the State Training School for juvenile delinquents, a school for the deaf at Sulphur, a school for the blind at Fort Gibson, a school for dependent and defective negro children at Taft. The Whitaker Orphan Home is State institution for the care of dependent children. It has a population of 135 children and the names of 200 children are on the waiting list. There are other large orphan schools on land set apart for the Choctaw and Creek nations. These receive appropriations from the Federal government. There are about 150 Indian children cared for in these institutions.

POLITICS AND GOVERNMENT. On January 20, Thomas B. Gore was re-elected United States Senator by the legislature, receiving a straight party vote. The most important events in the history of the State during the year were in connection with the indictments and prosecutions for land frauds, in which Governor Haskell and other prominent citizens of the State were concerned. On February 3, the United States Grand Jury for the Eastern District of Oklahoma brought in three indictments for frauds in Muskogee township. One indictment was against Governor Charles N. Haskell, Clarence W. Turner and Walter B. Eaton. The second was against William T. Hutchings and Clarence W. Turner, and the third was against Albert Z. English, Frederick B. Sever and Jesse Hill. The indictment set forth that the United States has always exercised official functions in the matter of protecting Indian tribes in the enjoyment of lands set apart for their use by supervising through the Interior Department the selling of such lands, when this is done under the law for such lands, and also taking care of the proceeds for the Indians. An act of March 1, 1901, provided for the selling of lots in town sites in the Muskogee or Creek Nation Reservation by auction to the highest bidders at not less than their appraised value. The act, however, contained a provision in favor of persons already in occupancy of lands within town sites in that it permitted such persons to purchase not more than two lots at one-half of their appraised value. Under these circumstances it was charged that the defendants conspired to so manage matters by means of "dummies" that they finally would come into possession of many valuable lots in Muskogee at one-half of their appraised value. They were first to schedule with the Town-site Commission the names of all the persons they could think of in the different parts of the United States, and so set in motion the government machinery which would finally result in the issuance of patents in these names. While this was being carried out it was charged that the defendants would secure quit claims from these prospective patentees. Having secured record title the defendants would then hasten to dispose of the lots to innocent third persons. The result of this is charged in the indictments as a fraud upon the United States and also upon the Creek Nation, as wards of the government. Overt acts to the number of 47 in the first indictment, 13 in the second and 92 in the third, are set forth as having been committed by the different defendants in pursuance of the conspiracy. These overt acts consisted in the writing of letters, signing of deeds, making of payments and accepting patents from the government. In cases where "dummies" refused to sign quit-claim deeds or demanded money, it was charged in the indictments that forgery of deeds in their names was resorted to to complete the claims of title.

It was charged by Governor Haskell that these indictments were returned as the result of a conspiracy against him between President Roosevelt and W. R. Hearst, with the object of discrediting him. Resolutions were passed in the lower house of the legislature on February 4, condemning the indictments returned against Governor Haskell. Similar resolutions were also passed in the Senate. Governor Haskell was not formally placed under arrest. The

trials under these indictments were begun on April 5 before Judge John A. Marshall of Utah, who was especially assigned to try the cases. A motion to quash the indictments had previously been made on March 14, as the result of alleged misconduct on the part of the special Assistant Attorney-General, Sylvester Rush of Omaha, who conducted the grand jury investigation at Muskogee, which resulted in the indictments. It was alleged that government secret service operatives gave hearsay testimony before the grand jury; that important testimony was suppressed; that the government denied the jury's request for certain testimony, and that witnesses were coerced. The motion to quash was upheld on April 10, and the indictments were dismissed. A new grand jury was drawn and the case was placed before it for another investigation. Civil suits had previously been begun against Governor Haskell and other prominent Oklahomans by the government, and on May 8, Federal Judge Campbell overruled the demurrs of the defendants of these suits. This decision involved the legality of millions of dollars worth of lots, and created great consternation at Muskogee. About 1500 purchasers of land were interested. Judge Campbell announced, however, that all innocent purchasers would be protected. These suits were brought by the United States government for the Creek Indian Nation to recover for that tribe 3000 acres of land alleged to have been obtained by Governor Haskell and the other defendants by the fraudulent scheduling of "dummies." The overruling of the demurrs of the defendants practically decided the cases on their merits against the defendants on the allegation that the defendants obtained the lots by fraud. On May 27, Governor Haskell forwarded a long petition to Washington in which he made charges against William G. Gregg, United States Attorney for the Eastern Division of Oklahoma, Sylvester Rush and M. L. Mott, special attorneys for the government, and Richard R. Taylor and Edward B. Lemon, secret service agents of the government, who had been engaged in the work of preparing and prosecuting against the Governor and other defendants, the cases growing out of the charges of alleged frauds and conspiracies touching town lots in Muskogee. Governor Haskell demanded that the attorneys and agents of whom he complained be withdrawn from the case and assigned as his reason that they have "combined and federated together to secure unlawfully and by improper means" indictments against him. The most sensational features in the Governor's charges were those in which he attempted to show that there was an organized conspiracy to indict and convict him and to accomplish it by such unusual methods as publicity and the intimidation of witnesses, and his charge that the whole affair was carried on with the sanction of President Roosevelt, who was then in the White House. On May 27, indictments were brought by the second grand jury against Governor Haskell, F. B. Sever, W. W. Eaton, A. Z. English, W. T. Hutchings and C. B. Turner, on practically the same charges as were brought by the previous grand jury. Jesse Hill, who was the only other man under investigation and who had been indicted in January at Muskogee, was not indicted. Bond was fixed at \$5000 each.

In addition to the indictments mentioned

above, the Federal grand jury on February 9 returned indictments against 26 representatives of corporations on the charges of stealing valuable timber lands from segregated lands in Oklahoma. On July 3, Federal Judge Campbell held that the Oklahoma State law, prohibiting the shipment of gas and oil out of the State, was unconstitutional. On August 6, Judge Campbell, ordered the dismissal of 30,000 Indian land alienation suits, involving 2,000,000 acres, brought by the government in the interests of the Five Civilized Tribes. On September 4 Governor Haskell addressed a letter to President Taft in which he charged the Federal government with giving aid to violators of the Prohibition law in Oklahoma, first by allowing liquor advertisements to be sent through the mails, and second, by not conforming to the law in issuing Federal liquor licenses, and third, through the abuse of the protection of interstate commerce. The letter was accompanied by a petition signed by 2000 citizens. The President was appealed to to recommend at the coming session of Congress an enactment for such additional legislation as may be necessary to give complete relief on all three propositions. On September 29, the State, in fulfillment of its pledge under the bank guaranty law passed in 1908, paid the depositors of the largest bank in the State with deposits of more than \$3,000,000. Less than \$200,000 was demanded by the depositors. On October 21, the Comptroller of the Currency granted permission to the Farmers' State Bank of Oklahoma City to change to a national bank. Following the adoption of the bank guaranty law, more than 60 of the national banks of Oklahoma renounced their Federal charters and became State associations. The Farmers' State Bank was the first to change back to a national bank. See ELECTORAL REFORM.

OTHER EVENTS. On March 25 a disturbance occurred out in McIntosh county caused by the attempt of several deputy sheriffs to arrest three cattle thieves who were half-breed Indians. In the struggle three half-breeds were killed, five were wounded, and 40 taken into custody. Two days later, five deputies attempted to arrest the leader of the half-breeds, Crazy Snake, and two of them were killed. The Governor thereupon ordered out the State militia and endeavored to capture the old chief, who fled. He assembled nearly 200 half-breed negro Indians and this band was surrounded on March 28 by the State militia at Hickory Hills. The Indians, however, escaped and fled to a stronger position. On March 29 a detachment of Crazy Snake's band was surrounded, one was killed and eight captured. The Indians scattered and 25 more were later captured, among them Crazy Snake. An investigation by government officials followed, and they reported on March 30 that no Indians were involved in the original trouble, and that Crazy Snake was to be absolved from blame as he had the right to defend his home from attacks by irresponsible persons. Crazy Snake insisted that deputies rode to his house and opened fire and that the bullets pierced the walls of his cabin. On May 29 a cyclone caused great damage in Lincoln county. Several persons were injured and many buildings were destroyed.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: A child labor law was passed and a measure

was enacted making eight hours a day's labor on all public works. A juvenile court was established.

OFFICERS: Governor, C. N. Haskell; Lieutenant-Governor, George Bellamy; Secretary of State, Bill Cross; Treasurer, J. A. Menefee; Auditor, M. E. Trapp; Attorney-General, Chas. West; Adjutant-General, F. M. Canton; Commissioner of Insurance, T. J. McComb; Commissioner of Education, E. D. Cameron—all Democrats.

JUDICLARY. Supreme Court: Chief Justice, Mathew J. Kane; Associate Justices, Jesse J. Dunn, Robert L. Williams, Jno. B. Turner and Samuel W. Hayes; Clerk of the Court, W. H. L. Campbell—all Democrats.

The State Legislature of 1909 was composed of 8 Republicans and 36 Democrats in the Senate, and 37 Republicans and 72 Democrats in the House. The State representatives of Congress will be found in the section *Congress* of the article UNITED STATES.

OLD-AGE PENSIONS. The world-wide agitation during the past few years for increased provision by public authority for the pensioning of aged employees continued during 1909. The very general adoption during recent years of some form of old-age annuities by governments, by employers or by the coöperation of governments and employers, with or without contributions from employees, indicates that in all probability some provision for retirement and support of workmen during their declining years will soon be universal. Probably the most notable new provision in the United States was that made in November by the New York Central Railroad, effective January 1, 1910, and applicable to all of its own and its leased lines, thus bringing into line with the old-age pension movement, the last of the great railway systems. About 100,000 men are employed by these lines; 1765 will be retired during 1910; the annual expense of the scheme is put at \$500,000. The plan provides for the retirement of all employees reaching the age of 70; the pensioning of those who have been in the service during the previous ten years; after twenty years of continuous service an employee may retire with a pension, regardless of age; the amount of the pension shall be as many per cent. of the average pay during the ten years preceding retirement, as the employee has served years. On December 25, the officials of the Rock Island railroad announced a pension system on exactly the same basis as the foregoing, to become effective January 1, 1910. The age of compulsory retirement was, however, fixed at 75, and provision was made for voluntary retirement at 65. In connection therewith, the rule was adopted that hereafter no inexperienced man of more than 35 years, and no experienced man of more than 45 shall be taken into the employ of the company. The Massachusetts Legislature authorized the establishment of a coöperation pension system by the Boston and Maine Railroad and its employees. The fund contributed by the road and the men is to be administered by a board of seven, three of whom are to be chosen by the road, three by the employees and the other by these six. The minimum pension, after twenty years' service, shall be \$200 per year. The pension scheme of the Pennsylvania Railroad, after which the above New York Central plan was patterned, now provides for the compulsory retirement of men at the age of 65;

late in December, some 4500 of its employees petitioned for the inauguration, in addition to the existing scheme, of a coöperative plan making it possible for employees to increase their pensions by contributions during their active years, and providing for voluntary retirement at age of 60. The civil service employees of the United States have organized a Retirement Association which aims to secure from Congress legislation providing pensions for aged civil service employees of the government. The civil service has now been in existence long enough so that it now includes a considerable number who have grown gray in some department of the national government. The great extension of the civil service, and particularly the inclusion of the large body of well-organized postal employees, makes highly probable the success of this demand. It is claimed that every European country and most American ones have already pensioned civil employees; and that civil servants are entitled to retirement on pensions equally with members of the army and navy. In his annual message to Congress, President Taft recommended the establishment of a civil pension system on grounds of efficiency and economy. He argued that with such a system, the government could secure able employees at moderate salaries, and could maintain the highest efficiency among its civil servants by retiring aged members. A bill introduced in Congress in December by Representative Wilson would provide pensions of \$120 annually for all men 65 years of age and over, regardless of whether they have ever been civil servants. New York State teachers in December petitioned the State Legislature for the establishment of a retiring fund. About December 20, the Brooklyn Rapid Transit Company announced a plan of pensioning aged employees. On December 31, the Philadelphia Rapid Transit Company decided to give \$500 free insurance to each of its 9000 employees, and to grant pensions of \$20 a month to all employees 65 years of age who have been in the service 25 years.

A bill was presented to the Massachusetts Legislature in 1907, providing a pension of \$5 per week for all persons 65 and over who should apply for it. This led to the appointment of a Commission to investigate thoroughly the whole subject of old-age pensions. The Commission submitted a preliminary report in January, 1909, and was continued until January 15, 1910. This represents the pioneer move in this country, looking toward a general public old-age pension scheme and is also notable for the thorough nature of the inquiry being made to determine the need and advantages of any kind of scheme for an American State. In its preliminary report, the Commission gave an account of the systems in Germany, England, Denmark, Belgium, France, Italy, New Zealand, New South Wales, Victoria, Australia, Canada and Austria, and of thirty-two pension schemes maintained by American railways and industrial, commercial and banking corporations. From a detailed study of European countries, the Commission concluded that as a rule the expenditures for poor-relief tend to increase rather than decrease after the establishment of an old-age pension scheme. While the expenditures for out-door relief were found lessened in many cases, those for in-door relief quite uniformly increased. It thus appears that old-age pensions are not a solution of poverty or de-

pendency, chiefly, because they do not reach the pauperized portion of the population. The Commission inquired intimately as to the various classes of dependents and as to the sex, nationality, occupation, income, physical condition, and methods of saving of the non-dependent, but necessitous poor. In connection with this Massachusetts movement, Mr. Frederick S. Hoffman calculated the minimum cost of State pensions of \$2.50 per week, on the assumption that 40 per cent. of pensionable persons should apply for them. This minimum cost for Massachusetts, were the pensionable age put at sixty years, would be \$13,138,000 per year; at sixty-five years, \$8,419,000; and at seventy years, \$4,982,000. For the entire United States at this last age he found the cost would be 106,605,000. Mr. Hoffman finds that less than 2 per cent. of the Massachusetts population sixty years old and over were in alms-houses; in his opinion, therefore, the most pertinent inquiry is to ascertain the condition of the other 98 per cent. and how they managed to keep out of the poorhouse.

GREAT BRITAIN. The scheme effective January 1, 1909, has attracted the interest of the entire world. Provision for the enormous outlay necessary to meet the pensions became the central fact in the budget of 1909, and was therefore largely responsible for the radical character of the Finance bill and the constitutional crisis growing therefrom. The statistics for the first nine months were as follows: England and Wales, pensioners, 421,432; amount of pensions, £3,642,747; Scotland, 75,134 and £667,007; Ireland, 186,202 and £1,723,904. There were thus a total of 682,768 pensioners, and they had received up to September 30, a total of about \$31,000,000.

AUSTRIA. In Austria public opinion has inclined more strongly to a system of working-men's insurance, providing annuities in case of disablement and old age as against the system of old-age pensions on a non-contributory basis, and granted as a right, as in England. An act to regulate such insurance for employees in private, and in certain branches of the public service, went into effect January 1, 1909. It divides employees into six classes on the basis of salary; fixes monthly premiums at one per cent. of the minimum salary in each class, one-third of the premium to be paid by employees and two-thirds by employers, except in certain cases when one-half is paid by each. No claims for benefits may be made until 120 monthly premiums have been paid, unless disability or death should result from accident during work. The disablement annuity at the end of ten years equals thirty times the monthly premium, and therefore increases 5 per cent. of this sum annually until the fortieth year. It then becomes an old age annuity.

FRANCE. France has operated a moderate old-age pension plan on a contributory basis since 1905, but there has been insistent demand for its extension. The age limit has been 70 years. The number of beneficiaries increased from 190,000 in 1905 to about 500,000 in 1909, and the cost to the state increased from \$3,500,000 to almost \$19,000,000. The Chamber of Deputies enacted a more liberal measure in 1907, but its passage was blocked by the Senate until February, 1909, when that body rejected it and substituted therefor a new bill. This provides for pensions of 120 francs to members of the work-

ing classes 65 years of age and over. The fund for their payment is to be raised by employers and the state. The employers are required to pay annually 9 francs for each workman or employee at least 18 years old, and 4½ francs for each one under 18 years. The bill also provides for old-age pensions based on regular monthly payments, but with the provision that the pension shall be considerably larger than would be provided by such payments.

NEW ZEALAND. The government's National Provident bill, which has been in contemplation for two years, has several unique features as an old-age pension scheme. It provides that any person depositing sums with the post-office, regularly or irregularly, in equal or unequal amounts, will receive, in addition to the annuities which these deposits would purchase, a subsidy provided by the state. The size of this subsidy is varied according to the age of the depositor; conjugal condition (with discrimination against bachelors and spinsters), and the number of children, if married; wealth; and membership in a friendly society.

OMAN. An independent state in southeastern Arabia. Area, about 82,000 square miles. Population (estimated), about 500,000, mostly Arabs with some Indians, Persians, Baluchis, and Swahili negroes. Muscat, the capital (with its suburb Muttra), has about 30,000 inhabitants; it possesses the only good harbor. About 76 per cent. of the foreign trade is with Great Britain and British India. The total trade in 1907-8 was valued at £939,500. Bombay serves as an *entrepot*. There is a cable to India via Jask, and a weekly mail service to Karachi and Bombay. The Sultan (1909, Seyyid Feysal bin Turki, born 1864) is in treaty relations with and is subsidized by the government of India. A British consul and political agent (Capt. F. McConaghey in 1909) resides at Muscat.

ONTARIO. A province of Canada. Area, 260,862 square miles. Population (1901), 2,182,947. Capital, Toronto, with 208,040 inhabitants in 1901 and, with suburbs, 335,000 in 1909. The executive authority rests with a lieutenant-governor, appointed by the Governor-General of Canada, and acting through a responsible Executive Council. The Legislative Assembly consists of one house of 106 members elected for four years. The Lieutenant-Governor in 1909 was Colonel John Morrison Gibson; the Premier was Sir James P. Whitney. For statistics and other details, see CANADA.

In April the grant of \$2,000,000 by the legislature to the Canadian Northern Railway was announced. Other lines were also to be subsidized. As a result of local option, there were in April 334 out of the 807 municipalities with only a single license. In Toronto, 142 bars were suppressed on May 1, and there were at that time only 110 licenses in the city.

OPERA. See MUSIC.

OPIUM. The International Opium Commission met at Shanghai, January 1, 1909. The Commission consisted of three men selected by those nations having territorial possessions in the Far East, Great Britain, Germany, France, Portugal, the Netherlands, China and Japan being represented. The Commission found that the use of opium in the Philippines was not confined to smoking, and that the morphine habit showed signs of spreading. It was recommended that the various governments having concessions

or settlements in China should close the opium dens within their limits. This measure will test the sincerity of the European Powers directly concerned. Rochester, of the Manila Bureau of Health, made a study of opium habitués in the Philippines, and concludes that opium-smoking has to a great extent declined among the Chinamen, who have not been slow to accept the hypodermic syringe as a method of taking the drug. It was found that 29 per cent. of the patients in San Lazaro had developed from opium-smoking to the injection method. One of the most interesting and surprising facts noted was the good physical condition of those who took the drug by the smoking method, even though they had been addicted to the habit for from five to ten years. Many of the smokers were of robust physique, and had been doing hard manual labor every day. In contrast to them were the users of the hypodermic syringe. These were usually greatly emaciated, with sunken eyes and haggard expression and a muddy skin. A corresponding difference was found in the amount of difficulty in instituting curative measures in these two classes of cases, the opium-smokers responding much more favorably to measures taken for their relief. A startling discovery was made in France, that in Paris and many garrison ports, the opium habit had become widely prevalent, particularly in Toulon. "Reputable" merchants were found to have installed secret opium dens in their premises, and the number of habitués was disquietingly large. The Minister of the Interior issued a decree regulating the sale, purchase and use of opium and its extracts, and forbidding the selling of opium in any quantity except to wholesale merchants for industrial purposes, to chemists and pharmacists. Officially, opium and its extracts are not permitted to be sold by pharmacists except for use in medicine, under severe penalties. Beginning with April 1, 1909, neither opium nor any mixture or compound containing or representing opium in any form can legally be brought into the United States or any outlying possessions, excepting for strictly medicinal purposes. This term is declared to mean for treatment or prevention of diseases only.

OPIUM COMMISSION, INTERNATIONAL. See CHINA and OPIUM.

ORANGE RIVER COLONY. A British colony in South Africa. Capital, Bloemfontein. Area (estimated), 50,392 square miles. A census taken in 1904 returned 142,679 whites and 244,636 colored; the population was estimated in 1907 at 447,008. Bloemfontein had (1905) 13,512 whites, 16,033 natives, 3487 military; Kroonstad, 2454 whites and 3343 natives; Ladybrand, 2333 and 1515; Harrismith, 2238 and 3068. Education (primary) is free and conditionally compulsory. There were (June 30, 1908) 377 government schools, with 725 teachers and 19,502 pupils. Grey College and its branches provide higher instruction. In 1904 the Dutch Reformed numbered 101,079; Anglicans, 17,879; Wesleyans, 5121; Roman Catholics, 3286. The country is essentially pastoral. There were (1906-7) 155,330 acres under wheat and 1543 under tobacco. The live-stock (1907) numbered 8,020,308 sheep, 585,077 cattle, 127,579 horses, and 62,439 swine. The total mining output in 1905-6 was valued at £997,753 (diamonds, £902,728); in 1906-7, 446,063 tons

of coal, valued at £139,875, were produced. Gold and salt are found. The imports and exports for 1908-9 were valued at £2,945,860 and £3,558,373, against £3,317,770 and £3,789,653 in 1907-8. The colony belongs to the South African Customs Union. The railway statistics are included with those of the Transvaal (q. v.). There are 6653 miles of telegraph and 227 miles of telephone lines. The revenue and expenditure for 1908-9 were £915,286 and £952,513 respectively, against £740,367 and £733,233 for 1907-8. Six banks have branches in the Colony. In 1907 the Post-Office Savings banks had 6433 depositors, with deposits amounting to £158,061. By Letters Patent, dated June 5, 1907, a responsible government has been constituted for the Colony. The Lieutenant-Governorship was abolished July 1, 1907, and Sir Hamilton Goold-Adams, the holder of that office, was appointed Governor. The new constitution provides for a legislative council, and a legislative assembly popularly elected. By the South Africa act, the Orange River Colony is to be made a member of the Union of South Africa. See SOUTH AFRICA, BRITISH.

HISTORY. The chief issue in internal politics during the year was the education question. Down to the beginning of the year 1908, the Orange River Colony followed the same rule as to the use of the Dutch and English languages in the schools as was in force in the Transvaal under General Smuts. By this system, each child was taught first in his native tongue, and then gradually, if this was Dutch, learned English, which was the prescribed language for the higher classes. But under General Hertzog, who was a zealot for the Dutch tongue, a new law was adopted which went into effect at the beginning of 1908. This gave equal rights to both tongues, requiring that both should be the medium of instruction throughout the school course. This system of compulsory bi-lingualism was very objectionable to the English, and was also opposed by many of the Boers, in that it involved the repetition of lessons in both languages, and thus doubled the amount of time necessary for study, and greatly retarded progress. The English element protested against a system that denied them the rights which they had in every other colony. The Dutch element took no overt action, but privately expressed disapproval of the law. They contended that it victimized them for political party purposes. As to the retention of the *taal*, they believed that it could easily be taught in the home by the Dutch parents. Discussion became more acute after the dismissal of three school inspectors in May. No satisfactory reason could be drawn from the government for this action, and it was believed by the opposition that the inspectors were dismissed for executing the law with especial thoroughness, and that the government had merely wished to make scapegoats of them. Throughout the year the discussion of bi-lingualism was continued with some bitterness, and along party lines. The government refused to consider any amendment to the law to meet the objections of parents. This led to a movement in the country for the establishment of private schools on the Transvaal principle, and a committee was proposed in order to raise money for a system of education which would not require the compulsory use of both languages at the same time in teaching. On November 25 General Hertzog held a conference

with members of the School Boards, and there seemed a prospect of amicable adjustment. In the spring, it was reported that owing to the depression of agriculture, the condition of the British settlers in the colony was very bad. The matter came up for discussion in the British House of Commons, and it was said that the British settlements would fail unless aid were forthcoming. On June 2 the Act of Union was adopted by both Houses. (See SOUTH AFRICA, BRITISH.) The government was criticised for its policy of doles to the indigent which was carried out without regard to the advice of the Indigency Commission. This distribution of cattle and other aid was made possible by the financial surplus in prospect, and by the fact that a portion of recent loans still remained unspent. The progress in the matter of retrenchment of the civil service was reported on June 15 by Premier Fisher, who declared that the number of civil servants was cut down by thirty, of whom twenty were English and nine South African. Since November, 1907, there had been ninety-six new officials appointed, forty-two English and fifty-two South African. As to the government's programme the Lieutenant-Governor promised bills for land grants and for the relief of widows and orphans, and suggested a measure for industrial colonies. He declared that the customs revenue had decreased on account of the increased consumption of home products.

ORDWAY, JOHN MORSE. An American chemist and educator, died July 3, 1909. He was born in Amesbury, Mass., in 1827, and graduated from Dartmouth College in 1844. As a young man he worked in a druggist's shop in Lowell, Mass., and was chemist for several large manufacturing establishments in New England. He was for fifteen years professor of industrial chemistry and metallurgy in the Massachusetts Institute of Technology, and was, at the same time, an instructor in Boston University. Following this he served for thirteen years in the faculty of Tulane University, as professor of chemistry and biology, retiring in 1907. Professor Ordway was well known through his contributions on scientific subjects to magazines and technical publications.

OREGON. One of the Pacific Division of the United States. Its total area is 96,899 square miles. The population in 1909, according to a Federal estimate made in that year, was 505,339.

MINERAL PRODUCTION. The value of the mineral products of the State in 1908 was \$2,743,434, as compared with a value of \$2,638,587 in 1907. Oregon was one of the few Western States showing an increase in the value of the mineral production in 1908 over that of 1907. The most important mineral in point of value was gold, of which 43,823 fine ounces, valued at \$905,900, were produced in 1908, compared with 59,124 fine ounces, valued at \$1,222,200 in 1907. Next in point of value were clay products, which amounted to \$555,768 in 1908, as compared with \$545,839 in 1907. Coal was produced to the amount of 86,259 short tons, valued at \$236,021 in 1908, as compared with 70,981 short tons, valued at \$166,304 in 1907. The sand and gravel produced in 1908 was valued at \$524,984, as compared with a value in 1907 of \$289,422. Other mineral products of some importance are lime, silver, stone and mineral waters.

The gold production in 1909 was estimated by the Director of the Mint at 34,448 fine ounces, valued at \$712,900. The silver production was 71,100 fine ounces, valued at \$37,000.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 522,000 bushels, valued at \$418,000 from 17,000 acres; winter wheat, 11,235,000 bushels, valued at \$10,449,000 from 535,000 acres; spring wheat, 5,142,000 bushels, valued at \$4,782,000 from 275,000 acres; oats, 10,886,000 bushels, valued at \$5,661,000 from 288,000 acres; barley, 1,984,000 bushels, valued at \$1,309,000 from 63,000 acres; rye, 153,000 bushels, valued at \$153,000 from 9000 acres; potatoes, 7,360,000 bushels, valued at \$4,416,000 from 46,000 acres; hay, 865,000 tons, valued at \$10,120,000 from 422,000 acres. The crop of corn increased considerably in 1909 over 1908, when 440,000 bushels were produced. The acreage increased about 1,000. The winter wheat crop of 1909 was considerably larger than that of 1908, when 10,858,000 bushels were produced. The acreage also considerably increased. The spring wheat crop was larger by nearly 1,000,000 bushels in 1909 than in 1908, while the acreage increased about 15,000. The oat crop was more than one million bushels larger in 1909 than in 1908, when 9,519,000 bushels were produced. The acreage slightly increased. The potato crop in 1909 was nearly twice as large as in 1908, when 4,257,000 bushels were produced. The acreage increased from 43,000 to 60,000. The hay crop in 1909 increased by about 45,000 tons, while the acreage increased by about 8000 acres. A large and increasing area is devoted to the cultivation of apples, prunes and apricots. A number of important irrigation projects carried on by the United States Reclamation Service has greatly assisted the agricultural development of the State in recent years. The number of farm animals in the State on January 1, 1910, were as follows: Horses, 308,000; dairy cows, 174,000; other cattle, 698,000; sheep, 2,581,000; swine, 267,000. The wool clipped in 1909 was estimated at 17,030,000 pounds.

EDUCATION. It is probable that no State in the Union has made greater progress in its public school system during the past few years than has Oregon. At the Alaska-Yukon Exposition, the State won the grand prize for the best general educational exhibit. Two important laws were passed by the legislature of 1909. One of these requires that every rural board must have at least six months of school annually, and a fund of not less than \$300 annually is provided for the smaller districts to use as teachers' salaries. The other law permits a county to establish a county high school fund, and each district or group of districts maintaining a high school up to the standard prescribed by the State Department is entitled to \$40 a pupil for the first 20 high school pupils, \$30 a pupil for the second 20, and \$12 per pupil for all remaining high school pupils. Two counties have already taken advantage of this privilege and most encouraging reports are being received as to the practicability of the law. Each county in the State held the district school officers' convention provided for by a measure passed in 1907. A type of meeting, known as the educational rally, was introduced during the

year by the State Superintendent of Schools. By this system the county superintendent divides his county into six districts, and spends, together with the State Superintendent, a week in visiting and inspecting the schools of the county. At these meetings literary and musical programmes are carried out and addresses are given by the State Superintendent.

Trustees of the fund left by Mrs. Amanda W. Reed for the foundation of an educational institution in Portland, to be known as the Reed Institute, adopted definite plans late in 1909, deciding to establish a college of arts and sciences. For this purpose (approximately) \$2,000,000, which for several years was tied up by litigation, is now available. A central site of at least forty acres is soon to be selected. In their action the trustees followed the advice of Dr. Wallace Buttrick, Secretary of the General Education Board, of New York City, and it is expected, though not promised, that funds from the Rockefeller foundation will largely increase the original endowment. Dr. James Hayden Tufts, head of the department of philosophy of Chicago University, has been mentioned as the probable president of the Reed Institute.

The average daily attendance for 1909 was 95,081, as compared with 94,333 in 1908. The teachers numbered 4453, and of these 3590 were women and 863 men. The average monthly salary of men teachers was \$69.25, and of women, \$51.97. The average monthly salary of rural teachers was \$50.15. The number of high schools has increased to 175, and there were enrolled in these, during the year, 27,532. Completing the public school system are the University of Oregon and the Oregon Agricultural College, the former at Eugene, and the latter at Corvallis. Each institution has shown steady growth.

FINANCE. The biennial report of the State Treasurer for the fiscal years 1907 and 1908 showed receipts for the two years of \$5,770,103. The disbursements for the same period were \$5,527,124, which, with the balance left from the preceding fiscal year, left a total balance on hand September 30, 1908, of \$658,320.

CHARITIES AND CORRECTIONS. Among the charitable and correctional institutions of the State are the State Reform School, School for the Deaf Mutes and the Institute for the Blind at Salem. The appropriations for all the State charitable and penal institutions amount to about \$850,000 annually. The juvenile courts recently established proved to be a wise step and have been a great assistance in helping the reform school for the youth of Oregon.

POLITICS AND GOVERNMENT. On January 19 George E. Chamberlain, Democrat, was elected United States Senator by the legislature. The vote was: Chamberlain 53, Fulton 19, and Cake 17. Senator Chamberlain occupies the unique position of having been elected United States Senator by a Republican legislature. This result was brought about by the operation of the primary laws of the State by which the voters in 1908, at the regular State election in June, indicated Senator Chamberlain, who was then Governor, as their choice for United States Senator. Under the primary law a Senator is nominated at the same time and in the same manner as the State officers and at the succeeding regular election the voters go through the form of electing a Senator. A majority of the legislature (52 members out of 90) had sub-

scribed to a voluntary pledge prior to their own nomination as legislators that they would vote in the legislature for the "people's choice." All the members of the legislature who had subscribed to this pledge (known as Statement No. 1) fulfilled it by voting for Chamberlain. All but one unpledged Republican member voted against Chamberlain. F. W. Benson, Republican, Secretary of State, succeeded Chamberlain as Governor.

As in California, Nevada and other States, measures were introduced into the Oregon Legislature, providing for restriction against Japanese and other Orientals. The measures, however, did not make any considerable progress, as they were killed on February 19 by the Senate, when it adopted a resolution upholding the President's course. Senator Bailey, who introduced the measure, made a speech arguing for the reenactment of the Chinese exclusion act, and for broadening it to include Japanese, Malays, Hindus, and all other Asiatic races. On January 1, the United States Court of Claims announced its findings in the case of the State of Oregon against the United States, and awarded \$200,000 for moneys expended during the Civil War in protecting the adjoining territories of Washington and Idaho. When the Civil War began Oregon was left practically defenseless, the troops, which at that time guarded it against Indian outbreaks, having been taken East. Subsequently local volunteers performed services not performed by the United States, and this award is to compensate the State for these services. In June, the city of Portland held its second election under the initiative and referendum. Thirty-five separate questions and the names of candidates for six offices were submitted. Of the 35 questions, 12 were accepted and 23 rejected. Among the questions accepted were propositions to require holders of franchises to file quarterly reports, for a woman's auxiliary to the Police Department and a proposition to place the burden of proof on all discharged civil service employees. Among the measures defeated were those providing for a vehicle tax ordinance, the prohibition of the use of patented articles or processes in the use of street improvements, a proposition for the payment for water mains by benefited properties, and for the Des Moines plan of city government. The vote for mayor was 18,000, while on the question of referendum it averaged 15,000. Joseph Simon, former United States Senator, and the Republican candidate, was elected mayor. See ELECTORAL REFORM.

OTHER EVENTS. In August, 1909, it was announced that the Oregon Trunk Line up the Deschutes cañon into central Oregon, already begun, would be supported by James J. Hill. There are now under construction contract 109 miles from Celilo, where the Columbia will be bridged for connection with the Spokane, Portland and Seattle Railway, to Madras, and additional survey has been located to Crooked River, 20 miles beyond Madras. Klamath Falls is the projected terminus of the Oregon Trunk, but it is believed that the line will build on into California. It is also probable that there will be a branch from Bend to Lakeview, and an extension east, through Malheur Cañon and across Idaho, to connection with the Burlington. The central Oregon territory to be opened up is the largest district in the United States without railroads, and the de-

cision of Mr. Hill to build this road is regarded as of utmost importance.

The Deschutes Railroad Company, a Harriman corporation, is paralleling the Oregon Trunk up the Deschutes. There are now under contract 130 miles, from Deschutes to Redmond, with probable extension to Odell, where connection will be made with the Natron cut-off of the Southern Pacific to Klamath Falls. It is also believed that the Deschutes Railroad Company will build eastward to connect with the Oregon Short Line at Vale.

The Natron cut-off is being constructed from Klamath Falls to Natron, a distance of 150 miles. Thirty-five miles of this line are under contract at each end, leaving a gap of 80 miles.

Construction is also progressing on the Pacific Railway and Navigation Company's line from Hillsboro to Tillamook. This road, 98 miles long and to cost approximately \$3,000,000, is now 60 to 70 per cent. completed. It is a Harriman property.

The Beaverton-Willsburg Line, a branch of the Southern Pacific's West Side division, is also under construction. It is 14 miles long and its cost, including a bridge across the Willamette River, will be \$1,200,000.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: Measures were passed defining and prohibiting corrupt practices at elections. The salaries of public officers are made subject to garnishment. Provision is made for sanitation in hotels; the sale of food-stuffs is regulated, and co-operation with the national commission in the conservation of national resources provided for. State sanitaria for tuberculosis are established, and the 10-hours' law affecting female employees is extended to telegraph, telephone, express and transportation service. An insurance department was established and measures were passed regulating the insurance business and the use of the public waters of the State.

OFFICERS: Governor, Frank W. Benson, Rep.; Secretary of State, _____; State Treasurer, George A. Steele, Rep.; Superintendent of Public Instruction, J. H. Ackerman, Rep.; Adjutant-General, William Finzer, Dem.; Attorney-General, A. M. Crawford, Rep.; Commissioner of Insurance, S. A. Kozer, Rep.

JUDICIARY. Supreme Court: Chief Justice, F. A. Moore; Justices, Thomas A. McBride, Woodson T. Slater, William R. King and Robert Eakin; Clerk, J. C. Moreland—all Republicans.

The State Legislature of 1909 was composed of 23 Republicans and 6 Democrats in the Senate, and 51 Republicans and 7 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

ORGANIC CHEMISTRY. See CHEMISTRY.

ORNITHOLOGY. The 1908 *Year Book* contained a reference to experiments on the homing ability of terns, made by Watson, who liberated birds at Cape Hatteras, several hundred miles north of their normal area of distribution, but nevertheless found that they returned to their nesting places in the Tortugas. As a contribution from the Tortugas Laboratory of the Carnegie Institution, Watson

published in 1909 his complete paper embodying the results of his observations and experiments on the noddy and sooty terns of the Bird Key Reservation, about 66 miles west of Key West. The paper is primarily on the psychology of the birds, but many observations are of interest to ornithologists. On this island, about 300 yards wide and 400 long, were found 700 nests of noddy and nearly 9500 of sooty terns. The former were in bushes, and the latter in shallow depressions on the ground. This would give a probable total of over 30,000 adult birds on the island. The birds probably mate before reaching the island, and nest building had begun on May 4. They feed by following the schools of minnows, which, when attacked by other fish, jump above the surface of the water, and are caught by the birds when in the air. In the case of both species the female remains on the nest until the eggs are laid, the male meanwhile feeding her. During incubation, the parent birds alternate in their care for the eggs. By August 1 the birds had all left the island, but the locality where they spend the winter is not known.

Our knowledge of bird migration is still very incomplete, and various workers have suggested that if the birds could be tagged in some way before migration, data could be collected which would put the subject on a more satisfactory basis. The Bird Club of New Haven, Conn., reported that they have been making a systematic attempt at marking birds in this way, but have made no report of their results.

Townsend discussed the use of the wings and feet in diving birds and concluded that progression by both wings and feet was the primitive method, and is to be looked for among young birds. Specialization towards the use of the wings alone leads to a diminution in the size of the wings, and finally to a bird that is flightless in the air. Specialization toward the use of the feet alone is the best adaptation for rapid progression through the water.

The fifteenth supplement to the A. O. U. check list was published in the *Auk* for July, and it was expected that the complete third edition would be published early in 1910.

In connection with bird protection it is interesting to note that in October, 1908, the Territory of Papua passed an act prohibiting the taking out of the Territory the plumage of birds of paradise, goura pigeons and "osprey" (egret). In June, 1909, the Governor-General of Australia issued a proclamation making unlawful the importation into the Commonwealth of the plumage of any such birds except with the written permission of the Collector of Customs of the Territory of Papua.

At the American Museum of Natural History in New York City, a series of habitat groups of birds, begun some years earlier, was completed in 1909. The groups were erected under the supervision of F. M. Chapman, and embody the results of many expeditions to secure not only the specimens and nests, but photographs and paintings of their normal environment. The Alexander Alaska expedition of the University of California collected 532 bird skins, of which 6 were new species and have been described by Joseph Grinnell. Knowlton published in 1909 his *Birds of the World*, giving an account of every known species both living and fossil.

OSGOOD, HENRY BROWN. An American military officer, died March 12, 1909. He was born in Maine in 1843 and served as a volunteer in the Civil War until 1863, when he was appointed to the United States Military Academy. Graduating in 1867, he was made first lieutenant in 1870; captain, 1880; major, 1887; and colonel and assistant commissary-general in 1905. In 1907 he was retired as a brigadier-general. General Osgood was awarded a medal of honor in 1865 for voluntarily remaining in service during the invasion of Pennsylvania in 1863 after his term had expired.

OSMOTIC PRESSURE MEASUREMENT, DIRECT. See CHEMISTRY.

OSTHOFF, HERMANN. A German comparative philologist, died in May, 1909. He was born in Westphalia in 1847; studied at Bonn, Tübingen and Berlin, and became in 1877 professor of Sanskrit and comparative grammar at Heidelberg. He was one of the founders and editors of *Morphologische Untersuchungen auf dem Gebiete der indogermanischen Sprachen* (1878-95); *Vom Suppletivwesen der indo-germanischen Sprachen* (1899); *Etymologische Parerga* (1901) and other works.

OSTWALD, WILHELM. A German chemist, awarded on December 9, 1909, the Nobel prize for chemistry. He was born in Riga in 1853 and was educated at Dorpat, where he became a lecturer in 1878. In 1882 he was made professor in the Polytechnicum of Riga and from 1887 to 1896 he was professor of chemistry at Leipzig. In 1905-6 he visited the United States and lectured at Harvard University under an arrangement for the exchange of professors between American and German universities. As an investigator in physical chemistry and chemical affinity he is particularly well known. His researches have concerned, among numerous subjects, the electric conductivity of organic acids, the parallel existing between the volume of such acids and their power of chemical reaction, and the color of ions. He is the author of important works on physical chemistry, thermo-dynamics, electro-chemistry and the foundations of inorganic chemistry, besides several works of a scientific literary character, including one published in 1907, on *Personality and Immortality in the Annals of Natural Philosophy*. He is a member of all the leading scientific societies in the world.

OTIS, ELWELL STEPHEN. An American military officer, died October 21, 1909. He was born in Frederic, Maryland, in 1838, and two years later his family removed to Rochester, N. Y., where he graduated from the University of Rochester in 1858. He studied law at the Harvard Law School and graduated in 1861. He practiced law in Rochester until 1862, when he recruited a company of the One Hundred and Fortieth New York Volunteers and went to the war as a captain. He served in this regiment throughout the war, and took part in many important engagements, among them Gettysburg and the Wilderness. He was wounded in the battle of Chapel Hill, near Petersburg, Va. He rose to the rank of lieutenant-colonel, and on his discharge in 1865 received the brevets of colonel in the regular army and brigadier-general in the volunteers. On the formation of the Twenty-second Regular Infantry in 1866 he was appointed lieutenant-colonel and in 1880 was promoted to colonel. From 1867 to 1881 he

served in the West and took part in several Indian campaigns. He organized an infantry and cavalry school at Fort Leavenworth and in 1893 he was made a brigadier-general, being promoted over the heads of many officers who were his seniors. He spent several months assisting in the revision of the army regulations. On the outbreak of the Spanish War he was appointed major-general of volunteers and was sent to the Philippines under General Wesley Merritt, after having directed the work of organizing and equipping troops embarking from San Francisco. In August, 1898, he was put in command of the Department of the Pacific and was appointed military governor of the Philippines. During the hostilities following the rebellion of Aguinaldo in 1898 General Otis commanded at Manila. He performed the duties of military governor until May, 1900, when he was recalled. In June of the same year he was promoted to major-general and placed in command of the Department of the Lakes at Chicago. In 1902 he was retired for age.

OXONE. A proprietary name applied to fused sodium peroxide, containing a small percentage of a catalytic agent, whose identity is not divulged. It is said to yield its entire content of available oxygen upon contact with water, and is designed to furnish a cheap means of producing oxygen for therapeutic use.

OXY-ACETYLINE TORCH. See CHEMISTRY, INDUSTRIAL, paragraph on Metallurgy.

OXYGEN. See CHEMISTRY, INDUSTRIAL.

OXYRHYNCHUS, EXCAVATION AT. See ARCHAEOLOGY.

PACKARD, WILLIAM ALFRED. An American scholar and educator, died December 2, 1909. He was born in Brunswick, Maine, in 1830, and graduated from Bowdoin College in 1851. He taught in Andover Academy at Andover, 1852-3, and was a tutor in Bowdoin in 1853-4. He graduated from the Andover Theological Seminary in 1857 and in 1857-8 studied at the University of Göttingen. He was instructor of modern languages at Bowdoin, and professor of modern languages in that college 1850-63, and professor of Greek language and literature at Dartmouth from 1863 to 1870. From 1870 to the time of his death he was professor of Latin language and literature at Princeton University. The last years he was professor emeritus. He revised, with translations from later editions, Curtius's *History of Greece*, and wrote memorial sketches of lives of earlier Princeton presidents and professors, and articles and reviews of books and periodicals.

PAGEANTS. See CENTENARIES.

PAINTING. Landscapes and marines proved, as usual, to be superior at both of the New York Academy exhibitions of 1909 to portrait and figure work. In the spring show Mr. Arthur Hoeber's "Evening," Mr. Childe Hassam's "Sunlight through Leaves," Mr. Granville-Smith's "October Birches," Mr. Lathrop's "Pasture Brook," and Mr. Ben Foster's "Early Moonrise," which took the Inness gold medal, were all of uncommon merit. Also well worthy of mention were Mr. Paul Dougherty's "Golden Moon," Mr. Walter Palmer's "Winter Wizard," Mr. Gustav Wiegand's "On the Threshold of Spring," and Mr. G. H. Bogert's "Break of Day." In figure work Mr. Hawthorne, one of

the most vigorous among American figure painters, showed in his "Lemon Girl" that he can evoke picturesquely charm as well as rough movement. His "Return from the Catch," one of the vivid sketches of which he is so fond, was a stirring portrayal of marine life.

Mr. Albert L. Groll, who in the last few years has made great strides as a painter of the American desert, showed in another picture, "Silver Clouds," an impressive study of Arizona color. "A Lowering Day" was still another achievement in which endless stretches of plain and sky were cleverly portrayed.

Mr. Emil Carlsen's "Surf" suggested admirably the vast spaces of the ocean. "Off the Low Rocks" by Mr. Frederick J. Waugh, and Mr. Redfield's "Harbor of Boulogne" were the most notable marines shown.

In portraiture, of which there was but a small showing, Mr. Sargent's picture of Countess Szechenyi (Miss Vanderbilt) hardly did the American master justice, notwithstanding its admirable detail. It lacked brilliancy. Upon the other hand Mr. Sergeant Kendall's "Portrait of Miss H. H.," a figure of appealing charm, showed this artist at his best. Mr. Orlando Rouland's "Catherine" was a well poised and well painted composition. Mr. Irving R. Wiles had a decorative portrait of Mlle. Gerville-Reache as Carmen that barely escaped the commonplace. Other portrait work in the exhibition that calls for mention was by Miss Beaux, William H. Hyde, H. Stanley Todd, and J. Mortimer Lichtenauer.

Figure work of some merit included Miss Gent's sunlight study, "In the Arbor"; Miss Cassatt's "Children Playing with a Cat," crude in tone, but fairly spirited; Charles Bittinger's "After the Ball" (second Hallgarten prize), in which lamplight and early dawn are contrasted as they play upon the figures of two women in evening dress; George De Forest Brush's "Family Group," of familiar material and technic; Andrew Schwartz's "Primitive Family," after the manner of Puvis de Chavannes. F. B. Williams's "Court of the Beloved," and Hugo Ballin's "The Lesson," both showed ambition and hard work. The Shaw prize for the best work by an American woman was awarded to Mrs. A. A. Wiegand for "A Woman in Blue," the Clarke prize to Miss Lydia F. Emmet for "Playmates," and the first Hallgarten prize to Daniel Garber for his "Horses."

The most clamorous piece of work upon the walls of the winter academy was Mr. Boldini's portrait of Mrs. Clarence Mackay, almost a caricature in its over-accents. It was a restless vision of crying color, interesting enough as a fancy sketch, but too sensational for everyday purposes. By contrast, the most vivid work of Mr. Robert Henri's "Girl with Parasol" seemed tame, and Mr. Sargent's "Gitana" was reserve, itself. Mr. Ben-Ali Hagggin's frankly theatrical ballet girl, "Little White Dancer," was in its way quite as clever, technically, as Mr. Boldini's portrait and marked a step in advance. John W. Alexander's portrait of the late Richard Watson Gilder and Brush's portrait of Henry George both had dignity. Mr. Alexander's "Sunlight," the full-length figure of a graceful girl bathed in misty light, the whole a symphony in soft, shifting pale yellows, had the place of honor in the exhibition and deserved it. Sergeant Ken-

dall's "Psyche," a delightful study of a young girl, has been bought by the Metropolitan Museum.

Mr. Montague Flagg's "Portrait of My Wife," which took the Proctor prize, suggested the best period of Dutch painting in the vigor and quiet strength of drawing and refined color. Strong also, but with a touch of ultra-modern exaggeration never absent from this painter's portraits, was Robert Henri's representation of Mrs. William R. Clarke. Irving R. Wiles hardly did himself justice in his "Girl with the Horse," and the same must be recorded of Mr. Cushing's latest rendering of the red-haired young woman of whom he has made so many and better pictures. Mr. Wiles gave a better account of himself in the portrait of his fellow artist, Walter Palmer.

Elliot Dangerfield's "Pearls of the Morning," a group of ideal nudes, had charm of color and graceful form, and Mr. Baer's graceful reclining nude figure had also decided merit. Some figure work by Mr. John E. Johansen, two musicians playing in a sombrely lighted room, and a clever confection by Mr. Frieske called "Lady Trying on Hat" were both of more than average merit.

In landscape there was nothing in the winter exhibition superior to Ben Foster's "Moonrise," in which he returns to a theme he always handles with consummate skill and delightful poetry. Mr. Gardner Symons took the Carnegie prize with his "Opalescent River," a stream full of ice, that made one feel the rush and sweep of the water. In a picture of an army of men and steam shovels at work upon an excavation at night George Bellows showed much rude energy. Charles Warren Eaton, Bruce Crane, Redfield, Ranger and Alden Weir were also represented by work of characteristic merit. Paul Dougherty's "Black Squall" was perhaps the best marine shown.

Two exhibitions of far-reaching influence were held in New York during the year—that of work by the Spanish painter, Sorolla-y-Bastida, and the show of Dutch pictures gathered in the Metropolitan Museum of Art for the Hudson-Fulton celebration. Sorolla's 350 pictures and sketches showed the work of years by a man who ranks high as an open-air painter. Admirable drawing, the faculty of suggesting life and movement by few strokes, an astonishing gift for color and the representation of light made the exhibition as interesting to artists as to the public. Some of his portraits were admirable in their vivid quality, but the most notable offerings of the distinguished foreigner were such pictures as that of oxen drawing fishing boats through the surf, and the beach scenes. Some of the Sorolla pictures have been acquired by the Metropolitan Museum.

The Dutch exhibition was the finest ever made in this country. More than a score of Rembrandts, half that number of Hals portraits and splendid examples of Maes, Ruysdael, Hobbema, Cuyp, Vermeer, and Jan Steen were loaned by collectors. About 150 pictures, most of them of importance, were shown. In the list of Rembrandts was the artist's portrait of himself, owned by Henry C. Frick. Mrs. Huntington's "The Savant." Mrs. H. O. Havemeyer's "The Gilder," W. K. Vanderbilt's "Noble Slave." J. Pierpont Morgan's two Hals portraits of Bodolph and his wife were equal

in interest to any pictures in this extraordinary exhibition.

The "Ten American Painters" gave their yearly exhibition as usual with some excellent work, particularly by Benson, Hassam, Tarbell, Metcalf and Chase. In the Water Color Club exhibition held in November F. Louis Mora had an interesting group of Spanish sketches. The Beal prize was awarded to Miss Hilda Belcher for a portrait. Hassam, F. Hopkinson Smith, Ritschel, Dufner, Alexander Robinson and Miss Alice Schille were among the contributors to the Water Color Society show held in May.

Interesting exhibitions were also given during the year of work by William M. Chase, showing the artist's versatility as painter of portraits, still-life and even landscapes. The growth of Chase's art from the Munich days of 1870 to the present was illustrated in some fifty pictures. A retrospective exhibition of the work of John W. Alexander at the National Arts Club, brought together more than half a hundred canvasses by one of the foremost of American painters. Among the representative pictures shown were Mr. Alexander's portraits of Joseph Jefferson, Dr. McCosh and Rodin, the French sculptor.

The opening in November of Boston's new Museum of Fine Arts added a noble building to the country's art museums. Although it is twice as large as the old building in Copley Square, it is but a part of the monumental structure that the art lovers of the city plan to erect. The architect, Guy Lowell, accomplished wonders in making what is part of a whole appear as if complete in itself. The attempt to make the different halls architecturally in harmony with the objects shown in them has led to interesting results. Thus one gets something of the atmosphere of Egypt, Persia, Greece, Rome, from the setting and environment as well as from the art treasures displayed.

Edmund C. Tarbell took the first prize of \$1500 at the Carnegie Institute May exhibition in Pittsburg with his "Girl Crocheting," an exquisite study in subdued lights, with a figure of much grace. The second prize went to an Englishman by adoption, George Sauter, for "The Bridal Morning," an award that caused much astonishment; drawing, color, sentiment seemed commonplace to all but the jury. Among the best work by Americans were Gari Melcher's "Morning Room"; Sergeant Kendall's "Mischief"; Miss Genth's "Spring"; and Charles W. Hawthorne's "Mother and Child."

A large decoration in the spirit of de Chavannes, a summer harvest scene by Henri Martin, was one of the impressive foreign contributions. Also there were René Menard's "Judgment of Paris," and Lucien Simon's "Procession in a Thunderstorm," both pictures of importance.

In the Pennsylvania Academy exhibition opened in January, the Temple gold medal was awarded to Frederick P. Vinton of Boston for his portrait of Carroll D. Wright. John S. Sargent received the Beck gold medal for his portrait of Miss Townsend. The Lippincott prize fell to Thomas P. Anschutz for his study of a young woman examining a Tanagra figure.

The painters well represented were Melchers, Frieske, Henri, Benson, Hoeber, Coroyer, Tanner, Schwartz, Redfield, Garber, Ericson,

Hassam and C. C. Cooper. About 300 pictures were shown, of which one hundred came from Europe.

At the Paris Salon of the Société Nationale in May were shown the splendid panels painted by René Menard for the Ecole de Droit, his greatest decoration achievement. In the same field were the panels for the Petit Palais, by Albert Besnard, mythological subjects treated with dazzling color. Alfred Roll, Gillot, Bouet de Monvel (who had some admirable Jeanne d'Arc designs for the Domrémy Church), La Touche, Gervex and Billotte were among the conspicuous contributors. Of Americans, Sargent sent nothing, but there was praise for Shannon's "Enfant Bacchus" and for a picture by Walter Gay. Eugene Ullman, Montgomery Roosevelt, and Karl Frieske were among the American exhibitors. At the Salon des Artistes Français some pictures by the Spaniard, Zuloaga, attracted much attention. There were more than one hundred contributions by Americans, but none of sensational merit. W. E. Schofield, Oscar Miller, H. S. Hubbell, Walter MacEwen and Seymour Thomas were in the list.

In London's International show, opened in February, Mr. Sauter had an effective "Resurrection," of modern feeling, but interesting. Ricketts, Shannon, Nicholson and Pryde were the Englishmen whose work made an impression. Of the Americans, Miss Cecilia Beaux, with a full length "Mother and Child" won high praise.

PALMER, WILLIAM JACKSON. An American railway official and philanthropist, died March 13, 1908. He was born in Kent county, Delaware, in 1836, and was educated privately. He served throughout the Civil War as captain, colonel and brevet brigadier-general of volunteers. A Congressional medal of honor was awarded him for gallant services. At the close of the war he engaged in railroad business. He was made secretary of the Kansas Pacific Railroad Company and helped build that road to Denver. He then built the Denver and Rio Grande road, and was its president until 1883. In that year he began the construction of the Mexican National and the Rio Grande Western. His holdings in railroads were, about 1900, sold, and he retired from active business. He gave his subordinate employees \$1,000,000 on his retirement, and presented Colorado Springs, Colo., his home city, with park land valued at \$1,000,000. General Palmer left a large fortune, valued at over \$10,000,000.

PANAMA. A republic occupying the Isthmus of Panama. The capital is Panama.

AREA AND POPULATION. The area of the seven provinces constituting the republic is variously estimated at from 31,570 to 33,778 square miles. By the treaty of November 18, 1903, the United States guaranteed the independence of the republic, and Panama granted to the United States, in perpetuity and with sovereign rights therein, a strip of land (the Canal Zone) extending to a width of five miles on either side of the Panama Canal. In 1900 the population was estimated at 419,029, mostly a mixed race of Spanish, Indian, and negro origin. There are about 40,000 negroes and 3000 Chinese. The principal cities are Panama and Colón (Aspinwall), with 85,664 and 15,271 inhabitants respectively in 1908. Immigration is encouraged, and a law of Janu-

ary 2, 1909, throws open large tracts of rich lands to the acquisition of foreigners. The reported number of primary schools is 165, with 9181 pupils. There are a few high schools and institutions for technical instruction. The reorganization of public instruction is to be undertaken.

PRODUCTION, COMMERCE, ETC. The soil of Panama is exceptionally fertile, making possible the successful cultivation of many tropical products. The most important crop is bananas. Other products are cacao, sugar-cane, coffee, rice, corn, yams, sweet potatoes, cocoanuts, vanilla, and rubber. The forests contain valuable hard woods, dye and resinous woods, and medicinal plants. Panama has numerous mineral deposits, but they have been only slightly exploited. A little gold is mined. Some mother-of-pearl and turtle shells are gathered. The government has recently entered into contracts providing for the erection of a sugar mill and of two sugar refineries.

In 1907 the imports, exclusive of non-dutiable supplies for the Panama Canal, were valued at \$9,564,450, and in 1908, \$7,806,812; exports, \$1,980,666 and \$1,757,138 respectively. Of the imports in 1908, vegetable and agricultural products amounted to \$3,138,197; mineral products, \$788,069; wines and liquors, \$675,703. Of the export value in 1908, over 70 per cent. was represented by bananas, the shipments of which aggregated nearly 4,000,000 bunches; the total export value of vegetable products was \$1,539,395; animal products, \$135,207; mineral products, \$79,621. In 1907 the non-dutiable imports for use by the Isthmian Canal Commission were valued at \$13,468,359. Both the import and the export trade is principally with the United States, although in 1908 Great Britain ranked first in the import of textiles. According to American statistics the imports of the United States from Panama during the fiscal year ending June 30, 1909, were valued at \$1,676,994, and the exports to Panama (including non-dutiable goods for the Canal Commission), \$16,797,530.

The railway from Colón to Panama, 47 miles, carried in 1908 westbound merchandise valued at about \$9,500,000, and eastbound merchandise, over \$1,000,000. In 1909 it was announced that an overland cable had been established between Colón and Panama, thus affording all-cable communication from the west coast of South America to the United States and Europe.

FINANCE AND GOVERNMENT. For the period January 1, 1909-December 31, 1910, the estimated revenue and expenditure were \$4,492,000 and \$6,877,470 respectively. The revenue is derived principally from customs and excise. The monetary unit is the gold balboa, equivalent to the American dollar.

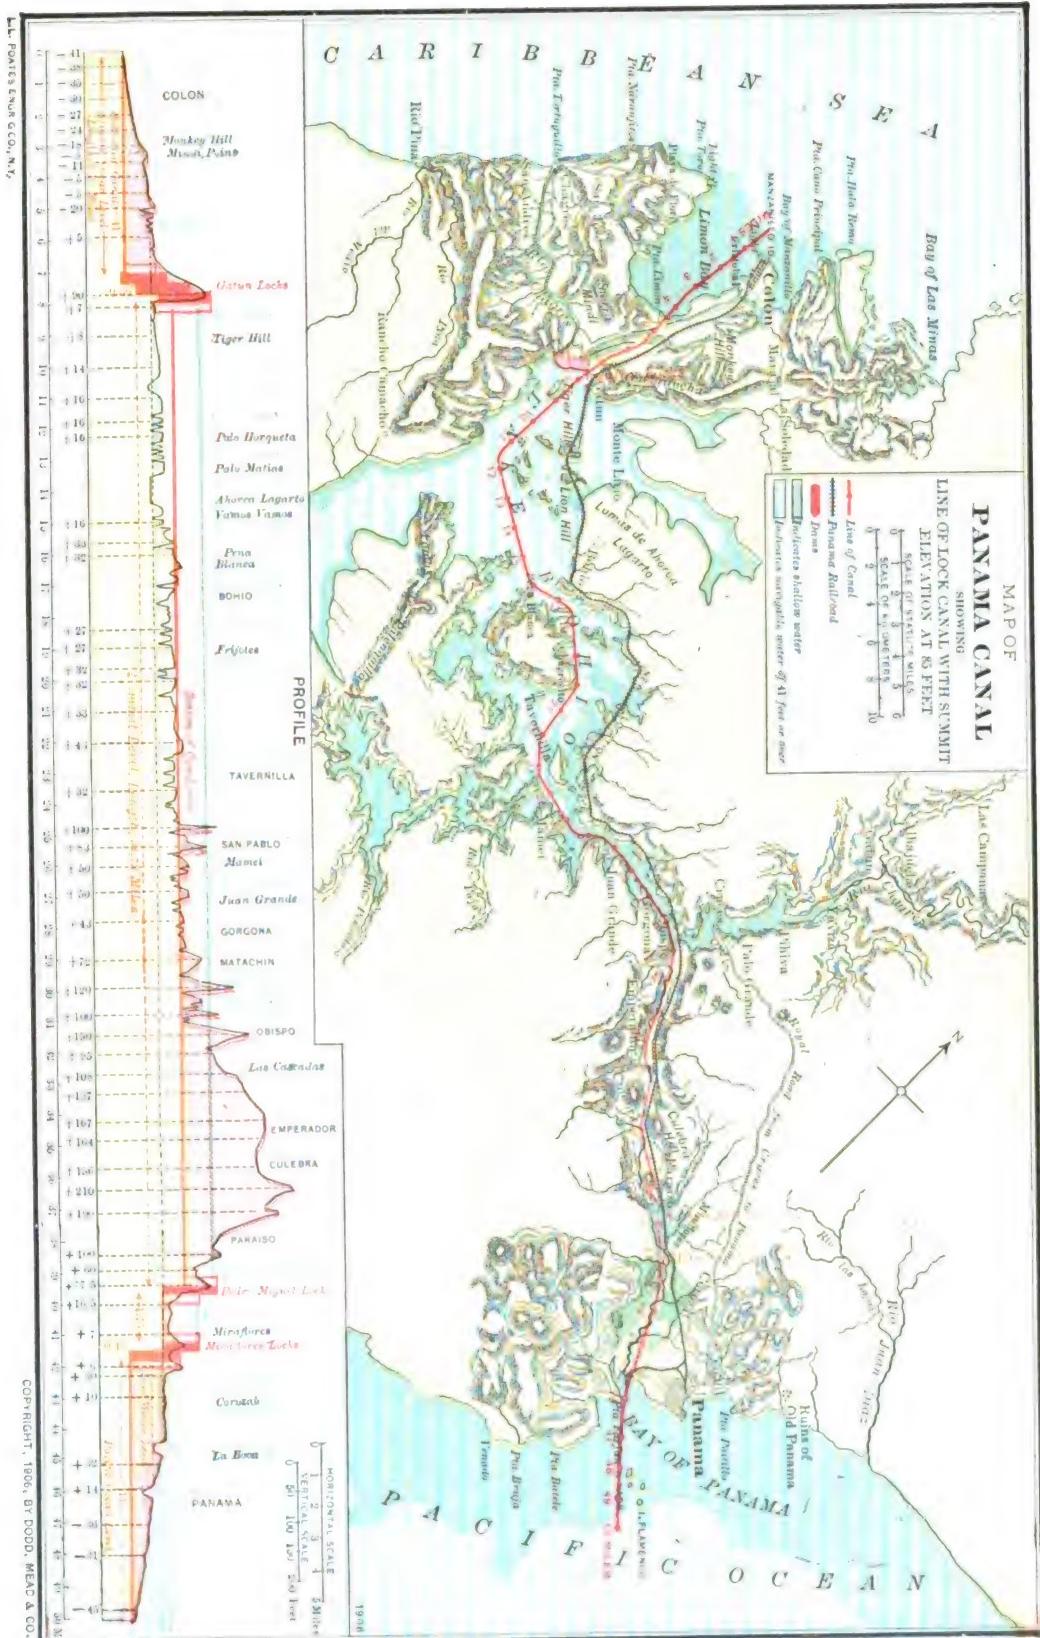

Under the Constitution of February 13, 1904, the executive authority is vested in a president, who is elected by popular vote for a term of four years and is assisted by a cabinet of five members. The legislative power devolves upon the unicameral National Assembly, composed of 32 members elected for four years by popular vote. The provinces are administered by governors appointed annually by the President. The President in 1909 was José Domingo de Obaldia, who assumed office October 1, 1908.

PANAMA CANAL. The history of the Panama Canal during 1909 was one of steady

progress. Although the grand total of excavation was somewhat less than that of 1908, as will be noted in the table below, this was due, not to the diminution of effort, but to the nature of the material excavated.

In the latter part of 1908 and in the early part of 1909 there was a great deal of criticism in Congress and outside as to the construction of a lock canal instead of a water level canal. It was alleged that the plans whereby the lock canal is being constructed were not the proper plans upon which the canal should be dug, but rather that the water level canal was the project which should originally have been undertaken. As a result of this criticism, Mr. Taft, who was at the time President-elect, visited the canal at the request of President Roosevelt, accompanied by a number of the most eminent American engineers. It was understood that if Mr. Taft and the engineers were satisfied with the plans under which the canal was being built, the question would not again be seriously raised and the work would be pushed to completion within the next six years. After a careful examination of the work in progress, Mr. Taft and the engineers declared the present plans to be entirely satisfactory, apart from certain modifications in detail, such as the lowering by some feet of the Gatun Dam. They declared, furthermore, that every dollar thus far expended in canal construction had been honestly spent. President Roosevelt at once transmitted this report to Congress with his own hearty concurrence in the conclusions.

On July 1, 1908, by direction of President Roosevelt a complete reorganization of the work was inaugurated, and this was brought about gradually through the year with a view to concentrating effort, to expediting the transacting of business, to securing better coöordination, to fixing more definitely the responsibility in any particular case, and to reducing the cost of administration. In order to bring about these results the sub-departments of the Department of Construction were abolished and three construction divisions were substituted: The Atlantic Division, extending from deep water in the Caribbean to include the Gatun locks and dam; the Central Division, extending from Gatun Dam to Pedro Miguel locks; and the Pacific Division, extending from Pedro Miguel locks to deep water in the Pacific. To these divisions were also assigned municipal improvements and the construction of buildings prior to July 1, 1909. On the latter date all work of construction and repair of buildings was transferred to the Quartermaster's Department. The division engineers also took charge of the execution of all sanitary engineering work that might be required by the Sanitary Department. As a result of these changes, the department of municipal engineering, motive power and machinery, and building construction as well as the construction forces of the Sanitary Department were eliminated. The main work connected with motive power and machinery was assigned to a new division called "Mechanical Division," which reports directly to the chief engineer. The work formerly embraced in the departments of labor, quarters and subsistence was subdivided and assigned to two new departments, the Quartermaster's Department and the Subsistence Department, the latter taking over the subsistence of employees, the manage-

ment of hotels, messes and kitchens and the work in certain sections, and because in wet control of the Panama railway commissary. A standard wage scale for employees on the silver rolls, that is the unskilled employees, was adopted and put into effect. A similar wage scale for employees on the gold roll was inaugurated during the year.

During the year 1909 there was no change in the membership of the Isthmian Canal Commission, except for the resignation in December of J. S. C. Blackburn, head of the Department of Civil Administration. The Commission at the end of the year was composed as follows: Lieut. Col. George W. Goethals, Corps of Engineers, U. S. A., Chairman and Chief Engineer; Lieut. Col. H. F. Hodges, Corps of Engineers, U. S. A., Assistant Chief Engineer in charge of the First Division; Lieut. Col. D. D. Gaillard, Corps of Engineers, U. S. A., Division Engineer of the Central Division; S. B. Williamson, Division Engineer of the Pacific Division; C. M. Saville, Assistant Engineer in charge of the Third Division; Mayor E. T. Wilson, U. S. A., Subsistence Officer, in charge of the Subsistence Department; W. W. Warwick, Examiner of Accounts; Edward J. Williams, Disbursing Officer; Col. W. C. Gorgas, Medical Corps, U. S. A., Chief Sanitary Officer, Head of the Department of Sanitation; Joseph Bucklin Bishop, Secretary.

In December, 1909, a measure was introduced into the House of Representatives providing for the abolition of the Isthmian Canal Commission, and placing the full authority for the administration of the Canal Zone and the prosecution of the work on the Canal on one official under the direction of the President.

The Canal excavation to the end of 1909, including that done by the French companies and by the Americans, together with the excavation done in the several divisions, is shown in the table below:

work in certain sections, and because in wet excavations the dredges encountered some difficult conditions. While 1908 is the record year as regards the total amount of excavation, the highest point reached in a single month was that in March, 1909, when for the first and only time the four million cubic yard limit was reached and passed, with a total of 4,062,632 cubic yards, including 182,295 cubic yards of "plant" excavation. The falling off in excavation in 1909 from 1908 was 1,241,467 cubic yards in dry excavation and 779,102 cubic yards in dredging. Of the total dry excavation in 1909 there were taken out in the territory of the Central Division, which includes Culebra Cut and the Gatun Lake region, 18,299,526 cubic yards.

In Culebra Cut where the excavation was continued on practically the same scale as in 1908, the amount excavated was 14,579,838 cubic yards in 1909, as compared with 13,914,326 cubic yards in 1908. Although it is considered that the maximum excavation in the Cut is that of March, 1909, it is expected that there will be little if any falling off in the total excavation in this part of the work in 1910. The work of widening the channel between Las Cascades and Paraiso, a distance of four and a half miles, from 200 to 300 feet at the bottom, was authorized in October, 1908, and during 1909 the excavation was carried on with this end in view. The consequent opening up of new banks caused a number of slides which were a source of inconvenience during the rainy season. The completion of the drainage system by opening the Obispo Diversion and installing pumps at Bas Obispo were another feature of the Culebra Cut in 1909.

At the Atlantic and Pacific entrances to the Canal the dredges have made, but not completed, a channel over five miles into the land, and the Pacific entrance was so far advanced

Total	<u>23,158,036</u>	<u>18,636,755</u>
Grand totals	94,969,387	79,697,207

As will be seen from this table the grand total of excavation in 1909 was 35,096,166 cubic yards. This was 2,020,569 cubic yards less than the grand total of 1908 for the reason that the field of operations in dry excavation had been narrowed by the completion of the

on February 1, 1909, that steamships began to use that portion of the canal.

At Gatun Locks, the preparatory work of installing a concrete mixing and handling plant was completed and the laying of concrete foundation for a permanent plant was begun

on August 24. From that time there was a steady increase in the amount of concrete laid each week, due to increasing effectiveness of the plant in its operation. Up to the close of the year 116,186 cubic yards of concrete had been laid, and the daily average had increased from 459 cubic yards in September to 1,672 in December, while in one instance over 2,000 cubic yards were placed in one day of twelve hours. The estimated amount of concrete necessary for completing these locks is 2,096,000 cubic yards.

The hydraulic fill between the rock toes of Gatun Dam was begun on September 24, 1908. From one to three 20-inch suction dredges were engaged during 1909 and they pumped 2,044,992 cubic yards of selected material into the dam. The dry fill amounted at the end of the year to 2,515,524 cubic yards, the total being 4,580,516. The estimated fill to be made by the hydraulic method is 20,000,000 cubic yards. On February 17, 1909, by order of President Roosevelt, the proposed height of the dam was reduced from 135 feet above sea level to 115 feet, which will make the top 35 feet above the normal level of the water impounded in Gatun Lake.

Shortly after the laying of concrete, with a permanent plant, was begun at Gatun Locks; a temporary plant was put into operation at Pedro Miguel and the laying of concrete in the locks at that point was begun. This temporary plant laid 33,994 cubic yards between September 1 and December 31. The estimated amount to be placed at this point is 992,600 cubic yards. The construction of the earth dam at Pedro Miguel was continued during the year. At Miraflores excavation in the upper lock chamber was practically completed during the year. Excavation on the lower lock chamber was continued and the work of building storage trestles for the cantilever concrete mixing and handling plant was begun. A total of 557,587 cubic yards of filling had been placed in the dam at Miraflores Locks up to December 31, 1909.

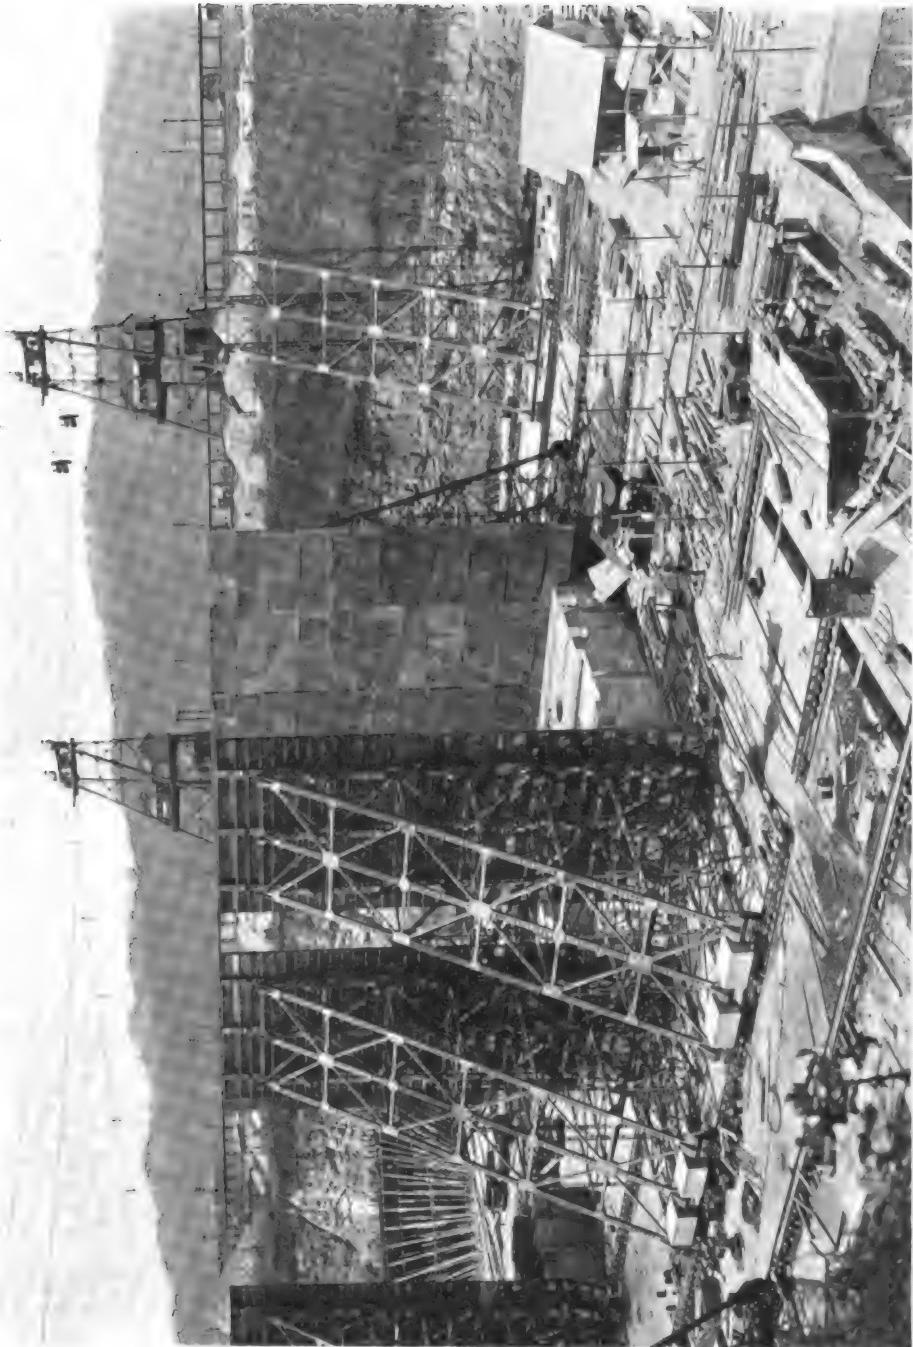

COST OF THE CANAL. The original cost of the canal as authorized by the act of June 28, 1902, aggregated, including sanitation and police, \$144,233,358, and by a modification of the plan the cost for engineering and construction, exclusive of the purchase price, the cost of sanitation and civil government and the interest, was fixed at \$139,705,200. In the preparation of this estimate the same unit prices were assumed as were adopted by the Board of 1899 and 1901. In the interval, however, wages had increased and the cost of materials and manufactured articles had risen. Conditions in the United States and on the Isthmus made it necessary to increase the wage scales from 30 to 60 per cent. over those paid in the United States for similar classes of work in order to induce the requisite class of laborers to come to the Isthmus. Moreover the provisions of the 8-hour law were made applicable to the Isthmus. As the result of these conditions the unit prices were materially increased. Various changes had also been made in the adopted plan, increasing the quantity of work to be done. In addition more detailed surveys and plans than were originally available had been made and the work had increased sufficiently to give reliable data relative to unit costs. This enabled a revised estimate to be prepared and submitted at a hearing before

the Committee on Appropriations in the House of Representatives in February, 1909. This estimate showed that nearly 50 per cent. more work is necessary in order to build the canal as increased by modifications of the original plans than was contemplated by the original estimate, and that the unit prices due to labor conditions, cost of materials and gratuities given to employees have been increased about 20 per cent. The estimate as prepared showed that the total cost of engineering and construction alone will amount to \$297,766,000, to which, if the purchase price, the estimated cost of sanitation and civil government be added, there results the sum of \$375,201,000 as the total cost of the canal.

The total appropriations by Congress up to the end of the fiscal year 1909, amounted to \$176,432,468. Of this, \$50,000,000 included the purchase of canal rights in 1902, \$40,000,000, and the purchase of the Canal Zone rights in 1904 for \$10,000,000. The total expenditures for the fiscal year 1909 were \$30,856,079. Of this sum, \$17,593,801 were expended in the Department of Construction and Engineering, \$7,979,142 on the plant account, \$1,683,824 by the Department of Sanitation, \$714,362 by the Department of Civil Administration, \$1,929,881 by the Quartermaster's Department, and \$981,518 in general expenses.

LABOR. Labor on the Isthmus is divided into two classes, skilled and unskilled. The skilled labor is recruited from the Washington office of the Isthmian Canal Commission. During the year there were 1,093 new skilled employees employed on the Isthmus and 884 were re-employed. The unskilled labor showed a steady increase during the year. It reached the maximum on April 28, when a total of 33,699 men were actually at work for the Commission and the Panama Railroad. This is the largest force on record during either the French or American administration. During the fiscal year 741 Europeans and 1,892 West Indians were brought to the Isthmus, a decided increase over the preceding year. The force of European laborers has decreased, none having been brought to the Isthmus since September, 1908. During the year there was a movement to South America. Efforts to recruit the force from Europe have been abandoned and the recruiting agent has been withdrawn. As emigration to Panama has been prohibited by the Spanish government it is impossible to obtain recruits from that country. The bulk of the unskilled labor is drawn from the islands of the West Indies.

ISTHMIAN CANAL ZONE. The civil government of the Isthmian Canal Zone is in the hands of the head of the Department of Civil Administration. Several important measures were passed by Congress in 1909 affecting the Canal Zone. These include a provision of the Appropriation act, approved March 4, 1909, respecting the use of local revenues of the zone, and the act approved February 27, 1909, relating to the use, control and ownership of lands in the Canal Zone. Naturally the chief relations of the Canal Zone outside its relations to the United States are with the Republic of Panama and chiefly with the cities of Panama and Colón. These relations during the fiscal year continued satisfactory. The question of sanitary work in the cities of Panama and Colón, the removal of sand from Panamanian territory for use in the construction of Gatun Locks, the purchase by the United States of

THE PORTABLE STEEL FORMS FOR THE CONCRETE ARE SHOWN
PANAMA CANAL

Photograph by Underwood & Underwood, New York

land at Porto Bello and the stationing there of Zone police, the enactment and enforcement of legislation prohibiting the soliciting of labor upon the Isthmus of Panama, were among the matters which came up during the year with the officials of Panama and were satisfactorily adjusted.

An Act of Congress, approved February 27, 1909, provides for leases of public land in the Canal Zone for a period not to exceed twenty-five years. On June 30, 1909, there were 2103 leases in force, of which 1615 were for building lots, 482 for agricultural land and six for building. During the year \$98,970 were collected on account of general taxes and licenses.

During the year the schools of the Canal Zone were reorganized and systematized. For white children, twelve schools were maintained and for colored children, seventeen. The enrollment of white children is about 700 and of colored about 1000. Two high schools are also provided, one at Culebra, and one at Cristobal.

The judicial system of the Isthmian Canal Zone includes three circuit judges, who together form a Supreme Court. In the circuit courts criminal cases were filed against 398 persons during the year, of whom 204 were convicted and 55 acquitted. In the district courts criminal cases were filed against 6025 persons, of whom 4646 were convicted.

SANITATION. The supervision of the Sanitary Department extends from the Canal Zone to the terminal cities, Panama and Colón. The work includes the collection and disposal of garbage, the cutting of grass and brush, and sanitary drainage and oiling, but under the reorganization referred to at the beginning of this article, this work, except oiling, was transferred to other departments, the Sanitary Department exercising general supervision and designating what work shall be done in order to accomplish certain desired ends. In the terminal cities the work consists of inspection, fumigation, disinfecting, grass cutting, surface drainage and oiling undrained areas. In addition the Sanitary Department has charge of the hospitals and of quarantine. The health conditions on the Isthmus during the year showed an improvement over the preceding year. The total number of admissions of employees to hospitals and sick camps, including those sick in quarters, amounted to 46,194, representing for the year 23.49 as the number of men sick daily out of every thousand names on the pay rolls as against 23.85 for the preceding year. The number of deaths was 530. No cases of yellow fever originated on the Isthmus in 1909. One case of the plague developed on a ship at Balboa and was transferred to the quarantine station where death ensued.

PAN-AMERICAN CONFERENCE. See ARBITRATION, INTERNATIONAL.

PAPER. The agitation on the part of publishers against the paper manufacturers which was so conspicuous in 1908 continued in 1909, and the revision of the tariff in the first half of the year made it possible for the controversy to become very general and public. Inasmuch as the publishers were able to direct the force of their editorial and news columns against the paper men the controversy attracted considerable attention, both within and without the halls of Congress. For some time there had

been a demand for a lower duty and for an investigation of the industry by the government. In fact during the year 1908 the so-called Mann Committee of the House of Representatives had devoted itself assiduously to this subject, and in February, 1909, submitted a voluminous report on the paper and pulp industry. The recommendations of this committee directly affected the paper and pulp schedules of the new tariff then under consideration by the Ways and Means Committee, for they recommended the reduction of the duty on print paper from \$6 to \$2 a ton, the admission free of ground wood pulp, and 1/16 of a cent duty per pound on unbleached chemical wood pulp used in the manufacture of paper. After many hearings and rather acrimonious discussions the rates finally adopted in the bill as enacted into law were as follows: Print paper, \$3.75 per ton; mechanically ground wood pulp, 1/12 cent per pound; and unbleached chemically ground wood pulp, 1/4 cent per pound. There was, however, provision for an increased duty on paper and pulp where any country laid an export duty or otherwise restricted exportation into the United States, and for the announcement of such extra duties by a proclamation of the President.

In the controversy between the publishers and the paper manufacturers not only was the injustice of the former tariff alleged by the former, but the existence of various agreements or combinations acting in restraint of trade and maintaining prices at an undue and unnatural level. The removal of the duties on paper and pulp asked for by the publishers would not only remove this evil by bringing the foreign product into competition with the domestic but would also act for the conservation of the forests by drawing on other countries for pulp wood, which was the principal drain on American forest resources.

In December Herman Ridder, president of the American Newspaper Publishers Association, addressed the Attorney-General of the United States, calling attention to an organization of paper manufacturers alleged to be advisory paper makers as to the prices. The association then furnished the United States Attorney in New York specifications alleging restraint of trade in the paper industry which affected most seriously newspaper publishers. These changes were under consideration by the Federal authorities at the close of the year.

A termination of the struggle against the Manila Paper trust or "Parks Pool" was reached in April when the United States filed a bill in equity against the Manila and Fibre Association for violation of the anti-trust laws, asking that the association be dissolved and that punishment be inflicted on its members. The members of the association pleaded guilty and were fined \$2000 each with the exception of J. H. Parks, the prime mover in the association, who, after a number of months spent in Europe, returned also to plead guilty and was fined \$4000. The Federal authorities then devoted their attention to the "Parks" box-board pool (Box-Board Association), but no striking developments had been announced up to the close of the year.

The new tariff naturally brought up many interesting questions in the paper and pulp industry and there were rumors of a trade war with Canada, as the United States is the chief

customer of Canada's pulp and pulp wood. In Wis., a Government Wood Pulp Experiment Station where work could be carried on under manufacturing conditions. At the end of the year the plant had not been finally selected, but it was to be put in operation early in the year 1910.

An excellent and interesting monograph on *Suitable Paper for Permanent Records* was prepared during the year by F. P. Veitch, Chief of the Leather and Paper Laboratory of the Bureau of Chemistry, United States Department of Agriculture, and published by that department.

The Anglo-Newfoundland Development Co. worked energetically during the year with its large mills at Great Falls, erected within four or five years at an expense of over \$4,000,000, and various auxiliary enterprises. A large financial interest in this corporation is held by the Amalgamated Press, Ltd., of which Lord Northcliffe is the leading controller. The pulp produced from the Newfoundland spruce is of high quality and enough wood was cut in 1909 for the following year's run, amounting to 80,000 cords. The first paper was made at the mills early in December, and the actual manufacture of newspaper on a large scale was expected soon to begin.

Great Britain imported more paper in 1909 (January-November, 8,718,604 cwts.) than in 1908 (January-November, 8,659,519 cwts.). Foreign competition was proving distressing to British manufacturers, who were beginning to demand protection, as improved machinery and methods have failed to improve conditions. Thus reel paper from the United States in 1909 was valued at £115,824, as compared with £42,400 in the previous year. Moreover the British manufacturer was face to face, not only with foreign, but with colonial competition, especially from Canada and Newfoundland, where the large works of the Harmsworth Company were being erected for operation in 1910. Nevertheless exports showed an increase and for the 11 months, January to November, were valued at £2,318,452, as compared with £2,114,639 in 1908.

In Germany the paper industry was badly depressed during 1909 and many manufacturers experienced losses. This was particularly serious, as several years before electric and other improved machinery had been installed so that the factories were in excellent shape to handle a large volume of business when it was forthcoming, which was not the case in 1909.

Imports of paper and products into the United States increased from 3,000,000 dollars in 1899 to 12,000,000 dollars in 1909, while exports of paper and manufactures thereof increased from 5,500,000 dollars in 1899 to practically 8,000,000 in 1909. These figures are exclusive of books, maps, and engravings, the imports of which increased from 1,330,000 dollars in 1899 to nearly 6,000,000 in 1909, and the exports thereof, from 2,660,000 dollars in 1899 to 6,000,000 in 1909.

Germany is the chief source of imports of paper and paper goods, that country having supplied in the fiscal year 1909 over 7,000,000 dollars' worth out of a total importation of 12,000,000. From the United Kingdom the imports were valued at a little over 1,000,000 dollars; from France, less than a half million dollars, and from other Europe, about 2,000,000 dollars. Japan is credited with nearly 300,

Business conditions were not particularly good for the first half of the year on account of tariff agitation and other considerations, but during the summer and autumn there was a healthy increase in business. On the whole there was a distinct improvement over 1908, a year characterized by slack demand.

Furthermore, low water acted against active manufacturing and the year began with prospects of a paper famine, though the demand was not particularly active and the mills were able to supply their customers. Later in the year, and especially towards its end when business conditions were better, there was also a lack of power. In May there was a short-lived strike among the grinders in the pulp mill of the Crown-Columbia Pulp and Paper Co. at Oregon City, Oregon, but on the whole there were few labor difficulties in the United States during the year. The effects of the strike of Swedish sulphite mill workers, however, were felt, as the shipments to America were curtailed and prices increased, but following the resumption of work came a large increase of shipments.

The capital investment of the paper manufacturing industry according to Arthur C. Hastings, president of the American Paper and Pulp Association, amounted in 1909 to some \$300,000,000. The annual output was valued in that year at \$250,000,000 and represented over 4,500,000 tons of paper in different grades, produced by over 100,000 people directly employed in the business, there being in the United States about 600 paper and pulp mills engaged in the manufacture of all grades of paper. The output in 1909 was made up of many grades, but it was essentially composed as follows: Newspaper, 1,200,000 tons; book paper, 850,000 tons; writing paper, 200,000 tons; box-board, 1,000,000 tons, and the remainder made up of wrapping papers and tissue.

During the year a plant for the manufacture of paper pulp from cotton seed hulls and rice straw was installed at the Southern Fibre Company, in Virginia, to work a process which it was believed would be available for the manufacture of high grade paper, and would ultimately lead to the establishment of a paper finishing mill. With the increase in the prices of wood, paper containers were gaining a place of increased importance as substitutes for wooden boxes, so that not only were the manufacturers of container board very active, but even the wooden box makers in many instances began to add equipment for making paper board container boxes, which were finding wide vogue.

The United States government determined during the year to locate at the University of Wisconsin a new forestry and paper experiment station, which would be actively concerned with the study of the production of paper pulp. It was also proposed to maintain at Appleton,

000 dollars' worth, though arrivals from that country form a diminishing proportion of the total imports of the United States. Lithographic labels and prints comprise nearly one-half of the total paper imports, having ranged from 4,000,000 to 5,000,000 dollars in the last 3 years; while printing paper, enumerated for the first time in the fiscal year 1909, showed for that period a total importation of 37,000,000 pounds, valued at nearly 1,000,000 dollars.

PAPUA, TERRITORY OF. A British possession, constituting a dependency of the Commonwealth of Australia. Prior to September 1, 1906, it was known as British New Guinea. The Territory includes the southeastern part of the island of New Guinea, together with the D'Entrecasteaux and Louisiade groups and all islands between 8° and 12° S. latitude and 141° and 155° E. longitude. The total area is about 90,000 square miles (upwards of 87,000 square miles on the island of New Guinea), and the population about 500,000 (711 Europeans in 1907). The natives have been hostile and often given to cannibalism, but in certain large areas they have assumed peaceful habits. Thousands of them are receiving instruction from the four missionary bodies established in the Territory. Considerable progress has been made in agriculture, some 300,000 acres having been leased. The principal products are cocoanuts, rubber, sisal hemp and coffee; and there are also under cultivation cotton, cacao, vanilla, tapioca, tea, cinnamon, and tobacco. The forests contain much valuable timber, and the cocoanut and sago palm are abundant. Some gold is mined and near Port Moresby (the capital) promising copper deposits are being worked. The gold output in 1907 was valued at £39,710; in 1908, £52,837. Trade is chiefly with Queensland and New South Wales. The leading imports are food-stuffs, tissues, hardware, and tobacco; exports, trepang, copra, gold, pearl shell, pearls, sandal-wood, rubber, and coffee. Imports and exports in 1907 were valued at £87,776 and £63,756 respectively; in 1908, £94,061 and £80,616 respectively. Local revenue, derived mainly from customs, amounted to £21,813 in 1907 and £26,019 in 1908; in addition a regular subsidy of £20,000 is received annually from the Commonwealth. In those years the expenditure was £45,335 and £48,525. For account of explorations carried on during the year, see EXPLORATIONS.

PAPYRUS, DISCOVERIES OF. See ARCHAEOLOGY and PHILOLOGY.

PARA COTA. The bark of an undetermined South American tree, probably a species of *Cryptocarya*. The bark has a spicy odor and an aromatic and pungent taste. Its active principle is called paracotoin ($C_{11} H_8 O_4$), a pale yellow crystalline body, neutral in reaction, tasteless and odorless, and sparingly soluble in water. Para cota is used as an appetizer and in diarrhoeal diseases.

PARAGUAY. An interior South American Republic lying between Bolivia, Brazil, and Argentina. The capital is Asunción.

AREA, POPULATION, ETC. The estimated area is 97,722 square miles. The actual extent of Paraguayan territory, however, cannot be determined until the settlement of the boundary dispute with Bolivia. The estimated population is 636,000, mostly a mixture of Spanish, Guaraní Indian and negro origin. The Indian

inhabitants number about 50,000. The larger towns, with estimated population, are: Asunción, 60,259; Villa Rica, 25,000; Concepción, 15,000; Carapegua, 13,000; Paraguari, 10,000; Villa del Pilar, 10,000.

Primary instruction is free and compulsory. The public and primary schools are stated to number about 400, with 850 teachers and 40,000 pupils. There are five national colleges, corresponding to American high schools, a normal school, an agricultural school, and the University of Asunción, with departments of law, social sciences, medicine, and pharmacy. The matriculants of the University number about 200. The state religion is Roman Catholicism, but religious toleration prevails.

PRODUCTION AND COMMERCE. The greater part of the soil has been alienated by the government to capitalists, syndicates, and foreign bondholders, and is mostly uncultivated. Of the crops, yerba maté, tobacco, and oranges are commercially the most important. The annual production of yerba maté is estimated at 17,000,000 pounds and of tobacco at 6,000,000 pounds. About one-half of the maté and tobacco are consumed in the country. Other products of importance are cotton, corn, alfalfa, beans, manioc, and various fruits. The live-stock industry shows continued development; the following figures, which are probably too small, are given: Cattle, 2,800,000; horses, 187,000; sheep, 214,000; goats, 24,000; mules and asses, 8000. The leading forest products are quebracho logs and extract.

Imports and exports have been valued as follows in pesos (the peso is equivalent to the Argentine peso, worth 96.5 cents):

	1906	1907	1908
Imports.....	6,627,194	8,077,414	3,929,724
Exports.....	2,695,139	4,156,409	3,731,745

The leading imports in 1908 were: Food-stuffs, 981,919 pesos; textiles, 727,471; hardware, 319,947; beverages, 253,274. The most important exports are live-stock products, tobacco, yerba maté, oranges (and petit grain), quebracho wood and extract, and cotton. Of the imports, in 1908, Germany supplied a value of 989,047 pesos; Great Britain, 868,257; Argentina, 763,660; France, 355,558; Italy, 323,578; Spain, 256,189; the United States, 214,467. Of the exports Argentina received a value of 1,830,365 pesos; Germany, 812,186; Uruguay, 529,204; Belgium, 146,013. Exports to the United States amounted to only 1231 pesos.

COMMUNICATIONS. The only railway in operation extends from Asunción to Parapó, 155 miles. An extension from Parapó to Encarnación, 70 miles distant on the Paraná River, was under construction in 1908. Across the river from Parapó is the Argentine town of Posadas, to which a line is being extended. Upon the completion of both lines, ferry service will be established and the time between Asunción and Buenos Ayres reduced to 48 hours. It is expected that the Paraguayan line will be finished in 1912. There is steamer connection between the Paraguayan ports and Montevideo. There are about 2000 miles of telegraph line, which connects with the Argentine system.

FINANCE. For 1907, the internal revenue is reported at 274,939 pesos (gold), and the customs receipts, 1,927,469; total, 2,202,409;

for 1908, internal revenue, 288,390, and customs receipts, 1,471,844; total, 1,760,234. The expenditure for 1907 is stated at 2,189,965 pesos (gold). The gold peso coincides in value with the Argentine peso, 96.5 cents. The average value of the fluctuating paper peso is about 10 cents. The external debt consists of the British debt, which stood at £831,850 on December 31, 1908; the Argentine debt, 12,435,590 pesos (gold) in 1904; the Brazilian debt, 9,876,500 pesos (gold) in 1904. The internal debt in 1906 amounted to 35,000,000 pesos of notes in circulation. From this sum should be deducted the invested capital of the Agricultural Bank, 14,531,238 pesos (paper) and redemptions, 7,374,378 pesos (paper), the balance being 13,094,384 pesos (paper). In addition there is a debt of 4,700,000 pesos (paper) incurred during the revolutionary movement of 1908.

ARMY. There is a permanent army nominally of about 100 officers and 2500 men formed into 4 battalions of infantry, 6 squadrons of cavalry, 5 batteries of field artillery, 2 machine gun sections, and 1 battalion of coast artillery. The organization is on German lines and while every citizen between the ages of 20 and 35 is liable for service there is but a small annual contingent of recruits.

GOVERNMENT. The executive authority is vested in a president, who is elected indirectly for a term of four years and is assisted by a cabinet of five members. The legislative power devolves upon a congress of two houses, the Senate and the chamber of Deputies, members of each being chosen by popular vote. General Benigno Ferreira, who was elected for the term ending in 1910, was superseded in 1908 by the Vice-President, Emiliano González Navero, who was chief executive in 1909.

PARDOW, WILLIAM O'BRIEN. An American Jesuit priest, died January 23, 1909. He was born in New York City in 1847. He graduated at the College of St. Xavier in 1864, and completed his course of training as a Jesuit at Woodstock College and the University of Laval, in France. In 1891 he was president of St. Francis Xavier; in 1893, provincial superior of New York and Maryland; in 1901-3, curate of the Church of St. Ignatius; 1903-6, lecturer at the Jesuit Institution, and, from 1906 to his death, curate of the Church of Gesu in Philadelphia. Father Pardow was regarded by many as the foremost Catholic preacher in the United States. He was among the most liberal of the Catholic clergy in his theological views and was also a scholar of wide attainments. He was identified with the Modernist movement in the Church. The Society of Daughters of the Faith chose him as their spiritual adviser.

PARLOA, MARIA. An American author and domestic economist, died August 21, 1909. She was born in Massachusetts in 1843. She lectured extensively on cookery and other subjects and contributed to magazines on food preparation and household management. She was the author of *First Principles of Household Management and Cookery, Kitchen Companion, Young Housekeeper, New Cook Book and Marketing Guide, and Home Economics.*

PARTY DESIGNATIONS. See ELECTORAL REFORM.

PATENTS. See UNITED STATES, paragraph Patents.

PATRIOTIC SOCIETIES. A number of organizations which have as their object the preservation of the records of important historical events and especially of the wars in which the United States has participated; the encouragement of love of country, the saving and restoration of historical sites and objects, the celebration of anniversaries and historic events and the fostering of fraternal feeling and intercourse among the veterans, with their membership and chief officer in 1909, are the following: Society of the Cincinnati, founded in 1783, 842; President-General, Hon. Winslow Warren; Sons of the Revolution, founded in 1875, 7560; General-President, John Leo Carroll; Sons of the American Revolution, organized in 1889, 12,000; President-General, Morris B. Beardsley; Grand Army of the Republic, organized in 1866, 220,600; Commander-in-Chief, Samuel R. Van Sant; Military Order of the Loyal Legion, instituted in 1885, 8902; Commander-in-Chief, Major-General Grenville M. Dodge; Sons of Veterans, founded in 1879, about 50,000; Commander-in-Chief, George W. Pollitt; Union Veteran Legion, organized in 1884, 20,000; National Commander, Thomas J. Shannon; General Society of Mayflower Descendants, founded in 1894; Governor-General, Samuel B. Capen; Military Order of Foreign Wars, instituted in 1894; Commander-General, Alexander S. Webb; Society of Colonial Wars, founded in 1892; Governor-General, Arthur J. C. Sowdon; Order of Founders and Patriots of America, founded in 1896; Governor-General, Col. Rollin Simmons Woodruff; Huguenot Society of America, organized in 1883; President, Col. William Jay.

The most important patriotic societies maintained by women and their membership are the following: Women's Relief Corps, auxiliary of the Grand Army of the Republic, 161,646. National President, Mrs. Jennie Berry; Colonial Dames of America, founded in 1890, President, Mrs. William Ruffin Cox; Daughters of the American Revolution, founded in 1890, 60,250, President-General, Mrs. Matthew T. Scott; Daughters of the Revolution, organized in 1891, President-General, Mrs. Frank E. Fitz; Dames of the Revolution, organized in 1896, President Mrs. Montgomery Schuyler.

The army corps of the Union and Confederate armies that participated in the Civil War have also distinct organizations, and there are several patriotic societies of Spanish War veterans and of descendants of the War of 1812.

The Grand Army of the Republic held its national encampment in 1909 at Minneapolis, and the following officers were chosen: Commander-in-Chief, Samuel R. Van Sant, of Minnesota; Senior Vice-Commander, William M. Bostaph, of Utah; Junior Vice-Commander, A. B. Beers, of Connecticut. The loss by death for the year beginning January 1, 1909, was reported at 10,124, leaving the total strength of the Grand Army of the Republic at that date 220,600.

The twenty-eighth encampment of the Sons of Veterans was held at Washington, D. C., on August 23-26, 1909, and the twenty-ninth annual encampment will be held at Atlantic City, N. J., in September, 1910.

Many of the patriotic societies participated in the Hudson-Fulton celebration (q. v.) and to their efforts no little of its success was

due. The Daughters of the American Revolution placed a memorial to mark the first line of defense at Washington Heights, New York City. This line was defended by the American army in 1776. The Order of the Founders and Patriots of America placed a tablet on the Custom House during the progress of the celebration to mark the site of Fort Amsterdam, erected in 1626, and its successor, Fort George, demolished in 1790. The Society of Colonial Wars placed a tablet at 48 Wall street to mark the position of the bastion of the wall, which between 1663 and 1699 extended from the East River along the line of present Wall street and thence westerly to the Hudson River. The Daughters of the Revolution participated in the unveiling of a statue of General Anthony Wayne at Newburg on September 29. The Daughters of the American Revolution erected a fountain commemorative of the Hudson-Fulton celebration at Hudson, N. Y., on October 7.

PATTERSON, RAYMOND ALBERT. An American journalist, died November 13, 1909. He was born in Chicago in 1856 and graduated from Yale College in 1878, being a classmate of President Taft. He engaged in newspaper work for the Chicago Tribune soon after leaving college, and became Washington correspondent for that paper in 1894. He continued in this position until the time of his death. Mr. Patterson was one of the best known and influential newspaper writers in the country.

PAVEMENTS AND ROADS. There was little change in either city paving or country and town road construction in 1909. The search for a durable and dustless road surfacing material that will stand the wear and tear of the automobile has continued, and has resulted in a material extension of the use of various types of bituminous macadam. Abroad tar is used chiefly as a bituminous binder of broken stone road surfaces. In America there are also used heavy asphaltic oils and to a relatively slight extent asphalt itself. A British Royal Conference was held in London in May, 1909, which resembled, on a small scale, the International Road Congress held in Paris in 1907. A road congress was also held in connection with the Alaska-Yukon-Pacific Exposition, at Seattle, in 1909. The usual Good Roads Congress was held at Topeka, Kan., later in the year.

PAYNE, SERENO ELISHA. An American Congressman, Chairman of the Ways and Means Committee of the House of Representatives, born at Hamilton, N. Y., in 1843. He graduated from the University of Rochester in 1864 and in 1866 was admitted to the practice of law. From 1868 to 1871 he was city clerk at Auburn, N. Y., and in 1871 supervisor. He was district attorney of Cayuga county from 1873 to 1879. He was elected member of Congress from the Twenty-sixth New York District in 1883, serving until 1885, and from 1885 to 1887, and from 1889 to 1909 represented the Thirty-first New York District. He was active in framing the McKinley and Dingley tariff laws, and took the chief part in preparing the measure introduced into the House of Representatives in a special session in 1909. (See TARIFF and UNITED STATES, section Tariff.) In

1898 he was a member of the Joint High Commission to negotiate the treaty with Canada.

PEABODY MUSEUM OF HARVARD UNIVERSITY. An institution for anthropological and archaeological research founded in 1866 by George Peabody, who gave \$150,000 for that purpose and for a professorship in Harvard University, which has become the anthropological section of the university museum. The South American Expedition, which returned in August, 1909, after three years spent in the field, is the most extensive expedition undertaken by the museum. Another important enterprise of the museum was the starting of another Central American expedition, with Dr. A. M. Tozzer as field director, and Mr. R. E. Merwin as second officer. This party has a special permit from the government of Guatemala to carry on archeological research in that country. Its headquarters will be in Belize, British Honduras. The most important event in the history of the museum during the year was the resignation of Professor F. W. Putnam from the office of Peabody professor of American Archaeology and Ethnology in Harvard University, and of his curatorship of the museum. On the acceptance of his resignation the corporation, on request of the museum faculty, appointed him honorary curator in charge of the museum. This office he accepted and will remain in charge as formerly, but his services will be gratuitous. He receives a salary from the Carnegie Foundation for the Advancement of Teaching. The officers of the museum in 1909 were Abbott Lawrence Lowell, President; Frederic W. Putnam, Honorary Curator; Roland B. Dixon, Ph.D., Secretary and Librarian, and Frances H. Mead, Secretary.

PEARY, ROBERT EDWIN. An American Arctic explorer and civil engineer in the United States navy, who on April 6, 1909, was the first to reach the North Pole. He was born at Cresson, Pa., in 1856 and graduated from Bowdoin College in 1877. In 1881 he became a civil engineer in the navy, and was assistant engineer on the route for the proposed Nicaragua Ship Canal in 1884-5. In 1887-8 he was Engineering Chief of the Nicaragua Canal Survey. His interest in Arctic exploration had been awakened even before this time, and in 1886 he had made a reconnaissance of the Greenland inland ice cap east of Disco Bay, in latitude 70° N. Following this he began preparations for his first expedition to Northwest Greenland, and he sailed on this expedition in 1891. He was in the Arctic regions at this time from June, 1891, to September, 1892, and the result was a brilliant record of achievements, not the least of which was the fruit of his studies and minute experimentation in the field covering every phase of equipment for Arctic work. He made a journey over the inland ice from 5000 to 8000 feet above the sea from McCormick Bay to the northeastern angle of Greenland, a round trip of 1300 miles, including land travel on the northeast coast. This was considered to be one of the most brilliant feats of polar sledge work ever accomplished. On this trip he proved that the northern extension of the great interior ice cap ends below latitude 82° N. He also established the insularity of Greenland and ascertained the existence of detached

ice-free land masses north of the mainland, and the fact that the east and west coasts rapidly converge north of the seventy-eighth parallel. His ethnological work among the Eskimos, known as the Arctic Highlanders (from Cape York to Smith Sound), was the most thorough and noteworthy that had hitherto been done in that region. Well known men of science participated in auxiliary expeditions which resulted in the securing of important data as to glacial and other Arctic phenomena. In 1893-95 Peary made another journey to the same region, completing his study of the Arctic Highlanders and making another journey across the ice cap of Independence Bay. At this time he discovered the famous meteorites of the Eskimos near the coast of Melville Bay. These meteorites became in 1909 the property of the American Museum of Natural History (q. v.). In 1896-7 summer voyages were made to the Melville Bay region, and in 1898 Peary again started north for the purpose of outlining the northern extension of land masses above Greenland and of reaching the North Pole if possible. This expedition covered four years, during which resurveys of a considerable extent of coast land in the neighborhood of Smith Sound were made, and new coast lines were surveyed on the west side of Grinnell Land and north of the Greenland mainland. Peary also made at this time a number of notable and very difficult sledge journeys along the northern channels leading to Lincoln Sea. He passed the farthest north made up to that time, by Lockwood, and traced the northern limit of the land masses north of Greenland to its highest point, $83^{\circ} 39' N.$, and then followed the southerly trend of the coast for many miles toward Independence Bay on the east coast. In the spring of 1902 he made an attempt to reach the North Pole from Cape Hecla, on the north coast of Grant Land. At latitude $84^{\circ} 17'$ the polar pack became impracticable and further efforts to advance were given up. In the summer of 1905 he commanded another expedition in the ship *Roosevelt*, and in the summer of 1906 reached $87^{\circ} 6'$, the nearest approach to the pole up to that date. In 1907 he made preparations for another expedition to reach the pole, but on account of the failure of the builders to complete repairs to the vessel in time he was obliged to postpone the expedition until 1908. On the final and successful attempt to reach the pole he sailed on July 6, 1908, on the steamer *Roosevelt* for the Arctic Ocean by way of Smith Sound Channels, West Greenland. For an account of the successful culmination of his plans and the circumstances connected with the discovery of the pole, see the article **POLAR EXPLORATION**. During his Arctic explorations Peary retained his position as a naval officer and attained the rank of a civil engineer with the title of commander. The success of his expedition was due in large measure to the support of the Peary Arctic Club, an organization formed for the purpose of rendering him such assistance. The total expense involved in the various expeditions is estimated at \$500,000. Peary is a member of many learned societies and is the recipient of gold medals from the Philadelphia Geographical Society, the American Geographical Society, and the National Geographic Society. The medal

presented by the last-named society was in recognition of his discovery of the pole. He has contributed much to geographical journals and popular magazines and is the author of *Northward Over the Great Ice* (1898) and *Nearest the Pole* (1907).

PEAT. See FERTILIZERS.

PECKHAM, RUFUS WHEELER. An American jurist, Associate Justice of the Supreme Court of the United States, died October 24, 1909. He was born at Albany in 1838, the son of Rufus William Peckham, an eminent jurist. He was educated at the Albany Academy and at a school in Philadelphia, after which he studied law in his father's office. At the age of 21 years he was admitted to the bar, and soon thereafter became a member of the firm of Peckham and Tremain. This connection lasted until 1878, when Mr. Tremain died, and the firm became Peckham and Rosendale. In 1869 he was elected district attorney of Albany county, N. Y., and he was engaged while in this office in many important trials. He was an ardent and aggressive Democrat, and was at one time president of the Albany Democratic County Committee and presiding officer of several of the conventions of the party. He took an active part in the National Conventions of 1876 and 1880. In 1883 he was elected Justice of the Supreme Court of New York, and while holding that office in 1886 was elected Associate Judge of the Court of Appeals. While serving on this bench he was appointed by President Cleveland in 1895 Associate Justice of the Supreme Court of the United States. In 1907 Justice Peckham was offered the nomination for Governor of New York State by David B. Hill, but this offer he declined. Justice Peckham was one of the most able jurists that ever occupied the American bench.

PELLAGRA. (It. *pelle*, skin, and *agra*, rough.) This disease, although of recent recognition in the United States, has already been reported from seventeen States, and assumed the proportions of a national public health problem during 1909. Sporadic cases of the disease had been reported as early as 1863, and King, of Washington, suggests that the great mortality in the Andersonville and Libby Prisons might have been due in part to this disease, since the sanitary conditions (and the fact that corn was the chief article of diet) were those under which the disease would most likely be developed. It was not until 1907, however, that any number of cases were recognized in the United States, but in 1908-9 reports indicated it to be of alarming frequency in the Carolinas, Georgia and Alabama. The *Public Health Reports*, vol. xxiv., No. 25, contains a table showing about 1000 known cases of pellagra in thirteen States, most of them in asylums or similar institutions. A conference to consider the problem was held at Columbia, S. C., during 1909, which nearly 600 physicians attended.

The disease in Europe dates back to 1680. In the period of 1680 to 1700 corn was introduced into Spain, and authentic accounts of the disease begin to appear from that time on. The disease spread from Oviedo, still the principal focus of the disease, to Lower Aragon, Saragossa, Navarre and other provinces, and was variously known as *mal de la ross*.

DISCOVERER OF THE NORTH POLE**

'epra scorbutica, mal del solc, and mal de la misera. In Italy the disease was first reported fifteen years after it was noticed in Spain. It broke out simultaneously in the districts of Milan, Brescia, Bergamo and Lodi, and rapidly spread through the whole of Lombardy, and finally, beginning with the year 1800, spread southward as far as Tuscany. Here, too, spoiled maize was believed to be the cause of the disease. Immense numbers of the population were attacked, so that at various times 31.70, 30.52 and 23.66 per thousand of the population were affected. In 1878 it was stated that 20 per cent. of the conscripts in Lombardy were unfit for military duty by reason of pellagra. The Italians called it *il delirio della miseria*. In 1884 it was estimated that there were 10,000 pellagrins in Italian hospitals and insane asylums, and in 1903 it was stated that there were 60,000 cases of pellagra in Italy. In France the disease was somewhat less prevalent, but cases and epidemics have been reported since 1818, when it was known by the name of *maladie de la Teste*, from the fact of its being first noted in the vicinity of Teste. In Rumania the first recorded case was in 1810. Between 1833 and 1846 it was very prevalent and was known by the name of "Buba Tranjilar." Its cause was attributed to the importation of damaged corn from Italy. In 1907 there were estimated to be 40,000 pellagrins in Rumania. The disease may be said to be endemic between 42 and 46 degrees north latitude, 11 degrees west and 26 degrees east longitude of Paris. Pellagra has been endemic in Corfu, in the Austrian Tyrol, in Egypt, in Algeria, Tunis, Bulgaria and Servia, and several other countries in the south of Europe.

The exact etiological factor in the production of pellagra is not definitely known. A connection between the eating of damaged corn and the disease has been recognized from the earliest times, but later investigations point to some other cause. Predisposition is believed to be an important factor, lowered physical resistance, worry, insufficient food, bad housing and alcoholism are supposed to make the individual more susceptible. Neusser believes that corn contains a non-toxic glucoside produced by the *bacillus mädis*, that in the intestine this body is decomposed, producing a toxic substance, but that this occurs only when the bowel is already in a diseased condition. Sambon sums up the situation by saying that while the association of pellagra with the eating of maize is too universal to be ignored, there is good ground for the belief that pellagra is a protozoan disease allied with trypanosomiasis and syphilis. Wood has isolated a bacillus from the blood of a pellagrin, which he believes is the same organism that Peltauf and Heider, Zuboni, Majocchi and Tizzoni have found. The organism is a strepto-bacillus.

The disease appears in two forms. The chronic form is characterized by symmetrical erythema, appearing usually in the spring and associated with stomatitis, diarrhoea and gastric disturbances, followed by profound nervous and mental disturbances and cachexia. As summer advances the symptoms usually disappear, but recur with the following spring in a more pronounced and enduring form. The acute or fulminating variety of pellagra, called by Lombroso the typhoid form, runs a course of

three weeks to three months and invariably ends fatally. No satisfactory treatment has yet been found. Improvement in hygienic surroundings, liberal diet and baths and douches are valuable, together with tonics, such as arsenic. The transfusion of blood from recovered pellagrins into the sick has been reported as successful. See in *Public Health Reports*, June, 1909, an article on Pellagra by C. H. Lavinder.

PENANG. See STRAITS SETTLEMENTS.

PENFIELD, WILLIAM L. An American lawyer and public official, died May 9, 1909. He was born in Dover, Mich., in 1846 and graduated from the University of Michigan in 1870. From 1870 to 1872 he was an instructor in Adrian College, and in the latter year was admitted to the bar. He began to practice in Auburn, Ind., in 1873. He was chosen city attorney and became identified with local politics. From 1894 to 1897 he was judge of the Thirty-fifth Circuit of Indiana, and from 1897 to 1905 was solicitor to the United States Department of State. In the latter year he resigned and resumed the practice of law in Washington. Judge Penfield, as solicitor, was counsel for the government in many important cases, among them arbitrations between the United States and Santo Domingo, Peru, Haiti, Nicaragua, Guatemala, Salvador and Mexico; the Pius fund cases against Mexico, and in the arbitration between the United States and Venezuela before the Hague Tribunal.

PENNSYLVANIA. One of the Middle Atlantic Division of the United States. Its area is 45,126 square miles. The population in 1909, according to a Federal estimate made in that year, was 7,241,716.

MINERAL PRODUCTION. Pennsylvania far surpasses any other State in the value of its mineral products. It produces practically 50 per cent. of the coal mined in the United States. The total production of coal in 1908 was 200,448,281 short tons, having a spot value of \$276,995,152. This included 74,347,102 long tons of anthracite, with a spot value of \$158,178,849, and 117,179,527 short tons of bituminous coal, with a spot value of \$118,816,303. The production of both anthracite and bituminous coal in 1908 was less than in 1907, but owing to the fact that anthracite no longer enters to any great extent into manufacturing industries it was less seriously affected by the financial depression than bituminous coal. The aggregate production of both kinds in 1908 showed a decrease of 39,399,208 short tons, or 14.97 per cent. in quantity, and of \$42,242,930, or 15.24 per cent. in value, from that of 1907. Of the total decrease, 2,085,319 long tons and \$5,405,207 in value were in the production of anthracite. Notwithstanding the decrease the output of anthracite in 1908 was, with the exception of 1907, the largest ever obtained, and exceeded that of 1906 by 10,702,092 long tons in quantity and \$26,261,155 in value. The decrease in the production of bituminous coal in the State from 1907 to 1908 was 32,963,650 tons and \$36,847,723 in value. In spite of the decreased production the number of men employed in the coal mines of the State showed an increase of 9606 over 1907, the number reported in 1908 being 340,135. Of this number 171,174 were in the anthracite mines and 165,961 in the bituminous mines. From 1814,

when mining first began in the State, to the beginning of 1909 the total production of both anthracite and bituminous has amounted to about 4,000,000,000 short tons, the production of anthracite being slightly more than half. It is estimated that the amount of coal originally in the anthracite fields was 21,000,000,000 short tons, and in the bituminous fields 112,574,000,000 short tons. It is estimated that 2,014,779,075 short tons of anthracite have been mined and 1,963,248,780 tons of bituminous. During the year 1250 men were killed and 2189 injured in the coal mines of the State, as against 1514 killed and 2576 injured in 1907. Pennsylvania alone produces more coal than any other single foreign country except Great Britain. In the manufacture of coke Pennsylvania also stands first among the States. The quantity produced in 1908 was 15,511,634 short tons, which was considerably more than half the total production of the country. This, however, was a decided falling off from the production of 1907, which was 26,513,214 short tons. This production is the smallest since 1904, and was caused almost entirely by the financial depression throughout the country. The total value of the coke produced in Pennsylvania in 1908 was \$32,560,621, as against \$67,638,024 in 1907. The number of coke-making establishments in 1908 was 252, one less than in 1907, though the total number of ovens increased in the State from 51,364 to 52,606. Of these establishments 44 were idle during the year. The production of petroleum has steadily declined since 1896. There were produced in 1908 9,424,325 barrels, as compared with 9,999,306 barrels in 1907. While Pennsylvania stands seventh in the quantity of petroleum produced, in the value of the product it stands fifth, being surpassed only by California, Illinois, Oklahoma and West Virginia. Pennsylvania stands first in the production of natural gas, and it is first among the States in the cement industry. In 1908 there were produced 18,254,806 barrels, valued at \$13,899,807, as compared with 20,393,965 barrels in 1907, valued at \$19,698,806. Other important mineral products are slate, stone, coal products, sand and gravel, iron ores, lime, clay, natural cement, quartz, salt and talc. The value of the mineral products of the State in 1908 was \$473,083,212, as compared with \$657,783,345, the value of the product in 1907.

During the latter part of 1909 the coal mining operations, particularly in the anthracite region of the State, were seriously hampered by a scarcity of water, which affected also to some extent the bituminous regions, where a large quantity of water is required in connection with the operation of coke ovens. The shipments of anthracite from the mines of the State during the eleven months ending November 30, 1909, amounted to 56,194,447 tons. The total production of anthracite during the year was approximately 79,700,000 short tons, while the bituminous production was between 360,000,000 and 370,000,000 short tons. The recovery of the iron trade in 1909 from the depression of 1908 caused a great increase in the production of coke in the Connellsville district, bringing it practically to equality with the production of 1907, or an increase of from 30 to 100 per cent. over the production of 1908.

The decline in the production of petroleum

in the State in 1909 amounted to about 3 per cent.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 48,800,000 bushels, valued at \$34,160,000 from 1,525,000 acres; winter wheat, 26,265,000 bushels, valued at \$28,629,000 from 1,545,000 acres; oats, 25,948,000 bushels, valued at \$12,974,000 from 998,000 acres; barley, 196,000 bushels, valued at \$131,000 from 9000 acres; rye, 5,508,000 bushels, valued at \$4,406,000 from 360,000 acres; buckwheat, 5,655,000 bushels, valued at \$3,845,000 from 290,000 acres; potatoes, 23,790,000 bushels, valued at \$15,464,000 from 305,000 acres; hay, 3,732,000 tons, valued at \$54,633,000 from 3,118,000 acres; tobacco, 30,732,000 pounds, valued at \$2,765,080 from 31,200 acres. Pennsylvania ranks second in the production of rye. The rye crop of 1909 was slightly smaller than in 1908, when it was 5,660,000 bushels. The acreage, however, increased in 1909 by about 20,000. The oat crop of 1909 was smaller than that of 1908 by about 2,000,000 bushels. The acreage increased by about 1000. The corn crop of 1909 showed a decrease from that of 1908 by nearly 10,000,000 bushels. The crop of the latter year was 57,275,000 bushels. The acreage, however, increased from 1,450,000 to 1,525,000 in 1909. The tobacco crop in 1909 was much smaller than that in 1908, when 39,008,000 pounds were produced. The acreage, however, increased from 29,440 to 31,200. The number of farm animals in the State on January 1, 1910, was as follows: Horses, 619,000; mules, 43,000; dairy cows, 1,140,000; other cattle, 917,000; sheep, 1,112,000; swine, 931,000. The wool clipped in 1909 was estimated at 4,936,960 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$500,470. Of these products the chief in point of value was oysters, of which 129,400 bushels, valued at \$13,950, were taken for market purposes, and 147,500 bushels, valued at \$41,650, for seeding purposes. Next in point of value was the pike perch, of which 2,761,900 pounds, valued at \$90,540, were taken. Other fish in the order of the value of their production were sea bass, \$44,340; shad, \$38,350; and whitefish, \$36,290. Other fish taken in considerable quantities were alewives, German carp, sea bass and cod. There were engaged in the fisheries of the State 557 independent fishermen and 679 wage-earning fishermen were employed. The number of vessels engaged in the fishing industry was 66, valued at \$214,850.

EDUCATION. The school attendance of the State in 1909 was 1,263,034. There were 26,771 female teachers and 7935 male teachers. The average monthly salary of male teachers was \$62.23 and of female teachers \$47.07. The total expenditure for education was \$38,523,925. The legislature of 1909 passed a complete code for the public schools of Pennsylvania, but it was vetoed by the Governor by reason of changes and amendments which had been made to the code after it had left the hands of the educational commission. The issue of employment certificates to minors between the ages of 14 and 16 was placed in the hands of the school officials who are responsible for the education

of the children. This will enable those in charge of the enforcement of the compulsory attendance laws to secure the attendance of all the children who should be in school. The State Commissioner of Health at the end of the year was about to undertake the medical inspection of all pupils in rural schools at State expense.

FINANCE. The report of the State Treasurer for the fiscal year ending November 30, 1908, showed a balance in the general fund on December 1, 1907, of \$10,486,410. The receipts from all sources for the year ending November 30, 1908, were \$25,870,540, and the payments to the general fund for the same period were \$29,158,878, leaving a balance in the general fund on December 1, 1908, of \$6,998,073, which, with the balance in the sinking fund, made a total amount in the treasury at that date of \$9,540,604.

POLITICS AND GOVERNMENT. The legislature on January 29 re-elected Boies Penrose United States Senator for the third time. There was practically no opposition to Senator Penrose's election. The legislature on March 17 elected George T. Oliver of Pittsburgh United States Senator to fill the vacancy caused by the resignation of Philander Chase Knox, who entered the Cabinet of President Taft. Of the 202 Republican votes cast, Senator Oliver received 201. The legislature adjourned on April 15. The most important measures passed at this session will be found in the paragraph *Legislation* below. A school code was finally passed after it had received many amendments, but it was vetoed by Governor Edwin S. Stuart. An attempt to pass a local option measure was defeated on March 9, when the House voted against it by a vote of 137 to 66. Local option was the chief issue in the spring of 1908 when the legislators were nominated. The legislature appointed a commission to report upon a revision of the laws of the commonwealth relating to corporations and to revenue. It also authorized the Governor to appoint a commission to revise the election laws of the State. The legislature made appropriations to the aggregate of \$73,000,000. From this Governor Stuart cut about \$21,000,000, including his vetoes of the State highway bill, which he had always advocated, and the bill for the extension of the Capitol park. These cuts were made for the purpose of bringing the appropriations within the estimates of \$52,000,000 of revenue available in the next two years. Large sums were cut from the appropriations of the semi-State institutions. From the appropriation of \$650,000 for the University of Pennsylvania, recommended by the legislature, the Governor cut a sum reducing it to \$430,000. A pure food law, designed to take the place of the Tustin act, declared unconstitutional by the Superior Court in May, was signed by Governor Stuart on May 13. This bill prohibits the sale of adulterated or misbranded articles of foods and is generally modeled on the food law of the United States.

The Republican State Convention on June 16 nominated candidates for State offices. For Justice of the Supreme Court, Judge Robert Von Moschzisker of Philadelphia was nominated; for Auditor-General, Senator A. E. Sisson, and for State Treasurer, Jeremiah A. Stober. The chief feature of the platform adopted was the endorsement of the position

taken by Senator Aldrich and his supporters on the tariff schedule as opposed to the downward revisionists. The Democratic Convention for the nomination of State officers was held at Harrisburg on August 4. Colonel James M. Guffey, National Committeeman, was in absolute control of the convention. For Justice of the Supreme Court, C. LaRue Munson was nominated; for Auditor-General, J. Wood Clark, and for State Treasurer, George W. Kipp. All the nominations were made by acclamation. The platform took up the subject of capital and labor, and insisted on the enactment of laws by the legislature insuring the rights of speech, as well as the enforcement of the anti-trust laws. The Republican party was denounced for its extravagance and particularly for the establishment of new offices and for the increase of salaries of the State officials. The Prohibition State Convention was held on August 27 at Pittsburg. For State Treasurer, Dr. Franklin Fish was nominated; for Auditor-General, Colonel C. W. R. Smith, and for Justice of the Supreme Court, Harold L. Robinson.

In the election of November 2 the Republicans elected all the State officers voted for by large majorities. The total vote cast for State Treasurer was 811,179, of which Stober, the Republican candidate, received 450,630, and Kipp, the Democratic candidate, 307,763. The Republican candidates for Auditor-General and Supreme Court Justices were elected also by large pluralities. The results in Philadelphia will be found in the paragraph below. Ten amendments to the State constitution and the schedule to make them effective were voted for at the election, and of these all but one received the necessary number of votes for their adoption. These amendments were chiefly in regard to the elections in the State.

On November 5 a decision of great importance was handed down by the Supreme Court of the State affecting the granting of licenses to corporations under the Brooks high license law. The decision was in the case of the Indiana Brewing Company of Indiana, Pennsylvania. The Quarter Sessions Court of Indiana county had refused the brewing concern a license, and the Superior Court affirmed the decision. In the opinion of the majority of the court, it was declared that the license was refused on the sole ground that the brewing concern was an unfit corporation. The opinion affirmed that the personal habits of the members of the corporation should not be taken into account, but that the corporate acts of the corporation must be examined to learn whether they have violated the laws of the State.

PHILADELPHIA. The primary elections held in Philadelphia on June 5 were particularly significant on account of the attitude of the public toward the conduct of the Rapid Transit Company, which operates the street railroads of the city. The candidates for the respective nominations for district attorney were Samuel P. Rotan, who had the support of the regular Republican organization, and D. C. Gibboney, who was nominated by the reform element, including the Democratic and William Penn parties. Mr. Gibboney made a remarkably strong fight for the nomination. It was alleged that in spite of an agreement made in 1907 between the city and the Rapid Transit Company the company had acted from time

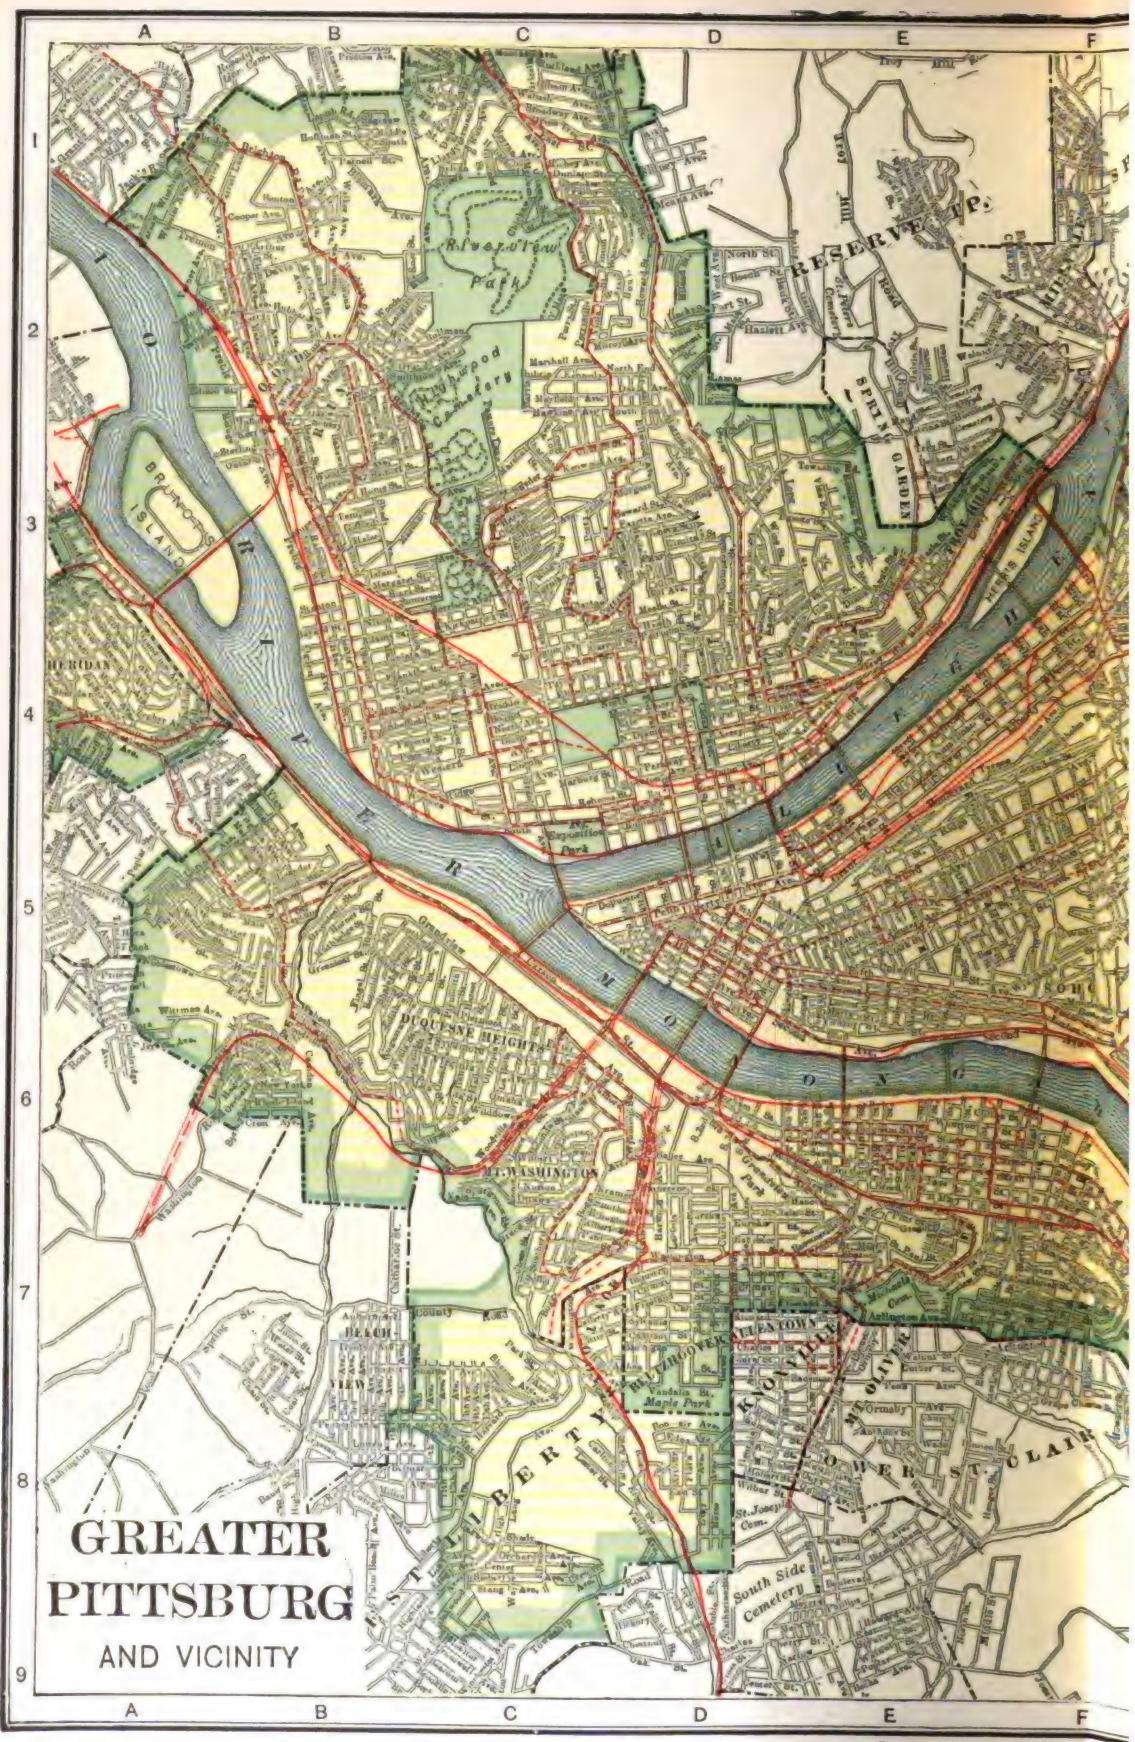

to time in an arbitrary fashion, and in particular its action in abolishing "strip tickets," six tickets for twenty-five cents, aroused a resentment which was manifested in a great mass meeting for the appointment of a Committee of Fifteen to enforce the public's side of the question. There was also considerable dissatisfaction over the attitude of Mayor Reburn, who minimized the public outburst, and against the continuance of State Senator Wolf as one of the city's representatives. Subsequently came the street car strike (see *STRIKES*) and the triumph of the strikers. Under the direct primary Mr. Gibboney was voted for as a candidate for renomination on three tickets, those of the Republican party, the Democratic party and the William Penn party. In the William Penn party he had no opposition and was unanimously nominated by over 20,000 votes. In the Democratic party he was also successful, receiving nearly 9000 votes. In the Republican party he received over 56,000 votes, but was defeated by about 5000 votes by Mr. Rotan. Senator Wolf resigned as the city's representative of the street car corporation, and the City Solicitor was asked to take steps to enforce the reinstatement of the "strip ticket." In the election on November 2 Mr. Gibboney ran on the Democratic and Independent tickets. He was defeated by Rotan by a plurality of more than 45,000. The vote was the largest in the city's history and the interest was intense.

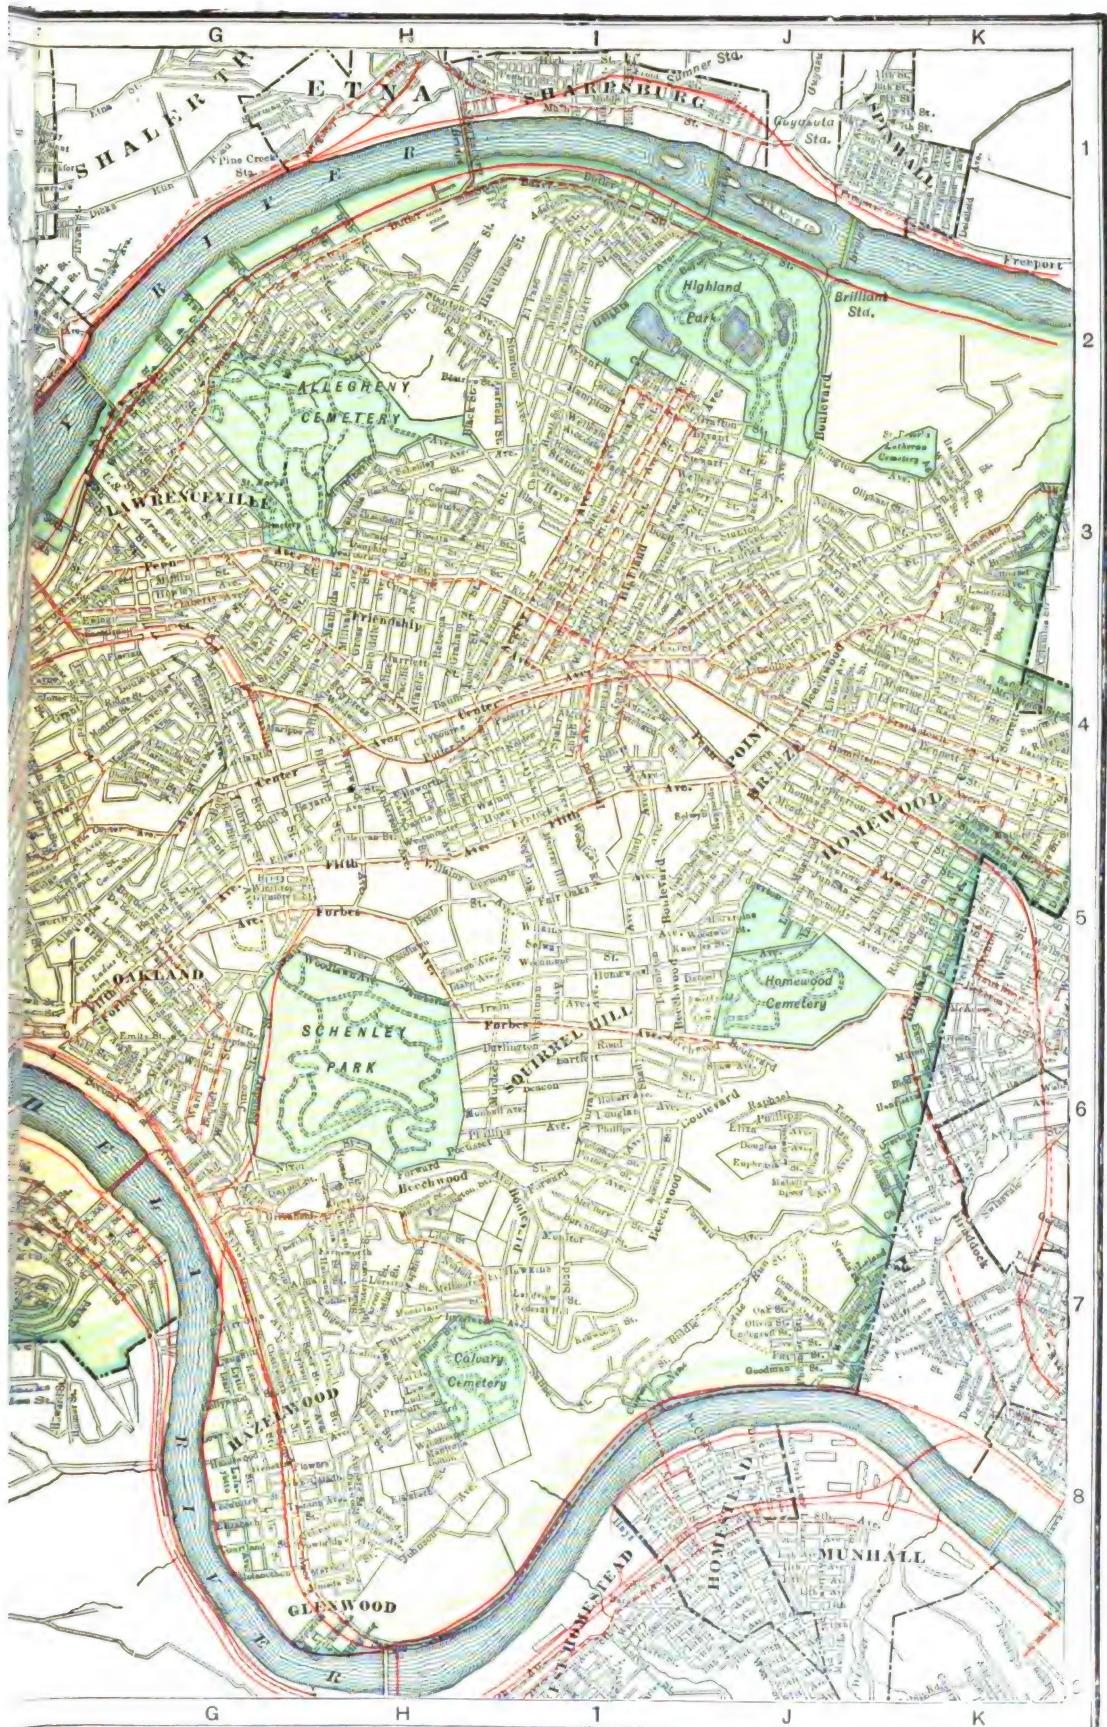

On February 19 the new system of waterworks for the city was put in operation, and filtered water from the mammoth filtration plant at Torrerdale flowed through the city mains. The output of this plant is over 200,000,000 gallons a day. On May 28 the Councils passed the measure advocated by Mayor Reburn providing for a widened parkway for the city. This is the beginning of a scheme by which a great boulevard is to be constructed, extending from City Hall to the Green street centres, not only on the American seaboard, that the plan, when completed, will cost from \$22,000,000 to \$25,000,000. This final action by Councils marks the actual beginning of this public improvement. The War Department during the year approved the recommendation of the Board of Engineers providing for a 35-foot channel survey of the Delaware River. It was expected that this decision would meet with the approval of the Chief of Engineers of the army, and that the necessary bonds for the work will be issued in the near future. The survey is a necessary preliminary of the realization of the 35-foot channel, which would put Philadelphia on a par with great maritime centres, not only on the American seaboard, but of the world.

GRAFT PROSECUTIONS. The year was notable for the uncovering of a remarkable condition of corruption among members of the city government of Pittsburg and the conviction of a number of city officials and others. Corrupt conditions had for many years been known to exist in Pittsburg, but it was not until the election of Mayor George W. Guthrie in 1906 and the activities of the Voters' League that active steps were taken against suspected persons. Corrupt practices centred about the custom of naming certain banks in the State as depositories of State and city funds. This custom, begun many years ago, has resulted in

the wrecking of financial institutions, the suicide of many bank officials and the disgrace of others. The city of Pittsburg had up to July, 1908, been paid 2 per cent. on its bank deposits and on daily balances, which were held in several banks. In these institutions the city treasurer carried about \$15,000,000. An ordinance was introduced in Councils providing that certain city depositories be designated by Councils for a term of four years, the city to receive only 2 per cent. on daily balances. Certain other reliable banks offered to pay $2\frac{1}{2}$ per cent. Out of 77 votes cast at the balloting on this ordinance in Common Councils, 76 were in favor of it. The ordinance was vetoed by Mayor Guthrie and was repassed over his veto by a vote of 73 to 2 in Common Council, and 42 to 6 in Select Council. One of the banks which was to profit by this measure was the German National of Pittsburg, and on December 7, 1908, a special national bank examiner, visiting this bank, came upon a suspicious entry in its books of a sum of \$17,500, which subsequently was found to have been paid to councilmen. This memorandum led to the exposure of the system of corruption. Aside from this accidental discovery on the part of the national bank examiner, secret investigations had been in progress by the Civic Voters' League in 1908. These investigations had not been completed at the time of the bank exposure, and the officials of the league attempted to prevent the disclosures until its evidence should be ready for use. The Comptroller of the Treasury was asked to keep the disclosure secret, but it was said that he referred the matter to President Roosevelt, who directed the examiner to do his duty and to make immediate exposures. Fearing the flight of the men against whom they had secured evidence in their secret activities, the members of the League on December 21, 1908, caused the arrest of seven councilmen. These were William Brand, president of the Common Council; John F. Klein, William H. Melaney, T. O. Atkinson of Select Council, Joseph C. Wasson, Jacob Soffel, Jr., and Hugh Ferguson. All except Atkinson were members of the Common Council. President Brand, Wasson and Klein were charged with conspiracy, bribery and solicitation of bribes, while the others were charged with the latter two offenses only. At the same time W. W. Ramsey, president and A. A. Vilsack, cashier of the German National Bank of Pittsburg, were arrested on charges of bribery. These events were the result of investigations carried on by the Voters' League. Nearly a year previous William A. Martin, a common councilman, was convicted and sent to the penitentiary for having accepted a bribe to aid in procuring a franchise for the Tube City Railroad, connecting Pittsburg with McKeesport. According to Martin's story, C. S. Cameron, president of the Tube City Railroad, offered him \$70,000 to put the franchise through councils. Martin was sentenced to three years in the Western Penitentiary. Cameron fled to Canada, but returning, stood trial and was convicted on Martin's evidence. He was, however, released on bail, pending an appeal of his case to the State Supreme Court. He was convicted on January 12, 1909.

On February 18, 1909, W. W. Ramsey, former president of the German National Bank

of Pittsburg, was convicted on a charge of bribing councilmen to have his bank named as one of the six city depositories. A. A. Vilsack, cashier of this bank, testified to the payment of the money to Councilman John F. Klein. On February 22, 1909, Vilsack pleaded no defense to the charge of bribery. Klein was found guilty on February 20, 1909. On March 1, 1909, Councilmen John F. Klein, Joseph C. Wasson and William Brand were found guilty of conspiracy. W. W. Ramsey was indicted with them, but was cleared under the court's instruction, it having been admitted in open court by District Attorney William A. Blakeley that he had no evidence against him.

On March 22, 1909, a grand jury handed down indictments against six more persons accused of having taken part in the grafting among the city councilmen. Those indicted were Dallas C. Byers, the head of A. M. Byers and Co., for conspiracy to bribe; Frank A. Griffin, vice-president and cashier of the Columbia National Bank of Pittsburg, for perjury; Dr. W. H. Weber, select councilman, for conspiracy to bribe; Charles Stewart, select councilman, for soliciting a bribe of \$2500 for the passage of the city depositories ordinance from A. A. Vilsack, cashier of the German National Bank of Pittsburg; Henry W. Bolger, saloon-keeper, for aiding and abetting a bribe in connection with the city depositories ordinance, and John F. Klein, common councilman, for conspiracy to bribe. Mr. Byers was accused of having secured the vacation of city streets for his firm by bribing councilmen, after withdrawing his offer to pay \$21,500 to the city for the street. Mr. Byers has since died. Mr. Griffin was accused of perjury while testifying before the grand jury concerning the allegation that he paid \$25,000 from the funds of the Columbia Bank to have the bank named as one of the city depositories.

On April 19, 1909, John and Charles Colbert, brothers, were found guilty of attempting to bribe the jury paneled for the trial of Klein, Wasson, Brand and Ramsey. They were on May 5, 1909, each sentenced to two years' imprisonment in the Western Penitentiary and to pay fines of \$500. On the same date John F. Klein was sentenced to three and one-half years and a fine of \$1500 for bribery and conspiracy; Joseph C. Wasson and William Brand were each sentenced to pay a fine of \$500 and serve eighteen months in the penitentiary; H. M. Bolger to two years' imprisonment and a fine of \$500; W. W. Ramsey, former president of the German National Bank, was sentenced on a charge of bribery to eighteen months' imprisonment and a fine of \$1000; A. A. Vilsack, cashier of the German National Bank, was not called for sentence, as he was to be used as a witness in other cases. At the close of the year the cases of Klein, Wasson, Brand, Ramsey and Bolger were pending in the Superior Court and the men were under bail. These convictions were obtained largely through the efforts of William A. Blakeley, the District Attorney of Allegheny county.

In addition to the revelations and convictions in Pittsburg, a grand jury in August and September carried on investigations into charges of graft and extravagance in the construction of a \$2,000,000 court house at Wilkes-Barre. In its report the jury charged county officials, contractors and others with malfeas-

ance in office, fraud, extravagance, ignorance and collusion. While this jury had not the power to prosecute, it recommended that the next grand jury find indictments against the men it had accused. The Superior Court, after hearing the appeal of the four principals found guilty of defrauding the State in connection with the furnishing of the State Capitol at Harrisburg from 1902 to 1907, decided that they had received fair and impartial trials and ordered that the surviving defendants serve their sentences in jail. The men convicted were John H. Sanderson, who had the contract for "trimmings" of the building, and who died in 1909; William H. Mathues, former State Treasurer, who is also dead; William P. Snyder, formerly Auditor-General, and J. M. Shumaker, who was Superintendent of Public Grounds and Buildings when the Capitol was being furnished. The decision as applying to Snyder and Shumaker, the only survivors, requires that they submit themselves for the two years' term of imprisonment imposed on all the defendants. These sentences were given on December 18, 1908, and their execution had been delayed, pending appeals.

GREATER PITTSBURG. In February, 1909, William A. Magee was elected mayor of Greater Pittsburg and took office in April. At the beginning of his administration the work of improving the greater city began. Greater Pittsburg has an area of 40.969 square miles. The old city of Pittsburg had an area of 28.369 square miles and was divided into 38 wards. Between 1905 and prior to the actual annexation of the City of Allegheny on December 5, 1907, the boroughs of Elliott, Espلن and Montooth and the township of Sterrett were added to Pittsburg. On December 21, 1907, Sheraden borough was admitted and on January 17, 1908, West Liberty borough was annexed. These boroughs and Allegheny added 12.6 square miles to the territory of the Greater City. It is now divided into 27 wards. With the exception of the northern boundary the city is surrounded by populous boroughs. In November, 1909, the people approved a bond issue of \$6,775,000. Of this sum \$3,000,000 is to be expended to give every part of the municipality the benefit of filtered water. Another \$1,500,000 is to be used in removing the heavy grades in the business section, for the widening of busy thoroughfares and the raising of streets in the flood district. The remainder of the issue is to be utilized for freeing the Allegheny river bridges, connecting the old city with the North Side; the purchasing of playgrounds; the popularizing of the parks; the erection of a tuberculosis hospital and the building of a rubbish disposal plant. The city is making substantial appropriations for public baths, a municipal lodging house and a tree commission.

OTHER STATE EVENTS. The year was notable for a number of serious strikes in Philadelphia, Pittsburg and other cities. These will be found discussed in the article on STRIKES. One of the most remarkable incidents of the year in the State, from the widespread interest which it caused, was the abduction in March of the young son of James P. Whitla of Sharon. The boy was taken from his home and was not returned until a ransom of \$10,000 was paid for his recovery. The abductors were

subsequently captured and were tried and convicted. On October 18 sentences ranging from six to eighteen months were imposed upon five members of the election board of Reilly township, who had pleaded guilty to a charge of making a false return of the votes cast at the June primary election. The judge of election in the Fifth Ward, Shenandoah, who pleaded guilty to a similar charge, was sentenced to three years' imprisonment and to pay a fine of \$500 and costs. Twelve men were killed in the Cambria Steel Company's coal mine, two miles from Johnstown, on October 31, as the result of what is supposed to have been a dynamite explosion.

LEGISLATION. Among the measures enacted by the legislature of 1909 are those noted below: Measures were enacted creating a legislative reference bureau. Provision was made that opinions on religious matters should not affect the competency or credibility of witnesses. Laws were enacted providing for adult probation and the indeterminate sentence. It is provided that no money shall be paid out of the State treasury except under authority of an act, in which not only the purpose but the amount to be expended shall be specified. A number of acts were passed relating to public health and to the purity of foods and drinks. An excellent child labor law was enacted. See CHILD LABOR.

OFFICERS: Governor, E. S. Stuart; Lieutenant-Governor, R. S. Murphy; Secretary of the Commonwealth, Robert R. McAfee; Treasurer, J. O. Sheatz; Auditor-General, R. K. Young; Adjutant-General, Thos. J. Stewart; Attorney-General, M. Hampton Todd; Superintendent of Public Instruction, N. C. Schaeffer; Insurance Commissioner, David Martin; Commissioner of Public Lands, Nathaniel Ewing—all Republicans, except Schaeffer, Dem.

JUDICIARY. Supreme Court: Chief Justice, D. Newton Fell; Associate Justices, J. Hay Brown, William P. Potter, John Stewart, Robert Von Moschzisker, S. L. Mestrezat and John P. Elkin—all Republicans, except Mestrezat. Clerk, Eastern District, vacant; Clerk, Middle District, William Pearson; Clerk, Western District, George Pearson.

The legislature of 1909 was composed of 39 Republicans and 11 Democrats in the Senate, and 173 Republicans and 34 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

PENNSYLVANIA, UNIVERSITY OF. An institution of higher learning in Philadelphia, Pa., founded in 1740. In October, 1909, the total registration was about 4800 in the six departments, College, Graduate School, School of Law, School of Medicine, School of Dentistry, and School of Veterinary Medicine. The officers of instruction for all departments numbered about 500. A feature of the University list is the large representation from foreign countries in all departments. Among the new buildings added during the year was an extension of the Veterinary School. There is also to be a new Graduate School building. The collections in the library number about 300,000 volumes and many independent pamphlets of historical and contemporary interest. Numerous additions are made at intervals to the fine archaeological exhibits in the University museum. The productive funds of the University

amount to about \$5,350,000 and the total income is about \$550,000. The president is Charles C. Harrison, LL. D.

PENOLOGY. The National Conference on Criminal Law and Criminology met at Chicago in June. The most important result of this conference was the founding of the American Institute of Criminal Law and Criminology, designed to further the scientific study of crime and to organize the practical movements for solving the problems revealed. Sectional committees were appointed for the investigation of the following topics: systems of recording data regarding criminals, as physical and moral status, heredity, environment, characteristics of habitual criminals; drugs and intoxicants and their relations to crime, both in use and in traffic; reform methods, as probation, parole, pardon, and indeterminate sentence, together with the best means of organizing and correlating boards supervising these devices in connection with the courts; methods and organization of the criminal courts, with reference to the possibilities of simplifying and unifying court procedure. Other committees were selected to develop plans with reference to the translation of European books and documents, the establishment of a journal and the compilation of statistics.

The most important legislative investigation of prison conditions during the year was undertaken by Texas. Continued agitation by the press and the demand of the people led the legislature to appoint a committee which began work in July. In November a preliminary report was sent in to the Governor. Further testimony will be taken in January, 1910, and a final report submitted. The Texas system of leasing convict labor to contractors grew out of a lack of funds for prison maintenance in the '70's, and was started by legislative order. The prisons have been a source of profit to the State; but the punishment dealt the convicts has been brutal, and there has been very little attention given to reforming the prisons. The system is conducted on a purely mercenary basis, both in the penitentiaries and in the convict camps, though the latter are more severely criticised. The preliminary report showed the majority of the committee apparently indifferent to the urgent necessity of concentrating the prisoners and as favorable to the retention of corporal punishment, though under more stringent regulation. A minority report favored the abolition of corporal punishment.

In Pennsylvania the prison commission on investigation found decided demoralization, especially in the smaller prisons. Both at Franklin and at Crawford there was found great lack of discipline and woeful inattention to sanitation. In the District of Columbia provision was made for the payment of fifty cents per day to the families of men under sentence. This plan was only carried through Congress by the tact and firmness of Judge Lacy. The plan also provides that as soon as the prisoner shows a disposition to work steadily he is released on parole. He is thereafter, until his sentence is entirely completed, required to pay into the hands of the police each Saturday a stipulated amount. This money is, of course, given to his family, but this device enables the police and parole officer more readily to ascertain what the paroled is doing.

Cornelius V. Collins, Superintendent of State

Prisons in New York, in his annual report laid great stress on the recent increase in the number of criminals in that State. He attributed this increase to alien immigration, and suggested that the national government assume the burden of caring for such prisoners, and that these be deported after serving sentence. Of the 4320 prisoners in the three prisons, on September 30, one-fourth were aliens; Italians comprised 43 per cent. of the alien prisoners. New York receives more than its due share of vicious, lawless immigrants. The Superintendent declared that modern prison methods do not fit them. He referred to the exceedingly large proportion of the executions of the death sentence in New York State that have been of aliens. In connection with the new Great Meadow prison at Comstock, the young and promising first offenders will be taught agriculture in all its branches. This, with the schools for the illiterate and industrial training in shops will make the New York prison educational work superior to any other in this country, if not in the world.

The advance report of the department of prisons, New South Wales, written by the comptroller-general, Frederick W. Neitenstein, showed a reorganization based upon the most advanced theories. Mr. Neitenstein stated that New South Wales is the first country to adopt the indeterminate sentence plan for habitual criminals without maximum or minimum limitations; he believed this plan had been very successful. A majority of all prisoners, and 90 per cent. of the juveniles probationed, turned out favorably. The "Shaftsbury House," a half-way station to freedom, is part of the system, and there is an inebriate act in the code which allows the term of a drunkard to be prolonged beyond that named in the first sentence. There has been a progressive and very marked decrease in the proportion of prisoners to population, this proportion being less than two-fifths what it was not many years ago. Thirteen large prisons had been closed up to 1908 and several smaller ones, many of the officers being dispensed with. Moreover, fifty-nine per cent. of the prisoners were from outside the commonwealth. The report showed that the prisons are splendidly equipped and managed. See JUVENILE COURTS.

PENSIONS. See UNITED STATES, section Pensions.

PEROGEN (OXYGEN BATH SALTS). Perojen bath is a preparation consisting of sodium perborate and a catalyzer which, when mixed with water, are capable of yielding 10 per cent. of oxygen. The catalyzing substance is a light, odorless powder, the exact composition of which is not divulged. It has no medicinal action, but the oxygen bath obtained by the use of perojen is said to have marked soothing, soporific effects, and to reduce blood pressure and the pulse rate to a much greater extent than the ordinary bath. For this reason it is useful in cardiac diseases characterized by high vascular tension, neurosis, insomnia, chronic nephritis, and skin diseases. See OXONE.

PERSIA. An Asiatic monarchy lying between the Caspian Sea and the Gulf of Oman. The capital is Teheran.

AREA, POPULATION, ETC. The latest and most trustworthy estimates place the area at 628,000 square miles, of which vast regions are desert;

the population at about nine and a half millions (including 1200 Europeans). The nomads are chiefly Arabs, Kurds, Turks, and Leks, to the number of about two millions. There are about eight million Mohammedans of the Sh'ah sect and 800,000 of the Sunni sect; 45,000 Armenians; 35,000 Jews; 25,000 Nestorians; and 9000 Parsis (Guebres). Teheran has about 280,000 inhabitants; Tabriz, 200,000; Ispahan, 80,000; Meshed and Kerman, 60,000 each; Barfurush and Shiraz, 50,000 each.

For the bulk of the people the acquiring of sufficient ability to read the Koran is considered adequate education. Instruction in religion, Persian and Arabic literature, science, etc., is imparted in a number of Persian colleges, while European institutions are maintained by private subscription.

PRODUCTION. The chief products are cereals, cotton, gums (especially tragacanth), dried fruits, silk, tobacco, and opium. Sheep and goats are numerous, and the wool produced is of excellent quality. The minerals (little exploited) are iron, coal, copper, lead, sulphur, antimony, nickel, cobalt, manganese, gypsum, borax, and salt. Turquoises are mined near Nishapur. Oil fields in the south have been successfully worked by an English company since 1902. Woolen carpets and rugs, shawls, silks, and cotton fabrics are almost the only manufactures.

COMMERCE. Trade conditions were greatly disturbed owing to the unsettled state of the country attendant upon the revolution of 1908-9. The trade of Tabriz, the centre of disorder, was at a standstill for many months. The latest available official figures are for the fiscal year ending March 20, 1908, which give imports and exports at 408,434,263 and 317,080,682 krans (1 kran was equal, July 1, 1908, to 7.2 cents) respectively, against 431,039,773 and 353,376,841 krans for the previous year, a decline of 58,902,000 krans in the total trade. The principal articles of trade in 1907-8, with the value in krans, are given as follows:

Imports	Krans
Cottons	148,672,000
Sugar	98,620,000
Tea	27,692,000
Cotton yarn	10,242,000
Gold and silver bars	9,938,000
Gold and silver coined	9,052,000
Woolens	9,230,000
Petroleum	6,018,000
Flour	5,948,000
Indigo and cochineal	3,852,000
Haberdashery	3,459,000
Exports	Krans
Fruits	46,332,000
Raw cotton	45,088,000
Rugs and carpets	29,284,000
Fish	24,588,000
Silk in cocoons	24,547,000
Rice	24,000,000
Opium	16,920,000
Gold and silver coined	15,106,000
Wool	12,078,000
Skins	10,814,000
Gums	9,628,000

Russia contributed imports valued at 191,171,870 krans, and received exports to the value of 202,661,562 krans; British Empire, 169,065,352 and 36,578,438; Turkey, 11,863,914 and 39,234,800; France, 9,965,970 and 10,915,917.

COMMUNICATIONS. A (Belgian) railway about six miles long runs south from Teheran. Several good wagon roads have been made and

others are in process of construction. Traveling is mostly by caravan, and transport by pack animals. There are 6312 miles of telegraph lines, with 10,754 miles of wires and 131 stations. There are 144 post-offices. The shipping of the Persian Gulf is principally British. Tonnage entered at Bushire, Lingah, Bender Abbas, and Muhamrah (1907-8) was 1,098,506 (897,159 British); at Caspian ports, 555,192, all Russian.

FINANCE. The monetary unit is the kran, whose value fluctuates with the value of silver. It was worth 7.2 cents July 1, 1908; July 1, 1909, 7 cents. No official statistics are published for the revenue and expenditure. The revenue, derived mainly from land tax, Crown lands, customs, and lease of monopolies, was estimated (1907-8) at 80,000,000 krans. The expenditure for the foreign office is about 2,600,000 krans annually; no data exist for other expenditures. The foreign debt is 32,500,000 roubles (\$16,737,500) borrowed in 1900 and 1902 from the Russian Banque d'Escompte for 75 years. It is guaranteed by the Russian government, and secured on the customs.

The (English) Imperial Bank of Persia issues notes. There are, besides, one Russian and two native banks, and a concession for a German bank was granted in 1907. A national bank is projected.

NAVY. The navy consists of eight small vessels, the largest of 600 tons, all employed in the customs service, none of which can be regarded as effective in war.

ARMY. The most important element in the Persian army is the Cossack brigade, trained and commanded in the higher ranks by Russian officers. It consists of 4 regiments of cavalry, each of 2 squadrons of 170 men, aggregating 1350 men, a battalion of infantry consisting of 4 companies each of 100 men, 2 horse batteries of 4 6-horsed guns and 80 men, 6 ammunition wagons and a brigade band of 59. Arms and equipment are in large part obsolete, but in 1908 and 1909 new machine guns and field guns were being added. In 1909 eight 7.5 centimetre automatic-recoil field guns from Schneider-Creusot were added. Service in the brigade is by voluntary enlistment. There is also an irregular cavalry of about 20,000 mounted tribesmen under their tribal chiefs, whose inadequate arms and equipment were being improved. In addition there is an irregular infantry in which service is for life unless exemption or substitution is secured, usually by bribery. The irregular infantry is grouped in 69 battalions of 4 companies each 40 to 100 strong, and among these troops and civil population there were estimated to be some 300,000 muskets of various patterns, in addition to 10,000 or 15,000 muzzle loaders owned by the government and some 10,000 Lebel repeating rifles which had not been issued to the troops. Of semi-regular artillery there were 15 commands each consisting of 4 to 6 guns and a nominal personnel of 250 men. The guns are quite obsolete and not of the slightest use against Europeans. In 1909 of 32 Creusot field guns supplied in the previous year 16 were mounted and 8 given to the Cossack brigade. They were not considered good according to modern artillery standards.

GOVERNMENT. The reigning Shah is Ahmed Mirza, son of Mohammed Ali, the abdicated Shah. He was born January 20, 1898, succeeded his father upon the latter's abdica-

tion July 16, 1909, and was enthroned July 20. The Regent is Azad-ul-Mulk, chief of the Kazar tribe. The heir-presumptive is Mohammed Hassan Mirza. In June, 1909, under British and Russian coercion, Mohammed Ali restored the constitution and signed a new electoral law, by which law the elections subsequent to his abdication were conducted. The new National Council (Mejlass) consists of 120 deputies. Each constituency elects three times the number of persons entitled to represent it in the Mejlass, and these appoint the deputies.

HISTORY

THE NATIONALIST REVOLT. In spite of the triumph of reaction in 1908, the Nationalists kept up their opposition. A rising of the people of Isfahan occurred on January 1, and they were supported by the powerful tribe of Bakhtiari. Some fighting occurred and the Governor sought the protection of the British Consul. The chief of the Bakhtiari took possession of the city on January 5. The invaders soon constructed defenses and controlled the country for some forty miles around. Meanwhile the Nationalists held out at Tabriz, where Satar Khan repulsed three Royalist attacks in January. The Shah's forces could make little headway against the Nationalists at either Isfahan or Tabriz. Trouble occurred in Resht on February 8, when a mob attacked the troops, killed the Governor and set the government offices on fire. An insurgent government was set up and declared in favor of Nationalist principles. Fighting at Tabriz occurred at intervals during the spring. The Royalists effected a blockade at the end of February, and although the Nationalists succeeded in making sorties and in repulsing Royalist attacks, they were not in sufficient force to follow up their success. The situation soon became serious, since if the Revolutionists continued to hold the city, starvation would result, and if they surrendered a massacre was almost certain. On April 21, the Shah, at the instance of the Russian and British Ministers, granted a six days' armistice. The Europeans had feared that unless a famine were averted, an attack might be made on the consulate. Before the armistice went into effect, a sortie of the Nationalists occurred, in the course of which an American missionary named Baskerville was killed. Early in the summer it was evident that the Shah was unable to cope with the Nationalist opposition and he began to show signs of meeting the wishes of the constitutional party.

THE SHAH AND THE CONSTITUTION. When Shah Mohammed Ali succeeded in 1907, after his father, Muzaffir Ed-din, had granted a constitution, little was known of him except as governor of Azerbaijan, in which capacity he had shown hostility to reforms and in general a reactionary tendency. From the first it was clear that he was not in sympathy with the new ideas. Although he had sworn fidelity to the constitution in February, 1907, he promulgated another constitution in October and in December, 1907, he began his attacks on the Parliament. After the attempt on his life by a bomb-thrower in February, 1908, he was more than ever pronounced in his hostility toward the constitutional party and finally brought about the *coup d'état* of 1908, in the course of which the buildings of the Mejlass (Parliament)

The deposed Shah of Persia

were bombarded and the Deputies scattered. The Nationalist movement, however, was by no means put down and continued to make progress during the early months of 1909. As indicated in the preceding paragraph, the centre of the revolutionary fighting was Tabriz. Ispahan was also in the hands of the Nationalists and later Shiraz went over to their side. Before the end of January, the northern provinces were largely Nationalist and the constitution was supported by the people of the entire coast, reaching from Astara to Astarabad on the Caspian. Order was nowhere effectively established except in the region occupied by the constitutionalists. The only force that the Shah could depend on were the Russian Cossacks in his service. This resort to foreign mercenaries taken in connection with the constant fear of Russian intervention added greatly to his unpopularity. Finally the Russian government dismissed these troops and their commander, General Liakoff, from the Russian service as a proof of non-interference.

As in the closing months of 1908, there were conflicting reports as to the Shah's intention of restoring the constitution. His policy seemed to be wavering and at one time it was reported that he would restore the constitution, and at another it was denied. In February, however, it was said that he was in desperate straits for money and his troops would soon desert unless their arrears were paid. To forestall the placing of a foreign loan, the Nationalist leaders sent a circular to all the legations saying that they would not recognize any loans accorded to the Shah. It had been reported earlier in the year that the Shah intended to re-establish constitutional government and had appointed a Liberal as Minister of Foreign Affairs. Later it was said that he would introduce reforms and grant a limited measure of constitutionalism as soon as order was restored. But finally he found it necessary to make further concessions. On May 5 he signed a rescript declaring that a reorganization of the administration by constitutional means was necessary and appointing July 19 as the date for the election of a representative assembly. In two proclamations he announced that the constitution would again go into force and that political amnesty was granted. Thirty members of the constitutional party were added to the Cabinet in order to frame the new electoral law.

These concessions, however, were not sufficient for the Nationalists, who from past experience were very distrustful of the Shah's promises and who found matter of complaint in the Shah's appointments, and in the conduct of the Russian troops at Tabriz, and insisted on a number of radical changes. In June the draft of the new electoral law was finished and submitted to the provinces. The Mejliss was to consist of 120 members. Each town and province constituency was to elect three times the number of its representatives and from these intermediate bodies of electors the members of the Mejliss were to be chosen. Meanwhile, in spite of the Shah's constitutional policy, the Nationalists were preparing to march on the capital. Two columns, consisting chiefly of the Bakhtiari, were converging on Teheran, one from the north, comprising the Nationalists from Tabriz and Kazvin together with some revolutionists from the Caucasus, and the other from the

south, from the region adjacent to the capital. The representatives of the British and Russian legations met the advancing Bakhtiari on July 4. The latter made the following demands: The new Cabinet must be chosen by the Anjumans and the provincial governors must be approved by them; the Russian troops must leave the country and the Shah's irregulars be disarmed; the Ministry of War must control all the Persian forces. The Shah would not grant all these demands and the advance continued. The Cossacks prepared to oppose the invaders and a serious battle was apparently imminent; but the defenders were not numerous enough to guard all the approaches into the city and on the night of July 13 a large body of the Nationalists and Bakhtiari entered the capital without opposition and occupied the Mejliss and all the northern part of the city. It was not known why they were permitted to make this unobstructed entry and in some quarters it was suspected that treachery among the Shah's forces accounted for it, but the people were enthusiastic supporters of the Nationalists and this fact in connection with the small number of the Shah's guard may be a sufficient explanation. Some fighting occurred on Tuesday and Wednesday, but it was of slight importance. After two days had passed in negotiations, the Shah took refuge at the Russian legation.

Terms of peace were arranged between the Nationalist force and the Cossacks, who were thenceforth to be under the Ministry of War. The Nationalists immediately constituted the National Assembly, which deposed the Shah, unanimously chose as his successor his favorite son, Ahmed Mirza, a child of eleven years of age, and appointed as regent a man of known liberal sympathies and popular with the Nationalists, namely Azad-ul-Mulk. The young Shah was proclaimed on July 17, and on the following day formally acknowledged by the members of the National Council. It was arranged that the ex-Shah should receive a pension, which was finally fixed at 100,000 tomans, for his life and that he should not remain on Persian soil. He left the Russian legation on September 9 on his way to Europe. On August 4, General Liakoff returned to Russia. On the approach of the crisis Russian troops from the Caucasus had been dispatched to Kazvin to await the turn of events and to march on Teheran if war broke out between the Nationalists and the Shah's forces. As it turned out, their interference was not necessary and it was announced that they would soon return to Russia.

UNDER THE NEW GOVERNMENT. The general condition of the country continued to be greatly disturbed. Raids of tribesmen were reported in the Tabriz region in August and in some of the Armenian villages of the Karu Dagh. In parts of the country a condition of anarchy prevailed and in October disturbances were reported at Yezd and Zimjan. No definite details could be secured in regard to these reported disturbances. Early in November news came that Ardebil had been captured by a body of tribesmen, who co-operated with a force of reactionaries under Rahim-Khan, who was said to be the champion of the ex-Shah, and a force was dispatched from the capital and from Tabriz which together amounted to about four thousand men. The Russians had reinforced the

consular guard there, which was to defend the town until the government forces arrived. The tribesmen and Rahim-Khan left the city after negotiations. On their way to Ardebil the government troops encountered a force of anti-constitutionalists and after eleven hours of fighting defeated them and took four hundred prisoners. From the dispatches in regard to these events, it was impossible to determine to what extent these risings were due to a desire to restore the Shah or to a mere lust for plunder. The Russians subsequently withdrew their force from Ardebil. The elections for the new Majlis took place in October. The Majlis was opened on November 15 under Shah Ahmed and in the speech from the throne administrative reforms were promised. The speech declared that the presence of the foreign troops was the only menacing feature in Persia, and that it was hoped that they soon would be removed. On December 7 the Majlis voted unanimously for the government's plan of borrowing money abroad and employing Europeans as advisers in the reorganization of the finance department; and application was subsequently made to the British and Russian legations for a loan of £500,000. An attack having been made on the Russian Consul-General at Bushire, near Shiraz, the government in November expressed its regret to the Russian representatives and announced that troops would be sent there to maintain order. There were reports later of disturbances at Shiraz.

For an account of the earthquakes occurring in 1909, see EARTHQUAKES.

PERU. A republic on the Pacific Coast of South America, between Ecuador and Chile. The capital is Lima.

AREA AND POPULATION. Neither Peru's territorial extent nor its number of inhabitants is definitely known. The area has been stated at about 440,000 square miles, though some estimates place it at nearly 700,000 square miles. There are several unsettled boundary disputes. Population estimates vary from less than 3,000,000 to more than 4,600,000. Probably more than half of the inhabitants are Indians, many of them uncivilized, and a large part of the remainder mestizos. The population of the larger cities in 1908 is given as follows: Lima, 140,884 (including 5522 Chinese and Japanese); Arequipa, 35,000 to 40,000; Callao, 31,000; Ayacucho, 14,346; Cuzco, 10,000 to 15,000; Iquitos (district), 12,000; Cerro de Pasco, 10,000; Huaura, 7646; Huacho, 6283. Immigration, which is small (although recently there has been a noticeable increase in the number of Japanese immigrants), is encouraged by the government. A decree of May 14, 1909, prohibits the immigration of Chinese having less than 5000 soles in cash.

Primary instruction is free and nominally compulsory. The President's message, July 28, 1909, stated that in the preceding year the primary schools numbered 2339, with 3105 teachers and 162,298 pupils. Normal schools and, in the departmental capitals high schools, are maintained by the government. Institutions for higher, technical, and professional education are established at Lima, Cuzco, Arequipa, and Trujillo. The budget estimate for public instruction in 1908 was 842,440 soles. In Lima and some of the other principal towns there are private schools under the direction of European teachers. The state religion is Roman

Catholicism, and the public exercise of other religious forms is unlawful.

MINING. The exploitation of minerals occupies first place among Peru's sources of wealth. Mineral production in 1907 was valued at 34,990,570 soles, against 26,105,740 soles in 1906. In 1907 the copper output was valued at 17,092,750 soles; silver, 12,299,510; crude petroleum, 2,504,400; coal, 1,060,000; gold, 932,290; lead, 346,890. Other mineral deposits include nickel, zinc, mercury, iron, bismuth, salt, borates, sulphur, cobalt, borax, and antimony. At the head of the mineral-producing sections is the Department of Junin, embracing the celebrated Cerro de Pasco district; its output of silver in 1907 amounted to 108,026 kilos; copper, 17,151 tons; lead, 4970 tons, and coal, 169,368 tons. Recent developments in copper-mining have been particularly numerous and important, although in 1908 mining operations suffered temporarily from the fall in the price of copper and silver. Valuable coal measures, which hitherto have been practically useless on account of the lack of transportation facilities, are now being developed by a London syndicate; a railway is being constructed from Chimbote to the coal fields, which it was expected in 1909 would be reached early in the following year upon the completion of 81 miles of the line. At the beginning of 1908 there were in operation 177 mining camps, with 16,936 employees. Peruvian mines are exploited and managed very largely by Americans. Metallurgical plants in operation are reported to the number of 89, of which 19 are for amalgamation, 32 for lixiviation, 23 smelters, and 12 combination. There are also two petroleum refineries and one for sulphur.

AGRICULTURE. The leading crops are sugar, cotton, coffee, and rice. Cacao cultivation is extending. Other products are tobacco, wine, wheat, corn, olives, rubber, ramie, and cotton. The leading products in 1907 are reported as follows: Sugar, 141,193 tons, valued at 11,247,230 soles; rubber, 9,545,820 soles; cotton, 14,484 tons, 5,844,410 soles; wool, 4203 tons, 4,566,690 soles; coffee, 1108 tons, 421,060 soles. The annual rice production is about 30,000 tons. Peruvian rubber is gathered in the eastern forest regions and shipped from Iquitos down the Amazon. The rearing of wool-bearing animals—sheep, alpacas, and llamas—is increasing importance, and the introduction of Patagonian sheep for cross-breeding is one of the recent developments of the industry. **IRRIGATION.**

MANUFACTURES. Manufacturing industries except in the treatment of mining products, has not yet attained importance. Native industries include hat-plaiting and the weaving of coarse woolen blankets. There are five cotton factories and five woolen factories, consuming annually about 3000 tons and 600 tons of raw material respectively. For the manufacture of coca 24 small factories are in operation, with an aggregate product in 1907 of 5914 kilos, value at 666,300 soles. On a small scale there also manufactures of beer, cigars, clothing, matches, candles, olive oil, soap, cotton-seed cake, saddlery, and furniture.

COMMERCE. Imports and exports have been valued as follows, in soles:

	1906	1907	1908
Imports.....	49,990,460	55,147,870	52,851,500
Exports.....	17,885,670	67,477,320	53,777,000

Detailed statistics of the articles of trade are not available later than 1906. For that year the values of the leading imports are reported as follows: Minerals and metals (exclusive of coal), 10,391,690 soles; cotton goods, 6,060,060; wheat, 2,665,170; coal, 2,323,310; woolen goods, 2,320,770; timber, etc., 2,210,610; machinery, 2,088,510. The leading exports in 1906 were valued: Sugar, 14,151,460 soles; minerals and metals, 11,880,880; gums, resins, etc., 10,378,720; wool, 5,197,510; cotton, 4,708,250; guano, 3,616,520. For 1907 imports from and exports to the countries commercially most important are stated as follows, in soles:

Countries	Imports	Exports
Great Britain.....	16,341,290	24,339,130
United States.....	11,646,670	13,671,060
Germany	8,984,330	8,669,570
Australia	8,184,620
France	2,919,580	4,627,770
Belgium	2,599,100	2,685,710
Chile	2,471,240	5,731,930
Italy	1,816,210	50,940

COMMUNICATIONS. In 1908 the length of railways open to traffic was 1471 miles, of which 844 miles were operated by the Peruvian Corporation. The Central Railway extends from Callas to Oroya (140 miles), with a branch from Oroya to Cerro de Pasco (68 miles), and another to Huancayo. The Southern Railway runs from the port of Mollendo to Puno, on Lake Titicaca (324 miles), connecting there with a line of steamers running to Guaqui, Bolivia; from Juliaca, near the lake, a branch extends to Sicuani (125 miles), and thence to Cuzco an extension was completed in September, 1908. Other railways in operation comprise spurs running from minor ports up the various river valleys; in 1909 a line from the port of Ilo to Moquegua was completed. In 1909 several railways were under construction, including a line from Huancayo to Ayacucho (part of the Pan-American Railway), from Chimbote (through the coal region) to Recuay, from Lima to Huacho, from Tumbes to Puerto Pizarro, and from Yonan to Chilete. A railway is projected from Cerro de Pasco to Ucayali, and another from the Pacific port of Paita to Marañon, in the Amazon basin. Post-offices in 1909 numbered 613, and telegraph offices, 178, with 5988 miles of line. Excellent steamship service is maintained at the Peruvian ports, chief of which is Callao.

FINANCE. Gold is the standard of value. Ten soles comprise one libra, which is equivalent to the pound sterling, or \$4.8665. Revenue and expenditure have been as follows, in soles, for fiscal years ended May 31:

	1906	1907	1908
Revenue.....	25,277,660	26,792,660	29,974,330
Expenditure..	21,782,520	21,070,410	30,430,320

The sources of revenue in the fiscal year 1908 were: Customs, 13,623,020 soles; taxes, 9,480,200; salt monopoly, 1,450,000; posts and telegraphs, 1,015,000; various, 4,405,210. In the same year expenditures were: War and marine, 5,041,690 soles; interior, 4,312,350; justice and instruction, 4,286,220; finance and commerce, 4,229,380; fomento, 3,049,777; Congress, 1,016,110; foreign affairs, 481,530; extraordinary,

8,013,270. The estimated expenditure for the fiscal year 1909 was 30,011,930 soles. For the following year the estimated revenue and expenditure were 30,759,860 soles and 31,999,910 soles respectively. Of the estimated receipts for 1910 the following were the principal items: Customs, 14,421,500 soles; taxes, 8,192,360; spirituous liquors, 3,800,000; tobacco, 2,000,000; salt monopoly, 1,800,000.

In January, 1890, Peru was released from its foreign debt, in consideration of extensive concessions (including the state railways, and certain rights over guano deposits, the Cerro de Pasco mines, and vast tracts of lands), to the bondholders, who constitute the Peruvian Corporation. The terms of the contract were not satisfactorily carried out by either the government or the Corporation, and on April 2, 1907, an agreement was reached annulling, in part, the contract of 1890, and providing for the payment by the government to the Corporation of 800,000 soles annually, in monthly installments, for 30 years, beginning in July, 1907. The Corporation lease, originally 66 years, was extended by 17 years. In 1906 a German loan of 6,000,000 soles, guaranteed by the salt tax, was contracted for the purchase of armaments. In the spring of 1909 a loan of 4,000,000 was contracted, guaranteed by the internal-revenue tax on alcoholic liquors, the proceeds in the main to be applied to existing debts. The internal liabilities consist of a debt amounting to 26,606,450 soles, at one per cent., and a non-interest-bearing debt of 4,713,550 soles.

ARMY. Every citizen of Peru is liable for military service by the law of December 10, 1898, from his 19th to 50th year. From 19 to 23, service is with the regular army or on the supernumerary, from 24 to 30 in the first reserve, and from 31 to 35 in the second reserve, and those from 36 to 50 in the National Guard. The regular army, which is the active army in time of peace, has an effective strength of 4000 men. There are six battalions, of four companies each, of infantry, six squadrons of cavalry, each of two half squadrons, a regiment of artillery divided into two 4-gun mountain batteries, a section of two 4-gun field batteries, a section of foot artillery for coast defense, and a company of engineers. A reorganization was in progress in 1909. In addition to the regular army it was estimated that a force of 80,000 could be mobilized, but the majority would be deficient in military training.

GOVERNMENT. The executive authority is vested in a president, who is elected by popular vote for a term of four years, and is assisted by a cabinet of six members. The legislative power devolves upon a congress of two houses, the Senate (51 members, elected for six years) and the House of Representatives (116 members, elected for six years). The President in 1909 was Augusto B. Leguia, who was installed September 24, 1908.

HISTORY. An attempt was made by the revolutionary partisans of Pierola to get possession of the government, and at the end of May they seized President Leguia, but he remained in their hands only an hour. Loyal government forces attacked the revolutionists, secured the person of the President, took some prisoners and scattered the rest. Order was soon restored. The Argentine government rendered its award in the boundary dispute between Bolivia and Peru in July. The dispute concerned the

stretch of territory between longitude 02 and 78 degrees West, and latitude one degree North and 12 degrees South. For the possession of parts of this region there had been repeated contests between the South American States for many years, which resulted in numerous treaties and redefinitions of boundary lines. Bolivia, as Peru's ally in the war with Chile, had lost her part of the territory, which deprived her of her coast line and made her an inland country. Bolivia also lost in turn by the treaty of 1903 with Brazil, giving up her claim to the greater part of the Acre territory. In 1902 a general arbitration treaty was agreed upon between Bolivia, Peru and Argentina for the settlement of all boundary disputes, and in the same year Peru and Bolivia agreed to refer their boundary dispute to the Argentine President. President Alcorta's decision, rendered in July, was largely in Peru's favor, granting her the best part of the territory, including rich rubber forests. Riots followed the announcement of the decision in the Bolivian capital, and feeling ran very high against the Argentine and Peruvian representatives. The Bolivian government refused to abide by the decision, alleging that the territory in dispute had not been inspected, and that the judgment was based on spurious documents. The situation was growing more and more strained, but the Bolivian government finally announced that it would accept the decision, rendered an apology to Argentina for the riots, and declared that it would enter into direct negotiation with Peru over any matters of dispute that remained. A protocol between Bolivia and Peru was signed in September. See *ARBITRATION, INTERNATIONAL, and EXPLORATION.*

PETROLEUM. During 1908 a study was made by the National Conservation Commission of the stock of petroleum in the known fields of the United States, and from this estimated total supply, the probable duration of the oil fields was calculated from the present increasing rate of production. From this investigation it was shown that in each nine years as much petroleum was produced as in all the preceding years. The enormous production of 1907-8 was at a still greater rate than that required to keep up this ratio of increase, although the product of production since 1900 is almost equal to all the preceding product since the beginning of the industry. In all nearly two billion barrels have been produced in 49 years, worth \$1,750,000,000. The total production in 1908 was 179,572,479 barrels with a value of \$129,706,258, as compared with a production of 166,095,335 barrels with a value of \$120,106,749 in 1907. The average price per barrel in 1908 was \$.722, as compared with \$.723 in 1907. The rank of the oil-producing States as regards quantity produced remained in 1908 practically the same as in 1907. While this was true, the rate of increase in California was so much greater than in the ranking State, Oklahoma, that California came within 1,000,000 barrels of first place, and the increased rate of production continued in 1909. California's product in 1908 exceeded the product of Oklahoma in 1907. In percentage of increase, however, Illinois exceeded either of the other great producers. For the production of the various States, including those mentioned, see paragraphs on *Mineral Production* under these States.

The consumption of fuel oil by railroads in 1908 continued in about the same proportion as

in 1907, with the addition of the Chicago, Rock Island and Pacific Railroad operating in Kansas and Oklahoma. The consumption of fuel oil by all railroads in the country in 1908 aggregated 10,889,070 barrels, as compared with 18,855,891 barrels in 1907. In the production by fields in 1908, the Mid-Continent field led, with 48,323,810 barrels; the California field was second, with 44,854,737 barrels. The total number of wells completed in all the fields in 1908 was 16,909, of which 13,210 were oil wells, 485 were gas wells, and 3214 were dry wells.

According to reports of the United States Geological Survey, a remarkable rate of increase in the production of petroleum which extended over 1907 and 1908 was checked in 1909. The total production in the United States in the latter year is estimated between 173,000,000 and 178,000,000 barrels, as against 179,572,479 barrels in 1908. The decrease was less than had been expected in view of the great accumulation of stocks during the preceding year. This accumulation occurred entirely in the States east of the Rocky Mountains that have no trade connection with California. This State, therefore, showed a great gain in which nearly all the pools participated. As a result of this, California now stands first in oil production, producing fully 10,000,000 barrels more than Oklahoma, which ranked second, and in 1908 ranked first. Developments begun in 1908 continued with increasing rapidity in 1909, many sections producing wells of large capacity (see CALIFORNIA). In Oklahoma the strenuous efforts of the Producers' Association to suspend drilling operations were successful to the point of reducing production, and even stocks. Transportation facilities improved throughout the year. Kansas continued to decline in the production of both petroleum and natural gas.

PRODUCTION OF CRUDE PETROLEUM IN THE UNITED STATES

(In Barrels of 42 Gal.)
(Engineering and Mining Journal.)

Field	1908	1909
California	45,000,000	58,250,300
Colorado	411,836	*500,000
{ Gulf, Texas	11,206,464	9,593,000
{ Louisiana	6,835,130	3,192,000
Illinois	38,844,899	29,500,000
{ Lima, Indiana	7,287,000	6,192,000
{ Ohio		
Mid-continent†	50,741,678	46,826,196
Kentucky-Tennessee	1,250,000	*1,250,000
Appalachian†	24,240,000	25,394,200

Total	184,711,413	180,717,696

* Estimated.

† Kansas and Oklahoma.

‡ Pennsylvania, New York, West Virginia and eastern Ohio.

The figures for the production of 1909 given by the *Engineering and Mining Journal* are a trifle larger than the product estimated by the United States Geological Survey. According to the former authority, the production in 1909 was 180,717,696 barrels, a decrease of about 2 per cent. over the production of 1908. The oil fields of Texas and Louisiana showed a greatly decreased production in 1909. Every large pool, except Caddo, recorded a smaller output than that for 1908. The dissolution of the Waters-Pierce Company by the Federal government was an important happening in 1909. (See TEXAS.)

See also STANDARD OIL Co.) Illinois produced in 1909 only about 75 per cent. as much petroleum as in 1908. The Appalachian field, however, had a slightly increased output. The preceding table taken from the *Engineering and Mining Journal* indicates the production of crude petroleum in the United States in the various fields in 1908-9. See CHEMISTRY, INDUSTRIAL.

PETROLOGY. See GEOLOGY.

PETROSINO, JOSEPH. An Italo-American detective, assassinated in Palermo, Sicily, on March 13, 1909. He was born in the province of Salerno, Italy, in 1861, and came to the United States in 1865. He entered the police department of New York City in 1883, and after several years' service was made a detective. His knowledge of Italian and Sicilian criminals and his familiarity with their methods and characteristics made him a valuable agent for the detection of the criminals of these nationalities. He did notable work in discovering the perpetrators of many atrocious crimes. In 1905 a squad of detectives was established to deal especially with the blackmailers and murderers of the so-called "Black Hand" associations, which were composed chiefly of Sicilian outlaws and fugitives from justice. Petrosino was made chief of this squad, and he took up the work with a zeal and courage that continued until his death. He obtained the conviction of many of the leaders of the "Black Hand" societies, and, in doing this, incurred the violent hatred of the members of these bodies. In 1909 he went to Sicily on a secret mission, supposedly to study the emigration of criminals to the United States, and to bring about its cessation. In the performance of this duty he was shot in the Piazza Marina, Palermo, on the night of March 13. The assassin was not discovered. Petrosino was a power among the Italians of New York City, and was highly respected by his superior officers, and by those with whom he came in contact. His funeral was a public one and one of the most notable ever seen in New York City. It was attended by the mayor and other high officials, and the city flags were placed at half-mast.

PHILIPPINE ISLANDS. A colonial dependency of the United States, the most northerly group of the Malayan Archipelago. The total number of islands is 3141, the area of the total land surface is 115,026 square miles, and the total population, according to the census of 1903, was 7,635,426, of whom 647,740 were wild peoples. The average density of the population was 67 per square mile. The area and population of the most important islands are given in the accompanying table:

Island	Area in sq. miles	Popu-lation	Pop. per sq. m.
Bohol	1,441	243,148	169
Cebu	1,762	512,247	336
Cebute	2,722	357,641	131
Uzon	40,969	3,798,507	93
Marinduque	352	50,601	144
Masbate	1,236	29,451	24
Indanao	36,292	499,631	14
Indoro	3,851	28,361	7
Egros	4,881	460,776	94
Alawan	4,027	10,918	3
Inay	4,611	743,646	161
Tamar	5,031	222,690	44

In 1907 the Bureau of Health took a census of Manila, which showed the population to be 223,542, as against 210,941 given by the official census in 1903. There was an increase of 18 per cent. in the number of Americans, 2 per cent. in the number of Filipinos, 14 per cent. in Spaniards, and 27 per cent. in other nationalities. The Chinese population showed a decrease of 15 per cent.

MINERAL RESOURCES. The Bureau of Science at Manila undertakes each year the preparation of an annual report of the mineral resources and production of the islands. The latest report available is that for 1908. From this publication it has been found that coal has been discovered in nearly every island on the archipelago, in many places associated with petroleum. This coal is sub-bituminous, having the appearance and specific gravity of lignite, but the carbon content and streak of the bituminous coal. Petroleum occurs on the seacoast of Tayabas province, and natural gas is found in Rizal province, and on the island of Marinduque. Cement, lime, building stone, abrasives, gypsum, phosphate, sulphur, salt, and mineral paints are among the other non-metallic minerals found in the islands. The most important of the metallic mineral resources of the Philippines is gold. It is found in most of the provinces of the Archipelago, but chiefly in the provinces of Benguet, Masbate and Ambos Camarines. The gold product in 1908 was 10,510 troy ounces, valued at \$200,000. This was a gain of over 100 per cent. over the production of 1907. The production in 1909 was estimated at 9000 fine ounces, valued at \$186,100. In addition, silver is found in the provinces of Benguet and Lapanto. Silver-bearing galena also occurs in Cebu, Marinduque and Ambos Camarines, but none of these deposits has as yet been developed. The silver production of 1908 was 2350 troy ounces. Copper ranks second among the mineral resources of the island, but practically none has been produced since the American occupation. This is due to the absence of smelters on the islands, and to the difficulties of transportation from the mountain regions where the ore has been found to the nearest port where the product can be shipped to foreign ports. Lead and iron exist in various places, but there has been no development in the mining of these minerals since American occupation. There are large deposits of excellent iron ore in the provinces of Bulacan and Rizal, but the difficulties of transportation and the lack of native coking coal have prevented the incoming of sufficient capital for production on a large scale. Among other minerals known to exist are kaolin, phosphate, salt and mineral waters. Clay, guano and other minerals are also found. Few of the better class of Filipinos take any interest in the development of the mineral resources of their own country. They are almost absolutely ignorant about mining and are apparently apathetic in regard to it.

AGRICULTURE. Owing to economic and other conditions the agricultural resources of the Philippines have not been developed as rapidly as their great extent would justify. It is believed, however, that as a result of the tariff revision made in 1909 and the passage of the Philippine tariff bill (see below) there will be a considerable increase in agricultural development. The chief agricultural products of the islands are abaca, mineral hemp, the fibre of a

fruitless variety of banana plant; cocoanuts, generally in the form of dried cocoanut meat called copra; sugar, exported in a form having the lowest degree of polarization known in commerce, and tobacco, exported in leaf, also in cigars and cigarettes. In addition to these, and in excess of most of them, except hemp, is rice, which constitutes the staple food of the inhabitants. In the first few years of the American occupation, owing to the insurrection and the continuance of guerilla warfare, and the prevalence of ladronism, many of the rice fields of the island lay idle and the importation of rice reached \$12,000,000, gold, or about .4 of the total imports. After the restoration of better conditions, the production of rice increased so that the amount imported in 1907 was only \$3,500,000, gold. Among other products are maguey and sisal corn, coffee, cacao, garden truck and fruits. The hemp industry suffered a considerable decline in 1909, as a result of the low price of manila hemp, and as a result, while the exports for the year were 147,621 tons, or 33,618 tons more than in 1908, this greatly increased quantity was marketed at a value of \$1,478,181 less than that received for the export production of 1908. The export of sugar in 1909 amounted to 110,604 tons, a reduction of 38,718 tons over the production of 1908, and of \$1,291,328 in value. The average price for the year was, however, slightly greater than that of 1908. There was much good land available for sugar cultivation in the Philippines, but there is very little of it as good as that of Cuba, and the amount of capital involved in developing it is so great that the possibility of a great extension is quite remote. Under the new tariff law, sugar to the amount of 300,000 gross tons was to be admitted to the United States free of duty. It is believed that this will result in a considerable increase in the amount of land cultivated for sugar. The value of the copra exported in 1909 was \$6,657,740, and the quantity, 103,896 tons, as compared with 75,211 tons in 1908. The average price was slightly less than in 1908, and the total crop showed an increased value of \$1,196,080. The provision of the new tariff in regard to tobacco resulted in an immediate increase in the quantity of cigars and other forms of manufactured tobacco exported to the United States. The figures for the calendar year were not available at the end of the year, and the figures for the fiscal year do not show the increase which came later. For the fiscal year the imports of tobacco amounted to \$2,792,253, as compared with a value of \$2,714,456 in 1908. There was a substantial increase in the quantity of maguey produced, but in the value of the cocoanut oil it exported there was a reduction. Coffee was formerly grown in considerable quantities in the islands, but efforts to produce it have been abandoned and hemp has been substituted as a more profitable crop. The development in agriculture during the American occupation has been delayed by a series of destructive typhoons, and also by an epidemic of the rinderpest, which carried off in two or three years 75 or 80 per cent. of the draft animals of the islands. For experiments carried on by the United States Department of Agriculture in the islands, see AGRICULTURAL EXPERIMENT STATIONS.

COMMERCE. The value of both Philippine imports and exports for the fiscal year ending June 30, 1909, fell somewhat below the average

of recent fiscal years. The imports amounted to \$27,792,397, and were \$3,125,960 less than in 1908, while the export total of \$30,993,563 was smaller by \$1,823,004. The uncertainty of pending tariff legislation toward the close of the year affected the export total to some extent in consequence of the important bearing of that legislation on sugar exports, tariff disturbance of trade appears to have figured to no important degree, and the general condition as indicated by the year's figures is to be explained rather by the widespread commercial depression which existed throughout the world.

The cotton trade of the islands for the year amounted to \$6,944,978. There was a reduction of \$1,066,856, as compared with 1908. All the leading classes of these imports figured with reduced totals, and all leading countries in this trade shared in the general decline except Japan, which took rank second to Great Britain. The imports from the United Kingdom amounted to \$3,499,452, as compared with \$4,161,487 in 1908, while purchases from Japan increased from \$515,615 to \$662,019, and those from the United States declined from \$685,919 to \$590,635.

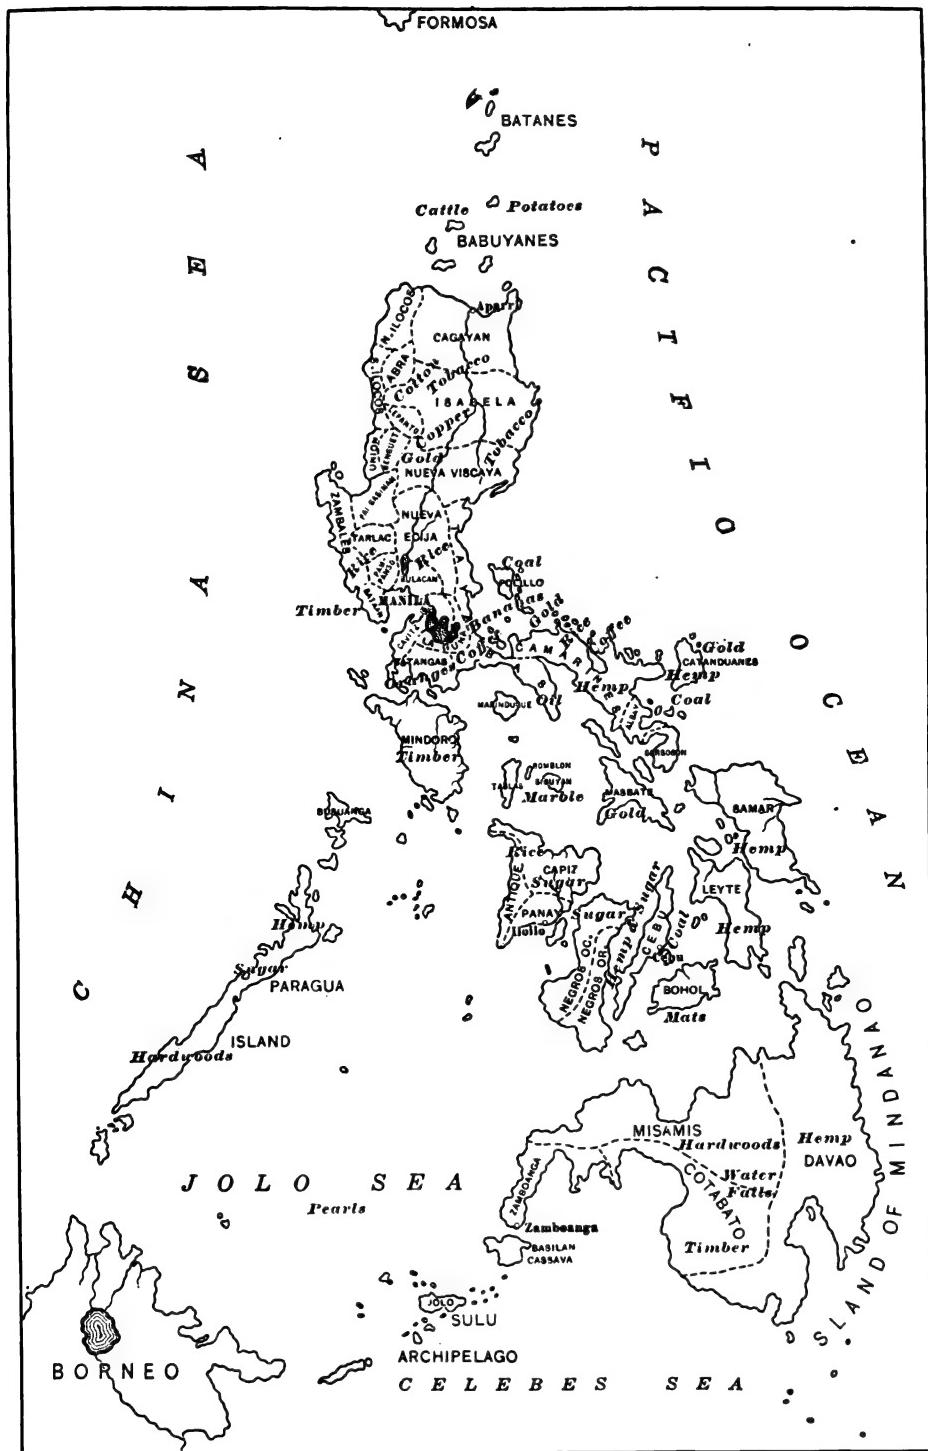

The iron and steel trade was smaller by \$231,232, but the total imports from the United States slightly increased, amounting to \$818,991 of the total of \$1,933,475, while the United Kingdom and Germany, the only other competitors of any importance, bore the chief part of the year's decline.

Imports of coal declined in value from \$567,220 to \$461,465, though prices in the Australian market, from which the supply chiefly comes, averaged substantially the same. Recent active exploitation of Philippine coal mines presents a factor of growing importance in connection with declines in this trade.

A notable exception to the general reduction in the year's trade was in the group of meat and dairy products. In all of the leading items of this group, increased import values were recorded. Fresh beef reached the unprecedented figure of \$825,461, or \$372,904 more than 1908. This increase was, however, offset in large measure by a decline of \$300,000 in cattle imports, coincident with active quarantine and restrictive measures against the importation of diseased and infected cattle.

The total value of exports for the year was less than for any fiscal year since 1904, and in the net reduction of \$1,823,004, as compared with the figures of 1908, both the great hemp and sugar industries figured largely, exports of copra substantially increased, and tobacco made slight gains, while in the miscellaneous group of minor products there was a very general decline in values. The worst feature in the export trade was the low price of Manila hemp. The market conditions of this great staple—exclusively the product of the Philippines—were characterized by heavy shipments and steadily declining prices throughout the year. Export production reached the highest figure since American occupation, while prices averaged the lowest since 1899. The total exports for the year were 147,621 tons, or 33,618 tons more than for 1908, and yet this greatly increased quantity was marketed at a value \$1,478,181 less than that received for the exports of 1908.

Exports of sugar in 1909 amounted to 110,604 tons, a reduction of 38,718 tons, and of \$1,291,328 in value, as compared with those of 1908.

MAP SHOWING THE NATURAL PRODUCTS OF THE PHILIPPINE ISLANDS

The smaller quantity of sugar marketed during the year was at a somewhat higher average price than that of 1908. The returns for the fiscal year, however, are not a very trustworthy index to production in the sugar industry. The crop is more coincident with the calendar year. The prospective tariff legislation providing for the free admission of sugar into the United States tended to accumulate and hold back stocks awaiting Congressional action. Exports to the United States were 20,948 tons.

Copra in 1909 ranked second in export value to hemp with a value of \$6,657,740. The average price was slightly less than in 1908, but the quantity increased from 75,211 tons to 103,896 tons, with an increased value of \$1,196,000. The greater part, as usual, found a French market, with Spain second. Exports to the United States are relatively unimportant, although there was an increase in 1909 over 1908.

Exports of tobacco in its various forms amounted to \$2,792,253. The value of the cigar trade was \$1,083,702, or almost the same as in 1908, but leaf exports showed a slight increase both in quantity and average price.

The share of the United States in the import trade of the islands amounted to \$4,691,770, and was \$387,717 less than 1908. Nearly half of the year's total was made up of leather, iron and steel, and of the two great American export staples, wheat flour and illuminating oil, while the balance was widely diversified. American goods constituted 17 per cent. of the total value of Philippine imports. That under the free trade conditions inaugurated by the new tariff of August 5, 1909, there will be a considerable increase in the volume of American shipments is to be expected, but to what extent the Philippine market will be supplied by the United States will depend upon how far the tariff differential will go toward compensating for the higher cost of American production in competition with other countries entrenched in the trade, and the extent to which the American manufacturer will press his opportunity and adapt his products to the native taste and requirements.

Of the year's exports, the United States took only a slightly smaller value than in 1908, and was credited with \$10,215,331. The large American demand for hemp has made the United States a good customer of the islands in the past, while limited free entry of Philippine sugar and tobacco, provides a much improved market for these staples, and free admission of other commodities furnishes a new stimulus to their production. A new era of activity and an increased volume of trade is, therefore, to be expected with the lapse of the restraining clause of the treaty of Paris and the establishment of practically unrestricted commercial conditions between the two countries.

The table given in the next column indicates the imports and exports from the Philippine Islands by countries for the fiscal years 1907, 1908 and 1909.

EDUCATION. The public educational work in the Philippines is carried on by the Secretary of Public Instruction, and is performed through the Bureau of Education, at the head of which is the Director of Education. The Archipelago is divided into 36 educational divisions, each in charge of a Division Superintendent, embracing in all 460 school districts, each in charge of a supervising teacher. The total number of

schools in operation during the fiscal year 1909, were as follows: Primary schools, 4194, an increase of 493 over 1908; intermediate schools, 193; secondary schools, 37; total, 4424, as compared with 3932 in 1908. The arts and trades, normal, domestic science, agricultural, and special insular schools are included in intermediate or secondary schools. The teaching force maintained directly by the Insular government is approximately 1601, of which 825 are American teachers. The force of Filipino insular teachers was increased during the year to 786, of whom 662 were men and 124 were women. Of the men, 113 were engaged in district supervision; three men and one woman were giving secondary instruction, and 158 men and 50 women were teaching in intermediate schools, while 388 men and 78 women were teaching in primary schools.

The total enrollment during the school year was 570,502, as compared with 486,676 in 1908. Of those enrolled, 350,643 were boys, and 291,859 were girls. The average enrollment by month during the school year was 405,478, and the average monthly attendance was 321,415. By act of the Philippine Legislature, the sum of 3,300,000 pesos was appropriated for current expenses of the Bureau of Education during the fiscal year 1909. For the work of the fiscal year 1910, 3,275,000 pesos were appropriated. During the last two years there were either built or purchased by the government two provincial high schools, 22 domestic science, 10 agricultural schools, 18 schools of arts and trades, 101 intermediate schools and 548 primary schools.

School work among the non-Christian peoples

of the Philippines was continued in 1909 with decided success. For this work, 70,000 pesos were appropriated by the legislature. Schools for the Negritos, of whom there are estimated to be from 25,000 to 30,000, were opened in the provinces of Zambales and various other points in the islands. In these schools are taught reading, writing, knowledge of money values and simple business figuring. Schools were also started among the primitive Malayan people, among the Visayan islands and in Northern Mindanao. Industrial boarding schools and village primary schools were established among the Igorotes and other island people of Northern Luzon, of whom there are several hundred thousand. As fast as the native boys can be trained as teachers the village schools will be opened in the different communities. Among the subjects taught to the Igorots are basket-making, truck gardening, pottery, blacksmithing, carpentry, cloth weaving and brass casting.

POSTS AND TELEGRAPHHS. On June 30, 1909, 553 post-offices were in operation, as compared with 540 at the beginning of the fiscal year. A free delivery municipal letter carrier service has been established in 35 municipalities. There were 79 money-order offices at the end of the year, an increase of 11. There were on June 30, 1909, 5161.2 kilometres of Insular telegraph lines, 3325.6 kilometres of telephone lines, and 1861.67 kilometres of cables. The total length of Insular telegraph, telephone and cable lines at the close of the fiscal year was 10,348.47. At the close of the fiscal year 1909 there were 251 postal savings banks in operation, a net increase during the year of six. There were 8752 accounts, as compared with 5389 at the beginning of the fiscal year. The amount of deposits in the bank on June 30, 1909, was 1,448,958 pesos, as compared with 1,031,994 pesos on June 30, 1908. Of the 8752 depositors in these banks 4927 were Filipinos.

RAILROADS. During the fiscal year 1909, the Manila Railroad Company completed 8.1 miles of grading; 30 miles of track were laid, and 41 miles of track were opened for operation. Toward the end of the year the railway suffered somewhat from a strike on the part of the engineers and firemen, which lasted for six weeks during April and May. The original concession to this company has been modified so as to require it to construct a line in Luzon to Baguio, and to construct in Southern Luzon the 135 miles necessary to close the gap between the Manila-Patangas line and the Albay line. On the Island of Panay, the Philippine Railway Company, during the fiscal year, graded 17.7 miles, laid 14.9 miles of track, and opened 20 miles of road for operation, making a total of 40 miles now open. The total railroad constructed in the Philippines in kilometres at the close of the fiscal years 1909, was as follows: Manila Railroad Company, 545.8, with 800.1 to be constructed; Manila Electric Railroad and Lighting Company, 39.8, with 5.2 to be constructed; Manila Suburban Railways Company, 9.9, with 10 to be constructed; Tarlac Railway Company, 20.6; Daet Tramway Company, 7.2; Philippine Railway Company, 159.4, with 204.22 to be constructed; Insular Coal Company, 12. The total length of road operated in the fiscal year was 794.7 kilometres, with 1061 to be constructed.

An act of the Philippine Commission created a board known as the Board of Rate Regulation,

for the regulation of rates charged by public service corporations. This board is composed of the Governor-General, Secretary of Commerce and Police, and the supervising railway expert, and the powers given are in general similar to those conferred on the Interstate Commerce Commission by Congress.

PUBLIC WORKS. The following sums were expended during the past fiscal year under the direction of the Bureau of Public Works: Roads and bridges, 5,288,028 pesos; buildings, 1,500,830 pesos; irrigation, 171,602 pesos; artesian wells, 129,345 pesos. This includes almost one-quarter of the entire revenue of the Insular provisional and municipal governments. The length of the first-class roads on June 30, 1909, was 551.5 kilometres, an increase of 156.5 kilometres during the year, and with the Benguet road, making a total of 548.5 kilometres on the islands. At the present time there are nearly 700 kilometres of hard surface roads in the island. During the year 31 steel bridges, with a total span of 1080 metres were constructed, and 203 concrete bridges, with a total span of 2059 metres were constructed. During the year 42 buildings were completed at a cost of 1,141,700 pesos. The greater part of these are of reinforced concrete. The most noteworthy was the general hospital and medical school in the city of Manila, aggregating in cost 1,000,000 pesos. During the past year 50 successful artesian wells were drilled. These wells are very popular in the islands. During 1909 1,239,588 pesos were expended on port works, most of the work being at the Port of Manila, Ilo-Ilo and Cebu. Two steel and concrete wharves of the government, including the sheds were completed in Manila Harbor about June 1, 1909.

SANITATION. During 1909 there were more large sanitary projects and works of public utility completed than during any similar period since the United States took possession of the Philippines. Among these projects was the new gravity water system, the supply for which is collected from an uninhabited watershed. This was sufficiently advanced in November so that the water from this source had been exclusively used in the water mains of the city since that date thus practically insuring the inhabitants of Manila against a serious break of cholera or other grave intestinal diseases. During May the sanitary sewer of the city was ready for use, thus placing Manila in the front rank of Oriental cities in the question of sewage disposal. The capacity of the leper colony was greatly increased, so that will now accommodate about 1900 lepers.

CONSTABULARY. The strength of the constabulary at the close of the fiscal year 1909 was 315 officers and 4573 men. The Director four of the Assistant Directors and three inspectors are detailed from the United States army. The cost of maintaining the constabulary was 3,089,942 pesos.

CITY OF MANILA. By an act of the Philippine Legislature in 1909, a change was made in the government of the city. The advisory board of thirteen members, which was abolished. The municipal board was reorganized, and is now composed of three appointed members, one ex officio member, and two elected members. The operation of the government of this city continued without notable change during the year, the distinctive feature having

a decided advance in the permanent betterment of sanitary conditions. The sewerage system was virtually completed at the end of May, 1909, and the work of making house connections was begun. (See *Sanitation*.) Marked advance was made during the year in the matter of permanent improvements, notably in paving the streets in the principal retail districts, and the construction of permanent bridges of concrete and steel in place of inadequate and temporary structures. The conditions as to public order continued good in the city during the year. A strike of the street railway employees, which was the most important occurrence of this kind, terminated without any serious disturbance. The Cavité Boulevard, as provided in the Burnham plan for beautifying the city, was under construction during the year.

POLITICS AND GOVERNMENT

One of the most important events in the history of the islands since the occupation by the United States was the enactment of the Philippine pine tariff bill by Congress. This bill had the earnest support of President Taft, who was intimate with conditions in the Philippines from his services there as Governor-General. In accordance with this act, goods, except rice, which are the growth, product or manufacture of the United States are admitted into the Philippine Islands free of duty, provided certain conditions are complied with. Similarly, with the exception of rice, all goods, the growth, product or manufacture of the Philippine Islands, may be shipped to the United States free of duty under the same conditions, with the added ones, first, that in any one year the number of cigars is limited to 150,000,000, the wrapper tobacco, and filler tobacco when mixed with more than 15 per cent. of wrapper tobacco, to 300,000 pounds, the filler tobacco to 1,000,000 pounds, and sugar to 300,000 gross tons; second, not more than 20 per cent. of the value of manufactured articles shall consist of foreign materials. This legislation was the result of a continuous effort extending over several years. The Philippine Islands, owing to conditions, were perhaps more in need of special consideration in the matter of tariff legislation than any part of United States territory. While there is a limit as to the amount of the sugar and tobacco, the product of the islands, which may be admitted free of duty to the United States, the limit is well beyond the present capacity of the islands, and admits of a healthy growth of these industries, while still retaining the great advantage of free entry to the United States market for the entire product suitable to the trade. An important result of the enactment of the law was to increase the price paid to the grower for his leaf tobacco from 10 per cent. for the poorer grades to 45 per cent. for the best grades. The price received by the producer of sugar for his product, likewise increased by 25 per cent. In the month of September all exports to the Philippine Islands of American goods was more than double that of the same month in the previous year. This increase was general, including practically every class of goods imported from the United States.

PHILIPPINE LEGISLATURE. The first Philippine Legislature convened for its second session February 1, 1909. Among the important measures passed at this session were the fol-

lowing: An act granting a new concession to construct additional railroad lines in the Island of Luzon; an act creating a code committee to have five years in which to compile and codify the laws of the islands; an act providing for the continuance of Spanish as the official language of the courts for an additional two years or until January 1, 1913; an act providing for the establishment of the province of Batanes; an internal revenue law changing the domestic rates of internal revenue duty on all alcoholic and tobacco products, whether coming from the United States or foreign countries. This act was conditional on the passage of the Payne tariff bill and was made effective by the proclamation of the Governor-General on August 7, 1909. An act was passed providing for the sale of public improvement bonds to the amount of 3,000,000 pesos. During this session 375 laws were introduced in both Houses, of which 47 were introduced from the Commission and 328 were Assembly bills. Of the bills introduced in the Assembly, 119 were passed and received by the Commission. A total of 72 laws were passed by the legislature during the session. On May 15 the legislature elected Benito Legarda and Manuel Quezon delegates to Congress.

MILITARY OPERATIONS. The only military operation of consequence during the year was the pursuit and capture in July of a Moro band of outlaws under their leader, Jikiri. This took place at Batian Island, south of Jolo. This band of outlaws had long given trouble in the Sulu Archipelago and after a sharp pursuit by government forces, they took refuge in a cave. Attempts were made to dislodge them on July 2 and 3. They made a stubborn resistance and it was necessary to exterminate the entire band. Fourteen soldiers engaged were injured and one died of his wounds. On June 15 members of the second company of constabulary at Davao, in the island of Mindanao, mutinied against their commanding officers, wounding one of them. An American planter was also killed. On December 9 fourteen of the mutineers were sentenced to death.

ADMINISTRATION. On November 23 W. Cameron Forbes, who had been appointed Governor by President Taft, was inaugurated at Manila. The day was made a general holiday and the buildings of the city were decorated. Governor Forbes in his inaugural address emphasized the necessity of a stable government. He said that the faith of the United States was pledged, that just and equitable laws, sound and uniform policy, and just and fair treatment in the courts should be assured to the Filipinos. He urged the necessity of interesting foreign capital in the islands. He declared that the development of the Philippines would proceed along the lines originally set forth, strictly adhered to by each successive administration and by the gradual processes in line of declared policy. He said that he was opposed to the admission of Chinese labor. Filipinos, he said, can do all the necessary work if properly paid and properly treated. The government should offer reasonable inducement to capital and should make more liberal the land and mining laws and lessen the restrictions which are at present discouraging investors.

On March 1, 1909, W. Morgan Shuster resigned as Secretary of Public Instruction and Newton W. Gilbert was appointed in his place. Trinidad H. Pardo de Tabera resigned as Com-

missioner on March 1, 1909, and Juan Sumulong, judge of the Court of the First Instance, was appointed to the vacancy thus created. Frank A. Branagan, Treasurer of the Philippine Islands, was appointed a member of the Commission on March 4, 1909. Charles A. Willard and James F. Tracey, Justices of the Supreme Court, resigned, and these vacancies were filled by the appointments of Sherman Moreland and Charles B. Elliot. Dr. William S. Washburn, director of civil service, and J. W. Beardsley, director of public works, resigned during the year and Dr. David P. Barrows, director of education, submitted his resignation, to take effect later. On May 7, James F. Smith, Governor-General, departed from the islands and turned over the duties of his office to Hon. W. Cameron Forbes, as Acting President and Governor-General. Mr. Forbes was appointed Governor-General and was inaugurated as noted above.

PHILOLOGICAL ASSOCIATION, AMERICAN. See PHILOLOGY.

PHILOLOGY, CLASSICAL. Though the sum of the work done in classical philology in 1909 was far from negligible, the progress made was in no instance sensational.

In the field of inscriptions we may note first of all that to *Inscriptiones Graecae* O. Kern has added a volume on Thessalian inscriptions. A new part of the *Inscriptiones Graecae ad res Romanas pertinentes* contains 282 texts dealing mainly with Lesbos and Mysia. Worthy of attention also are H. Lattermann, *Griechische Bauinschriften*, E. Ziebarth, *Aus dem griechischen Schulwesen*, which sets forth the light thrown by epigraphy on the organization, curriculum, and endowments of Greek schools; W. S. Ferguson, "The Athenian Calendar," published in 1908 in *Classical Philology*, and several articles by H. Pomtow, published in *Klio* and in the *Berliner Philologische Wochenschrift*, discussing the history and topography of Delphi, with due regard to the evidence afforded by the inscriptions.

For an annual summary of the results in Roman epigraphy the reader is referred to *L'Année Epigraphique*, edited by MM. Cagnat and Besnier. In recent years the inscriptions found in Africa have been particularly interesting; see M. A. Merlin, *Nouvelles Archives des missions scientifiques et littéraires*, volume xiv. The *Corpus Inscriptionum Latinarum* has been enriched by volume iv. *Supplementum*, which gives wall inscriptions from Pompeii. Three more parts of Olcott's *Thesaurus Linguae Latinae Epigraphiae* appeared; these carry the work down to *apis*.

Neither in the discovery nor in the publication of papyri did the year 1909 vie in interest with some of its recent predecessors. Most important was the publication in Part vi. of the Oxyrhynchus Papyri of some 300 lines, practically complete, of the Hypsipyle of Euripides; this has been described as the most noteworthy addition yet made by the papyri to the remains of Greek tragedy. These verses, which are so widely distributed throughout the play that it is possible to construct with some certainty the plot, have been published separately at Utrecht by van Herwerden, under the title *Euripiatis Hypsipyla Fragmenta*. Parts 1-2 of Volume v. of *Berliner griechische Urkunden*, by W. Schubart, discuss Alexandrian docu-

ments (deeds, contracts, leases) of the time of Augustus. In the *Archiv für Papyrusforschung* Wilcken reviews recent publications of papyri. K. Sudhoff in *Ärzliches aus griechischen Papyrus-Urkunden* brings together documents bearing on medical matters. The new (seventh) edition of Bruna's *Fontis Juris Romani* has made good use of the papyri. W. Otto in *Priester und Tempel* exhaustively studied the organization and position of the Egyptian priesthood in the Ptolemaic and Roman periods.

In paleography, reference may be made to the second edition, much enlarged, of Steffen's *lateinische Paläographie*, described as the best work of its kind for the textual critic. Traube's *Vorlesungen und Abhandlungen* I. gives the history of paleographical studies and an account of the chief libraries with Latin manuscripts. So, too, Weinberger's *Beiträge zur Handschriftenkunde* (Vienna) throws light on libraries containing important manuscripts and gives some account of individual manuscripts. Finally a manuscript of Juvenal not used by any editor of Juvenal, though its existence had not been unknown, is described in *The Classical Quarterly*.

In the field of religion and mythology mention must be made first of the fifth and concluding volume of Farnell's great work, *Cults of the Greek States*. The major part of the volume deals with the worship of Dionysus, who "for religion—as distinct from civilization—is the most momentous figure in the Greek polytheism," according to Professor Farnell; the book also gives summary accounts of the cults of Hermes, Ares, Hephaistos, Hestia, but does not include any discussion of the worship of heroes and ancestors or of the ideas associated with the cult of the dead. Another part of Roscher's great *Lexikon of Mythology* has appeared. W. Wundt's *Mythus und Religion*, which forms part of the second volume of the *Völkerpsychologie*, bears on the philosophy and psychology of Greek mythology. In the field of Roman mythology and religion the most important contributions are to be found in Roscher's *Lexikon*, mentioned above; the articles on *Quirinus* and *Romulus*, by Wisowa and Carter, deserve special mention. In the same work Fr. Richter has a good paper on the deification and worship of Roma. Mention may be made also of Mulder, *De Conscientia notione qua et qualis fuerit Romanis*, and of *De Precationibus Romanorum*, by G. Appel, in *Religionsgeschichtliche Versuche und Verarbeitungen*. The last named work aims to give a collection of all extant Roman forms of *precatio*, together with a discussion of the times, objects and methods of *precatio*, the deities addressed and the epithets applied to the gods addressed. Von Domaszewski's *Abhandlungen sur römischen Religion* is a reprint of twenty-four papers published by him within the last two score years.

The text of the new Greek historian has been published separately by the Clarendon Press, under the title *Hellenica Oxyrhynchica*. Scholars now incline more decidedly to assign the fragment to Cratippus. An important work is D. G. Hogarth's *Ionia and the East*, whose thesis is that Ionian civilization is the product of a decadent Aegean and Danubian culture brought to Asia by successive immigrations from Europe and of a vivifying Ori-

ental culture communicated more immediately by the kindred Phrygian folk, but derived ultimately from the great Syro-Cappadocian nation, which in turn stood largely under Assyrian influence. W. H. Jones's *Malaria in Greek History* aims to determine the effect of malaria on Greek society. Parallel to this is another work by the same author, entitled *Dea Febris*, treating malaria in ancient Italy. Both books throw light on matters of religion.

In Roman history we have the fifth volume of the English translation of Ferrero's *Greatness and Decline of Rome*, and a collection of papers by him, called *Characters and Events of Roman History*. A very elaborate work in three volumes, entitled *The Roman Republic*, appeared in the very last days of the year, too late for exact appraisal here. Of much interest is a new historical inscription of the time of the Roman Republic (few inscriptions of the Republic have survived). This inscription records a grant of citizenship by Cn. Pompeius Strabo, father of Pompey the Great, to Spanish soldiers serving during the Social War at the siege of Asculum in Picenum. (See *The Classical Review* for 1909, page 158.) We may mention also W. Warde Fowler's *Social Life at Rome in the Age of Cicero*, a very suggestive book; Henderson's *Civil War and Rebellion in the Roman Empire*, a careful study of military history in 60-70 A. D., and E. G. Hardy's *Studies in Roman History*, second series. The new half-volume of Pauly-Wissowa's *Realencylopädie* contains articles bearing on Roman history. Mention may be made finally of a very important American work, by G. W. Botsford, *The Roman Assemblies*, which treats elaborately the organization of the *populus*, at Rome, the tribes, the centuries, the classes, the several assemblies, in their organization and history, comitial procedure and legislation, comitial days, the preservation of statutes, and kindred topics. There is elaborate bibliographical information and a very full index. This book is of prime importance on all the topics of which it treats. Perhaps we may mention here T. E. Peet's *The Stone and Bronze Age in Italy and Sicily*.

In the field of grammar and linguistic science in general reference may be made first to an article in *The Classical Weekly* 2.50-52, by E. H. Sturtevant, entitled *Recent Literature on Comparative Philology*. To this paper we may add J. F. W. Müller's *Die Syntax des Dativs im lateinischen*, a fragment published after the author's death. In the periodical called *Glotta* L. Methner published a paper on *Dum, dummodo, modo*, and another paper by the same author, entitled *Der Konjunktiv in den Konjunktivsätzen mit ut* appeared in *Neue Jahrbücher*. In *Glotta* also appeared an alphabetical list of the Latin and Greek words which had been discussed in various places in 1907 and 1908. Part ii., Section 1 of the second volume of Brugmann's *Grundriss der vergleichenden Grammatik* appeared; this deals with morphology. Albert Thumb's *Handbuch der iechischen Dialekte* should not be omitted, nor should F. Solmsen's *Zur griechischer Wortwissenschaft*, a very important contribution to Greek etymology.

In the field of lexicography we may note Scott's *Thesaurus Linguae Latinae Epigraphicus*, mentioned above, and the first part of a supplement to the great *Thesaurus Linguae Latinae*, which gives *Nomina Propria Latina*.

In metrical matters we have to name J. W. White's very careful study of *The Iambic Trimeter in Menander*, published in *Classical Philology*, and two papers by J. A. Scott, entitled *The Influence of Metre on the Homerio Choice of Dissyllables*, in *Classical Philology*, and *Studies in Greek Sigmatism*. In the former it is shown that in epic verse dissyllables with a short penult are avoided, in the latter that sigmatism does not in fact appear to excess in Euripides. S. Sudhaus has published a small book called *Der Aufbau der Plautinschen Cantica*.

In the field of literature mention may be of a careful study of Pausanias, by C. Robert, in a work entitled *Pausanias als Schriftsteller*, J. W. Duff's *A Literary History of Rome, From the Origins to the Close of the Augustan Age*, H. E. Butler's *Post-Augustan Poetry*, most helpful, in spite of limitations, because we have not had in English any work treating this subject in detail, Plessis's *La Poésie Latine*, Mahaffy's *What Have the Greeks Done for Modern Civilization?* Croiset's *Aristophanes and the Political Parties at Athens* (a translation by J. Loeb), and Professor Gilbert Murray's Inaugural Lecture at Oxford, *The Interpretation of Ancient Greek Literature*. Lack of space forbids the mention in detail of important editions of classic authors, aside from a very valuable edition of the *Poetics* of Aristotle, by Ingram Bywater.

We may conclude this review, all too brief, of a great body of conscientious and valuable work by mentioning H. St. John Thackeray's *Grammar of the Old Testament in Greek*, which has been characterized as the only systematic grammar in English of that form of the Greek language known as the Koine, and of a book by an American scholar, A. T. Robertson, *A Short Grammar of the Greek New Testament*.

PHILOLOGY, MODERN. This branch of the linguistic science received comparatively scanty treatment during the year 1909; and the progress made may be conveniently summarized by a bibliographical synopsis of the principal discussions that appeared during this period, together with a number of works issued in 1908.

In the department of Germanic philology S. Feist completed his *Etymologisches Wörterbuch der gotischen Sprache*, the fifth edition of F. L. K. Wiegand's *Deutsches Wörterbuch*, the *Sachsenburgisch-sächsisches Wörterbuch*, and the German edition of H. Falk and A. Torp's *Norwegisch-dänisches etymologisches Wörterbuch* were continued, and F. Kluge began the seventh edition of his *Etymologisches Wörterbuch der deutschen Sprache*. Late in 1908, moreover, F. Wrede issued the first part of his important *Deutsche Dialektgeographie*, which is based on Wenker's *Sprachatlas des deutschen Reichs*. In the division of Old High German J. Franck published his *Altfränkische Grammatik* (Göttingen, 1909) and P. Habermann his *Metrik der kleineren althochdeutschen Reimgedichte* (Halle, 1909); and mention may here be made of two publications of the preceding year which belong in this category: H. Reichert's *Deutsche Familiennamen nach Breslauer Quellen der dreizehnten und vierzehnten Jahrhunderte* (Breslau, 1908) and K. Hoeber's *Beiträge zur Kenntnis des Sprachgebrauchs im Volkslied der vierzehnten und fünfzehnten Jahrhunderte* (Berlin, 1908).

In Modern High German, except for V. Moe-

ser's *Historisch-grammatische Einführung in die frühneuhochdeutschen Schriftdialekte* (Halle, 1909) and K. Heinrich's *Studien über die Namengebung im Deutschen seit dem Anfange des sechzehnten Jahrhunderts* (Strassburg, 1908), work has been carried on almost entirely in dialectology. Here belong A. Egger's *Die Laute der Silltalcr Mundart* (Innsbruck, 1909), J. Schiessl's *Niederbayerische Mundart in der Gegend von Eichendorf* (Passau, 1909), H. Tschinkel's *Grammatik der Gottscheer Mundart* (Halle, 1908), H. Schönhoff's *Emsländische Grammatik* (Heidelberg, 1908), E. Gerbet's *Grammatik der Mundart des Vogtlandes* (Leipzig, 1908), and E. Halter's *Die Mundarten im Elsass* (Strassburg, 1908).

Turning to the general English field, Anglo-Saxon research was represented by C. Richter's *Chronologische Studien zur angelsächsischen Litteratur auf Grund sprachlich-metrischer Kriterien* (Halle, 1909), B. Thülin's *Das Verbum bei Orm* (Leipzig, 1909), E. Rotzoll's *Aussterben alt und mittel-englischer Diminutivbildungen im Neuenglischen* (Heidelberg, 1909), E. Brenner's *Der altenglische Junius-Psalter: die Interlinear-Glosse der Handschrift Junius 27 der Bodleiana zu Oxford* (Heidelberg, 1909), U. Lindelöf's *Die altenglischen Glossen im Beowulf-Psalter* (Helsingfors, 1909), and the first part (text and glossary) of the same scholar's *Altenglische Interlinearversion des Psalters in der Handschrift 437 der erzbischöpflichen Lambeth Palace Library* (Helsingfors, 1909), to which may be added, G. Hackmann's *Kürzung langer Tonvokale vor einfachen auslautenden Konsonanten in einsilbigen Worten im Alt-, Mittel- und Neuenglischen* (Halle, 1908), W. Stolz's *Vokalismus der betonten Silben in der altnordisch-humbrischen Interlinearversion der Lindisfarner Evangelien* (Bonn, 1908), R. Obrich's *Laut- und Flexionslehre der fremden Eigennamen in den Werken König Alfreds* (Strassburg, 1908), W. Oberdörfler's *Aussterben altenglischer Adjektiva und ihr Ersatz im Verlaufe der englischen Sprachgeschichte* (Kiel, 1908), A. Lorz's *Aktionsarten des Verbums in Beowulf* (Würzburg, 1908), J. von der Wurth's *Mittel- und Sprachliches und Textkritisches zu Cynewulf's Werken* (Halle, 1908), A. Bdlker's *Critical Contribution to Early English Syntax* (first series, on *of*, *at*, *by*, *to*, numerals, adverbs, and conjunctions; Christiania, 1908), B. Tschischwitz's *Metrik der angelsächsischen Psalmenübersetzung* (Breslau, 1908), and A. Bohlen's *Zusammenghörige Wortgruppen getrennt durch Casus oder Verschluss in der angelsächsischen Epik* (Bonn, 1908).

In Middle and Modern English there has been far less activity. In the former department mention may be made of P. Hoffmann's *Das grammatische Genus in Layamons Brut* (Halle, 1909), A. Püttmann's *Syntax der sogenannten progressiven Form im Alt- und Frühmittelenglischen* (Marburg, 1908), and B. Rossmann's *Zum Gebrauch der Mode und Modalverba in Adverbialsätzen im Frühmittelenglischen* (Kiel, 1908); while Modern English is represented by O. Jespersen's *Modern English Grammar on Historical Principles* (part 1, on sounds and spelling; Heidelberg, 1909), E. Eckwall's *Zur Geschichte der stimmhaften interdentalen Spirans im Englischen* (Lund, 1908), and M. Müller's *Reim- und Ablautskomposita des Englischen* (Strassburg, 1908). In the department of Norse philology prac-

tically the only work of note is the second volume of A. Kock's *Svensk Ljudhistoria* (Lund, 1909).

Still more scanty has been the attention devoted to the Romance languages, but from the late gleanings of 1908 there may be recorded the general survey of the Romance and Celtic languages and literatures by H. Zimmer, K. Meyer, L. Stern, H. Morf, and W. Meyer-Lübke in the Leipzig series *Kultur der Gegenwart*, the first volume (on phonology and morphology) of Meyer-Lübke's *Historische Grammatik der französischen Sprache* (Heidelberg, 1908), the third volume of K. Nyrop's *Grammatique historique de la langue française* (Copenhagen, 1908), A. Dauzat's *Langue française d'aujourd'hui* (Paris, 1908), and B. Horluc and G. Martinet's *Bibliographie de la syntaxe du français (1840-1905)*, (Paris, 1908); while more special topics are discussed in A. Gatscha's *Altprovençalische und altfranzösische Diminutiva* (Vienna, 1908), R. Ekblom's *Etude sur l'extinction des verbes au présent enmsi et enmui en français* (Uppsala, 1908), A. Förster's *Avoir und être als Hilfsverba beim intransitiven Zeitwort in ihrer Entwicklung vom Alt- zum Neufranzösischen* (Darmstadt, 1908), and T. Ranft's *Einfluss der französischen Revolution auf den Wortschatz der französischen Sprache* (Darmstadt). French dialectology and Provençal are considered in A. Verrier and R. Onillion's *Glossaire étymologique et historique des patois et des parlers de l'Anjou* (2 volumes, Angers, 1908), J. Ducamin's *editio princeps* of Pierre Alphonse's *Disciplines de clergé et de moralités* (a fourteenth or fifteenth century work in Gascon; Toulouse 1908), and the first volume of P. Roman's *Lei Mount-Joio: vocabulari dei proverbi e locuzioni proverbiale de la lenga provençalo* (Avignon, 1908). Spanish receives attention in the first part (on phonology) of A. Espinosa's *Studies in New Mexican Spanias* (Chicago, 1909), and, from the literary side, in A. González-Blanco's *Historia de la novela en España desde el romanticismo a nuestros días* (Madrid, 1908); and Rumanian studies are furthered by G. Wiegand's *Linguistischer Atlas des dorumänischen Sprachgebietes* (Leipzig, 1909).

A noteworthy advance in Celtic philology is marked by the completion of the first volume (on phonology) of H. Pedersen's *Vergleichende Grammatik der keltischen Sprachen* (Göttingen, 1909), while Old Irish receives an admirable grammar in R. Thurneysen's *Handbuch der Alt-irischen* (Heidelberg, 1909; a chrestomath was to appear early in 1910). Welsh is represented by S. J. Evans's *Studies in Welsh Phonology* (Newport, 1909), and Gaelic by the first part (on phonology) of P. Wieckert's *Die Sprache der einzigen schottischen Bibelübersetzung von Murdoch Nisbet* (Königsberg, 1908), while late in 1908 E. Berneker's *Slavisch-etymologisches Wörterbuch* commenced to appear. Mention should finally be made of work in a more outlying member of the Indo-Germanic linguistic stock in Europe, the Albanian, which receives a new grammar in Pekmer's *Grammatik der albanesischen Sprache* (Vienna, 1908), and a new Italian-Albanian dictionary in F. Bianchi, P. Budi, P. Bogdani, and S. C. Kristoforidi's *Fiatner i rii i shqyp's perbiec précie schoenriet t'bashkimit* (Scutari, 1908).

PHILOSOPHICAL ASSOCIATION, AMERICAN. An association of professors of philosophy and others interested in philosophy.

founded in 1902. Its object is the "promotion of the interests of philosophy in all its branches, and more particularly the encouragement of original work among its members. The Association holds annual meetings at the different universities, and these are devoted to the reading and discussion of papers. The official annual *Proceedings* of the Association, containing an address by the president, and summaries of the papers and discussions, are published in the *Philosophical Review*, and reprinted separately for distribution among the members. The annual meeting in 1909 was held at Yale University on December 27-29. At this meeting seventeen papers were read. The president's address was given by Professor John Grier Hibben, of Princeton University, on "The Philosophical Aspects of Evolution." The subject for the general discussion was "The Problem of Time in its Relation to Present Tendencies and Philosophy." The following officers were chosen for the year 1910: President, Professor Charles M. Bakewell, of Yale University; Vice-President, Professor Arthur O. Lovejoy, of the University of Missouri; Secretary-Treasurer, Professor E. G. Spaulding, Princeton University; members of the Executive Committee (in addition to the above), Professor F. J. W. Woodbridge, of Columbia University; Professor W. H. Sheldon, of Dartmouth College; Professor Norman Smith, of Princeton University, and Professor Frank Thilly, of Cornell University. The next meeting will be held at Princeton University during the Christmas holidays of 1910. The Association numbers 175 members.

PHILOSOPHICAL SOCIETY, AMERICAN. A learned society founded by Benjamin Franklin in 1743 "for the cultivation of useful knowledge and the advancement of liberal arts and sciences." It was the first learned society formed on the American continent. Ordinary meetings are held on the first and third Fridays of each month from October to May, inclusive. The Society also holds annually in the month of April a general meeting. The papers presented to the Society at the annual meeting are published either in its *Transactions* in quarto or in its *Proceedings* in octavo form. The Society awards two medals, the Magellanie, a gold medal to the author of the best discovery of the most useful invention relating to navigation, astronomy or natural philosophy, and the Henry W. Phillips prize of \$2000, which is awarded from time to time for the best essay in science and philosophy of jurisprudence. The annual meeting for 1909 was held in Philadelphia, April 22, 23 and 24. Among the papers read were the following: "The American-British Atlantic Fisheries Question," by Thomas Willing Balch; "The Evolution of the City of Rome from Its Origin to the Gallic Catastrophe," by Prof. Jesse B. Carter, of Rome; "Magic and Religion," by Prof. Edward W. Hopkins; "J. J. Rousseau, Precursor of Modern Pragmatism," by Prof. Albert Schinz, of Bryn Mawr College; "New Evidences as to the Physical Basis of Heredity," by Prof. Edwin Grant Conklin, of Princeton University; "The Volcanic Formations of Java," by Henry G. Bryant; "The Past History of the Earth as Inferred from the Mode of Formation of the Solar System," by Dr. T. J. J. See, of the U. S. Naval Observatory, Mare Island, Cal. On April 23 was observed the

centennial of Charles Darwin's birth, and the fiftieth anniversary of the publication of the "Origin of the Species." James Bryce, the British Ambassador, gave personal reminiscences of Charles Darwin and addresses were made by George Lincoln Goodale, of Cambridge, and Prof. George Stuart Fullerton, of New York. The officers of the Society for 1909 were William W. Keen, President; William B. Scott, Simon Newcomb and Albert A. Michelsen, Vice-Presidents; I. Minis Hayes, Arthur W. Goodspeed, James W. Holland and Amos P. Brown, Secretaries, and Henry La Barre Jayne, Treasurer.

PHILOSOPHICAL SOCIETY, WESTERN.

A learned society organized at Kansas City in 1900. Its aim is to stimulate an interest in philosophy in all its branches and to encourage original investigation. The Association, which started with thirty students and teachers of philosophy, has grown rapidly. Its membership now approaches 100 and extends across the country. Its meeting in 1909 was held in St. Louis in April under the auspices of Washington University, and commemorated the fiftieth anniversary of the Hegelian movement of philosophy in the Middle West, as indicated by the founding of the *Journal of Speculative Philosophy* in St. Louis by William T. Harris, the late United States Commissioner of Education, and others. The executive committee of the Association in 1909 consisted of Professor C. E. Seashore, University of Iowa, President; B. C. Ewer, Northwestern University, Secretary and Treasurer; F. C. Sharp, University of Wisconsin; A. O. Lovejoy, University of Missouri, and G. A. Tawney, University of Cincinnati. For several years the annual reports of the Association were printed in the *Philosophical Review*. They now appear in the *Journal of Philosophy, Psychology, and Scientific Methods*.

PHILOSOPHY. There was no marked change in the nature of contemporary philosophical thinking during 1909. The epistemological problems, which have held the centre of the stage since the days of Kant, are still attracting the most attention, and idealism remains the "most influential and powerful" system, as Professor Stein declares in his *Philosophische Strömungen der Gegenwart*. At the same time the idealistic, rationalistic and monistic teachings of the dominant school are being vigorously attacked. Professor William James, who is the most prominent opponent of the "old truths," has brought out two new books within the year, one of which, *A Pluralistic Universe*, attacks the philosophical monism of the day, while the other, *The Meaning of Truth: A Sequel to "Pragmatism,"* largely consisting of a collection of articles published before, continues the warfare against rationalism and idealism. The periodicals of the different countries have not ceased discussing the so-called "American" philosophy; even the Germans, who ignored the controversy for a long time, are beginning to show some interest in it. The German translation of Professor James's *Pragmatism* has been followed by a translation of his *Psychology*. Professor Stein devotes considerable space to the new movement in his *Philosophische Strömungen der Gegenwart*, and a little book, *Der Pragmatismus*, has been written on it by

Jacoby. Among some of the other recent contributions to the subject are the articles of Montague in the *Journal of Philosophy*, of G. E. Moore in the *Proceedings of the Aristotelian Society*, of Paulhan in the *Revue philosophique*, and Pratt's book, *What is Pragmatism?*

Interest in Kant and the post-Kantians, however, has not abated. New editions of the works of the great idealistic philosophers are being published; Schelling is being translated into Italian and Schopenhauer into French. The Western Philosophical Association (q. v.) devoted its Easter meeting, which was held in St. Louis to commemorate the semi-centennial of philosophy in the West, to papers on Hegelianism. An able book by the well-known Italian Hegelian, Croce, has been translated into German under the title *Wahres und Falsches in Hegel's Philosophie*. Other works bearing on German idealism which have appeared during the year are: Kronenberg, *Geschichte des deutschen Idealismus*, vol. i. (vol. ii. is to take up German idealism from Kant to Hegel); Chamberlain, *Kant* (2d ed.); Arnold, *Beitrag zu dem Material der Geschichte von Kant's Leben*, etc.; Sternberg, *Versuch einer Entwicklungsgeschichte des kantischen Denkens*; Nelson, *Untersuchungen über die Entwicklungsgeschichte der kantischen Erkenntnistheorie*; Prichard, *Kant's Theory of Knowledge*; van Biéma, *L'espace et le temps chez Leibniz et chez Kant*; Jordan, *Kant's Stellung zur Metaphysik*, etc.; Menzel, *Die Grunlagen der fichteschen Wissenschaftslehre*, etc.; Lasson, *Beiträge zur Hegelforschung*; Dittmann, *Der Begriff des Volksgenates bei Hegel*; O'Sullivan, *Kant and Hegel*; Sliskind, *Der Einfluss Schellings auf die Entwicklung von Schleiermachers System*.

It would be impossible to mention here the many articles and books on the theory of knowledge which have appeared in 1909. Nearly all the papers read at the last two annual meetings of the American Philosophical Association were on epistemological questions, and the subjects of the general discussion in both years were of the same nature: "Realism and Idealism" in 1908, and "The Problem of Time" in 1909. Besides the books in this field already noted above, we call attention to the following: Kastil, *Studien zur neuern Erkenntnistheorie*, I.: *Descartes*; Uphues, *Geschichte der Philosophie als Erkenntnistheorie*; Hermant and van de Waele, *Les principales théories de la logique contemporaine*; Croce, *Logica come scienza del concetto puro* (2d ed.); Fonsegrive, *Essais sur la connaissance*; Stirring, *Einführung in die Erkenntnistheorie*; Messer, *Einführung in die Erkenntnistheorie*; Kern, *Das Erkenntnisproblem und seine kritische Lösung*; Schwartzkopf, *Das Wesen der Erkenntnis*; Maticevic, *Zur Grundlegung der Logik*; Stern, *Das Denken und sein Gegenstand*; Espinasset, *L'être et connaître*; Maugé, *Le rationalisme comme hypothèse méthodologique*. The student of epistemology will also find the following helpful: Kreibig, *Die intellektuellen Functionen*; Miller, *The Psychology of Thinking*; Titchener, *Lectures on the Experimental Psychology of the Thought Processes*; Uphues, *Erkenntnisskritische Psychologie*; Marshall, *Consciousness*; Maier, *Psychologie des emotionalen Denkens*; Sollier, *Le doute*; Jaensch, *Zur Analyse der Gesichtswahrnehmungen*; Lévy-Bruhl, *Les fonctions mentales dans les sociétés inférieures*; Langfeld, *Thier-und Menschenverst*; and Bohn, *La naissance de l'intelligence*. The following discuss the logic of science and scientific conceptions: Volkmann, *Erkenntnistheoretische Grundzüge der Naturwissenschaften*; Brunhes, *La dégradation de l'énergie*; Baumann, *Der Wissensbegriff*; Enriques, *Les problèmes de la science et de la logique*; Bouth, *La Vérité scientifique*; Thomas, Tannery, and others, *De la méthode dans les sciences*; Haas, *Die Entwicklungsgeschichte des Satzes von der Erhaltung der Kraft*; Bieganski, *Medizinische Logik*. Symptomatic of the increasing interest in logical studies are the many discussions on the foundations of mathematics which have been appearing. Among the articles we mention those of Poincaré, Brunschwig and Reymond in the *Revue de métaphysique et de morale*; Milhaud in the *Revue philosophique*; Haldane in *Mind*; Jansen in the *Archiv. f. Gesch. der Phil.*; Glasenapp in *Vacht f. Phil.*; Baumann in *Ann. d. Naturph.*; Brown, Rogers, and Shelton in the *Journal of Philosophy*. Books on the subject are Peslouan, *Les systèmes logiques et la logistique*; Lechalas, *Étude sur l'espace et le temps* (2d ed.); Reymond, *Logique et mathématiques* (1908); Voss, *Über das Wesen der Mathematik* (1908).

Philosophy in the sense of metaphysics or the attempt to reach a systematic conception of the universe, has not been neglected during the past year. For Croce as for Hegel "logic as the science of pure concept" is the philosophy of philosophy. Münsterberg, whose *Philosophie der Werte* appeared in 1908, offers the same neo-Fichtean views in an English version under the title of *Eternal Values*. Ladd who shows the influence of Lotze, presents his theory of the world in a new book: *Knowledge, Life, and Reason: An Essay in Systematic Philosophy*. H. Jones has written a clear and interesting little book, *Idealism as a Practical Creed*. Books of the same trend are MacColl's *Man's Origin, Destiny, and Duty*; Eucken's *Geistige Strömungen der Gegenwart* (the 4th ed. of *Grundbegriffe der Gegenwart*); and E. Naville's last work, *Les systèmes de philosophie ou les philosophies affirmatives*. All these thinkers are advocates of some form of idealism or spiritualism. We have already spoken of James's *A Pluralistic Universe*, which opposes all these systems in method and results. It sets up the method of direct and immediate experience. "Philosophy is more a matter of passionate vision than of logic, . . . key only finding reasons for the vision afterwards. Reality if not irrational is at least non-rational in its constitution. We must get behind the conceptual function altogether and look to the more primitive flux of the sensational life for reality's true shape." Philosophy should seek this kind of living understanding of the movement of reality, not follow science in vainly patching together fragments of its dead results." This method, which may call sensationalistic, anti-rationalistic, mystical and voluntaristic, yields an atomistic or pluralistic philosophy. The Frenchman Boë-Borg, in his *Le pluralisme casuistique discontinué et l'hétérogénéité des phénomènes*, declares that pluralism deserves to be developed logically and persistently, that the results of experience have never been unfavorable to it. The following books

also prove of interest to philosophers: Schulz, *Die Maschinentheorie des Lebens*; Kern, *Das Problem des Lebens*; Petrucci, *Essai sur une théorie de la vie* (1908); Kingsland, *Scientific Idealism; or Matter and Force and Their Relation to Life and Consciousness*. In the second volume of his Gifford Lectures, *The Science and Philosophy of the Organism*, Driesch continues his protest against the mechanical theory of life, and works out his own neo-vitalistic theory. Students of metaphysics will also be interested in the discussions of the theory of evolution brought out on occasion of the Darwin centenary: *Fifty Years of Darwinism: Modern Aspects of Evolution*; Centennial Addresses, etc.; *Darwin and Modern Science*, etc.; Poulton, *Charles Darwin and the Origin of the Species*; Baldwin, *Evolution and the Humanities* (1910); Wagner, *Geschichte des Lamarckismus*. The April number of the *Popular Science Monthly* and the May number of the *Psychological Review* are devoted to different phases of Darwinism and its relations to different sciences.

The number of works on ethical subjects and problems bearing on ethics is very large, showing how intense the interest in this field has become during recent years. Not only are the general principles of morality being subjected to renewed examination, but special problems are being taken up and treated in a critical spirit. We note also a growing interest in the questions of moral education and a remarkable increase in studies on social and political ethics. Of the more general works that of the Italian Croce, *Filosofia della practica*, follows Hegelian lines. The books of Read, *Natural and Social Morals*; Perry, *The Moral Economy*; and Davies, *The Moral Life*, are characterized by the common purpose to remain close to the facts of moral life, or, to express it in the language of Read, by the endeavor "to study morals as a matter of fact and experience, instead of merely worrying the traditional abstract ideas in the fashion of a scholastic age." The subject is to be studied in the light of inductive biology, psychology, and anthropology. Sarlo and Calo, *Principii di scienza etica*, also treat ethics as an independent normative science in which the act of valuation is the highest fact. For Rodrigues, *Le problème de l'action*, there is but one problem for ethics, the problem of conduct, which consists in placing us in rapport with others. Similar in spirit to the above is Unold, *Aufgaben und Ziele des Menschenlebens* (2d. ed.). Souriau, *Les conditions du bonheur*, is a representative of the old-fashioned utilitarianism. According to Praines's *Critique des conditions de l'action* (2 vols.), ethics has for its necessary basis a critique of the conditions of action, which must be sought just as Kant sought the conditions of knowledge. Cronin, *Science of Ethics*, and Williams, *Philosophia moralis* (1908) treat the subject from the neo-scholastic standpoint. Ottley's *Christian Ideas and Ideals* is an outline of Christian ethical theory. An Italian Nietzsche is appeared in the person of Leo Sera, whose book has been translated into English under the title: *On the Tracks of Life: The Immorality of Morality*. Urban's *Valuation: Its Nature and Its Laws*, is a painstaking psychological analysis of our worth-experiences, together with an attempt at an outline of a

coherent philosophy of values. Berguer's *La notion du valeur* (1908) also analyzes the notion of value and shows its importance for theology. The second volume of Hastings's *Encyclopedia of Religion and Ethics* contains many articles on ethics.

Books on special phases of ethics are: Chollet, *La morale est elle une science?*; Joussain, *Le fondement psychologique de la morale*; Parodi, *Le problème moral et la pensée contemporaine* (1910); Aslan, *L'expérience et l'invention en morale* (1908); Leroy, *Esquisses de morale et de sociologie*; Baumann, *Le coeur humain et les lois de la psychologie positiviste*; Stumpf, *Vom ethischen Sceptizismus*; Schlesinger, *Der Begriff des Ideals* (1908); Paulhan, *La morale de l'ironie*; Petersen, *Kausalität, Determinismus und Fatalismus*; Sarlo and Calo, *La patologia mentale*, etc. The student of ethics will also be interested in the following: Nadejde, *Die biologische Theorie der Lust und Unlust* (1908); Ribot, *Problèmes de psychologie affective*; Joteyko and Stefanowska, *Psycho-physiologie de la douleur*; C. and W. Stern, *Erinnerung, Aussage und Lüge in der ersten Kindheit*.

Books on the evolution of morals, moral ideals and the history of ethics are: Allier, Belot and others, *Morales et religions*; Eucken, *The Problem of Human Life* (translation); Nordau *Der Sinn der Geschichte*; Lafargue, *Le determinisme économique de K. Marx*; Hughes, *The Ethics of Jewish Apocryphal Literature*; King, *The Ethics of Jesus*; Kinkel, *Der Humanitätsgedanke*; Spranger, *W. von Humboldt und die Humanitätsidee*; M. Wundt, *Geschichte der griechischen Ethik*; Verweyen, *Das Problem der Willensfreiheit in der Scholastik*; Ethik; Mausbach, *Ethik des hl. Augustinus*, 2 vols. Rand's *Classical Moralists* in a useful selection of extracts from the works of the great ethical writers.

Books on moral education and allied fields are: Payot, *The Education of the Will* (trans.); Leclère, *L'éducation morale rationnelle*; Spiller, *Moral Education in Eighteen Countries*, and *Papers on Moral Education*; Scott, *Social Education*; Natorp, *Sozialpädagogik*, and *Philosophie u. Pädagogik*; O'Shea, *Social Development and Education*; Millich, *Kultur u. Erziehung*; Rowe, *Habit-Formation and the Science of Teaching*; M. Mackenzie, *Hegel's Educational Theory and Practice*.

Among the many works on social, legal and political ethics and sociology the following will prove of service: Tönnies, *Die Sitte*; Sully-Prudhomme, *Le lien social*; Duguit, *Le droit social*, etc.; Becher, *Der Darwinismus u. die soziale Ethik*; Novicow, *Le critique du darwinisme social*; Aslanian, *Les principes de l'évolution sociale*; Wallas, *Human Nature in Politics*; Traub, *Ethik u. Kapitalismus*; Kotanecki, *Arbeit u. Armut*; Beveridge, *Unemployment*; Maxwell, *La crise et la société*; Parsons, *Responsibility for Crime*; Prevost, *De la prostitution des enfants*; Kohler, *Lehrbuch der Rechtsphilosophie*; Picard, *Le droit pur*; Vecchio, *Il concetto della nature e il principio del diritto*; Kohler, *Der Vergeltungsgedanke*, etc.; Oppenheimer, *Criminal Responsibility of Lunatics*; Wassermann, *Begriff u. Grenzen der Kriminalstatistik*; Ettinger, *Das Verbrecherproblem*; Duprez, *Etude médico-social sur les questions de responsabilité atténuée*; Thomas, *Source Book of Social Ori-*

gins; Cooley, *Social Organization*; Peabody, *Approach to the Social Question*; Roberty, *Sociologie de l'action*; de Groot, *Précis de sociologie*; Ruta, *La psiche sociale*; Mataquin, *La psychologie sociale de G. Tardé*; Davis, *Psychological Interpretations of Society*; Fouillée, *Le socialisme et la sociologie réformiste*. Volume iii. of Mayer's *Statistik u. Gesellschaftslehre* contains moral statistics.

A number of good books on aesthetics have been published, among them the following: Volkelt, *System der Ästhetik*, vol. II. (1910); Croce, *Ästhetic as Science of Expression and General Linguistic* (trans.); Christiansen, *Philosophie der Kunst*; Cornelius, *Elementargrundsätze der bildenden Kunst*; Gordon, *Ästhetics*; Neumann, *Einführung in die Ästhetik der Gegenwart*; Lalo, *Les sentiments esthétiques* and *L'esthétique expérimentale contemporaine* (1908). The second volume of Wundt's great work on *Völkerpsychologie* is devoted to a genetic psychological study of Art.

In the history of philosophy the great work of the year is the universal history of philosophy (*Allgemeine Geschichte der Philosophie*, appearing as vol. v. of *Kultur der Gegenwart*), which deals with the philosophy of primitive peoples, Oriental philosophy (Hindoo, Islam, Jewish, Chinese, Japanese), and European philosophy. The contributors to this volume are scholars of the highest rank: Wundt, Oldenberg, Goldziher, Grube, Inouye, von Arnim, Baeumker and Windelband. There have also been published, besides the many historical works referred to in the course of this article, the following: Hasse, *Von Plotin zu Goethe*; Bryk, *Entwicklungs geschichte der Naturwissenschaft*; a translation of de Wulf's *History of Medieval Philosophy*; Grabmann, *Die Geschichte der scholastischen Methode*; Bonilla y San Martin, *Historia de la filosofía española hasta el siglo XII*; Morselli, *Introduzione alla filosofia moderna*; Lindsay, *Studies in European Philosophy*; Perrier, *The Revival of Scholastic Philosophy in the XIX. Century*; Bodrero, *Eraclito*; Zuccante, *Socrate*; Taylor, *Plato*; Hartmann, *Plato's Lehre des Seins*; Diés, *La définition de l'être et la nature des idées dans le Sophiste de Plato*, and *Le cycle mystique*; Stewart, *Plato's Doctrine of Ideas*; J. M. Watson, *Aristotle's Criticisms of Plato*; Whithy, *The Wisdom of Plotinus*; Elsee, *Neoplatonism in Relation to Christian Philosophy*; Duhem, *Etudes sur Leonardo de Vinci*, 3 vols. (1906-9); Strowski, *Pascal et son temps*, 3 vols. (1907-8); Ollion, *La philosophie générale de J. Locke*; Thomas, *Spinoza's Individualismus u. Pantheismus*; Fraser, *Berkeley and Spiritual Realism*; Kabitz, *Die Philosophie des jungen Leibniz*; Daville, *Leibniz historicus*; Dumont, *Nicolas de Béguelin*; Van Biëma, M. Knutzen, *La critique de l'harmonie prétable*; Dedieu, *Montesquieu et la tradition*; Lederbogen, F. Schlegel's *Geschichtsphilosophie*; Cramaussel, *La philosophie religieuse de Schleiermacher*; Tisserand, *L'anthropologie de Maine de Biran*; Kowaleksi, *Schopenhauer u. seine Weltanschauung*; Richter, *Schopenhauer*; Duherme, *Comte et son œuvre*; Lacombe, *Taine, historien et sociologue*; Nève, *La philosophie de Taine*; Palhoris, Rosmini (1908); Mügge, *Nietzsche*; Richter, *Nietzsche, sein Leben u. sein Werk*; Hoffding, *Danske filosofier*; Windelband, *Die Philosophie im deutschen Geistesleben des XIX. Jahrhun-*

derts; Prezzolini, B. Croce; Steenborgen, Bergson's *intuitive Philosophie*.

PHLORIDZIN (syn. PHLOBIDZINUM, PHLOBIZIN) is a glucoside obtained from the root of the apple, pear, cherry, etc., and has the chemical formula $C_{21}H_{20}O_9 + 2H_2O$. It occurs as minute white slightly pinkish crystals, of a silky texture, or as a pale yellow light crystalline powder, odorless and having at first a bitter and then a sweet taste. It is freely soluble in hot water. Phloridzin destroys the malaria parasite, and is recommended as an antiperiodic in malaria, but its chief use is as a means of testing the functional activity of the kidney. When administered to man or animals it produces glycosuria of renal origin, in addition to polyuria. To test the permeability of the kidney 1-12 of a grain of the drug is dissolved in 15 minims of a 0.5 per cent solution of sodium carbonate and injected hypodermically. Glucose should appear in the urine in from 15 minutes to a half hour and the secretion of sugar continue for two to four hours. The urine of each kidney is collected separately.

PHOTOGRAPHY. RECENT PROGRESS IN. The most conspicuous advance in the last few years has been in color photography, which has not, however, as yet yielded the results that had been hoped for it. The aniline pigments which under proper conditions yield such beautiful results are fugitive, and certain chemical reactions, producing slight changes in the composition of the sensitive material, are frequent causes of unsatisfactory reproductions of the original colors. Reports of improved methods are constantly being published, and doubtless in time a perfected color process will be found. Nevertheless advances were being made and more sensitive and improved screen plates for taking photographic transparencies in colors were made. The "autochrome" plate developed by Lumière was improved so that its development was rendered more simple and could be carried on by yellow light, instead of in complete darkness as was at first demanded. Other color screen plates were successfully used during the year, and in some cases plate and screen were combined instead of being separate as was previously necessary.

Progress was also made during the year with telegraphic transmission of pictures and photographs, and the Korn telautograph where a half-tone photograph is printed on metal foil and attached to a revolving cylinder, over which passes a steel tracing point, was still further developed during the year. In this device the current is interrupted by the glue lines of the half-tone print on the tin foil, and at the distant station a silver wire rises and falls so that a slit through which light passes to the sensitive film on a drum revolving synchronously with the original transmitting drum, makes a record on the sensitive paper, which is subsequently developed. A number of tests of this invention were made during the year over considerable distances, and indicated the possibilities of the method.

Increased attention was paid to nature photography, and interesting studies were made of animals in their native haunts, under unusual conditions. An important series of pictures were made by A. Radclyffe Dugmore in the

"big game country" of Africa, in which giraffes, rhinoceroses, hippopotamuses, lions and tigers were photographed at close range by the use of special apparatus as well as with telephotic lenses. In certain cases the batteries of cameras were arranged to be automatically exposed by flash-light under electrical control. Important improvements were also made in subaqueous photography, and the study of fishes and other marine life was carried on under new conditions.

Along with the increased use of moving pictures, there have been a number of attempts to secure photographic reproduction in the natural colors. During the year apparatus invented by Barricelli, Fries-Greene, and Urban and Smith, was shown where the principle of presenting colored images to the eye in rapid succession was utilized. Various images were colored red, yellow and blue, and the successive presentations followed so rapidly that the eye, being unable to separate them, combined them into one picture. The application of the moving picture principle to the microscope, which had been suggested previously for physiological investigation, was developed in connection with the ultra-microscope by Dr. Comandon. This invention was considered of considerable educational importance, inasmuch as such processes as the struggle of the blood corpuscles with their microbe enemies could be actually represented.

A curious instance of the application of moving pictures is shown by the fact of its use by the United States Reclamation Service to demonstrate practical operations in irrigation and farming. The contrasting of improved methods with those less satisfactory, when shown by such means, is naturally of great value to the land owner or farmer.

During the year photographic surveying, which for ten years or more had been used with considerable success in Canada and India, found increased application. By photographic methods a rapid survey could be made, especially in mountainous country where rugged peaks and other important landmarks could be identified readily on the plates. In fact, photographic methods are now deemed essential in all rapid topographic surveys on a large scale, and the accuracy attained is being constantly increased. Not only the directions and distances are readily obtained, but also altitudes that are sufficiently accurate for many purposes. Standard types of instruments, capable of precise adjustment, are in use, and special lenses have been devised.

It has been found more economical in topographical work, where maps are constantly undergoing revision, to photograph the "mother map," so to speak, and prepare small editions for use until the final results are obtained. The making of very large photographs is now in use by the United States Bureau of Forestry, and a specially designed apparatus has been installed through which a sheet of sensitized paper, six feet in width, may be passed and undergo automatically the progressive operations of printing, toning, washing, and drying. The preservation of printed or written documents of value, as in insurance offices, is a growing application of photography. Electric mounting presses for the purpose of fixing the print on a card have recently been introduced in large establishments. Professor R. W. Wood, of the Johns Hopkins University, has shown

some interesting effects in photography made by exposure both to the infra-red and ultra-violet invisible rays of light.

PHOTOTHERAPY. A tendency toward restriction in the employment of the Roentgen ray rather than a widening of its application, was noticeable during 1909. Its use in all but very superficial cancers was practically abandoned. It is now believed that only in external conditions, such as epithelioma of the skin and rodent ulcer can cure be anticipated. Elischer and Engel have investigated the influence of the rays on the blood since 1904. Leukemia, a disease of the blood characterized by swelling of the lymphatic glands, enormous enlargement of the spleen and an undue multiplication of the white cell elements of the blood, is, according to these authors, definitely influenced for the better, and in some cases symptomatically cured by exposure to the X-ray. Early treatment is advised, beginning with short exposures to avoid toxic symptoms, which may be produced by the destruction and absorption of large numbers of blood cells in the body. Treatments are intermittent and close watch is kept on the patient's blood and weight. The main point is to work with as small a dosage of the rays as possible. No case is recorded of permanent recovery, and it is stated that in time the rays lose their influence, the tissues becoming immune to their action. A case of syringomyelia was cured symptomatically by Holmgren and Wiman. Aubertin and Bordet found it possible to destroy the thymus gland in animals without altering the other organs in the vicinity of the gland, and therefore suggest the employment of the X-ray in tumors of the thymus.

Radium was used in 1909 to an extent only limited by the extreme scarcity and the high cost of this curious element. The mines at Johannesthal in Austria produced about 15 grains of the pure substance, which it was intended to sell in the form of radium bromide to charitable institutions and for scientific purposes, at the rate of \$244 per portion of 1-60th of a grain. It is known that certain substances have the power of absorbing and retaining radium emanations for a greater or less time, so that they themselves become radioactive, and search is being made for same material that may be charged with radial activity and used therapeutically in the same way as radium itself. Water, it is well known, can be rendered radioactive by contact with radium or pitchblende, and certain springs are believed to owe their curative virtues to minute amounts of this element contained in them. These waters, however, soon lose their potency when removed from contact with radium. Water artificially charged is of low potency and loses its efficacy in a few days; nevertheless such water has been used internally and for baths with good results. A more promising substance is cocoanut charcoal. According to Shober, this substance will absorb and retain radium emanations and can be raised to a high degree of activity compared with water (200 or 300 times). He has succeeded in taking photographs with charcoal so charged. The practical application of this discovery lies in the cheapness with which the agent can be prepared. The charcoal retains its activity for at least two weeks and can be charged over and over again. It may be

cathode, and further that the rays on this side are more penetrating than those on the side nearer the cathode. This dissymmetry has been investigated by Stark, who concludes from it that the old ether-pulse theory of cathode rays is untenable. On the other hand, Sommerfeld has attempted to show by theoretical computation that the dissymmetry determined by experiment agrees closely with that to be expected according to the latter hypothesis. The question is still an open one, and can only be settled by further experimentation.

LIGHT. After several years of work Michelson has succeeded in perfecting a machine capable of ruling gratings whose resolving power is comparable with that of the echelon spectroscope, the increased precision of the ruling making possible the use of larger gratings. The grating spectroscope has the advantage over the echelon of much greater ease of manipulation and little confusion of lines due to spectra of different orders. For this reason the perfecting of this ruling machine may be looked upon as a distinct advance in spectral work.

The magnetic rotation of the plane of polarization in the infra-red has been investigated by U. Myer. He found that in crystals of fluor-spar, rock-salt, and sylvite the amount of rotation decreased continually with increasing wave-length to the longest wave-length used (about nine thousandths of a millimetre). This is in agreement with Drude's theory of the Faraday effect, but does not show definitely which of his two developments of that theory, the one based on the assumption of molecular currents or the other on the Hall effect, is correct.

R. W. Wood, continuing his researches on sodium vapor, has extended the principal Balmer's series of double spectral lines for this metal as far as the forty-eighth line ($n=50$). The most complete series hitherto observed was that of hydrogen, of which thirty lines had been found in the solar spectrum. The last twenty-two lines in the sodium series are crowded into a spectral range less than that between the two D lines.

SOUND. Lloyd and Agnew have carried out at the Bureau of Standards, experiments bearing on the old controversy as to whether the quality of a note is influenced by variations in the phases of its overtones. Alternating currents of harmonically related frequencies produced by specially designed generators were combined in a telephone. The alternators were arranged in two sets with two driving motors, one set being used to furnish the fundamental, while the other set produced the overtones. When the two driving motors were run slightly out of synchronism, a gradual shifting of phase between the fundamental and the overtones occurred, but no difference in the quality of the note produced by their combination could be detected. This result is in agreement with the view held by Helmholtz and Kelvin.

LOWEST TEMPERATURE. In Leyden, H. Kamerlingh Onnes has succeeded in liquefying helium and found its boiling-point at atmospheric pressure to be -268.5° C. By cooling liquid helium by rapid evaporation at low pressures, he obtained a temperature lower than 2.5° absolute. The critical pressure of helium was found to be approximately 2.75 atmospheres.

PINCHOT, GIFFORD. See FORESTRY; LANDS, PUBLIC, and UNITED STATES, Administration.

PITTSBURG. See PENNSYLVANIA.

PITTSBURG, UNIVERSITY OF. An institution of higher learning, in Pittsburg, Pa., founded in 1890 as the Western University of Pennsylvania. The name was changed to its present form in 1908. The University includes a college of liberal arts, a graduate school, school of engineering, department of law, department of medicine, summer school, college of pharmacy, department of dentistry and school of mines. It also conducts a system of evening schools. The attendance in 1908-9 was 1243, of whom 108 were in the undergraduate department, 371 in the medical college, and 231 in the college of pharmacy. The faculty numbered 183. There were in the library 12,000 volumes. The new School of Mines building, the foundation for which was laid in 1908, was completed in May, 1909, at a cost of over \$200,000. The productive funds of the University amounted in 1909 to \$507,478, and the total income was \$206,308. The chancellor is Samuel Black McCormick.

PLAGUE. During 1909 the plague was in abeyance in India, and the deaths numbered hundreds instead of thousands; but apprehensions exist that it may reappear in epidemic form. In 1896 the present pandemic began, in the Bombay Presidency, where it caused 2219 deaths, the mortality increasing to 54,000 the following year. The disease spread steadily until 1906, when a great decrease occurred, and gave rise to hopes that the scourge had suspended its virulence, but in 1907 it broke out with fresh vigor and caused more deaths than ever—about 1,316,000. In 1908, the deaths fell to 149,000. It is estimated that the total mortality since the disease appeared is 6,200,000. See VITAL STATISTICS.

Recent investigation in India and in California have demonstrated that fleas play an important part in conveying plague from rats to man. The common rat flea of India (*Pulex pallidus*) is especially implicated in that country. The United States Public Health and Marine Hospital Service has, since 1907, collected and identified fleas from different sea ports, in connection with plague prophylaxis. It has been demonstrated that the *Pulex pallidus* has a wide distribution, and is common in the United States.

PLANT PATHOLOGY. See BOTANY.

PLANT PHYSIOLOGY. See BOTANY.

PLATINUM. Platinum is obtained in the United States as a by-product in placer gold mining. All the metal produced is recovered from placer mines in Oregon and California. The production in 1908 amounted to 750 fine ounces, valued at \$14,250. This was nearly double the quantity obtained in 1907. The imports of platinum from other countries, chiefly Russia, in 1908, amounted to 4237 pounds of platinum ore, valued at \$1,095,754, and 134,119 pounds of manufactured products, valued at \$1,229,873. The price of ingot platinum per troy ounce in New York markets varied in 1908 from \$18.20 to \$24.50. The production in 1908 in the United States, so far as could be ascertained at the close of the year, was about the same as in 1908. Most of this was recovered from the mint where certain quantities are recovered every year as a by-product in the reinf-

ing of gold and silver. The largest quantity of the metal is produced in Russia, where in 1909, taking the actual returns for eleven months and estimating the output for December, the *Engineering and Mining Journal* estimates that 184,240 ounces of crude metal were produced, containing 83 per cent. of platinum. This is an increase of 16.7 per cent. over the production of 1908. The gain was made chiefly in the latter months of 1909, the activity in mining being stimulated by the larger demand for the metal and the higher prices realized for it. The concentration of the industry made much progress during the year, and the Russian platinum industry is now almost entirely carried on by a syndicate. The average price for platinum per troy ounce in New York in 1909 was \$24.87. It ranged from \$22.43 in July to \$29.50 in December. These prices are for refined platinum. The average price for crude metal at St. Petersburg was \$20.02 per troy ounce. The production in Russia in 1908 is estimated by the United States Geological Survey at 130,000 troy ounces. A considerable amount of the metal is found in Colombia, where in 1907 36,738 troy ounces were exported. The use of platinum in jewelry has increased in recent years. It is without doubt the best material for mounting diamonds. It is also used extensively in the electrical industries for alloys.

PLAYGROUND ASSOCIATION, NATIONAL. See EDUCATION IN THE UNITED STATES.

PLAYGROUNDS. The third annual congress of the Playground Association of America was held at Pittsburgh in May. The scope of the activities of the Association is shown by the committee reports, which covered the following subjects: Athletics for boys, playground equipment, folk-dances, playgrounds as social centres, play in institutions, story-telling on playgrounds, State laws, and playground statistics. The meeting developed sentiment in favor of a campaign for the substitution of significant exercises for the noisy and random celebrations of national holidays.

A Council of One Hundred was organized in New York City early in the year as an auxiliary to the Parks and Playgrounds Association, with Mr. Richard Watson Gilder as president. Following a report on dance halls, some forty children's welfare societies drew up a petition and a model license law to be presented to the State Legislature. This was followed in March by similar action by the Ethical Social League of New York.

Under the Massachusetts law of 1908 authorizing cities to submit to popular vote the question of establishing playgrounds, thirty-eight out of the forty cities and towns holding such elections voted favorably. The total vote was 153,651 for, and 34,284 against. The movement was well supported by the Civic League and the Playground Association. Many cities at once began the practical work of instituting playgrounds, the law requiring these to be in readiness by July, 1910. Following careful inquiry in the fall, Boston made provision for open air class rooms and more adequate open-air play for anæmic and physically defective children.

POE CENTENARY. See CENTENARIES.

POE, JOHN PRENTISS. An American lawyer, died October 14, 1909. He was the nephew of Edgar Allan Poe, and was a graduate of Princeton University. He was at one time Attorney

General of the State and Dean of the Law School of the University of Maryland. He was the author of the *Poe Code* and other legal books, and was for ten years the adviser of the Democratic State Central Committee. He codified the public general laws of Maryland in two volumes in 1905.

POIRE, EMMANUEL; better known under his pen-name of Caran d'Ache (Russian: "lead pencil"). A French artist and caricaturist, died February 26, 1909. He was born in Russia in 1858, and at twenty years of age went to France, where he became a citizen. His drawings for illustrated supplements of *Figaro* first attracted public attention to him, and gave him a fame which he continued to hold until his death. His humorous drawings of animals were probably never excelled in the skill of the draughtsmanship. The work of Caran d'Ache was widely copied in American, English, and other European periodicals.

POLAR RESEARCH. The achievements of the year were marked by two events which were the most brilliant in polar annals. On April 6, 1909, Commander Robert E. Peary, U. S. N., reached the North Pole, the goal that, for centuries, had baffled all efforts to attain it. On January 9, Mr. Ernest H. Shackleton, of England, after traveling far south over the Antarctic continent, reached a point within about 111 statute miles of the South Pole in 88° 23' S. Lat. and 162° E. Long.

The whole of Peary's previous arctic career was a preparation for this final, complete success. His vessel, the *Roosevelt*, his equipment and his plans seem to have reached the nearest approach to perfection that has yet been attained. He was also favored by unusually excellent natural conditions for his final attempt on the Pole. His scientific assistants, Ross G. Marvin, of Cornell, George Borup, of Yale, and D. B. McMillan, of Worcester, Mass., rendered services of much importance; and wholly apart from his attainment of the Pole, Peary's last work in the Arctic added facts of the greatest significance to our knowledge of that region.

Leaving Etah, at the southern gate of the waterway to the north, on August 17, 1908, the *Roosevelt* reached Cape Sheridan, on the shore of the Arctic Sea, on September 1. Here the party wintered. Many loads of supplies for the polar trip were sledged westward to Cape Columbia, the most northern point of the Grant Land coast; hunting parties brought in large supplies of fresh meat (musk ox, bear and deer), and the scientific staff took tidal and meteorological observations from Cape Bryant on the Greenland coast to Cape Columbia. On February 15, 1909, the first of the five detachments of the North Pole sledge party left Cape Sheridan for Cape Columbia, the entire expedition numbering 66 men, 140 dogs and 23 sledges. On March 1, they set out on the sea ice for the north. There being very little ice drift to change the direction of the course, the whole route from Cape Columbia was practically due north. Water leads were the chief impediment on the northern march, the total delays on this account being about two weeks. Pressure ridges were not so formidable as Peary had found them further east. With organization and personnel in the highest state of efficiency the pace was remarkably rapid. The distance from the mainland to the Pole was 475 statute miles, and it was covered at the average rate of

over 13 miles a day, including the long detentions. This was nearly double the distance per day covered by the Italian expedition (the Duke of the Abruzzi) on its sledge march towards the Pole.

As the explorer advanced, the supporting parties, one after another, were turned back and, for the final dash of 140 miles, there were left only five men (Peary, Matt Hensen, his colored servant, and three Eskimos), 40 dogs and five sledges. This distance was covered in five forced marches of forty hours, and the Pole was reached on April 6. During the 30 hours spent in taking observations there the minimum temperature was -30° F., the maximum, -12° and, for 20 hours, the sky was cloudless. No animal or other kind of life was found there and Peary describes the ice at the Pole as "chalky white," and practically level. The return journey to land was made by forced marches at the phenomenal rate of about 20½ miles a day. This burst of speed was facilitated by the lighter sledge loads, and the fact that the party returned along its outward route, sleeping in the snow houses that were then erected. The one unfortunate occurrence was the accidental death, by drowning, of Professor Marvin.

The most significant feature of the scientific work on this journey over the sea ice, was the soundings which were secured, at intervals, from Cape Columbia to the North Pole. All known arctic lands rise from the continental shelf, as physical geographers call the submarine platform surrounding continental coasts and sometimes extending far away from them, from 600 to 1000 feet below the surface of the sea. It has long been regarded as probable that no arctic land exists beyond the point where the continental shelf ends and the sea bottom descends to oceanic depths. The first sounding on which Peary has definitely reported was made about fifty miles north of Cape Columbia, where bottom was reached at 660 feet, which apparently shows that the shelf is rather wide north of that Cape. Peary's second sounding, not far from the eighty-fifth parallel, gave a depth of 1950 feet, and he had then passed beyond the shelf, and the ice upon which he stood was over oceanic depth. The third sounding was within five miles of the pole, where all the wire, 1500 fathoms, was sent down without touching bottom. The depth of the ocean, near the North Pole, therefore, exceeds 9000 feet. The northern apex of the world is amid waters that descend to a deep oceanic basin such as those which Nansen discovered in the Asian Arctic. This is the first decisive proof of the existence of great oceanic depths to the north of the American Arctic lands, and the existence of any considerable land mass still unknown, in that field, is very doubtful.

A few weeks before Peary's return home, Dr. Frederick A. Cook arrived at Copenhagen, on a Danish vessel from Greenland. He claimed to have reached the North Pole on April 21, 1908. His story was accepted as true in Copenhagen where he was received with high honors. It was known that he went to northwest Greenland in the summer of 1907, with Mr. J. R. Bradley, ostensibly on a hunting cruise. The latter returned home leaving Cook, with a considerable quantity of supplies, in camp a little north of Peary's old base station at Etah. About sunrise on February 19, 1908, Cook with a

party of Eskimos started west with their sledges on a journey across Grinnell Land to the outlet of Nansen Sound in the Arctic Ocean. After obtaining a good supply of fresh meat in Grinnell Land, Cook set out on the sea ice. He claimed that he sent back his last supporting party after three days, and then pushed on to the north with his two best Eskimo and 26 dogs. In the reports of his journey, which he published after his return to civilization, Cook gave a somewhat detailed, but still rather hazy, account of his advance to the Pole and back, his camp at Cape Sparbo on Jones Sound, during the winter of 1908-9, and of his return first to the Smith Sound region to leave his Eskimos, and then to the Danish settlements in South Greenland, where he took ship for Denmark.

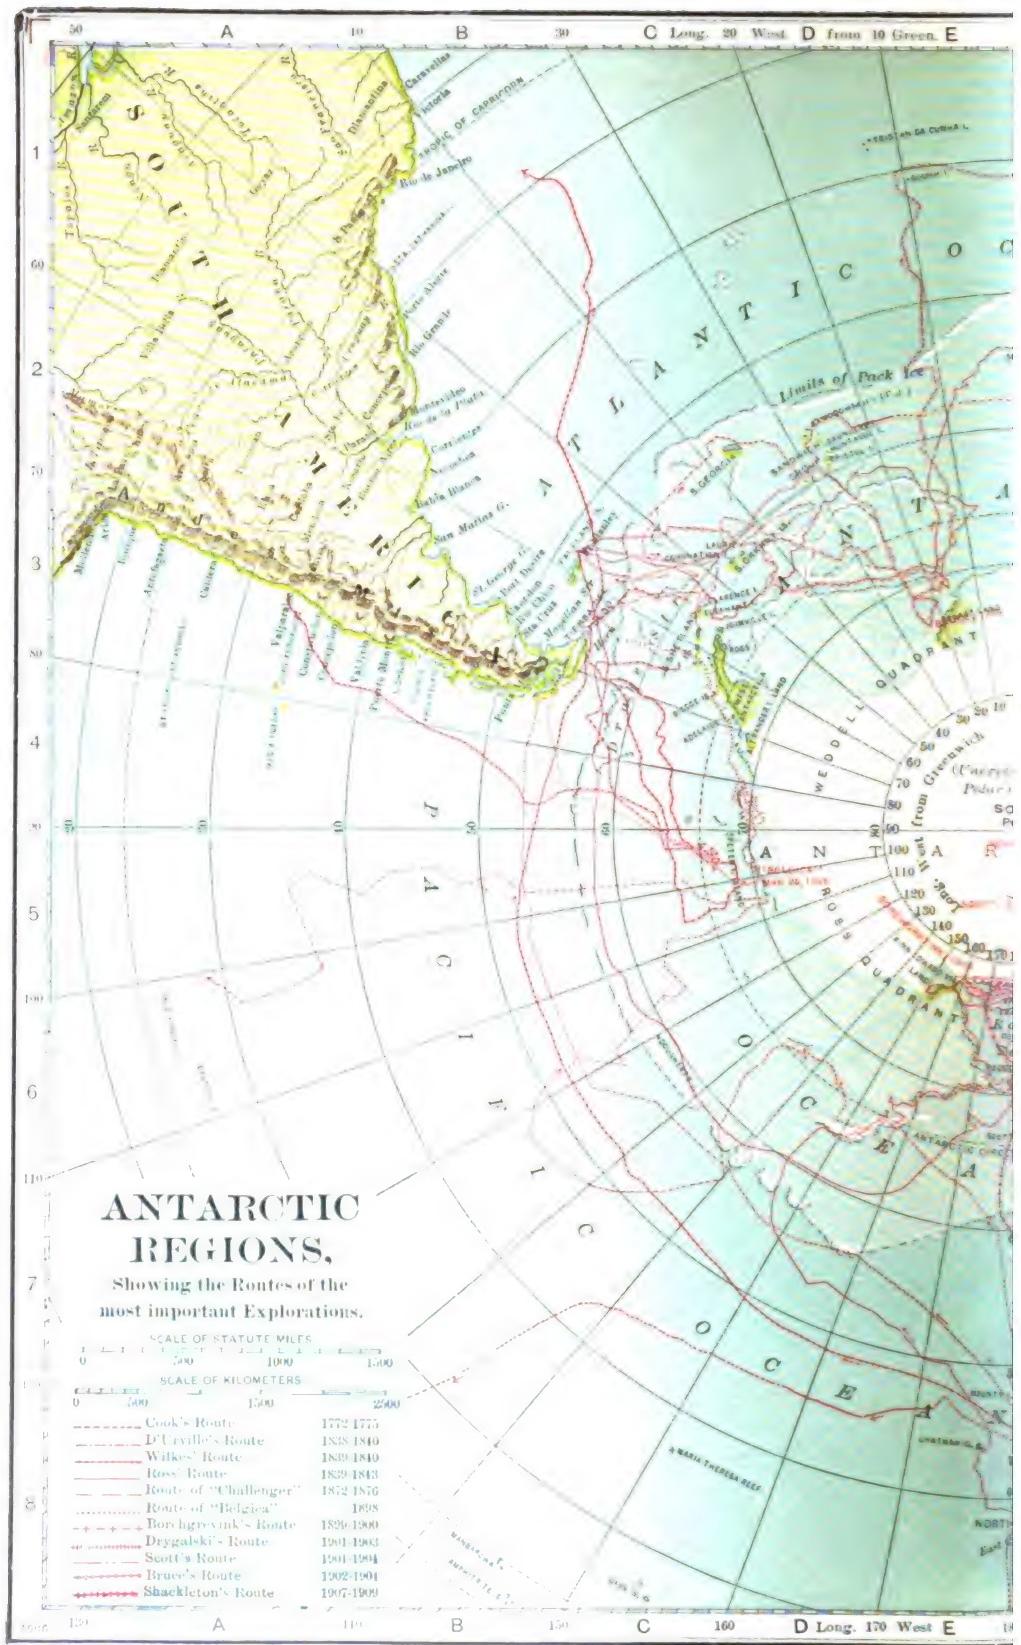

Wide credence was given to Cook's narration for some months and, after his return to New York, he soon made a large sum of money by his writings and lectures. Many, however, had doubted his honesty from the first; and faith in him was rudely shaken by an affidavit from a man who had accompanied Cook, several years earlier, on his second visit to Mount McKinley, to the effect that Cook's narrative of his ascent of that mountain was false, as no ascent was made. Then the two Eskimos who had accompanied Cook told the Peary party that the white man took them only a few miles north of Nansen Sound, and then turned south to Jones Sound, where they spent the winter. This was followed by the sworn statement of a person who said, he had prepared for Cook a set of observations for latitudes and longitudes on his journey to the Pole, to send with his other data to the University of Copenhagen, where his scientific results were to be examined. Cook was to pay him \$4000 for this work, but only about \$600 had been received. Meanwhile Cook disappeared from view, a little before the Copenhagen committee reported that the material he had sent to them contained no proof whatever that he had been to the North Pole.

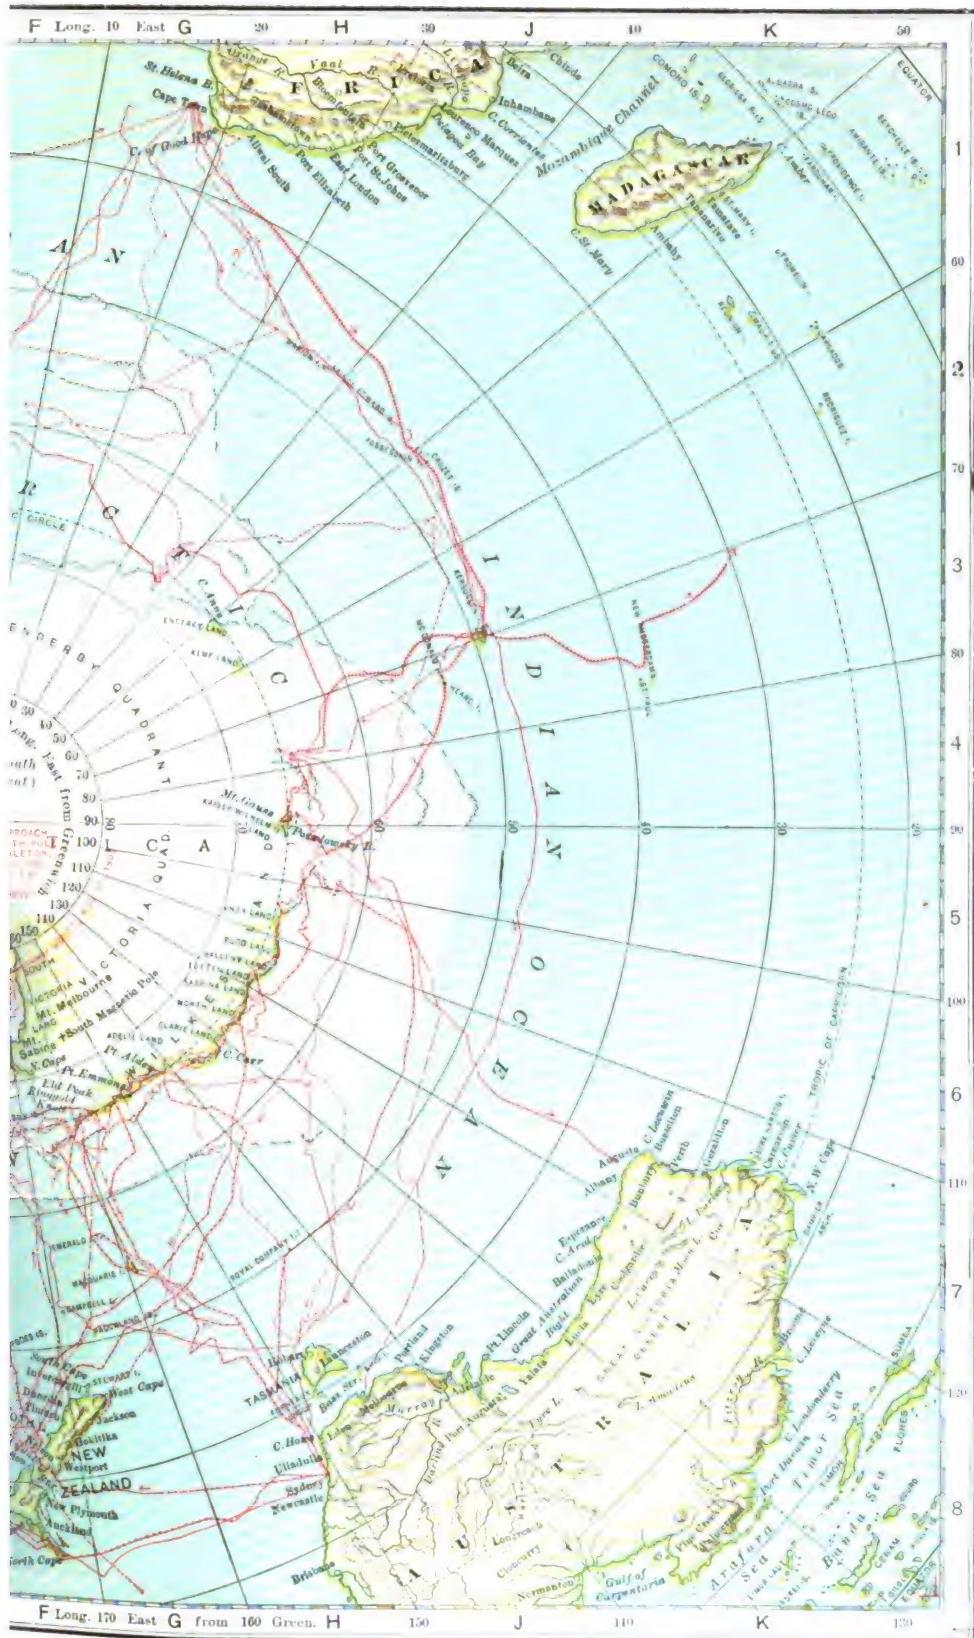

Peary submitted to a special committee of the National Geographic Society, consisting of Mr. Henry Gannett, Rear Admiral C. M. Chester, retired, and Mr. O. H. Tittmann, Superintendent of the United States Coast and Geodetic Survey, his original journal, records of observations, instruments, etc. The committee reported that this material supplied proof that he had attained the North Pole on April 6, 1909. The gold medal of the Society was awarded to him.

Captain Bernier, in the Canadian service, spent the winter of 1908-9 on Melville Island, in the Canadian arctic archipelago. He found an abundance of grass and flowers there from April to July, and also many musk ox, reindeer and other animals. The records left by Sir Edward Parry were discovered and brought back.

Denmark sent an expedition under the command of Captain Ejnar Mikkelsen to search for the body and records of the late Dr. Mylius Erichsen, who completed, in 1907, the mapping of the northeast coast of Greenland. The results will not be learned till the latter part of 1910.

Preparations were under way in 1909 for the organization of the British Antarctic Expedition under Mr. Shackleton, and it arrived safely at Cape Royds, Erebus Island, South Victoria Land, where it spent the winter of 1908. The party made four important land journeys. The first was the ascent of the Erebus volcano, whose

COPYRIGHT, 1906, BY DODD, MEAD & CO.

summit, 13,379 feet, was reached on March 10, 1908. The crater of this magnificent mountain is 900 feet deep and a half mile wide, and the steam ascending from it sometimes rises to a height of more than half a mile. During the winter, the presence of molten lava in the crater was shown by the deep red reflection on the steam cloud.

The second journey, one of the finest sledging exploits on record, by Shackleton, Adams, Marshall and Wild, started towards the South Pole on October 29, 1908. They traveled almost due south for 34 days on the Great Ice Barrier, passing Scott's furthest south and with the coast of the Antarctic Continent on their right as they advanced. In $83^{\circ} 28' S.$ Lat., they found the coast in front of them. A mighty glacier, one of the largest known, here discharged its ice on the Barrier, and up this ice river, which was named the Beardmore Glacier, they forced their way. At $83^{\circ} 40' S.$ they saw a brown bird and this was the last sign of life on the journey south. The glacier proved to be about 130 miles long, and its top was reached at an altitude of 10,477 feet above the sea. The explorers were now standing on the ice cap of East Antarctica, and the plateau was still rising gently before them. Some seams of coal, from 8 inches to 4 feet thick, were found. The wind sometimes blew at 80 to 90 miles an hour with temperatures of 60° below freezing, so that they had to lie in their bags till the storm subsided. Food was failing and rations were reduced, but the men pushed forward till January 9, 1909, when they were within 111 statute miles of the South Pole, and at an elevation of 11,600 feet above the sea. Southward stretched the same dead white snow plain and there is practically no doubt that the South Pole lies in this ice-covered land mass. They returned to winter quarters on March 1.

While this journey was in progress, another party made a long journey to the northwest over the interior ice cap and on January 16 reached the position of the South Magnetic Pole, which they fixed in $72^{\circ} 25' S.$ Lat., $155^{\circ} 16' E.$ Long. Still another sledge party traveled a considerable distance inland, up the Ferrar Glacier. On March 4 the expedition started for home on their steamer *Nimrod*.

The health of the party was remarkably good. The Manchurian ponies proved their great value as transport animals on the southern journey. Living microscopic animals were found in the fresh water lakes of the continent. It was proven that most of the Antarctic icebergs are largely or wholly snowbergs. The glaciers in some cases push out as far as thirty miles from the coast. The expedition practically solved the problem of the South Pole, and its leader has received the highest honors of many geographical societies and has been knighted by the British government. At the close of the year, the preparations of Captain R. F. Scott, leader of the earlier British expedition to this region, were far advanced for the renewal of work in the Antarctic with the special view of reaching the South Pole.

POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF. A learned society founded in 1889 for the purpose of promoting political and social science in a broad sense of the term. It had in 1909 a membership and subscription list of about 4500, of whom 250 were residents of foreign countries. The Acad-

emy edits a bi-monthly publication called *The Annals*, of which Professor Emory R. Johnson of the University of Pennsylvania is the editor-in-chief. During 1909 the following volumes of the *Annals* were issued: January, *Industrial Education*; March, *Labor and Wages*; May, *Conservation of Natural Resources*; July, *Race Improvement in the United States*. The following supplementary volumes were also issued: March, *Child Workers of the Nation*; July, *Consumers' Control of Production*; September, *Chinese and Japanese in America*; November, *American Business Conditions*. The annual meeting of the Academy is held in April, while several monthly meetings are held during the year. The twentieth annual meeting of the Academy was held in Philadelphia, April 16-17, 1909. The general topic discussed was "Race Improvement in the United States: The Development of Physical Welfare through Social Environment." A special exhibit was held illustrating the congestion in cities. This was prepared in co-operation with the Committee on Congestion of Population in New York and the City Club in Philadelphia. The general subject of the meeting was discussed under five special heads: The first of these was "The Relative Importance of Heredity and Environment in Race Improvement." This was discussed by Carl Kelsey, Ph. D., with a paper on "The Significance of the Problem"; by Dudley Allen Sargent, on "The Significance of a Sound Physique"; by Charles B. Davenport, on "The Influence of Heredity in Human Society," and by Alexander Johnson, on "Race Improvement by Control of Defectives." The second topic of the main subject was "Influence of City Environment on National Life and Vigor." The following papers were read: "Popular Recreation and Public Morality," by Luther H. Gulick, M. D.; "Are There Evidences of Race Degeneration in the United States?" by Woods Hutchinson, M. D.; "Relation of Federal Government to Race Improvement, with Special Reference to the Establishment of a Children's Bureau," by the Hon. Herbert Parsons; "Influence of City Environment on the Negro," by Booker T. Washington. The third subdivision was "The Clinical Study and Treatment of Normal and Abnormal Development," and this was illustrated by a "Psychological Clinic with Presentation of Cases," by Dr. Lightner Witmer, and a general discussion followed. The fourth subdivision was "Obstacles to Race Progress in the United States," and the following papers were contributed: "Use of Liquor as a Factor in the Race Problem in the South," by Ray Stannard Baker; "Alcoholism as a Cause of Insanity," by Charles L. Dana, M. D.; "The Moral Influence of Women in American Society," by Ethelbert Dudley Warfield, LL. D.; "Quacks and Quackery—The Drug Habit: Limitations of Legislation in Remedyng Public Health Evils," by Champe S. Andrews; "The Fatal Invasion of Family Life by Industry," by Mrs. Florence Kelley; "The Instability of the Family," by J. P. Lichtenberger, Ph. D. The last subdivision was "The Relation of Immigration to Race Improvement," and the following papers were contributed: "Restriction of Immigration," by Hon. Oscar S. Straus; "Immigrants and Crime," by Hon. William S. Bennett; "The Relation of Immigration to the Condition of the Laboring Classes in the United States," by John Mitchell, and "The Relation of Immigration to Race Progress in the United

States," by William Z. Ripley, Ph. D. The officers in 1909 were: President, L. S. Rowe; Secretary, Carl Kelsey.

POLITICAL ECONOMY. The year 1909 was the twenty-fifth anniversary of the founding of the American Economic Association (q. v.). This fact led to an unusually elaborate programme at the annual meeting in New York the last week in December. Sessions were held in connection with the American Sociological Society (see SOCIOLOGY), the American Political Science Association, the American Association for Labor Legislation, the American Statistical Association, and the American Historical Association. President Taft, Governor Hughes, and Mayor McClellan spoke at one of the opening meetings; members were given unusual opportunities to observe the workings of numerous financial and commercial institutions, including the Stock Exchange; luncheons and receptions of considerable distinction were given; and an excursion to West Point closed the events of the official programme.

There follows a bibliography of many of the more important books issued during the year.

GENERAL WORKS. *Handwörterbuch der Staatswissenschaften*, edited by J. Conrad, L. Elster, W. Lexis, and Edg. Loenig, volume one, completely revised; Philippovich, *Grundriss der politischen Ökonomie*, II. Bd., *Volkswirtschaftspolitik*; Gide, *Cours d'économie politique*, new edition; Pareto, *Manuel d'économie politique*, translated from the Italian by Alfred Bonnet; Gide and Rist, *Histoire des doctrines économiques depuis les Physiocrates jusqu'à nos jours*; Hobson, *The Industrial System*; Wagner, *Theoretische Sozialökonomik oder allgemeine und theoretische Volkswirtschaftslehre*; *Documentary History of American Industrial Society*, edited by Professor John R. Commons and others, in ten volumes; Unwin, *The Guilds and Companies of London*.

MONEY AND BANKING. Victor Morawetz, *The Banking and Currency Problem in the United States* (see CENTRAL BANK); Andréades, *History of the Bank of England, 1640-1903*; Kemmerer, *Money and Credit Instruments in their Relation to General Prices*; Davies, *The Money and the Stock Share Market*.

TRADE AND TRANSPORTATION. A. B. Hepburn, *Artificial Waterways and Commercial Development*; Cleveland and Powell, *Railroad Promotion and Capitalization in the United States*; Horrocks, *Railway Rates: The Method of Calculating Equitable Rates and Charges for Merchandise Carried on Railways*; Ketchum, *Freight Economics, How Traffic Experts Save Money*; McPherson, *Railroad Freight Rates in Relation to the Industry and Commerce of the United States*; Mathews, *Remaking the Mississippi: Preliminary Report of the Inland Waterways Commission*; Brooks, *Odd Prices and Bargains in Retail Trade*; Commissioner of Corporations, *Report on Transportation by Water in the United States*; Fagan, *Labor and the Railroads*.

LABOR. Beveridge, *Unemployment, a Problem of Industry*; Bryan, *The Development of the English Law of Conspiracy*; Chapin, *The Standard of Living among Workingmen's Families in New York City*; Shadwell, *Industrial Efficiency, a Comparative Study of Industrial Life in England, Germany and America*; *Working Classes, France*, being the report of an inquiry by the London Board of Trade on the cost of living

of the working classes; Lewis, *State Insurance: A Social and Industrial Need*; Schloss, *Insurance against Unemployment*.

TAXATION AND FINANCE. *British Tariff Commission Report*, including special reports on fourteen leading industries as the result of several years' work; Eheberg, *Finanzwissenschaft*; Hobson, *The Taxation of Unearned Income*; Jordan, *The Fate of Iciodorum*; Noyes, *Forty Years of American Finances*; Robertson, *Trade and Tariffs*; Bureau of Corporations, *Taxation of Corporations, Part I., New England*; Plehn, *Introduction to Public Finance*, new and completely revised edition.

For classified lists of the periodical output of the year see *The Economic Bulletin* or *The Readers' Guide*.

POLO. The most notable event in the polo history of 1909 was the winning of the American Polo Cup from the Hurlingham Club of England by the Meadow Brook team of Long Island. This international trophy was carried to England in 1886. The American players who brought it back were J. M. Waterbury, Jr., Lawrence Waterbury, Harry Payne Whitney and Devereux Milburn. A series of three games was arranged, but the Americans won two straight, which made it unnecessary to play the third. The first match was won by a score of 9 to 5 and the second by 8 to 2. The senior club championship in the United States was won by the New Haven Country Club, which defeated the Bryn Mawr Polo Club by 7½ goals to 3. The Meadow Brook Club won the junior championship, defeating the Dedham Polo Club by 15 to 4½. In the cup contests Devon defeated Bryn Mawr 16½ to 8½ and 6½ to 4½, and Rumson, 12 to 7½; and was defeated by Bryn Mawr 8½ to 7½. Great Neck 2d defeated Meadow Brook 2d by 7 to 5½; Rumson, by 7 to 4; Rumson Freebooters, by 8½ to 5; Bryn Mawr, by 13½ to 10; Point Judith, by 10½ to 7, and Dedham B., by 8 to 7.

POPE, ALBERT AUGUSTUS. An American manufacturer and capitalist, died August 10, 1909. He was born in Brookline, Mass., in 1843, and was educated in the public schools. At the outbreak of the Civil War he enlisted in the Thirty-fifth Massachusetts Infantry. He rose rapidly from the ranks and was brevetted lieutenant-colonel for gallant conduct. At the close of the war he engaged in the making of shoe manufacturers' supplies. In 1876, with the importation of the first bicycles, Colonel Pope saw a great opportunity. He founded the Pope Manufacturing Company, and made a large fortune as a maker of bicycles. When these wheels lost their popularity he began the manufacture of automobiles. Financial troubles in 1907 forced the Pope Motor Company into the hands of a receiver. To the efforts of Colonel Pope is largely due the general improvement of roads throughout the United States, since the advent of the bicycle.

PORTLAND, ORE. See ELECTORAL REFORM.

PORTO RICO. A territorial possession of the United States, ceded by Spain as a result of the Spanish-American War in the treaty of December 11, 1898. It is the easternmost of the four Great Antilles. The population, according to a census made in 1900, is 952,243, of whom 589,426 were white and 363,817 were colored. The proportion of whites is greater than in any other of the West Indies, except

Cuba, constituting 61.8 per cent. Provision was made in the Sixty-first Congress (see UNITED STATES, paragraph on *Congress*) for a census of the population to be taken in 1910.

AGRICULTURE. The fiscal year 1909 was a poor one in all branches of agriculture in the island, and as a result there was a falling off in quantity and value of the exports of almost every product. The outlook for 1910, however, is much brighter. The total value of the sugar exported in 1909 was \$18,432,446 and the quantity was 244,257 tons. The acreage under cultivation was 185,927. Although the exports of sugar were the largest in the history of the island and exceeded those of 1908 by 10,000 tons, and the acreage increased, the amount of money received from the crop was less than in 1908. The effects of the drought on the south side of the island were still evident in some districts, but the rain was so plentiful in the latter part of the year that the outlook for 1910 is much more encouraging, and indications point to a still greater output for the entire island than in the past year. Tobacco showed a slightly decreased acreage planted than in 1908. The total value of exports of tobacco in all forms for the fiscal year 1909 was \$5,634,130. Of this amount \$4,383,893 was for cigars, of which 142,088,000 were exported. This is an increase of nearly \$1,000,000 in value and about 5,000,000 in quantity over the export of 1908. If leaf and stem tobacco there were exported 539,320 pounds, valued at \$1,250,237, which was a great decrease in quantity and a slight decrease in value from the export of 1908. The total acreage planted in tobacco was 27,596. The greater proportion of the crop of 1909 was made up into cigars on the island and the number of cigars manufactured in the island in 1909 was the greatest on record, exceeding the output of 1908 by over 35,000,000, whereas only about one-half the amount of leaf tobacco was exported. This is greatly to the advantage of the island, as the manufacture of the leaf into cigars gives employment to thousands of people. In addition to the cigars exported, there were also manufactured for home consumption 933,265, making the total number of cigars manufactured on the island 227,021,365. In addition to the cigars there were manufactured 5,525,563 cigarettes, practically all of which were consumed on the island.

crease in 1909 as compared with 1908. The total value of the export of 1909 was \$485,896, as compared with \$875,258 in 1908. The exports of cocoanuts were slightly less than in 1908 and were valued at \$204,498. In the export of pineapples there was a great increase in 1909 over 1908, the respective figures being 442,780 and 172,779. A considerable quantity of canned pineapples was also exported. Although more orange groves in the island come into bearing each year than the year before, owing to agricultural conditions the value of the crop in 1909 was \$229,000 less than that of the crop of 1908. The acreage planted in pineapples is increasing enormously. Transportation facilities for fruit are still inadequate, but the steamship companies are endeavoring to assist the growers in every way possible. Great ignorance still exists on the part of many shippers as to the best manner of picking and packing their fruit.

The exports of other agricultural products in 1909 remained about stationary, except that cotton fell off from 223,053 to 199,562 pounds, with a corresponding decrease in the value. Sisal plants have been planted upon a tract of government land near Yauco and are being cared for under the supervision of the United States Experiment Station.

COMMERCE. The total trade of the island continued to increase during the fiscal year 1909 and approximated in that year \$57,000,000, while the balance of trade in favor of the island was \$3,846,899. The trade with the United States is steadily increasing, while that with foreign countries is decreasing. The exports to foreign countries in the fiscal year were \$1,000,000 less than in 1908 and the imports more than \$1,000,000 less than in 1908, whereas there was sold to the United States about \$500,000 worth of goods and the purchases in the island from the United States amounted to \$23,500,000. Porto Rico now ranks as the thirteenth customer of the United States among all the nations of the world, its purchases being only a small amount less than those of the entire United Chinese Empire. The table below shows the value of the imports from and the exports to the United States and foreign countries, together with the total imports and exports, and the total trade for the years 1907, 1908 and 1909.

	Imports from—		Exports to—		Total imports	Total exports	Total Trade
	United States	Foreign countries	United States	Foreign Countries			
1-8.....	\$23,677,376 23,618,545	\$3,148,980 2,925,781	\$25,891,281 26,394,312	\$4,753,209 3,906,913	\$25,892,665 26,544,326	\$30,644,490 30,391,225	\$56,470,155 56,935,551
1-9.....							

The coffee crop in 1909 showed a decrease nearly 7,000,000 pounds and the acreage is steadily decreasing year by year, as plantations are abandoned. The total amount exported in 1909 was 28,489,236 pounds, valued at \$3,715,000, as compared with 35,256,489 pounds, valued at \$4,304,609 in 1908. The total acreage planted in coffee in 1909 was 155,778, as compared with 169,873 in 1908. The indications for 1910 are promising, as the coffee trees have covered well over the entire island. The export of citrus fruits showed a considerable de-

TRANSPORTATION. No new railroad lines were built during the fiscal year 1909, but the companies operating on the islands extended their lines about 22 kilometres. The Ponce-Guayama Road was under construction during the year and through traffic between Ponce and Guayama in conjunction with the road of the Compagnie de Sucreries was to be opened by January 1, 1910. A franchise was granted to the San Juan Light and Transit Company to double-track its line between San Juan and Martin Peña. The road between Naguabo and Fajardo will be com-

pleted during 1910. The dredging of the harbor of San Juan by the United States government progressed rapidly during the year. The inner harbor has been dredged to a depth of 30 feet, and the dredging plant is at work on the outer channel. Road and bridge construction by the insular government was virtually suspended at the end of the year, as practically all the proceeds of the road loan were expended and no appropriations were made at the session of the legislature for that purpose. See *History* below.

EDUCATION. The number of pupils actually enrolled in all the schools of the island, including special schools, in 1908-9, was 105,125. Of these the white pupils numbered 78,506, and the colored 26,619. Of the white pupils 45,298 were males, and 33,208 were females; of the colored, 15,060 were males, and 11,559 were females. The total number of teachers employed in the common schools at the end of the fiscal year was 1571. Of these 1383 were white and 188 were colored. Of the white teachers 694 were males and 689 females. Of the colored teachers 91 were males and 97 females. There were employed in the special schools at the end of the fiscal year 37 teachers, making a total of all the teachers employed in schools 1608. The monthly salary of teachers was as follows: Preparatory teachers, \$20; rural, \$35; graded, \$60; English graded teachers, \$65; principal teachers, teachers of English and special work teachers, \$75. The total expenditures for school purposes in 1908-9 were \$848,817 by the insular government, and \$437,485 by the local government, making a total expenditure for education for the fiscal year of \$1,286,302. During the year difficult problems arose, due in part to the failure of the legislative assembly to provide revenues for the support of the government during the fiscal year 1910. (See *History* below.) During the year a number of school playgrounds were established in the island. A school savings bank was established in 1908, and was successfully carried on during 1909. Total deposits to the credit of the pupils in the schools of \$6763 were made during the year. During the year an effort was made in the development of libraries already in operation in the schools and the establishment of additional libraries. There were at the opening of the year school libraries in ten towns. At the close of the year there were 57 rural libraries containing 2891 volumes in operation. There are altogether in the island one hundred libraries with a total of 37,715 volumes, to which the public has access, and of these 81 are in either graded or rural schools. Increased activity was shown during the year in the erection of school buildings.

FINANCE. The receipts of the insular government from all sources for the fiscal year 1909 was \$25,000 less than in 1908, although the receipts from local sources somewhat increased. There was, however, a decrease of over \$175,000 in customs which caused a reduction in total receipts. The expenditures exceeded the receipts by \$546,223, reducing the total surplus from \$1,527,884 to \$1,222,604. This excess of the expenditures was due to the deliberate intention of the legislature to reduce the amount of the surplus, which was considered too great, and it accordingly made large appropriations for permanent public improvements. The total insular revenue receipts amounted to \$3,548,960,

and the total insular revenue expenditures to \$4,095,184. The assessed valuation of the island in 1909 as \$117,587,873, an increase of \$9,180,079 over that of the fiscal year 1908. The valuation is constantly increasing, and the tax for the fiscal year 1910 will be levied on the valuation of \$122,714,884.

HEALTH AND SANITATION. The general sanitary condition of the island continued to improve in 1909, as it has throughout the American administration. The construction of aqueducts for the supply of pure water has largely contributed to the general improvement. Deaths from transmissible diseases have decreased in total. The largest mortality is caused by tuberculosis, from which there were 2245 deaths in 1909, an increase of 335 over 1908. The death rate fell during the year to 20.90 per thousand, while the number of births had risen to 38,105, which leaves an excess of 16,056 over deaths and is the increase in the population of the island. The legislative assembly at its extraordinary session in 1908 passed a law providing for an organization called the Anæmia Dispensary Service. This succeeded the commission which had heretofore carried on the work. During the last nine months of the fiscal year 1909, 59 dispensaries for the treatment of anæmia were in operation and 9159 patients were registered during the fiscal year 1908 and were under treatment during the fiscal year 1909, making a total of 63,884 treated by the dispensaries during the period mentioned above. Of this total number 18,549 were cured and 8087 were considered to be practically cured, only 54 having died. During the fiscal year 1910 the Anæmia Dispensary Service will be part of the Dispensary Service of Tropical and Transmissible Disease, created by a legislative act, approved March 18, 1909.

CHARITIES AND CORRECTIONS. The Bureau of Charities has under its control the boys' and girls' charity schools in Santurce, the Insane Asylum, the Blind Asylum at Ponce, and the Leper Colony on Cabras Island. Many improvements were made in the buildings occupied by these institutions during the year. The general condition of the jail buildings is not good but a new penitentiary is projected and when it is finished there will be a relief from the conditions as they now exist.

POLITICS AND GOVERNMENT. The general political condition during the fiscal year 1908 was unsatisfactory. The election campaign during the summer and fall of 1908 without any disagreeable incidents, but great stress was laid upon objections to the present system of government, and some of more hotheaded orators even advocated partitioning for independence. At the extra session of the legislature in September, 1908, there were no serious difficulties encountered in passing the principal bills providing for an organization project and the settlement of the cases (see below), but there appeared to be an underlying spirit of unrest. At the nominating convention held in the same month many more conservative members of the House Delegates failed of renomination by the Unionist Party, which is the dominating party, up of the more radical element and opposed the government, and several Extremists nominated in their places. The result of the elections was a complete sweep of all the districts of the island for the Unionist

and for a second time the House of Delegates was composed of Unionists. At the assembling of the Legislative Assembly in January the House of Delegates and the central committee of the Unionist Party passed a resolution to the effect that in order to attract the attention of the United States to the opposition to the Organic Act, the House of Delegates should refuse to pass any legislation whatsoever. This resolution was defeated but obtained 9 votes of the 35 members present. A similar resolution was defeated in February, but this time it obtained 14 votes. The legislative session went on quietly until the last day. The sessions of the Assembly are fixed by the Organic Act at 60 days, and heretofore it has been the custom to leave most of the important legislation until the last and then sit in continuous session for three or four days until all the work is finished. On the last day of the session, however, the Governor received information that the House was to adjourn without having taken action on the important appropriation bills. The Governor did not oppose this but permitted the legislature to adjourn at midnight of the last day. He then called an extra session on the following morning and in a message authorized the consideration of the important bills. The extra session, however, refused to pass these bills and adjourned without having taken action. The policy which the House was prepared to adopt was to refuse to provide for the support of the government in order to force the attention of Congress to the situation and to send a delegation to attend the extra session of Congress in Washington in the hope of obtaining amendments to the Organic Act in conformity with their ideas. Such a commission was sent after the adjournment of the legislature. The President of the Council and the Attorney-General of the island also proceeded immediately to the United States for the purpose of presenting the government's side of the controversy. This commission was authorized to ask from Congress a provision similar to that in the Organic Acts of the Philippines and Hawaii, re-enacting the budget of the previous year, when the legislature fails to pass a new one. A full discussion of the message of President Taft in relation to the conditions in Porto Rico will be found in the section *Congress*, in the article UNITED STATES. On June 9, the bill asked for was passed by Congress and on July 15 was signed by the President. The programme of the Unionist Party, which is in political control of the island, included a demand for radical changes in the choice of the Executive Council, whereby this body shall be elected by Porto Ricans instead of being appointed by the President. In addition, the House of Delegates passed and requested the Executive Council to approve several acts which were obnoxious to Governor Post and other members of the Executive Council. One of these bills, which provided that local magistrates should be appointed, was enacted for political purposes and intended to provide offices for more than 100 natives. Other acts to which the Governor was opposed were those creating an agricultural bank, those instituting a system of manual training, and those which allow the largest property holders to appoint the tax assessors in the various districts of the island.

The bill passed by Congress was favorably received by the more conservative element on

the island, but was bitterly resented by the Radicals. The interpretation given to the measure by the Attorney-General was attacked and an injunction was asked for by the Unionists. On September 18, Judge Rodey of the District Court rendered an opinion holding that the Attorney-General had properly interpreted the Act and refused to grant an injunction. Under this ruling the Governor was authorized to approve payments up to a total amount of \$3,173,295. See UNITED STATES, paragraph on *Congress*.

On September 7, Regis H. Post resigned his office for personal reasons and Colonel George R. Colton of Illinois, formerly Collector of Customs at Manila, was appointed to succeed him. He was inaugurated on November 6.

The matters in dispute between the United States government and the Catholic Church in regard to the ownership of certain lands on the island was settled by a compromise on August 12, 1908. The amount involved was approximately \$650,000, of which \$283,000 was in dispute with the United States and \$365,000 with the insular government. It was agreed that the United States should pay \$120,000 and the insular government \$180,000 to the Catholic Church and that the insular government should turn over to the church some 60 acres of grazing land at Santurce, and the Censos which had been awarded to them by the Supreme Court of Porto Rico. The terms of the settlement were submitted to the legislature and were unanimously approved.

OFFICERS: Governor, George R. Colton; Secretary of Porto Rico, George Cabot Ward; Attorney-General, Henry M. Hoyt, 2d; Treasurer, W. J. Gromer; Auditor, A. P. Sawyer; Commissioner of Education, E. G. Dexter; Commissioner of the Interior, L. H. Grahame; Resident-Commissioner of the Territory at Washington, Tulio Larrinaga.

JUDICIARY: Chief Justice, José C. Hernandez; Justices, Emilio del Toro, José Figueros, James H. McLeary and Adolph G. Wolf; United States District Judge, B. F. Rodey; United States District Attorney, José R. F. Savage.

PORTUGAL. A constitutional monarchy of the Iberian Peninsula. Including the Azores and the Madeira Islands, which are regarded as integral parts of the kingdom, the area is 35,582 square miles, and the population, according to the census of 1900, was 5,423,132. Capital, Lisbon. Non-continental area and population (1900): Azores, 922 square miles and 256,291 inhabitants; Madeira Islands, 314 square miles and 150,574 inhabitants. The foreign population in 1900 was 41,728. In that year Lisbon had 356,009 inhabitants; Oporto, 167,955; Braga, 24,202; Setubal, 22,074; Funchal (Madeira), 20,844; Coimbra, 18,144; Ponta Delgada (Azores), 17,620. The movement of the population (including the Azores and Madeira) for 1905 was as follows: Marriages, 37,600; births, 179,746; deaths, 112,756. The emigrants (mostly to Brazil and the United States) numbered (1907) 41,950.

EDUCATION. Primary education is free and nominally compulsory; but of the population over six years of age more than 70 per cent. are illiterate. There were in 1905 something over 6700 public and private elementary schools; 33 public (besides many private) secondary schools, with 5978 pupils; 23 normal

schools, with 1168 students. There are also many special schools (commercial, technical, industrial, medical, etc., etc.), but the attendance is small. The University of Coimbra had (1905) 572 law, 157 philosophy, 138 medical, 122 mathematics, and 53 theological students. The expenditure on public instruction for that year (1905) was 1,427,157 milreis, exclusive of 226,898 milreis to be expended through the Ministries of War and Marine. Roman Catholicism is the state religion, but all other forms of worship are tolerated.

INDUSTRIES. Of the total (continental) area, 26.2 per cent. is under cereals, pulse, pasture, etc.; 3.5 per cent. under vineyards; 3.9 per cent. under fruit trees; 17.3 per cent. under forest; 43.1 per cent. is waste land. The principal crops are corn, rye, wheat, olives, figs, fruits, and vegetables. The vine is cultivated on large and increasing areas. The population engaged in agriculture was given in 1900 as 3,387,199. In 1907 the number of persons actually engaged in mining was 4121. The mineral wealth of the country remains largely unavailable for lack of fuel and cheap transport. The value of the output of the various mines in milreis (1 milreis=\$1.08) at the mines in 1907 was 1,858,606.

The value of the fisheries in 1907 was 4,724,-243 milreis (sardines, 2,073,799; tunnyfish, 368,929), besides 28,582 from the whale fisheries in the Azores and the cod fisheries. The persons engaged in this industry numbered 35,129, with 10,049 vessels of 29,157 tons.

COMMERCE. The imports in 1907 amounted to 61,453,100 milreis, against 60,391,301 in 1906; the chief articles being as follows: Raw materials, 27,097,700; food-stuffs, 12,682,600; textiles, 7,113,700; machinery, etc., 6,883,100; live animals, 2,391,600. Of the total imports, the value of 18,566,800 milreis came from Great Britain; 10,974,400 from Germany; 6,710,100 from France; 6,063,700 from the United States; 4,115,900 from Spain, and 1,987,800 from the Portuguese colonies. The exports amounted to 30,410,000 milreis, against 30,592,748 in 1906; the main articles being as follows: Wine, 10,099,115 milreis; cork, 4,378,991; preserved fish, 1,825,655; fruits and vegetables, 1,812,345; copper, 1,224,716; cottons and yarns, 1,171,831. Great Britain received exports valued at 7,367,900; Brazil, 5,824,200; Spain, 4,941,000. The exports of colonial produce through the Portuguese ports (not included in above totals) amounted to 10,555,300 milreis (cacao, 0,659,-671 milreis; rubber, 3,101,517). Imports and exports of coin and bullion amounted in 1907 to 285,187 and 926,548 milreis, respectively, against 666,690 and 347,868 in 1906.

COMMUNICATIONS. The total length of railways in operation December 31, 1908, was 1742 miles, of which 662 belonged to the state. At the end of 1907 there were 5860 miles of telegraph line and 13,299 of wires; there were 516 telegraph offices; the messages transmitted during the year numbered 4,074,030. There were (1907) 1528 post-offices. The merchant marine (including the colonies) on January 1, 1908, numbered 101 steamers of 82,788 tons, and 525 sailing vessels of 53,367 tons. In 1907 11,445 vessels of 18,005,508 tons entered at the ports.

FINANCE. The unit of value is the milreis, worth \$1.08. The revenue and expenditure in 1906-7 were 59,943,000 and 62,899,000 milreis,

respectively. The estimated revenue and expenditure for 1909-10 were 69,262,336 and 74,605,880 milreis, respectively, against 70,530,135 and 72,702,738 in 1908-9. The sources of revenue for 1909-10 were estimated as follows: Indirect taxes, 29,147,404 milreis; direct taxes, 13,624,501; receipts *d'ordre*, 12,712,460; registration fees and stamps, 6,697,700; national property and sundries, 4,494,685; additional taxes, 960,450; extraordinary, 1,625,138. Avenues of expenditure: Public debt, 31,057,096; public works, commerce, and industry, 10,214,-656; war, 7,969,236; interior, 5,595,662; marine and colonies, 5,100,438; finance, 4,590,234; civil list, Cortes, etc., 2,895,540; justice, etc., 1,414,-982; deposit office, 787,621; foreign affairs, 437,261; loss on exchange, 200,000; extraordinary, 4,347,154. The outstanding debt, December 31, 1908, was as follows: Total external, 198,722,490 milreis; total internal, 541,656,122; floating debt, 81,644,918. No gold has been coined since 1891; no silver since 1904. The Bank of Portugal stood, December 31, 1908, as follows: Metallic stock, 9,901,500 milreis; note circulation, 70,162,029; deposits, 2,565,312; commercial account, 18,943,156; advances, 1,599,871; balance against Treasury, 26,690,311; capital, 13,500,000. The Monte Pio Geral and the Portuguese (State) Savings Bank had on the above date deposits amounting to 22,737,000 milreis; the banks of Lisbon and Oporto have monthly average deposits of 20,451,000.

ARMY. Service is obligatory, but exemption may be secured by purchase or by certain classes. The army is recruited from three grand conscription districts, a quota of about 17,000 men being forthcoming annually. There are 6 military territorial divisions, in which the army is distributed and the effective total on a peace footing in 1909 was fixed at 30,000 men. The infantry numbered 20,000, the cavalry 3000, the dragoons 1800, chasseurs 1200, field artillery 3400, horse artillery 500. The total number of guns was 448 and the re-armament with Schneider field and mountain guns was being completed during the year. On a war footing the Portuguese army would be raised to a strength of about 100,000, to which 53,000 militia would contribute, and the ultimate strength available was estimated at 260,000. There is maintained a colonial army of 10,000 men. From the conscription of 1909 there were furnished 18,000 men, of which 16,300 were sent to the active army, 500 to the municipal guard, 300 to the garde fiscale, and 850 to the naval forces. The military budget was fixed at 8,725,236 milreis for 1909-10, of which 7,969,236 milreis was for ordinary expenses and 756,000 for extraordinary.

NAVY. The effective navy in 1909 consisted of one armored coast-defense vessel, of 3200 tons; 5 protected small cruisers, aggregating 11,266 tons; 14 gunboats, 6876 tons; one torpedo-boat destroyer, 530 tons; 4 torpedo boats, 240 tons. There were also a schoolship, several transports, river gunboats, and obsolete gunboats. The personnel is 4204 officers and men.

GOVERNMENT. The executive authority is vested in a king, assisted by a responsible ministry of seven members. The King in 1909 was Manuel II., who was born November 15, 1889, and succeeded to the throne on the assassination of his father, Carlos I., and his elder brother, Louis Philip, February 1, 1908. The

legislative power rests with the Cortes, or Parliament, consisting of the Chamber of Peers and the elective Chamber of Deputies. A Parliament lasts three years, and its annual session, which begins on January 2, continues for three months, but may be prolonged by the King. The Ministry in 1909 (from May 15) was constituted as follows: Premier and Minister of the Interior, Wenceslão de Lima; Foreign Affairs, Carlos de Roma du Bocage; Justice and Worship, Wenceslão de Lima, *ad interim*; Finance, Fr. P. Azevedo; War, J. Elvas Cardeira; Marine and Colonies, M. Terra Vianna; Public Works, Commerce, and Industries, A. Barjona de Freitas.

HISTORY. Early in the year the Regenerador party held a meeting in which they adopted the principle of state socialism. The dissatisfaction with the course of the Monarchist party was manifested by various commercial and industrial associations, which started a campaign against the intriguing tendencies of Monarchist groups and their delay in making any serious attempt to solve important problems. On the opening of Parliament, which was deferred to March 1, the government announced that it would introduce the measures, which had long been demanded by the public, dealing with education and economic financial administrations and colonial relations. In the same month the pretender, Dom Miguel, officially renounced his claim to the throne. On March 16 the meeting of Parliament closed in some confusion, one of the members, Senhor Matta, having accused the Finance Minister, Senhor Espigueira, of robbing the treasury, and a duel with pistols followed. An important question before the government was raised by the complaints of certain British firms against the system of recruiting labor in São Thomé and Principe. (See below, PORTUGUESE AFRICA.) The opposition groups obstructed all parliamentary business, having united in demanding an investigation of the loan which had been negotiated by the government a month before. The opposition motion was lost, but their obstructive tactics were successful, and finding it impossible to carry through its measure, the Ministry of Senhor Campos Henriques resigned. A new Cabinet was formed under Senhor Telles, as Prime Minister, but lasted only four weeks (to May 4), and was succeeded by a non-party Ministry under Senhor Wenceslão de Lima. (See above paragraph on Government.) In the autumn the young King Manuel started on his tour of royal visits, going first to Spain, and thence to England, where his visit was made the occasion for the renewal for a period of five years of the Treaty of Arbitration between Great Britain and Portugal. At the close of November he visited France.

Toward the close of the year reports were published referring to colonial maladministration in Timor, Goa, and the Cape Verde Islands, and at the same time China complained of the Portuguese treatment of the Chinese in Macao. Reports of cruelty toward the natives in Portuguese Africa continued, and the international agitation on the subject of the alleged peonage, and even slavery, at São Thomé and Principe on the west coast was going on. In December, however, the Royal decree, which had been issued in July, was published in London. This suspended for three months the recruiting of

labor in Angola for São Thomé and Principe and implies that in the future it will be completely suppressed. See PORTUGUESE AFRICA.

PORTUGUESE AFRICA. The Portuguese possessions in Africa comprise Angola, Portuguese East Africa, Portuguese Guinea, the Cape Verde Islands, and the islands of São Thomé and Principe, all of which are treated under their respective titles. During the last few years there has been much discussion of the system of labor-recruiting in the Portuguese West African possessions, where virtual slavery was said to be practiced. In a book by Mr. H. W. Nevinson, published in 1906, evidence to this effect was cited. Since its appearance witnesses have corroborated many of its statements. On December 4, 1908, a Caxton Hall meeting was held at London under the chairmanship of J. St. L. Strachey, and resolutions were passed protesting against the slave traffic in Portuguese West Africa. Leading English and German cocoa firms thereupon sent out a special commissioner to investigate labor conditions, and he reported that a system amounting to slavery actually existed. The novelist, John Galsworthy, gave instances to the same effect from his personal experience, in a letter to a newspaper in January. In the spring of 1909, Cadbury Brothers and other cocoa firms proposed a boycott, declaring that they would not buy the slave-produced cacao of the islands of São Thomé and Principe, as a result of their own investigations and a personal tour of inspection undertaken by Mr. William A. Cadbury in 1908. Other firms in England and abroad followed their example. The São Thomé cacao was therefore driven to America for an outlet, and in the autumn of 1909 the Anti-Slavery and Aborigines Protection Society decided to send to the United States a mission to induce cacao buyers in the northern and eastern centres of the country to refrain from purchasing the products of slave labor, and in general to arouse sympathy in the United States with their propaganda. Abuses in the recruiting system were admitted by some of the Portuguese authorities. It was thought that they could be removed by increasing the recruiting at Mozambique. A report on the charges alleged by Messrs. Cadbury and others was laid before the government in the spring, and it seemed likely that some action would be taken. It was held that the law as to recruiting labor worked well in Mozambique, Cape Verde and Cabinda, but not in Angola, on account of the backward state of the natives and their unwillingness to work. Moreover, the law was inadequately enforced in that colony, only a few officials having charge of an immense tract of country. Nearly ninety per cent. of the black labor was supplied by Angola, that is more than 40,000. At the close of August a riot occurred at São Thomé among the newly imported laborers from Mozambique, who declared that although they had signed for only one year, they were constrained to work for a period of two years.

PORTUGUESE EAST AFRICA, or MOZAMBIQUE. A colony of Portugal, on the east coast of Africa, between German East Africa and British South Africa. Area, about 293,860 square miles; population, about 3,120,000. The principal ports are: Lorenzo Marques, the capital, with 10,000 inhabitants (nearly one-half

Europeans); Mozambique, 5500; Beira, 4500 (about one-third Europeans); Inhambane, 3400; Chinde, 3000. The leading products are rubber, sugar, cocoanuts, beeswax, and mining products. Under cultivation, besides sugar-cane, are corn, wheat, oats, barley, alfalfa, pineapples, bananas, coffee, vegetables, sisal, and rubber. Cotton culture also has been tried with success. Extensive coal fields have been found in the Tete region, and important gold-bearing reefs on the Upper Zambezi. In 1908 imports were valued at 7,469,850 milreis; imports, 4,084,127 milreis; transit trade, 27,197,988 milreis; in 1907, 7,265,385, 4,582,218, and 21,615,013 respectively (1 milreis = \$1.08). The leading imports are cotton and iron goods and alcoholic beverages; exports, rubber, ores, wax, and ivory. A considerable part of the trade of British South Africa passes through Beira and Lorenzo Marques and thence by the Beira Railway or Delagoa Bay Railway. The latter has a length of 57 miles in the colony, and is continued 290 miles to Pretoria. An agreement was signed April 1, 1909, defining the commercial relations and the transit of goods by this railway between the Portuguese and British possessions. The Beira Railway extends 204 miles to the British border and thence to Bulawayo. In 1909 a line, which in part was open for traffic in 1908, was under construction from Lorenzo Marques to the Swaziland frontier. There are over 2200 miles of telegraph line. Part of the colony is administered directly by the state (the 5 districts of Lorenzo Marques, Inhambane, Tete, Quillimane, and Mozambique), part by the Nyasa Company, and part by the Mozambique Company. The estimated revenue and expenditure for the year 1908-9 were 5,223,592 milreis and 4,884,351 milreis. See TRANSVAAL.

PORTUGUESE GUINEA. A colony of Portugal on the west coast of Africa, between Senegal and French Guinea. It includes the adjacent archipelago of Bijagoz, with the island of Bolama, in which the capital (Bolama) is situated. Area, about 13,940 square miles; estimated population, 820,000. The chief port is Bissau. The principal products include rubber, wax, oil seeds, and hides. Imports and exports in 1908, 888,037 milreis and 576,535 milreis respectively. For the year 1908-9, estimated revenue, 275,750 milreis, and estimated expenditure, 295,406 milreis.

POST, GEORGE EDWARD. An American Presbyterian medical missionary, died September 30, 1909. He was born in New York City in 1838, and graduated from the New York Free Academy (now College of the City of New York). In 1860 he graduated from the medical department of the University of New York, and in 1861 from the Union Theological Seminary. Soon after his graduation he was elected to the professorship of surgery in the Syrian Protestant hospital at Beirut, Syria, which is maintained by the Presbyterian Board of Foreign Missions. This post he held until his death. He was also surgeon in the Johanniter Hospital in Beirut. Dr. Post received many decorations and orders from foreign countries for his missionary and surgical work. He was a voluminous writer and published books in many languages on botany, zoölogy, physiology, surgery, medicine, and the Bible. Among his works are: *The Flora of Syria, Palestine and Egypt; Text-Book of Botany; Text-Book of Mammalia; Text-Book*

of Birds; *Text-Book of Materia Medica*. He contributed also to Smith's, Hastings's, Jacobs's and Barnes's Bible dictionaries.

POSTAL SAVINGS BANKS. Very extensive opinion in favor of postal savings banks for the United States, the endorsement of the plan by all political parties, support by Presidents Roosevelt and Taft, and Postmaster-General Meyer, led to the expectation that the postal savings bank bill would be passed by Congress early in 1909. This bill provided that every money-order post-office should ultimately become eligible to receive savings deposits; that at first the Postmaster-General might designate only the first, second and third class offices to receive deposits; that accounts could be opened by deposit of one dollar and increased by ten cents, or multiples thereof; that 2 per cent. interest would be paid on all deposits up to \$500; that the funds thus accumulated should be redeposited by the government with national banks as near as practicable to the place of their receipt; that the national banks should pay to the government interest of two and one-fourth per cent.; and, as amended, that the maximum amount of a deposit be \$500, of which not more than \$100 could be deposited in any one month. In spite of hearings and apparent favor for the bill on the part of many Senators and Representatives, Congress, apparently with deliberation, failed to bring the bill to vote. The advocates of the measure charged that this failure was due to the pressure of the large private vested interests represented by existing savings and other banks.

Little new in the way of argument was developed, though some facts were strikingly put. The old arguments for postal savings banks on the ground of the educational value in the cultivation of thrift and good citizenship and as a prevention of bank panics were variously restated. It was added that since most existing savings banks are found in cities, and mainly in the larger ones, fully one-half the American people lack such facilities. George von L. Meyer, former Postmaster-General, stated that 98.4 per cent. of all savings bank deposits in this country are in 14 States, and only 1.6 per cent. in the other 32. He pointed out that while there was one savings depositor out of every two inhabitants in New England, there was only one out of 157 inhabitants in the rest of the country, New York also being excepted. It was pointed out that the main thing is to provide widespread and perfectly safe facilities for saving, and that even the minimum number of post-offices authorized by the proposed law to receive deposits would be four times as numerous as existing savings banks and well scattered throughout the country. Appeal was made to foreign experience as proving the advantages of postal savings banks. To the usual arguments that such banks are sorely needed by the immigrants was added the argument that since the immigrants are usually day laborers they cannot get to banks during banking hours, but would be able to get to the post-office before closing time.

The opposition was led by the American Bankers' Association, which at its annual meeting adopted adverse resolutions.

The postal savings bank system started in the Philippine Islands under laws of 1906 and 1907 embraced, on June 30, 1909, 251 banks with 8782 accounts and \$724,479 deposits. Of the

depositors, 3351 were Americans, 4771 Filipinos, 213 Europeans, and 181 Asiatics.

The following table from the report of the Comptroller of the Currency shows the statistics of postal savings banks throughout the world. The date of the returns is 1907 or 1908 in all but a few cases.

bushels per acre. Among the different States, Maine generally stands first in average acre yield, leading this year with 225 bushels. In the northern Rocky Mountain States the average acre production also runs high. The acreage, production and total value of crop in the principal potato-growing States for 1909, as compiled by the Bureau of Statistics of the Department of Agriculture, are given in the following table:

Country	No. of Depositors	Deposits	Avg. Dep.
Austria	2,064,403	\$44,269,223	\$21.45
Belgium	2,106,237	134,040,979	63.64
Bulgaria	201,956	6,495,913	166.66
Finland	60,007	1,410,810	23.51
France	5,034,998	276,655,969	54.95
Hungary	648,652	18,044,000	27.82
Italy	5,108,802	235,442,694	55.87
Netherlands	1,401,670	59,499,168	42.45
Russia	1,788,990	128,873,169	72.04
Sweden	566,976	13,582,491	23.96
United Kingdom	11,018,251	781,794,533	70.95
Bahamas	2,151	144,778	67.31
Canada	155,895	45,190,484	288.88
British Guiana	12,421	396,843	31.95
Dutch Guiana	6,525	261,405	40.06
Curaçao	8,250	52,143	16.04
British India	1,262,763	49,253,632	89.00
Ceylon	71,018	686,887	9.67
Straits Settlements	8,718	339,880	91.46
Fed. Malay States	8,739	389,883	105.84
Dutch East Indies	56,464	2,846,361	60.40
Japan	8,013,193	46,275,301	5.77
Toroma	70,152	699,591	9.97
Cape of Good Hope	101,722	10,806,964	106.24
Gold Coast	1,279	73,320	57.72
Orange River Col.	6,433	768,204	119.57
Indonesia	163,582
Liberia Leone	5,409	386,429	71.44
Transvaal	53,000	6,538,843	123.86
Egypt	86,728	1,986,755	22.91
Unis	5,415	1,080,413	199.52
Western Australia	69,533	14,042,106	201.95
New Zealand	\$19,773	56,077,803	175.37
Philippine Islands	8,782	724,479	82.50
Total	40,320,303	\$1,989,299,815	\$49.33

Comparison shows that in 10 years the number of postal savings bank depositors in the above countries just doubled and that deposits increased 75 per cent. See SAVINGS BANKS.

POTASH SALTS. See FERTILIZERS.

POTATOES. The potato crop of 1909 suffered at different times and in different localities in wet weather and from drought. These ditions resulted in a somewhat uneven crop,

they did not prevent the production of a yield never before equaled in this country. acreage, also, the year ranks first. In European countries the crop was generally good, but Germany, owing to leaf disease and wet weather, the yield was a little below normal, and parts of the country the tubers were small.

reduction in yield, however, will not enter Germany's position as the leading country of the world in potato production. Russia is second, Austria-Hungary third, and the United States usually fourth or fifth. In 1909 the country produced 376,537,000 bushels on an area of 3,525,000 acres, as compared with a of 278,985,000 bushels, and an acreage of ,000 in 1908. The value of the crop, which amounts to \$206,545,000, is the greatest ever recorded, exceeding the 5-year average by about 2 per cent. The price per bushel has often surpassed, but the larger yield, which is more than 25 per cent. above the 5-year average, makes this year's crop a leader in value. The average yield per acre, 106.8 bushels, is high as has been exceeded only three times since 1904.

Last year the average yield was only 85.7

States	Acreage	Production Bushels	Farm value Dec. 1, '09
New York	488,000	52,560,000	\$26,280,000
Michigan	348,000	36,540,000	12,789,000
Maine	130,000	29,250,000	13,748,000
Wisconsin	262,000	26,724,000	10,155,000
Pennsylvania	305,000	23,790,000	15,464,000
Minnesota	160,000	18,400,000	6,440,000
Ohio	182,000	16,926,000	9,479,000
Illinois	164,000	14,923,000	9,104,000
Iowa	145,000	12,905,000	7,098,000
Colorado	65,000	10,400,000	5,928,000
Indiana	95,000	9,025,000	4,893,000

Idaho	25,000	5,000,000	2,400,000

Owing to the prevalence of rainy and cloudy weather in the fall, the crop in Aroostook county and other localities of Maine was attacked by late blight and rot. The Maine Experiment Station, after studying these troubles, recommends careful and thorough spraying with standard Bordeaux mixture every 8 or 10 days after the tops are 6 to 8 inches high. When the crop has been attacked by late blight, the tubers are likely to rot in storage, and it is advised not to harvest such a crop too early, but to wait at least 10 days after the tops are killed by frost before digging the tubers.

PRAGMATISM. See PHILOSOPHY.

PRANG, LOUIS. An American art publisher, died June 15, 1909. He was born in Breslau, Germany, in 1824, and took part in the revolutionary movement of 1848, as a result of which he was obliged to leave the country. He came to the United States in 1850, settling in Boston. He became successively an engraver on wood, a lithographer and a publisher. He began the reproduction of famous paintings in colors, under the name of "chromos." His productions became widely known. He made a study for years of the problem of a standard of colors, and much of the perfection now attained in color printing is due to his experiments. He was the head of a firm which published textbooks on art and similar works, but he retired from active business in 1899.

PRATT INSTITUTE. An institution of practical and technical knowledge in Brooklyn, N. Y., founded in 1887. The number of students in 1909 was 3707, with 149 instructors. There were 94,615 books in the library. During the year there was received a gift of \$1,750,000 from the six sons and the daughter of the founder, Charles M. Pratt. This money was

added to the endowment fund. The total productive funds, with this addition, amount to about \$4,000,000. The president is C. M. Pratt.

PRESBYTERIAN CHURCH IN THE UNITED STATES, often called the Southern Presbyterian Church. A religious denomination organized as a separate body in 1861, as a result of the withdrawal of 47 presbyteries from the jurisdiction of the General Assembly of the Presbyterian Church in the United States of America, because of political action taken by the latter party, which action these presbyteries held it was incompetent for a spiritual court to take. The denomination in 1909 numbered 269,723 communicants, 3217 churches and 1825 ministers. It has 14 synods and 83 presbyteries. In 1908 the contributions to home missions amounted to \$276,318; to foreign missions, \$323,879; to education, \$250,903; to colored evangelization, \$20,321; to all causes, a total of \$3,507,075. The Assembly of 1908 organized a new synod, that of Oklahoma. At the meeting in 1909 there was celebrated the quadri-centennial of the birth of John Calvin. This meeting was held at Savannah, Georgia, on May 20. The stated clerk is Rev. W. A. Alexander.

PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA. A religious denomination which had its beginning as an organization in 1706 when the first presbytery was formed. Presbyterian congregations existed for many years previously, for example, the congregation at Hempstead, N. Y., being founded in 1644. The General Synod was established in 1716, and the first General Assembly met at Philadelphia in 1789. The denomination in 1909 included 36 synods and 291 presbyteries. The communicants numbered 1,321,386. There were 9023 ministers and 9997 churches. In the Sunday schools of the church were 1,206,015 members. The contributions of the denomination from all sources for the year ending March 31, 1909, amounted to \$21,664,756, as compared with a total of \$22,099,820 for the year ending March 31, 1908. Of this sum, \$1,541,665 was contributed for home missions, \$1,302,673 for foreign missions, \$137,832 for education, \$171,456 for Sunday school work, \$150,557 for church erection, \$139,019 for the relief fund, \$154,722 for freedmen, \$424,687 for the colleges of the denomination, \$133,504 for temperance, \$28,588 for the American Bible Society, \$146,175 for the purposes of the General Assembly, \$15,712,070 for congregational purposes and \$1,650,396 for miscellaneous purposes. Home missions are carried on in the whole of the United States, including Alaska and Porto Rico, and also in Cuba. Mission schools are maintained among the Indians, Alaskans, Mormons, mountaineers and the people of Porto Rico and Cuba. The school work is in charge of the Women's Board of Home Missions. On March 31, 1909, there were engaged in the work of home missions 1435 missionaries and 447 missionary teachers. There were added on profession of faith, 7135 communicants, and on certificate, 4645. There were 3214 adult baptisms and 2522 infant baptisms. The foreign missions of the denomination are carried on under the direction of the Board of Foreign Missions, and its work includes practically all countries in which missionaries are found. There were maintained in 1909, 28 missions, 146 stations, and 1781 out-stations. Under the auspices of the Board were

946 missionaries, 3367 native helpers, 524 fully organized churches, 96,801 communicants, 1446 schools, 46,479 pupils, 101,756 pupils in the Sunday schools, 414 students for the ministry, 137 hospitals and dispensaries at which 449,457 patients were treated during the year. There were printed 167,834,946 pages of Christian truth in twenty-one languages. The Board of Education is the organ of the General Assembly for the general and efficient superintendence of the church's work in furnishing a pious, educated and efficient ministry in sufficient numbers to meet the calls of its congregations, and supply the wants of destitute classes in regions of the United States, and to preach the gospel throughout the world. During the year 1908-9 880 candidates were under the care of the Board. The Board of Church Erection guarantees to churches the erection and completion of houses of worship and manses. It maintains a loan fund at which loans are granted at low interest to be returned in annual installments. The fund amounts to \$245,000. The Board of Missions for Freedmen works among the colored population of the South. It was organized in 1865, and has 399 churches and mission stations, with 24,324 communicants and 23,323 Sunday school teachers. Other important boards of the denomination are the College Board, the Permanent Committee on Temperance, the Board of Publication, and the Board of Ministerial Relief. The denomination has many colleges under its auspices in all parts of the country. Its theological seminaries are the Auburn Theological Seminary, at Auburn, N. Y.; Western Theological Seminary at Pittsburgh, Pa.; Lane Theological Seminary at Cincinnati, O.; the Theological Seminary of Kentucky at Danbury; the McCormick Seminary at Hanover, Ind.; San Francisco Theological Seminary at San Anselmo, Cal.; the Presbyterian Theological Seminary at Omaha, Neb.; and the Theological Seminary of the South at Lebanon, Tenn.

The 121st General Assembly of the denomination began at Denver, Col., on May 20, 1909. Among the important matters transacted at the meeting were the following: A Conference on Home Missions was authorized, composed of representatives of the agencies of different Presbyterian and Reformed churches; the Interchurch Federation was heartily approved; previous deliverances of the Assembly in regard to marriage and divorce were approved; among the decisions in church polity was one giving the presbytery full power to dissolve a church without the consent or request of its members, the property of dissolved churches to be taken charge of by trustees of the presbytery; closer relations with the Reformed churches of the United States were approved; the better observance of the Lord's Day to be secured in the District of Columbia was endorsed; a committee on social problems was appointed; complete Prohibition was approved, and ~~pastors~~ urged to inculcate total abstinence principle. The Assembly established the Theological Seminary of the South, and appointed a board to maintain and conduct it. The use of tolby laymen and ministers was discouraged proposal for closer relations with the U.S. Presbyterian Church was renewed and the of favorable action for union with the V.Presbyterian Church was expressed. The of the General Assembly in 1909 were as follows: Moderator, Rev. James M. Barkley, D.

Vice-Moderator, Charles S. Holt, Esq.; Stated Clerk and Treasurer, Rev. William Henry Roberts, D. D.; Permanent Clerk, Rev. William Brown Noble, D. D.; Assistant Clerk, Rev. James M. Hubbert. The next General Assembly will meet at Atlantic City, New Jersey, on May 19, 1910.

The census of religious bodies of the United States, taken by the United States Census Bureau and published in 1909, showed an increase in the denomination from 787,743 communicants in 1890 to 1,179,566 in 1906, but in view of the fact that the union between the Presbyterian Church was not fully consummated at the close of 1906, these statistics do not give a correct idea of the membership at that date.

PRESBYTERIANS, REFORMED. See REFORMED PRESBYTERIANS.

PRICE, THOMAS. An Australian public official, died May 31, 1909. He was born in North Wales in 1852. His early years were spent as a stone cutter in Liverpool, where he also took an active interest in local politics. In 1883, on account of ill-health, he was obliged to go to Australia. He worked at his trade of stone-cutting in Adelaide until 1891, when he became secretary of the Masons' and Bricklayers' Society. Two years later he entered the House of Assembly. In 1902 he was chosen secretary of the Labor party, and in 1903 its Parliamentary leader. He was made Prime Minister of South Australia in 1905, combining with that office the duties of Commissioner of Public Works and Minister of Education.

PRICES. The average prices of commodities continued upward during the year, the advance being especially rapid during the last six months. The total rise in the index was about 0 per cent. for the year in the United States, and about 8 per cent. in London, this latter reflecting the general rise throughout the world. *Bradstreet's* price index stood at \$8.2756 on January 1; it rose slightly during January and then declined during February, but thereafter advanced steadily. On July 1 it was \$8.4457 and on December 1, \$9.1262. These indexes may be compared with \$7.7227 on June 1, 1908, the post-panic minimum, \$8.2949 on January 1, 1908; \$9.1293 on March 1, 1907, the pre-panic maximum; and \$6.802 on January 1, 1899, the minimum for many years. Prices at the close

of the year averaged about the same as the highest level before the panic of 1907; were 20 per cent. higher than the lowest average since the panic; were about 35 per cent. above the level of 1899; and were about 22.5 per cent. above the general average for the preceding fifteen years. Articles entering generally standards of living in this country and attaining extraordinary high price levels in 1909 included wheat and flour, corn, butter, eggs, cheese, pork and all pork products, wool and so on. Many other less important commodities had higher prices than have been usual, and maintained a high average level.

The index of prices given by the London *Economist* stood at 2.197 on January 1, 1909, at 2.390 on December 31. London prices had downward during the first half of the year, the index standing at 2.176 at the end of June, but thereafter the rise was steady and reached 2. The year's minimum in June may be compared to that of 2.168 at the end of August,

1908; and the year's maximum to that of 2.309 at the end of January, 1908. The highest level in thirty years was reached at 2.601 on June 1, 1907, and the lowest since 1860 was 1.885 in 1897.

The cause of the great rise in prices during the past decade received a great deal of discussion during the year. The consensus of opinion was that the chief cause of the rise was the great increase in the production of gold during this same period. Thus the average production during the past five years has exceeded \$420,000,000 per year, and during the seven years 1898-1904 inclusive, the annual average was about \$300,000,000. These figures must be compared with an average of about \$108,000,000 for the decade 1880-1890, and an average of about \$180,000,000 for the seven years 1891-1897 inclusive. Prices being but ratios of the exchange value between gold and commodities, this great flood of gold has so outrun the increased supply of other economic goods that prices have necessarily risen. Other general causes of advance in prices presented by Professor F. W. Taussig, were (a) the rising standards of living, leading to more abundant and more fastidious demand, and (b) the necessary rise in the cost of food products as result of the concurrent increase in population and exhaustion of virgin farm land. Among special causes, affecting particular commodities to greater or less degree, are the tariffs of the world, particularly the American, and the monopoly power of trusts sheltered by the tariff wall. Among special causes should be included also the monopoly power of certain trade unions, increased cost of production due to rising wages and shorter hours, and extravagance in living. Connected with the latter by way of a growing demand for convenient and personal service, is the increased multiplicity of retail dealers and the greater expense of handling the retail trade. This is of especial importance in the cities where customers demand stores of all kinds near at hand, require the delivery of goods at all hours of the day, and prefer to have the grocer and the butcher call for the day's orders. All of these services are expensive, and the effort of each dealer to furnish them results in an inadequate utilization of clerks, deliverymen, and horses and wagons, thereby further increasing the necessary additions to prices.

An inquiry made by the United States Department of Agriculture into the supply and prices of beef showed that the annual supply was about 182 pounds per capita, but steadily decreasing. The results indicated that prices have not risen more rapidly than the prices of steers. Corn also has increased in price. The methods of retailing add greatly to prices in the cities. The average difference between wholesale and retail prices in the North Atlantic States was found to be 31.4 per cent.; in the South Atlantic, 38 per cent.; in the North Central, 38 per cent.; in the South Central, 54 per cent.; and in the Western, 39 per cent. This difference varied from 17 per cent. in Baltimore and 20 per cent. in New York City, to 58 per cent. in Spokane, Wash., and 68 per cent. in Shreveport, La.

PRINCE EDWARD ISLAND. An insular province of Canada. Area, 2184 square miles. Population (1901), 103,259. Capital, Charlottetown, with 12,080 inhabitants in 1901. The executive authority rests with a lieutenant-

governor appointed by the Governor-General of Canada and acting through a responsible Executive Council. The Legislative Assembly consists of one house of 30 elected members. The Lieutenant-Governor in 1909 was Donald A. McKinnon; the Premier and Attorney-General, Francis L. Hazard. For statistics and other details, see CANADA.

PRINCETON UNIVERSITY. An institution of higher learning at Princeton, N. J., founded in 1746. In the academic year 1909-10 there was an attendance of 1400 students, divided as follows: Graduate students 134, students in the school of electrical engineering 13, seniors 237, juniors 237, sophomores 343, freshmen 347, students qualifying for regular standing 84, specials 5. The faculty and instructors numbered 169. At the close of the academic year 1908-9 Mr. De Witt Clinton Blair resigned his membership in the Board of Trustees, and on July 31, 1909, the Board lost by death Mr. Cornelius C. Cuyler. New members of the Board elected in 1909 are Wilson Farrand, Alumni Trustee, and the Hon. John L. Cadwalader, Life Trustee. One member of the faculty, William Alfred Packard, Ph. D., Professor of Latin, died on December 2, 1909. The faculty has also lost by resignation Professor James Hopwood Jeans, Professor of Applied Mathematics, and Mr. Junius Spencer Morgan, Associate Librarian. Guyot Hall, the new biological and geological laboratory, was opened for instruction on October 11, 1909, and the equipment for biological study is being made still more complete by the addition of an unusually well-equipped vivarium. During the year Campbell Hall, the new dormitory given by the Class of 1877, was completed and is now in use. The construction of the dormitory given by Mrs. Russell Sage is nearing completion and will accommodate 150 men. Additional dormitory entries connected with the Sage building

tion for the higher degrees. He also reviews in considerable detail the working of the Preceptorial System, which has been in operation for five years, and may be said to have passed the experimental stage. It has met with marked success, especially in the more advanced courses. The receipts for the year were \$662,010.69, of which \$199,294.04 were from gifts. In addition there was received for endowment \$1,508,283.24. The total productive funds of the University amount to \$4,749,481.86. The president is Woodrow Wilson.

PRIVATE BANKS. Statistics compiled for the National Monetary Commission for the date of April 28, 1909, showed that there were at that time 1497 private banks in the United States. Of these 1145 were in the Middle Western States, while none was found in the New England or Pacific States. Illinois alone had 430 private banks, Indiana 194, Iowa 179, Ohio 174, and Michigan 120. The aggregate resources of such banks were \$246,256,000, or only 1.2 per cent. of the aggregate banking resources of the country. The resources included total loans and discounts of \$161,302,000; due from other banks, \$40,833,000; and cash on hand, \$11,053,000. Liabilities included individual deposits, \$193,263,000, and capital, surplus and undivided profits, \$43,517,000. Compared with the aggregates for all banks, private banks had 1.6 per cent. of the total loans and discounts; 8 per cent. of all cash, and 1.3 per cent. of all individual deposits. See BANKS AND BANKING.

PROFESSIONAL SCHOOLS. The accompanying table gives statistics of the professional schools of the United States for the years 1908-9. The schools included are those of theology, law, medicine, dentistry, pharmacy and veterinary medicine. The figures are from the report of the United States Commissioner of Education.

GENERAL SUMMARY OF STATISTICS OF PROFESSIONAL SCHOOLS FOR 1908-09.

Class	Schools	Students	Increase or decrease	Students having literary degrees	Value of grounds and buildings*	Endowment funds†	Income‡
Theological	162	10,218	+635	3,335	\$19,766,100	\$32,024,000	\$3,119,300
Law	109	18,553	+484	4,023	3,169,500	808,100	1,191,300
Medical	144	22,153	+629	1,605	12,583,981	3,468,734	1,843,518
Dental	55	6,178	+341	101	1,333,031	440,258
Pharmaceutical	78	5,999	+432	78	914,500	252,278	236,920
Veterinary	19	2,677	+438	60	907,000	187,774

* So far as reported.

have been provided for by gifts of alumni, and are in process of construction. The Graduate School shows a marked growth in the number of students, due to the new impulse and distinction given to graduate studies by the recent notable additions to the faculty, the reorganization of graduate studies, and the splendid facilities which have recently been supplied for teaching and investigation in the fields of physics, biology, and geology, by the erection and equipment of the Palmer Physical Laboratory and Guyot Hall. President Wilson, in his annual report, calls attention to changes in the scope and method of study in the Graduate School, which, it is believed, will produce increased thoroughness and comprehensiveness of prepara-

PROHIBITION. The movement for the prohibition and restriction of the liquor traffic, which has been so notable in the United States, especially in the Southern and Central Western portions, continued in 1909, and many radical laws were passed affecting liquor selling and manufacture. The liquor forces, too, were aggressive, and in several States strong efforts were made to repeal anti-saloon legislation. This was especially true of Indiana and Ohio. On January 1, Prohibition laws went into effect in Alabama, Mississippi and North Carolina. In the first named State, however, the Prohibition forces met with the most decisive defeat since the great movement for the extension of non-liquor-selling territory began in the South.

This was the defeat by a vote of the people of the measure placing Prohibition in the constitution of the State. A full discussion of this struggle and its results will be found in the article ALABAMA. In Tennessee the 4-mile limit was extended to all towns and cities of the State. This is practically equivalent to State-wide Prohibition. The legislature adopted also another measure prohibiting the manufacture of liquor within the State boundaries. In South Carolina Prohibition with a referendum by counties was adopted, and as a result of the referendum vote, 36 of the 42 counties prohibit the sale, while six others retain the county dispensaries. Strong effort was made in Arkansas to pass Prohibition bills through the legislature, but the two houses could not agree upon any particular measure. The lower house of the Missouri Legislature passed a resolution calling for a vote upon the Prohibition amendment, but no decisive action was taken. In Maine and New Hampshire new restrictive law enforcement measures were enacted. Washington passed a municipal and rural county unit option law, and in the election which followed, over forty places in the State voted "dry." In Idaho a straight county option measure was enacted, and in the first elections held, 14 of the 23 counties abolished saloons. In Delaware, the liquor question was resubmitted to the only "wet" county of the State. Arizona enacted a county option law. In Wyoming all saloons outside of incorporated towns were abolished. The Kansas Legislature passed a stringent measure prohibiting the sale of liquors for all purposes except for sacramental use. All open saloons in Nebraska were limited to the hours between 7 A. M. and 8 P. M. The city of Lincoln and two counties in the same State voted "dry." In Utah a county option law was passed, but was vetoed by the Governor after the legislature adjourned. More than half the counties in the State, however, abolished saloons by local decree. In Colorado a number of towns were added to the no-license column, making 11 counties in the State "dry." Four additional counties were carried for no-license in Illinois. In the fall elections 28 of the 36 places voting voted against the sale of liquor. In Michigan 9 counties abolished the saloon, while in Texas 2 counties voted no license. Three new counties in Kentucky voted for no-license, and two in Pennsylvania were made "dry." In West Virginia, the lower house of the legislature passed a Prohibition bill, but this did not become a law. Eight additional counties in the state voted "dry," in elections held during the year.

In New York the result of the elections during the year was a net gain for the anti-saloon forces of 88 towns. The most sweeping victories for the no-license party were gained in Indiana, where 60 counties voted "dry." The legislature of Connecticut passed a number of anti-saloon measures, and in California six additional counties adopted no-license. The legislature of North Dakota passed six temperance measures.

Pennsylvania the local option bill was brought to a vote in the House, but was defeated. The Florida Legislature passed a bill admitting the Prohibition amendment to a vote of the people. A discussion of these various measures adopted by State Legislatures and the results of the elections as affecting the regula-

tion of the saloon will be found in the articles on the separate States.

At the close of 1900, 16 States had local option with the county as a unit, 12 States had local option with a town or township as a unit, 20 States had local option with a municipality as a unit, and 2 States had local option with a residence district of cities as a unit. The only States which remained license States on December 31, 1900, were Nevada, New Jersey, New Mexico, Pennsylvania, Utah and Wyoming, and in all of these the issuing of licenses is guarded by certain restrictions. The States voting entire Prohibition on December 31, 1900, were as follows: Alabama, statutory; Georgia, statutory; Kansas, constitutional; Maine, constitutional; Mississippi, statutory; North Carolina, statutory; North Dakota, constitutional; Oklahoma, constitutional; Tennessee, constitutional. Under the remaining States local option laws in some form prevailed. The passage by Congress of the Knox C. O. D. liquor shipment law, which goes into effect July 1, 1910, will be very effective in aiding the enforcement of the State liquor laws. This measure, which was passed in the closing days of the 60th Congress as an amendment to the penal code, prohibits the C. O. D. shipment of liquor or delivering of liquors to fictitious consignees, and compels the marking of all shipments so as to show the kind and the contents. A bill was introduced in both houses of the 61st Congress calling for an amendment to the interstate commerce law for the purpose of protecting dry territory from the interstate shipment of intoxicating liquors. The Commission of Inquiry bill introduced in the 60th Congress, and advocated by certain temperance organizations, was opposed by the Anti-Saloon League on the ground that the League believes the day of government investigation of the liquor traffic is past. Certain measures were introduced also regulating the selling of liquor in the District of Columbia, and measures were supported by the Anti-Saloon League granting Federal tax receipts to liquor dealers in "dry" territory, the erection, equipment and maintenance of recreation buildings at army posts, measures to enforce more thoroughly the anti-canteen policy of the government in the army and soldiers' homes, measures making appropriations for the enforcement of the law against the liquor traffic among the Indians, and measures for full protection of the temperance interests in the enabling act of the Territories which are to be admitted to statehood.

The statistics of liquor production and consumption in the United States in 1900 will be found in the article LIQUORS, FERMENTED AND DISTILLED.

In foreign countries the most notable temperance agitation took place in Sweden, and it will be found discussed in the *History* of that country.

The International Anti-Alcohol Congress met in London in 1909. Delegates were present from nearly every country in the world. More than fifty temperance organizations are represented in the General Committee. The next Congress will be held in 1910 at The Hague. In 1908 a committee was appointed to inquire into the operation of the law relating to inebriates and to their detention in reformatories and retreats. In its report in January, 1909, the committee stated that none of the methods of drug treat-

ment into which they inquired found every case which applied for treatment curable, and that by no method can curable cases be distinguished before trial of the remedy. The committee reported that there had been a decided failure to apply the Inebriates act of 1898 as widely as intended by Parliament.

It was estimated by an authority upon the subject that there was in 1908 a diminution of the expenditure on intoxicating liquors in England to the amount of nearly \$30,000,000, and taking the increase in population into account, the decreased expenditure was equal to about \$37,000,000. The total number of licensed premises in England and Wales on January 1, 1908, according to the latest available statistics, was 118,752, as compared with 120,441 on January 1, 1908, and 124,883 on January 1, 1905, when the Licensing act of 1904 went into operation. There was no attempt in 1909 to pass a licensing bill similar to that which was defeated in the House of Lords in 1908. The bill dealt very severely with the liquor interests, and it was assumed by party leaders that popular opinion was not ready for a measure which threatened so great an economic disturbance.

For the latest researches in regard to the effect of alcohol on the human body, see ALCOHOL.

PROTEINS. See CHEMISTRY.

PROTESTANT EPISCOPAL CHURCH. A religious denomination which traces its descent as a member of the Anglican Communion through churches established in the American colonies and the Church of England. The church in 1909 comprised in the United States 65 dioceses and 21 missionary districts, including those in Alaska and the insular possessions. There are also 11 foreign missionary districts. There were in 1909 103 bishops of the Protestant Episcopal Church, including 28 missionary bishops. Five bishops were consecrated during the year: Alfred Harding, Bishop of Washington; Nathaniel Seymour Thomas, Bishop of Wyoming; Benjamin Brewster, Missionary Bishop of Western Colorado; John Gardner Murray, Coadjutor Bishop of Maryland, and Arthur Seldon Lloyd, Coadjutor Bishop of Virginia. The church lost during the year two bishops, George de Normandie Gillespie, First Bishop of Western Michigan, who died March 19, and William Hobart Hare, Missionary Bishop of South Dakota. The former was succeeded in the episcopate by the Coadjutor Bishop, the Right Reverend John M. McCormick, D. D. The church suffered a serious loss by the death of Dr. William Reed Huntington, D. D., rector of Grace Church, New York, since 1883, who died July 26.

Statistics of the Church are gathered yearly by the *Living Church Annual and Whittaker's Churchman's Almanac*. According to this publication the communicants in 1909 numbered 912,103, as compared with 900,606 in 1908. The clergy numbered 5272, an increase of 90 over the preceding year. The lay readers numbered 2643, and the postulants 384. There were 7594 parishes and missions, and in the Sunday schools of the church were 441,773 scholars and 49,591 teachers. The contributions from all sources amounted to \$18,025,690, an increase of \$368,351 over the contributions in the preceding year. The foreign missions of the church are carried on in West Africa,

China, Japan, Mexico, Cuba, Brazil, Panama Canal Zone, and Haiti. The church also has jurisdiction over certain American churches in Europe and charges a bishop with this oversight. Domestic missions are carried on throughout the United States, and its possessions. The fiscal year of the domestic and foreign missionary society showed the best record for general missions that has yet been made. By September 15 the excess in offerings over the year previous had reached \$110,700. The total contributions of parishes and individuals for the year aggregated \$550,322. Large bequests were received from the estates of George C. Thomas and Miss Mary Rhinelander King. The church was represented at a conference with the various Anglican missions in China in March. The organization was effected to embrace all the missions in China, somewhat after the Japanese precedent, with a name signifying the Holy Catholic Church in China. The Chinese delegates sent a message of thanks to the mother churches in England and America "for the planting, care and protection given to the church in China during the past sixty years or more." The opening of the Catechetical School in Hankow was an important feature of the year in the church in China.

A session of the House of Bishops was held in New York for the purpose of electing missionary bishops for Wyoming and Western Colorado. There were chosen for the former diocese, Rev. Nathaniel Seymour Thomas, rector of the Church of the Holy Apostles in Philadelphia, and for the latter, the Very Rev. Benjamin Brewster, Dean of St. Mark's Cathedral, Salt Lake City. Two memorials were presented to the House of Bishops at this session. One of these, signed by 1165 clergy, asked that the House of Bishops guard the ministry of the church against abuses that were being perpetrated under color of observance of canon 19, and that further action might be taken at the next general convention with respect to that canon. The House of Bishops replied that it was not legally competent to take any action upon the memorial until the meeting of the next General Convention. This canon formerly provided that no person might officiate in any congregation "without sufficient evidence of his being duly licensed or ordained to minister in this church." It was amended by the General Convention at Richmond in 1907 to provide that the bishop of any diocese or district might "give permission to Christian men who are not ministers to this church to make addresses on special occasions." This amendment resulted in a great deal of discussion and not a little opposition, especially among the clergy.

The diocese of Pennsylvania celebrated its 125th anniversary at the opening of its convention in May, in Christ Church, Philadelphia. In June the 50th anniversary of the ordination of Bishop Grafton of Fond du Lac to the priesthood and the 20th of his consecration to the episcopate were celebrated. At the diocesan council of the diocese of South Carolina, held in May, there were organized a separate council for colored churchmen at the request of the clergy of that race. Colored workers in the diocese will hereafter exercise self-government under the bishop. A committee was appointed at the same council to consider the question of the division of the diocese.

Considerable progress was made during the year in the direction of Christian unity. An American branch of the Anglican and Eastern Orthodox Churches' Union was effected in May. This society was formed in England and has the object of bringing the Anglican and the Eastern churches into closer touch. A branch of the society, the St. Willibrod, which was also organized in England, with the purpose of promoting more intimate relations between old Catholics and Anglicans, was also formed in the United States during the year, with the Rev. Dr. William Harman van Allen as American secretary.

In 1908 there was formed an association called the American Church Union. It was formed to defend and maintain unimpaired the doctrine, discipline and worship of the church against laxity and indifference within and hindrance and aggression from without. It gives unreserved sanction to the following principles: First, that the Protestant Episcopal Church is an integral part of the historic Catholic Church; second, that the church's creeds are to be interpreted and believed in their traditional sense; third, that the ministry of the church has been from the Apostles' time three-fold; and those only are to execute the functions of the ministry in this church who have episcopal consecration or ordination; fourth, that the Scriptures of the Old and New Testaments are the word of God; fifth, that the church's sacraments possess vital power to confer grace; sixth, that the marriage tie is indissoluble as set forth in the church's form of the solemnization of matrimony. The founders of the Union in their declaration of principles asserted that the gravity of the present situation in the church is that the boldest attacks on the faith and order of the church are made by those within her own household. Of these attacks the following are asserted to require immediate attention: First, the denial of the inspiration of Holy Writ; second, the admission to holy communion of persons who have not been confirmed by bishops of the church, and who have not confessed their desire to be so confirmed; and third, the permission to persons not communicants of the Anglican body to teach and preach in the congregations. The Union pledges itself to resist these and all other contraventions of the faith of the churches enshrined in the Book of Common Prayer.

The results of the religious census taken by the United States Census Bureau, based on figures of 1906 and issued in 1909, contain much interesting matter in regard to the Protestant Episcopal Church and its growth from the period 1890 to 1906. The increase during that period was 354,894 communicants, or 6.7 per cent. The church edifices increased in the same period 37.9 per cent., while the value of church property shows an increase of 54 per cent. The number of ministers increased in the sixteen years 29.5 per cent. The number of Protestant Episcopal churches for colored people increased from 49 in 1890 to 98 in 1906, while the communicants increased from 2977 in 1890 to 19,098 in 1906.

The Church Congress of 1909 was held in Boston during the week beginning May 11. The opening sermon was preached by the Bishop coadjutor of New Hampshire. The following were the subjects discussed at the Congress:

"Socialism in Relation to Christianity"; "The Alleged Incompatibility of Genius and Orthodoxy"; "The Ethical Aspects of Gambling"; "The Possible Contribution of Oriental Thought to Present-day Christianity"; "Psychotherapy as an Aid in Pastoral Work"; "The Outlook for Visible Church Unity"; and "The Office and Work of the Holy Spirit." The Episcopal Convention of the diocese of New York held its session in November. The chief matter of general interest discussed was the creation of suffragan bishops. It was resolved to memorialize the General Convention to adopt at its next meeting the constitutional amendment provisionally adopted in 1907, permitting the creation of suffragans on the ground that this form of episcopal assistance was best adapted to the needs of large cosmopolitan urban communities.

PROUT, EBENEZER. An English composer and educator. He was born in Oundle, England, in 1835, and graduated from London University. From 1876 to 1882 he was professor of harmony and composition at the National Training School, and later he held similar positions at the Royal College of Music at the Guildhall School. In 1894 he became professor of music in the University of Dublin, which office he held until the time of his death. He was an industrious composer and wrote four symphonies and many orchestral works. He wrote *Harmony: Its Theory and Practice* (1889); *Counterpoint Strict and Free* (1890); *Double Counterpoint and Canon* (1891); and a succession of books upon fugue and a volume entitled *The Orchestra*. He succeeded Sir Arthur Sullivan as a member of the Royal Academy of Music. He was the first editor of the *Monthly Musical Record*, from 1871 to 1874, and was a frequent contributor to that periodical after his editorial connections had ceased. He served also as a musical critic of the *Academy* and the *Athenaeum*. He contributed also to musical papers and wrote over fifty articles for *Grove's Dictionary of Music and Musicians*.

PSYCHICAL RESEARCH. In both the English and American Societies interest has been sustained in trance communications, especially as these bear on the question of the survival of bodily death. In the *Proceedings of the (British) Society for Psychical Research* (vol. xxiii., p. 2) Professor James reports sittings with Mrs. Piper, the trance-medium, under the "Hodgson control." Richard Hodgson was for many years devoted to the interpretation of Mrs. Piper's communications. Before his death in 1905 he indicated his purpose—in the event of his own demise—to establish relations with living friends. The reports which purported to come subsequently from him seemed, therefore, to be of especial value. But James has found them peculiarly difficult of interpretation. In drawing conclusions from them, he says: "I myself feel as if an external will to communicate were probably there, that is, I find myself doubting, in consequence of my whole acquaintance with that sphere of phenomena, that Mrs. Piper's dream-life, even equipped with 'telepathic' powers, accounts for all the results found. But if asked whether the will to communicate be Hodgson's, or be some mere spirit-counterfeit of Hodgson, I remain uncertain and await more facts, facts

which may not point clearly to a conclusion for fifty or a hundred years" (pp. 120-1). Sir Oliver Lodge has another long report in the *Proceedings* (vol. xxiii., p. 127) on sittings begun with Mrs. Piper in 1906; and a considerable part of his new book, *The Survival of Man*, is a reproduction (some of it quoted verbatim) of this report and of various earlier publications concerning the same medium and her "controls." An examination of James and Lodge leaves the impression that the new material has added but little of importance to the subject under investigation. Persons already familiar with the history of psychical research will be disappointed that Sir Oliver Lodge should have thrown together old materials in a work heralded as "the most distinguished book of his career"; others may welcome his clear statement of certain phases of the Society's work and his own optimistic interpretation of its results. A. C. Pigou, reviewing the evidence for alleged communications with the dead, offered by the method of "cross correspondences," comes to a negative conclusion. The agency involved is, so he thinks, "a product of the subliminal activity of some living person" (*Proceedings*, xxiii., 286). The recent visit to the United States of the Italian medium, Eusapia Palladino, has revived interest in the woman's unusual history and in the "physical phenomena of spiritualism." Messrs. Feilding, Baggally and Carrington wrote for the British *Proceedings* (xxiii., 309) a long account of sittings held at Naples in November, 1908. They conclude "that some of the phenomena were genuine and the others not proved to be either genuine or fraudulent" (p. 565). A more extensive investigation of Palladino was made (1905-8) in Paris by the *Institut général psychologique*. The report (*Bulletin* 5-6, 8^eme année) is admirably conservative, but it throws little light upon the agencies involved. A book that contains much of human interest is entitled *Both Sides of the Veil*, written by Anne M. Robbins, a person who has been for many years inside the Piper circle in Boston. Miss Robbins does not pose as an "authority" in psychical research, neither does she offer her communications with "spirits" as evidence, but "simply for what they are." *Modern Light on Immortality* (H. Frank) is an ingenious though labored attempt to coax from modern science the proof of human immortality that the historical religions and philosophies have failed, according to the author, to furnish. The attempt is based upon speculative biology—more specifically upon E. Haeckel, "an authority all must admit is supreme." The book will appeal to the adolescent mind. Its biology and its psychology (both taken at second or third hand) are, however, bad.

PSYCHOLOGICAL ASSOCIATION, AMERICAN. See PSYCHOLOGY.

PSYCHOLOGY. The rapid growth of applied psychology continued in 1909. It is in itself, however, of less import to the science than in its retroactive effect upon research and construction. The occupation of the psychologist with problems of the school-room, the law court, the clinic and the insane hospital inevitably shapes his conception of what is most worth doing within psychology itself. At present men are divided on the question whether the retroactive process is enriching or contami-

nating the science. For current views see H. Münsterberg, *Psychotherapy*, and W. Wundt, *Psychologische Studien*, v. 1. The process itself is apparent in the emphasis laid, during the past year, upon such subjects as memory, individual types and differences, and abnormal states. Like most other disciplines, psychology has felt the inspiration of the Darwin anniversaries. (See DARWIN MEMORIAL.) Evolutionary concepts have been used with extraordinary freedom during the past few months, but they can hardly be said really to have been naturalized as yet within the science. (See R. Semon, *Die mnemischen Empfindungen*; G. S. Hall, *Evolution and Psychology in Fifty Years of Darwinism*; J. R. Angell, *The Influence of Darwin on Psychology*; *Psychological Review*, xvi., 152.)

MEETINGS. The year 1909 was made notable within psychology by the unusual number of general meetings and conferences. The Sixth International Congress of Psychology convened in Geneva on August 3. All the main branches of psychology, pure and applied, furnished topics of discussion. The Congress declared its intention of holding the next meeting (1913) in the United States. The 18th annual meeting of the American Psychological Association was held at Cambridge during the Christmas holidays under the presidency of Professor C. H. Judd of the University of Chicago. The Southern Society for Philosophy and Psychology met at the same time in Charlotte, N. C. The annual conference of the Experimentalists occurred at Princeton, April 8-10. The celebration of the twentieth anniversary of Clark University in September was made the occasion of an international conference of psychologists. Among the distinguished Europeans who took part were Professors Freud (Vienna), Stern (Breslau), and Jung (Zurich). The psychology of testimony and of the abnormal occupied a prominent place on the programme. Psychology sustained a heavy loss in the death of Professor Hermann Ebbinghaus of Halle. Ebbinghaus was the author of the first experimental monograph on memory (1885), of *Grundzüge der Psychologie* (1902) and of *Abriss der Psychologie* (1908). He was one of the founders and editors of the periodical, the *Zeitschrift für Psychologie und Physiologie der Sinnesorgane*. The death of C. Lombroso recalls his distinguished work upon genius and upon the criminal type.

GENERAL BOOKS AND TREATISES. A new instalment (Band ii., *Mythus und Religion*, Teil iii.) of Wundt's *Völkerpsychologie* appeared early in the year. Most of its eight hundred pages are devoted to the nature-myth considered in its three developmental forms, the fairy-tale, the saga and the legend. The final chapter treats of the origin of religion. This monumental work upon the evolutionary development of speech, myth and custom brings under psychological laws a bewildering mass of facts that have never before been adequately systematized. Until last year the materials for the experimental study of thought were scattered through monographs and magazine articles, and investigators were at odds as regards problem and method. The new book by Professor E. B. Titchener, *Lectures on the Experimental Psychology of the Thought Processes*, reviews all the antecedent studies, inventories their results, and sets forth their value to the

science. A work of more general scope, written by the same author, is *A Text-Book of Psychology*, Part 1, 1909, which will, when it is completed, take the place of *An Outline of Psychology*, first written in 1896. A careful comparison of the two books indicates the substantial advances that the science has made in a dozen years. The part of the *Text-Book* now published covers sensation, affection and attention. The appearance, during 1909, of *A Text-Book of Experimental Psychology*, from the pen of an English writer (C. S. Myers), is an unusual event. England has been prolific in psychologies, but not of the experimental sort. The volume, which is well written, shows the double influence of American and Continental systems. A general work of quite a different character is H. R. Marshall's *Consciousness*, a theoretical treatise on the nature of mind. A volume unique in psychology is R. Schulze's *Aus der Werkstatt der experimentellen Psychologie und Pädagogik*, which seeks the extension of experimental technique in psychology and education. It is neither a manual nor a text-book, but similar to both. The material is conveniently arranged under the various chapter-headings of psychology, "Ideas," "Feelings," "Memory," etc. It is lavishly and effectively illustrated by drawings and photographs. The book will be of service both in pure and in applied psychology. Two new books on memory, by H. J. Watt (Glasgow), *The Economy and Training of Memory*, and Max Offner (Munich), *Das Gedächtnis*, have in view the teacher and the student. The first is a popular and readable exposition of experimental work, with especial emphasis laid on the means of economizing and conserving memory. Offner's book is a more intensive and more technical account of methods and results. Both books are written by men who know the laboratory at first hand.

SENSATION. Auditory. The new theory of clang-tint or "musical quality" proposed by Herrmann-Goldap in 1907 has stimulated the Berlin laboratory, long famous for its skill in psychological acoustics, to investigate the claims of this theory of constant-pitch elements in instrumental sounds. In describing these investigations, W. Köhler (*Zeitschrift für Psychologie*, liv., 241) inclines toward the old Helmholtzian theory of harmonic overtones. He rejects the "tone-tint" theory of his master, Stumpf, and instead derives clang-tint from the "tint" or "color" of the intervals furnished by the upper partials or overtones. Thus a note containing but two overtones, which stand in the relation of 1:2, would have its character determined by the octave-color," whereas a three-component note 1:2:3) would add to "octaveness" the colors of the fifth (2:3) and the twelfth (1:3). Köhler accomplished the difficult feat of photographing the movements of the drumskin of the ear under stimulation. It is to be hoped that a continuation of the work will clear up the vexed problem of the relation obtaining between musical sound and speech. Every one has heard of the "sixth sense" by means of which the blind are supposed to detect the presence and position of resting objects placed at a distance. The identity of this sixth sense has been a matter of controversy. Heat, air currents, pressure on the face, jarring of the sound, and odor are among the explanations offered. The recent experiments of L. Truschel

(*Archiv für die gesammte Psych.*, xiv., 133) make it appear as highly probable that the reflexion of sound-waves from the object are largely responsible for the perception. The common failure of the blind to detect any auditory element in the perception is only another illustration of the fact, brought out constantly by "occult" phenomena, that an accurate introspective account of sense-perception demands the most thorough psychological training in observation. **Organic.** The difficult quest for sensory qualities arising from stimulation of the internal organs (organic sensations) has been carried on during 1909 with much energy. E. Murray gives a critical and historical review of the subject (*Amer. Jour. of Psych.*, xx., 386), clearing up ambiguities and contradictions which had gradually found their way into the literature. The article fairly opens for serious investigation the whole field of the organic sensations. E. Becher (*Zeitsch. f. Psych.*, xlix., 341; *Arch. f. d. ges. Psych.*, xv., 356) introduced a small rubber tube into the oesophagus and stomach, through which he applied to these organs thermal (warm and cold), mechanical (pressure), and electrical stimuli. The oesophagus responded with sensations in every case. It gave pain also, under heavy pressure. The sensitivity was, however, less than that of the skin. At times the sensations had a peculiar coloring. The same kinds of stimulus applied to the stomach returned no sensations. But E. Meumann found (*Arch. f. d. ges. Psych.*, xiv., 279; xvi., 228) that pumping the stomach full of air and then emptying it gave rise to sensations of "fullness" and "emptiness," which he thinks derive, at least in part, from the stomach itself. He also produced a peculiar "burning" sensation from large doses of white pepper swallowed in capsules and followed by draughts of water. Meumann (in disagreement with Becher) credits both the stomach and intestines with sensibility. Upon the whole, Meumann's results, supported by experiments of C. Ritter (*Arch. f. klinische Chirurgie*, xl., Heft 2) indicate a swing of opinion away from the older view of the surgeons and toward a belief in a well-marked sensitivity of the visceral organs. **Dermal.** Curiously enough the end-organs of the skin, which subserve pressure, touch, warmth and cold, pain, etc., and which seemed twenty years ago to be on the way to accurate description, are again under discussion. The question was reopened by English physiologists (Head, Rivers and Sherren, *Brain*, 1906-8), who worked after injury or section of the nerves of the skin, and it has been continued through the past year by F. I. Franz (*Jour. of Comp. Neur. and Psych.*, xix., 107, 215), whose results disagree, in some respects, with the English results. Franz offers, however, no final theory of cutaneous sensibility. In a study of tickle (*Arch. f. Physiol.*, 1909, 1 and 27) M. Buch distinguishes dermal and deep-lying tickle, which he supposes to have had an entirely different racial history.

PERCEPTION, ACTION AND ATTENTION. Rhythm. The impression has prevailed in psychology that a purely visual rhythm does not exist; that rhythm demands auditory or motor factors. Recent work in the Berlin laboratory, however, has led K. Koffka to the opposite conclusion (*Zeitschr. f. Psych.*, lii., 1). His observers were shown disks lighted at regular intervals by a

Geissler tube. Successive flashes were, under certain conditions, combined in rhythmic groups without the intervention—so far as the introspective reports go—of any motor or auditory process. The method is ingenious, but the outcome—so far as it throws light on the nature and the theory of rhythm—is disappointing. The author's formulation of the nature of the rhythmizing consciousness as an "activity of the subject" is highly unsatisfactory. *Fatigue.* The literature of fatigue is large. Few titles in it, however, are more important than C. S. Yoakum's *An Experimental Study of Fatigue* (*Psych. Rev., Psych. Monographs*, 46). The analysis of physical and mental fatigue, of effort and exhaustion, is unusually thorough. "Sensations of fatigue" are found, which derive from sense organs in muscles indirectly concerned in performing a specific task. *Attention.* Variation in the degree of attention—from concentration to inattention—is a matter of common observation. The exact measurement of this variation has, however, baffled the psychologist. It is noteworthy, then, that L. R. Geissler, working in the Cornell laboratory (*Amer. Jour. of Psych.*, xx., 473), should have succeeded in expressing the degree of attention in terms of the clearness or obscurity of the processes standing in consciousness. Geissler found, further, that the observer's direct estimation of degree of attention accorded well with the quickness and accuracy of arithmetical and other forms of work done at the time. The experiments indicate that, with some observers at least, as many as three or even more degrees of attention (clearness) may exist side by side. A related study of expectation (W. H. Pyle, *ibid.*, xx., 530) brought out the curious fact that while the body takes the typical attentive attitude (straining, reaching out) in expectation, the expectant mind is not attentive, inasmuch as it lacks focus; it is only in preparation for an attentive state.

INDIVIDUAL AND CLASS PSYCHOLOGY. Character. In the *YEAR Books* for 1907 (p. 601) and 1908 (p. 603), attention was called to the investigations of the Dutch psychologists, Heymans and Wiersma. This work has been continued (*Zeitschr. f. Psych.*, li, 1) in the direction of the study of types of character. These men have succeeded in integrating more or less simple mental traits to form types of mind. Eight such types are named: amorphous, apathetic, nervous, sentimental, sanguine, phlegmatic, choleric and impassioned. The method and results are important, both for the analytic study of character and temperament and as a basis for the investigation of mental inheritance. The point of view is akin to that of the Mendelians in biology. *Sex.* The difference in weight between the brain of man and of woman has often been appealed to in connection with assumed differences of mental endowment. H. H. Donaldson now demonstrates the fact that in the rat, as in the human species, the greater weight of the central nervous system in the male is "completely explained by the greater body length" (*Jour. of Comp. Neur. and Psych.*, xix, 155). In a discussion of the psychological effects of bodily nakedness, Havelock Ellis notes (*Amer. Jour. of Psych.*, xx., 297) a gradual "movement of revolt against nakedness" throughout the Christian era, which became completely victorious in the nineteenth century. Ellis contends that the modern ban upon naked-

ness tends to prudishness, a form of false modesty. He advocates the cultivation of nakedness on grounds of sexual hygiene and of aesthetics, and for its "dynamic psychological influence" upon morals. *General Intelligence.* Some years ago C. Spearman proposed to measure the "general intelligence" of an individual by experimental observation of the accuracy of such simple operations as the discrimination of weights or tones. Within the last year work reported from Teachers College in Columbia University (*Amer. Jour. of Psych.*, xx., 364) indicates, however, that no significant correlation obtains between these simple operations and the more complex "intellectual" functions of human beings. From these negative results, Professor Thorndike draws the inference that "the efficiency of a man's equipment for the specifically human task of managing ideas is only loosely correlated with the efficiency of the simpler sensori-motor apparatus which he possesses in common with other species." C. Burt, working with English schoolboys (*Brit. Jour. of Psych.*, iii., 94), fails likewise to discover any "fundamental identity between intelligence and general sensory discrimination"; but he concedes that a close correlation may obtain for those senses that possess a "high cognitive value." Burt's tests involving attention and association brought out a higher and more consistent correlation with intelligence than the discrimination tests. However, no single test was found to furnish a reliable measure of intellectual ability. Against Thorndike's separation of human and animal endowment, Burt urges that all the functions of the human mind (including those held in common with animals) lie organized within "a single integrative system." The study furnishes some evidence for the hereditary transmission of intellectual proficiency.

ABNORMAL AND CRIMINAL. Diagnosis of Crime. Much has been made lately of the "associative reaction" as a means of discovering facts either unknown to or voluntarily concealed by the subject. A person suspected of criminal conduct, e. g., is given a series of words, some of which are suggestible of the crime in question, and he is instructed to call out the first thing that comes to mind after each word of the series is heard. From the nature of the response and the time consumed, the experimenter attempts to arrive at the subject's knowledge of, or participation in, the crime (*Tatbestandsdiagnostik*). Within the year the method was applied—for the sake of illustration—to normal students in psychology at the Harvard laboratory (*Amer. Jour. of Psych.*, xx., 22). A member of the class was sent from the audience room and asked to choose and to examine either one of two boxes; one box containing a dancing mouse, the other a pack of playing cards. After the subject's return to the room, he was asked to respond as quickly as possible—but without betraying his choice—to two lists of words. Certain words ("significant" words) in the one list (8 out of 30) referred to the contents of the mouse-box; in the other list, to the contents of the card-box. The responses to those words which referred to the box actually examined were considerably delayed. From this delay, the experimenter correctly inferred which of the two boxes had been opened by the subject. Again, this form of mental diagnosis succeeded when the experi-

menter sought to discover which of two persons was in possession of certain trivial facts. In spite of the success of the tests, however, it should be pointed out that the mental conditions involved are exceedingly complex and require careful and expert manipulation. The Harvard study concludes with a useful bibliography. (*Cf.* a similar study in method by F. G. Henke and M. W. Eddy, *Psych. Rev.*, xvi., 399.) Critics of the reaction-method of diagnosis have contended that while it was of great psychological interest, the method could not be applied to the serious examination of actual criminals. It remained for P. Stein, of Budapest, to make a somewhat extended test upon suspected and confessed criminals (*Zeitschr. f. Psych.*, lli., 161). He found, for ten cases, an average delay for significant or "critical" words of 1.6 sec. This delay did not appear with innocent controls who were put through the same tests. Stein concludes that the method is valuable in the hands of careful and expert investigators. (For a general review of the psychology of testimony see *Psych. Bull.*, vi., 153). *Psychoanalysis.* Professor Freud's visit paid to America during the year, and the appearance in revised form of the book which Freud himself regards as the key to his system (S. Freud, *Die Traumdeutung*, 2d ed., 1909) have combined to deepen an interest in the theory that dreams are the expression of unsatisfied and unfulfilled wishes. The wish is, according to Freud, often latent, and then it is revealed even to the dreamer, only by a process of psychoanalysis. Moreover, the basis of the dream is said to be sexual in origin. Freud's doctrine of the influence in mind of latent mental processes, and his method of dealing with them, have been applied not only to dreams, but also to insane and hysterical states, and in the past year or so to myths, folk-tales, legends and literary personages. (S. Freud, *Selected Papers on Hysteria and other Psychoneuroses*; K. Abraham, *Traum und Mythus*; O. Rank, *Der Mythus von der Geburt des Helden*.) *Literary Plagiarism.* A. Pick shows (*Zeitschr. f. Psych.*, I, 401) by the description of a number of cases that literary plagiarism is at times pathological and that it may be entirely unintentional. He cites as examples Lamartine, Landor, Nietzsche and other famous men. The pathological forms rest upon a disorder of memory; they involve both intellectual and emotive factors.

ANIMAL PSYCHOLOGY. *Tropisms.* The double influence of physiology and zoölogy continued in a marked degree throughout the year. J. Loeb, of the University of California, reviewed at the Geneva Congress the history of the doctrine of animal tropisms which seeks a physico-chemical explanation of mental processes (*Die Bedeutung der Tropismen für die Psychologie*). The doctrine lays emphasis upon the chemical processes directly intervening between stimulation and responsive movement. The theory as stated and defended against Jennings and other critics at the Congress, appears less extreme and more useful than under its older formulation. *The Salivary Reflex.* The expressive method—the method of interpreting consciousness from organic changes and movements—is fundamental to comparative psychology. The development of a new form of expression, the "salivary reflex" is therefore noteworthy. The Russian physiologist, Pawlow, and his pupils have lately pub-

lished some forty or fifty papers concerning the effect produced upon salivary secretion (say, of the dog) by sights, sounds, odors, tastes, etc. They have shown that this secretion varies both in quality and in amount with change of stimulus—even of such a stimulus as a colored card or a musical sound that has been associated only temporarily with food (taste or smell). It seems likely that the method will serve a more useful purpose in the physiology of the nervous system than in psychology. An account of the methods and of some of the results, together with a bibliography, was published in the August number of the *Psychological Bulletin* (vi., 257). *General Treatises.* It is unfortunate that the two general treatises of the year should prove to be unsatisfactory. Georges Bohn, the author of many clever experimental studies upon animals, has brought out his theoretical and systematic views on comparative psychology (*La naissance de l'intelligence*). Bohn is profoundly influenced by Loeb and other men who write for psychology from the biologist's point of view. He lacks psychological background, and for that reason he constantly confuses biological and mental terms. The trained psychologist will, however, find the book useful; in the hands of the immature student it will lead to disaster. A careful estimate of it will be found in the *Journal of Comp. Neur. and Psych.* (xix., 589). A much safer book, as regards the general point of view, is E. A. Kirkpatrick's *Genetic Psychology*. It is to be regretted that the author should have fallen into the pitfall of the evolutionist, contenting himself often with loose, vague reasoning, and especially with the use of the argument that whatever appears in nature is the result of adaptation. The volume makes the praiseworthy attempt to construct a *genetic gradation of minds* in the animal series on the basis of experimental work, *Bird Calls*. A good piece of descriptive work on vocal sounds and expressive movements in birds is reported in the *Jour. of Comp. Neur. and Psych.* (xix., 29), by W. Craig. The writer observed the blond ring dove, following it through its seasonal and its life cycle. Although the article is crude psychologically, it furnishes valuable material for the study of emotional expression—found for this form to be hereditary, not imitative (see *YEAR Book*, 1908, p. 604). *Taste.* R. E. Sheldon (*ibid.*, xix., 273), working at Woods Hole on the dog fish (*Mustelus canis*), found the entire surface of the body sensitive to chemical stimulation. This result suggests a diffused sense of taste; but Sheldon affirms that the reception of chemical substances was due (excepting the region of the mouth) to nerves of "general sensation," and not to gustatory nerves. He prefers, therefore, to speak of a "chemical sense." *Color-Vision.* The color-vision of animals attracted much interest during the year. A typical piece of work was done by J. B. Watson, on monkeys (*ibid.*, xix.). Watson selected narrow bands from an arc-light spectrum and presented them, with or without food, to his (Western and Old World) monkeys. The experiments failed to demonstrate beyond a question the capacity to discriminate colors; they indicate rather that color-vision plays, at most, a subordinate part in the monkey's life. The article is important for laboratory technique. Cole and Long's experiments on the color-vision of the raccoon (*ibid.*, xix., 657), came to a

similar issue. The results of S. S. Colvin and C. C. Burford, who experimented with dogs, a cat and a squirrel (*Psych. Rev.*, *Psych. Monographs*, 44, 1), were vitiated by faulty method. *Imitation*. The Harvard work on imitation in monkeys, mentioned in 1908 (p. 604), appeared last year in full (*Jour. of Comp. Neur. and Psych.*, xix., 337). By watching each other's movements, the monkeys learned to go through a number of more or less complicated operations. In most cases, however, the "imitation" was not so much a duplication of the actions watched as an attack made in the imitator's own individual way upon an object rendered interesting by the presence and the movements of another monkey. The psychological analysis given leaves much to be desired; but the author promises a further study.

PSYCHOTHERAPY or **PSYCHOTHERAPEUTICS**: The treatment of diseases and disorders through mental agencies. The work of the year consisted, in large measure, of the exploitation and critical comparison of widely differing methods: psychoanalysis (Freud), rational and persuasive therapeutics (Dubois), hypnosis, hypnotic states, work, rest, religious faith and prayer. An important series of papers, read by physicians, psychiatrists and neurologists before the Therapeutic Society (May), were printed in book form under the title *Psychotherapeutics*. The papers, which discuss the principles, scope and methods of psychotherapy, fairly represent the present state of this branch of the art of healing. The disorders treated were conceived to be "unhealthy habitual states of mind." "The therapeutic process is the association through education of healthy ideas and stimuli that adapt the individual to his environment." No current aspect of the subject is more significant than the insistent demand for mental prophylaxis; the prevention, especially in childhood, of those unhealthy inclinations of mind which ultimately reveal themselves in fears, obsessions, hysterical accidents, loss of self-control, pathological fatigues—a multitude of neurasthenic and psychasthenic states. Apropos of this tendency to seek preventive measures should be mentioned the appearance in English, during the year, of P. Dubois' *Self Control and How to Secure It*, and J. Payot's *The Education of the Will*. New publications from the leaders in the Emmanuel Movement continued to emphasize (though perhaps less strongly than before) religious motives in psychotherapy. A small work by E. Worcester and S. McComb, designed as a defense and an exposition of the movement, appeared first in magazine articles and later (November) as a book, *The Christian Religion as a Healing Power. Psychotherapy*, by H. Münsterberg, discusses the relation of psychology to medicine. The volume belongs to the series on applied psychology in which *On the Witness Stand* appeared in 1908. Professor Münsterberg finds psychotherapy in a chaotic condition, and he tries, by expounding the underlying principles of psychology, to place the subject upon a scientific basis. The book is by all odds the most important document of the year in the case of psychotherapy. The reader of it should gain an intelligent idea of its methods, of its proper use, and of its intimate relations with psychology, with medicine, and with the church. The historical miracles of healing take on a new interest when they are considered in the light of current doctrines and

practices of psychotherapy. C. W. Waddle has made a study of them in the *American Journal of Psychology* (xx., 219). He maintains that "those cures which have always seemed miraculous, are the cures effected in large measure by the influence of the mind on the body. They have seemed miraculous because the laws under which they were effected were not understood." The lack of explanation has led to their religious interpretation. A study of the world's great "healers" reveals the fact that they have been "in childhood nervous, excitable, hysterical, dreamers of dreams, seers of visions, subject to auditory and visual hallucinations . . . personalities supersensitive to mental influences both subjective and external. . . . In short, all things combined to develop a personality that could make effectual suggestions favorable to mental and physical well-being." See PSYCHOLOGY.

PUBLIC HEALTH. See FOOD AND NUTRITION.

PUBLIC HEALTH ASSOCIATION, AMERICAN. A society founded in 1872, which has for its object the advancement of sanitary science and the promotion of measures for the application of public hygiene. The work of the Association is divided into four parts. At the meetings of the General Association general subjects in relation to sanitary science are presented. The general session of 1909 was held at Richmond, Va., October 19-22. Among the important subjects discussed were "The Place of Public Hygiene in Modern Sociology," "Industrial Hygiene," "Fresh Air and Ventilation Problems in the Industries," "Popular Educational Movements in Public Health," and papers relating in general to hygienic subjects. The Association adopted a resolution protesting against the appointment of health officers on any basis other than fitness for the discharge of their duties, and urging their retention during good behavior. It appointed a committee to confer with representatives of other national organizations having to do directly or indirectly with public health problems, with a view to co-operative work. It also gave serious consideration to the establishment of an endowment fund to put the work of the Association on a better financial basis. The Association received during the year a legacy of \$2000 from the estate of the late Henry Lomb. The next meeting will be held in Milwaukee, Wisconsin, in 1910. The officers of the Association for 1909 were: President, Dr. Charles O. Probst, Columbus, O.; first vice-president, Dr. Charles A. Hodgetts, Toronto, Ont.; second vice-president, Dr. Ernest C. Levy, Richmond, Va.; third vice-president, Dr. Frederico Torralbas, Havana, Cuba; secretary, Dr. William C. Woodward, Washington, D. C.; treasurer, Dr. Frank W. Wright, New Haven, Conn.

PUGILISM. See BOXING.

PULLIAM, HENRY CLAY. An American baseball official, died by his own hand, July 28, 1909. He was born in Paducah, Ky., in 1869. He graduated from the law department of the University of Virginia, but subsequently engaged in newspaper work. He early took an interest in baseball, and was made secretary of the Louisville Baseball Club. In 1897 he was elected to the State Assembly. He was secre-

tary and treasurer of the Pittsburg Club from 1900 to 1903, and in 1904 he was elected president of the National League, which position he retained until his death. It is due largely to Mr. Pulliam's efforts and influence that professional baseball reached and was maintained on so high a level as a sport during his incumbency of the office of president of the National League.

PUMPING MACHINERY. One of the most interesting developments in applied mechanics of the year 1909 was a new gas pump in which was involved a novel application of the internal combustion principle. This pump, designed by H. A. Humphrey, a British authority on the gas engine, was described at length in *Engineering* (London) of October 15, and its design and merits were widely discussed. So great fuel economy was exhibited in trials conducted by Professor W. Cawthorne Unwin that the opinion was advanced that by using water so pumped to drive a hydraulic turbine one shaft horse power could be obtained at an expenditure of fuel less than is now possible by any known commercial method involving the use of gaseous fuel. The Humphrey pump consists of a U tube with legs of unequal length, with the shorter partially immersed in the supply tank and the larger communicating with the pressure or reservoir tank where the water is delivered. Valves are provided below the water level in the suction tank, and these admit the water to the shorter leg of the tube above which there is a combustion chamber, where gas under compression may be freed by an electric spark. The explosion thus produced sets in motion the column of water in the larger leg by the U tube and this mass of water acquiring a considerable momentum continues to flow after the pressure of the gases becomes reduced to that of the atmosphere and the exhaust valve is opened. The column, however, is still in motion and water flows in from the suction tank. A backward flow of the water in the larger arm then takes place and after the spent gases are expelled air is compressed in the combustion space. This pressure is sufficient to give fresh momentum to the water, and as the pressure falls in the combustion chamber an explosive charge of air and gas is drawn which at the next oscillation is compressed and then ignited, as described in *Engineering*: "The cycle, it will be seen, consists, therefore, of a long expansion stroke, in which the pressure falls to a little below that of the atmosphere, and water is drawn in from the suction tank, and air through the scavenger valve. This is followed by a long return stroke during which the products of combustion are expelled. After this comes a short compression stroke at the end of which the charge is ignited. The pump operates, therefore, on a four-stroke cycle, the strokes being equal in length." A single missed ignition does not stop the working of the pump and the only moving parts are the eight automatic valves. It was found that the consumption of gas per pump horse power per hour of the Humphrey pump was 83.1 cubic feet, as compared with 120 to 127 cubic feet for a gas engine driving a centrifugal pump required to do 16 pump horse power on a lift of 33 feet. The fuel consumption of the Humphrey gas pump was figured at 1.06 pounds of coal per pump horse power per hour, as compared with 1.022 to 1.996 pounds for steam pumping

engines of high efficiency. Professor Unwin concludes that the fuel consumption of the Humphrey pump "reckoned on the work done in lifting water, was less than in any pumping arrangement, either by gas or steam, hitherto recorded."

PURDUE UNIVERSITY. An institution of higher learning at Lafayette, Ind., founded in 1874. In 1908-9 the number of students was 1942 and the faculty numbered 149. There were in the library 27,300 bound volumes and 5700 pamphlets. There were received during the year in donations \$80,000. The fund was completed for the erection of a memorial gymnasium. This building was completed and dedicated in May, 1909. During the year a separate department in applied mechanics was established, and Professor R. A. Dukes, formerly of the Case School of Applied Science, was appointed head of the department. The president is W. E. Stone. The productive funds of the university amount to \$340,000 and the total income is about \$284,000.

PURE FOOD. See FOOD AND NUTRITION.

PURE FOOD LEGISLATION. See FOOD AND NUTRITION.

QUAKERS. See FRIENDS.

QUEBEC. A province of Canada. Area, 351,872 square miles. Population (1891), 1,648,898. Capital, Quebec, with 68,840 inhabitants in 1901 and about 78,000 in 1909. Montreal, the largest city in Canada, had 267,730 inhabitants in 1901 and about 390,000 in 1909. The executive authority rests with a lieutenant-governor, appointed by the Governor-General of Canada and acting through a responsible ministry. The legislative power devolves upon a parliament of two houses, the Legislative Council (24 appointed life members) and the Legislative Assembly (74 members elected for five years). The Lieutenant-Governor in 1909 was Sir C. Alphonse P. Pelletier; the Prime Minister and Attorney-General, Sir Lomer Gouin. For statistics and other details, see CANADA.

HISTORY. The one-man one-vote principle which prevailed in the province of Ontario was adopted by the Quebec government for both provincial and dominion elections. Early in February the report of the Royal Commission appointed by the Quebec government to consider the question of employers' liability for accidents was announced. It declared in favor of laws modeled on the English laws except as regarded domestic servants and it recommended an inter-provincial conference to remove differences that might exist between the provincial laws. The Provincial Legislature was opened on March 2. The speech from the throne expressed the hope that Ungava would be annexed during the year and proposed the establishment of two technical schools, three teachers' training schools and a commission for checking the spread of tuberculosis. Quebec was the centre of the Nationalist party and the agitation against the government's policy of naval defense. Considerable activity was shown by this party in the matter in spite of the fact that both the Liberals and Conservatives were agreed upon it and that Parliament was committed to it.

QUEBEC BRIDGE. See BRIDGES.

QUEENSLAND. A State of Australia. Area, 670,500 square miles. Estimated population, December 31, 1908, 558,237. The capital is Brisbane; population, within ten-mile radius, 137,670. The executive authority rests with a governor, appointed by the Crown and acting through a responsible ministry. The Parliament consists of two houses, the Legislative Council (45 appointed life members) and the Legislative Assembly (72 members, elected for three years by male and female suffrage). The Governor in 1909 was Sir William McGregor; the Premier, W. Kidston.

HISTORY. On the opening of Parliament, June 30, the government congratulated the country upon its prosperity and the good season, declared its policy in naval defense to be non-interference, and that the best service it could render would be the opening up of the coast lands and their settlement by a loyal white population. It promised to submit proposals for a number of new railways, although railway construction was already going on faster than ever before and announced that a survey was to be held for a trans-Queensland line to develop good mining and grazing regions and to establish serviceable mail routes with eastern Australia. In August the Lieutenant-Governor granted a dissolution of the Legislative Assembly. The elections returned forty-one members of the government party, twenty-seven Labor candidates and four members of the Independent opposition. The only minister who failed of re-election was Mr. Jackson, the Minister of Mines. The election was hailed by the newspapers as the downfall of the three-party system. During the third week of August Queensland celebrated the jubilee of her existence as a self-governing state. An exhibition was held, which opened with an attendance estimated at 50,000.

RABIES. Kerr and Stimson of the Public Health and Marine Hospital Service found that there were 111 deaths in human beings from hydrophobia reported from 30 States during the year 1908. Rabies was reported in the lower animals from at least 534 localities in 39 States and Territories, including the District of Columbia. Evidence was also secured of nearly 1500 persons, who, on account of exposure to rabies, were obliged to take the Pasteur treatment. The disease was disseminated throughout the eastern three-fourths of the country, and seems to have been unknown during 1908 only in the Rocky Mountain and Pacific Slope regions. There has been a widespread demand for antirabid virus throughout the United States. The extent of rabies in New York State is indicated by the fact that 45 outbreaks of the disease, caused by stray dogs, were reported to the Chief Veterinarian of the Department of Agriculture between January, 1906, and September, 1908. There were 36 quarantines laid on account of the rabies, and there were 9 places in which rabies was diagnosed, but in which quarantine was not laid by the Department of Agriculture. In Prussia during 1908, 295 persons were injured by animals either rabid or suspected of rabies. Of the 279 who were inoculated, 2 died, and of 16 who were not treated, 1 died; in 1907, of 382 inoculated, 2 died; in 1906, 4 out of 342; 1905, 3 out of 322; 1904, 5 out of 330; 1903, 4 out of 281. If only those who were bitten by an animal known to be rabid are considered, 2 out of 190 inoculated, died in 1908. Remlinger notes the

comparative rarity of rabies in Constantinople, in spite of the number of vagrant dogs (estimated as between 60,000 and 80,000) in this city. Only 49 dogs were brought to the public pound on account of the rabies in 1908, and of the 978 persons applying for treatment at the Ottoman Pasteur Institute, all but 157 came from outside of Constantinople. When infection does occur, however, it is unusually virulent. The dogs possess no natural immunity, but curiously enough keep strictly to their own territory, the dogs of one section of the city never venturing into another section, for if they do they are torn to pieces by the dogs of the section into which they intrude; therefore, when rabies does develop in one section, it never spreads to another. Furthermore, the dogs instinctively avoid one of their number who is sick with rabies. Sections to which the dogs confine themselves are sometimes not more than 150 feet long, and generations of dogs succeed each other without ever passing beyond these boundaries. Nitsch says that it is decisively shown that the Pasteur method of treatment decreases very considerably the percentage of mortality in persons bitten by rabid dogs. Without treatment, over 10 per cent perish, while under Pasteur treatment only about 1 per cent. die.

RACING. The racing interests experienced another poor season in 1909 as the result of the anti-betting laws which drove several of the principal owners to take their horses abroad. J. R. Keene again had the largest winnings, his total for the season being \$112,586. This sum represented, however, a big falling off from Mr. Keene's 1908 winnings, which aggregated \$287,912 and illustrates the decline in the sport. Other winning owners in 1909 were S. C. Hildreth, \$109,230 and R. T. Wilson, Jr., \$39,410. In England W. Fairie was the principal winner with \$188,595. King Edward VII. was second, His Majesty's winnings aggregating \$100,720. The leading jockeys in 1909 were Dugan and Butwell in the United States and Wootton and Maher in England.

Several new running records were made in the United States in 1909. These included: 3½ furlongs, A. J. Small and Donan, in 40 seconds; 6 furlongs, Prince Ahmed, in 1 minute 11 seconds; 1 mile 70 yards, Ida May and Grania, in 1 minute 42½ seconds; 1½ miles, Orgagna, in 3 minutes 17½ seconds; 2 miles, Fitz Herbert, in 3 minutes 25½ seconds.

New trotting records of the year were: 1 mile (yearling), against time, Miss Stokes, in 2 minutes, 19½ seconds; 1 mile, two-year-old, Native Belle, in 2 minutes 7½ seconds. The only new pacing record established was by Jim Logan, a three-year-old, who paced a mile in 2 minutes 5½ seconds.

Of the racing events in the United States during 1909, the most important, with their winners and time, were: The Futurity, Sleepy, 1 minute 11½ seconds; Brooklyn Handicap, King James, 2 minutes, 4 seconds; Suburban Handicap, Fitz Herbert, 2 minutes 3½ seconds; Saratoga Handicap, Affliction, 2 minutes 5 seconds; Metropolitan Handicap, King James, 1 minute 40 seconds, and Kentucky Derby, Wittergreen, 2 minutes 8½ seconds. The English Derby was won by King Edward's Minor, the time being 2 minutes 42½ seconds.

RACQUETS AND COURT TENNIS. The National Amateur Court Tennis championship tournament was held in Boston, April 5-10. E.

the preliminary rounds C. S. Derby defeated J. A. L. Blake, 6-1, 4-6, 6-5, 6-5, and Joshua Crane defeated Foxhall Keene, 6-0, 6-2, 6-1. In the finals Crane defeated Derby, 6-1, 6-0, 6-0.

The challenge round between Jay Gould, title holder, and Crane resulted in a victory for Gould, the score being 6-5, 3-6, 6-3, 6-3. The Gold Racquet Championship was won at Tuxedo Park by H. F. McCormick, who defeated E. Hewitt in the final round, 17-14, 15-2, 15-7. The National Amateur Racquet Championship in singles was also won by McCormick. In the final round he defeated G. F. Brooke 15-6, 10-15, 18-17, 15-5. The doubles were won by H. Hereford and P. O. Haughton. New York again won the annual doubles racquet inter-city match with Philadelphia. The English Amateur Court Tennis Championship was won by E. H. Miles. Jay Gould, the holder of the English title, did not defend it. The English Amateur Racquet Championship went to E. M. Baerlein.

RADIOACTIVITY. See CHEMISTRY.

RADIOCHEMISTRY. See CHEMISTRY.

RAILWAYS. The year 1909 was marked by rapid recovery of the railways from the effects of the financial and business depression of the previous year. The industrial and commercial interests of the country regained confidence following the election of President Taft in November, 1908, and the railways quickly felt the expansion of trade which was the result. Gross earnings increased to a point closely approaching that of the banner year 1907 and owing to the continuance of the policies of retrenchment in expenditures, the net earnings of a number of companies made a better showing than in any previous year of their operation. For the first time since November, 1907, the reports of freight car surplus and shortage from 170 railways to the American Railway Association showed a net shortage amounting to 6000 cars. The surplus on April 29, 1908, was 425,000 cars; that is nearly one-fourth of the freight cars of the country were standing idle with no freight offered to be moved in them. The last reports of the year 1909 showed a net surplus of 34,300 cars.

COURT DECISIONS. A number of important decisions were handed down by State and Federal courts during 1909 in cases relating to laws affecting the interests of railways. The famous Standard Oil rebating suit in which Judge Landis of Chicago imposed a fine of \$29,000,000 in 1907 was retried in March, 1909, before Judge Anderson in Chicago following a reversal of the finding of Judge Landis by the United States Court of Appeals. Judge Anderson, after hearing the government's evidence and argument, threw the case out of court, thus ending the proceedings summarily. See STANDARD OIL CO.

The United States Supreme Court early in May handed down a decision upholding the constitutionality of the so-called "commodities clause" of the Hepburn Act of 1906, which prohibits a railway company which manufactures, mines or produces any commodity to move that commodity in interstate commerce. The decision of the court, however, was in effect a victory for the railways, for it was held that the prohibition did not apply to commodities manufactured, owned or mined by a corporation in which the railway is a stockholder. The antracite roads, against which the clause was aimed, with the exception of the Delaware and

Hudson, which sells its coal at the mines, all own stocks of separate coal mining companies and hence the law does not affect their operations.

The Attorney-General withdrew the government's suit, alleging violation of the Sherman anti-trust law by the New York, New Haven and Hartford by reason of the virtual consolidation of the Boston and Maine with it. The suit was withdrawn late in June following the enactment of a Massachusetts law permitting the consolidation under certain restrictions.

In February the United States Supreme Court affirmed the verdict imposing a fine of \$126,000 on the New York Central and Hudson River Railroad for giving rebates to the American Sugar Refining Company on shipments of sugar to Detroit and Cleveland. The constitutionality of the anti-rebating clause of the interstate commerce act was unanimously upheld by the court.

Judge McPherson of the United States District Court on March 8 decided that the 2-cent fare law of Missouri, passed in 1907, was unconstitutional. He held that the rate was unremunerative and hence confiscatory. (See MISSOURI.) Similar litigation was pending in the State and Federal courts in Minnesota, South Dakota, Nebraska and Kansas, but no decisions were rendered during the year. In Virginia the State Corporation Commission voluntarily ruled that the railways in that State could increase their ticket rates from 2 cents to 2½ cents per mile provided interchangeable mileage books were sold at the 2-cent rate.

STATE RAILROAD COMMISSIONS. No new railroad commissions were created in 1908 or 1909. Forty States have commissions and New York has two. Perhaps the most important work done by any of the State commissions was the complete physical valuation of the railways in Minnesota, which was completed early in the year. It was probably the most exhaustive physical valuation of railways ever made and was of particular interest on account of the widespread interest in appraisements of railway values as a basis for rate regulation. The commission found that the total reproductive value of the 19 railways in the State was \$307,299,471, whereas the Minnesota proportion of their capitalization was but \$334,979,691, indicating that as a whole they were not over-capitalized. A bill enlarging the powers of the Connecticut Railroad Commission to include jurisdiction over public utility companies in the State failed of passage, but in Vermont a similar bill was passed and in Nevada the powers of the railroad commission were greatly enlarged. Bills creating new railroad commissions were defeated in the legislatures of Idaho and Utah, largely owing to the active efforts of the railway companies in these States, which conducted a publicity campaign to point out the effect on business produced by the pernicious acts of radical commissions in other States.

FEDERAL LEGISLATION. The session of Congress, held in the spring of 1909, was devoted principally to the framing of a new tariff bill, but the corporation tax law was passed and this will affect railway companies in common with all other corporations. The House of Representatives passed a bill empowering the Interstate Commerce Commission to investigate railway accidents, but it failed to

be considered by the Senate and did not become a law. It was again passed by the House late in December and gave promise of being accepted by the Senate before the end of the winter session. In its annual report presented to Congress at the end of 1909 the Interstate Commerce Commission asked for increased powers. Its principal recommendations were power to make physical valuations, to suspend the effectiveness of a change in rates pending a hearing, unrestricted discretion to establish through routes and joint rates, power to prescribe the conditions under which freight may be routed by a shipper; specific authority to institute proceedings without complaint from a shipper, control over railway capitalization and issues of bonds, and broader authority to prescribe and enforce "general regulations relating to the movement of traffic."

STATE RAILWAY LEGISLATION. At the beginning of 1909 14 States had laws in force limiting passenger fares on railways to 2 cents a mile. Twenty-seven of the largest railway systems operating in these States estimated that their combined loss in revenue due to the restrictions of the laws amounted to \$20,000,000 annually. The courts in several of the States declared 2-cent fare laws confiscatory and unconstitutional during the year. Many radical bills were introduced at the meetings of the legislatures of all but 8 States in the Union, but conservative policies generally prevailed and little drastic legislation resulted. Kansas passed a law prohibiting the use of public drinking cups in railway cars or stations and California passed a reciprocal demurrage law. In Wisconsin the railroad commission was given power to order changes in grades to abolish highway crossings with railways and to apportion the cost between the railways, the State and the county.

ACTIVITIES OF THE INTERSTATE COMMERCE COMMISSION. During 1909 the Interstate Commerce Commission continued to give most of its attention to interpretations of the interstate commerce acts for the guidance of shippers and carriers. It decided 591 cases instituted by formal complaint and 1097 additional proceedings were placed on the docket. For criminal violations of the acts to regulate commerce the commission caused to be returned 35 indictments; 42 prosecutions were concluded, and a total of \$304,233 was collected in fines. The Commission in its report to Congress says: "It is believed that violations of the act are decreasing in number, but the year's work has developed all the forms of wrongdoing known in previous years. There has been no decrease in the more insidious forms of rebating resulting from arrangements legal in every respect except in the result produced."

The Commission rendered several important decisions in cases brought before it. Among these were the Spokane and Denver rate cases in which it was held that the rates to these interior points were too high as compared with the rates to more distant points governed by water competition, although the force of water competition and its effect on rates was recognized. The Portland gateway was also ordered opened, the Commission holding that a railway, although offering adequate service over its own lines, could not compel the public to travel or shippers to route their freight exclusively over its lines by refusing to make all reasonable joint arrangements with other competing lines.

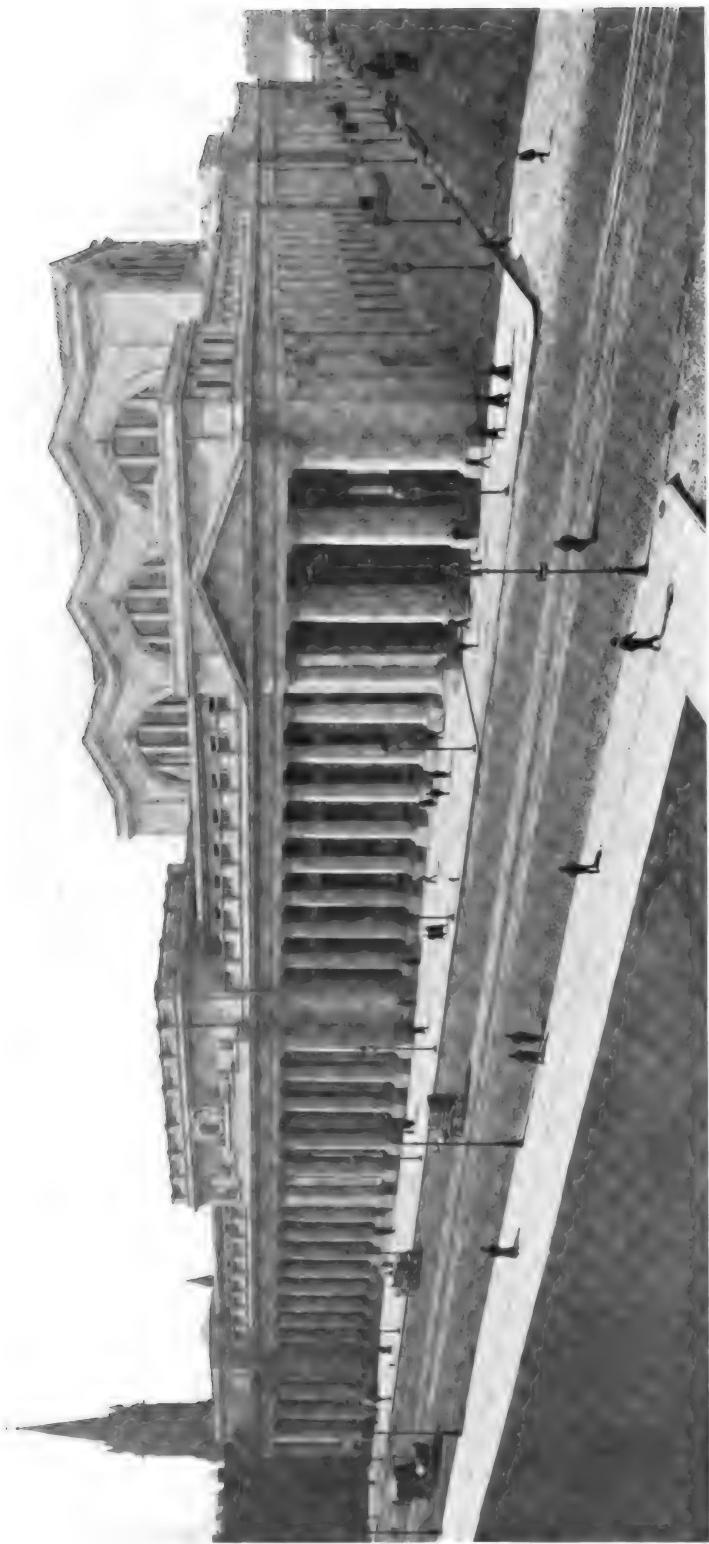

RECEIVERSHIPS. In the year following the fall panic of 1907, 24 railways, with an aggregate of 8009 miles of tracks and total capital liabilities of \$598,359,000, went into receiver's hands, but the general soundness of railroad financing was evidenced by the rapid check on the spread of bankruptcy proceedings in 1909. Only five roads, with a total of 859 miles and \$78,095,000 of outstanding stocks and bonds, had receivers appointed during the year. The Atlanta, Birmingham and Atlantic, with 572 miles, became insolvent in January, and the Chicago, Peoria and St. Louis, with 255 miles, failed to meet the interest on its bonds in July. The latter company attributed its failure largely to the effect on its earnings of the 2-cent fare law in Illinois.

A number of important railways which went into receiverships in 1908 were reorganized and sold at foreclosure sales during 1909. The Western Maryland, Chicago, Great Western and the Norfolk and Southern were included among these.

RAILWAY FINANCING. A steadily rising scale of prices in the bond and stock market during 1909 offered favorable opportunities for new financing and issues of refunding securities at lower interest rates. Approximately \$1,100,000,000 of new stocks and bonds of railways in the United States were disposed of. Of this amount about \$350,000,000 represented refunding issues. The largest sales of bonds were \$82,000,000 of 4 per cent., convertible bonds of the Southern Pacific, \$75,000,000 of 4 per cent. bonds of the Chicago, Milwaukee and St. Paul and \$115,799,000 bonds of the Missouri Pacific, which were issued as part of a new financial organization for this important Gould property. The three largest railroad systems in the East, namely the Pennsylvania, New York Central and Hudson River and the New York, New Haven and Hartford issued large blocks of stock to stockholders at low prices, thereby obtaining necessary funds for improvements and at the same time effecting the payment of the equivalent to an extra dividend. The Pennsylvania sold \$80,000,000 of stock; the New York Central sold \$44,658,000 and the New York, New Haven and Hartford sold \$50,000,000.

Few significant changes were made in the dividend rates of standard railroad stocks during the year, although there were some notable instances of "melon-cutting." Neither the New York Central or the Pennsylvania, which reduced their annual dividend rates in 1908, increased them in 1909. The Pennsylvania Company and the P. C. C. and St. L., two of the most important subsidiary lines of the Pennsylvania Railroad, both announced increases of 1 per cent. in the rate in December. The only reduction of importance was that of the St. Louis, Iron Mountain and Southern, which dropped from 5 per cent. to 4 per cent. The rights to subscribe at low prices for such stocks as Pennsylvania, New York Central and New Haven constituted extra dividends of from 5 to 10 per cent. to the stockholders of those roads. The most striking example of "melon-cutting" was the 50 per cent. extra cash dividend and 15 per cent. stock dividend declared by the Delaware, Lackawanna and Western in addition to regular dividends of 20 per cent., making a total of 85 per cent. for the year. Increases were also made by all the other so-called "anthracite" roads.

CHANGES IN RAILWAY OWNERSHIPS. An un-

THE NEW YORK TERMINAL OF THE PENNSYLVANIA RAILROAD
McKIM, MEAD, AND WHITE, ARCHITECTS

usually large number of changes of ownership or control of important railway systems took place during the year. Edwin Hawley and his associates acquired the Chesapeake and Ohio, the Missouri, Kansas and Texas, and the St. Louis and San Francisco and the Hawley group now comprises more than 14,000 miles of road. One of the former Hawley roads, the Colorado and Southern, passed to the Chicago, Burlington and Quincy. The Rock Island-Frisco system was broken up by the sale by the Chicago, Rock Island and Pacific Railroad of its controlling interest in the St. Louis and San Francisco and its allied lines to B. F. Yoakum, Edwin Hawley and their associates. It was reported late in the year, following the dissolution of the Rock Island-Frisco combination, that the owners of Rock Island had secured control of the Lehigh Valley. The same reports coupled the Wabash Railroad with the deal for a through connection for the Rock Island from the Rocky Mountains to the Atlantic Coast. In the Middle West the Baltimore and Ohio completed negotiations for taking over the Cincinnati, Hamilton and Dayton from the present receiver. The Minneapolis, St. Paul and Sault St. Marie acquired the Wisconsin Central, thus giving the Canadian Pacific an entrance into Chicago. After overcoming many obstacles the New Haven finally gained control of the Boston and Maine through the formation of the Boston Railroad Holding Company which owns a controlling interest in the Boston and Maine and is in turn controlled through stock ownership by the New Haven. The death of E. H. Harriman (q. v.) did not affect in any way the corporate control of activities of the Harriman lines and their affiliated systems.

CONSTRUCTION OF NEW RAILROAD MILEAGE. The new railroad track built in 1909, while less than that of any year since 1898, with the exception of 1908, was widely scattered throughout the country and afforded encouraging evidence of a return to more normal conditions. Statistics compiled by the *Railroad Age Gazette* show that 3748 miles of new track were laid during the calendar year as compared with 3214 miles in 1908 and 5212 miles in 1907. Texas headed the list of States with 666.43 miles, built by 23 companies. The total main track mileage of the railways in the United States on June 30, 1909, as given in the annual report of the Interstate Commerce Commission was 233,003, as compared with 228,165 miles in 1908. The longest line built in 1909 was the extension of the Western Pacific on which track was laid for 430 miles, 288 miles in Nevada and 142 miles in California. In Canada the new trans-continent line of the Grand Trunk Pacific was extended westward 623 miles which swelled the total new construction for the northern half of the continent to 1488 miles. According to statistics compiled by the *Archiv für Eisenbahnuesen*, the railway mileage of the world at the end of 1907 was divided in the table below:

Since 1897 the world's railway mileage has

increased 140,137 miles or 23.5 per cent. The capital invested in the railways of to-day is approximately \$50,000,000,000.

ELECTRIFICATION. New York City was the centre of activity in the electrification of steam railways in 1909. The Long Island Railroad added 40 miles to its electric suburban zone in preparation for operating of all of its trains through the Pennsylvania tunnels under the East River to the new terminal station at Seventh Avenue and Thirty-third Street on the Island of Manhattan. The station and tunnels from the Hackensack meadows in New Jersey to Sunnyside yard in Long Island City were nearly completed by the end of the year, and it was expected that all trains of the Pennsylvania and Long Island Railroads would be running into the new station by June 1, 1910. Two of the electric locomotives which will haul through trains in the tunnels were received in October and subjected to service tests on Long Island. These are the most powerful electric locomotives ever built, each half unit being driven by a 2000 horse-power motor mounted above the frames and connected through cranks and connecting rods on each side to the two pairs of driving wheels. The New York Central made progress on the new Grand Central Station and electrically equipped its Harlem Division from the present terminal of the electric zone at Wakefield to North White Plains, 12 miles. Electric operation was begun on this section early in 1910. The New Haven made no extension of its electric zone beyond Stamford, but it ordered two electric freight locomotives of a novel type which will be tried out in service with a view of ultimately operating both freight and passenger trains by electric power. In the far west the Great Northern began operations of trains through the Cascade tunnel in the State of Washington with three-phase locomotives on July 10. The Illinois Central, after a study of the possibilities of operating at Chicago terminals by electricity, announced in October that it would defer action on the project indefinitely. See ELECTRIC RAILWAYS.

CAB AND LOCOMOTIVE BUILDING. The policy of strict economy in all departments inaugurated by the railroads in 1908 was reflected in the statistics of cars and locomotives built in 1909, compiled by the *Railroad Age Gazette*. The real recovery did not begin until after the crops began to move in the summer when orders for new motive power and rolling stock equipment were placed on a scale comparing favorably with the buying of more prosperous years. During 1909, 53 car building companies in the United States and Canada built 93,570 freight cars and 2849 passenger cars; a total of 96,419, as compared with 78,271 in 1908, and 289,645 in 1907. The total number of cars ordered during the year was 193,874, as compared with 63,988 in 1908, and 151,711 in 1907. The following table shows the total number of cars built in each year since 1904:

	Year	Freight	Passenger	Total
Europe	199,385			
Asia	56,294			
Africa	18,519			
North America	268,058			
South America	34,911			
Australia	17,700			
Total entire world.....	594,867			
	1904.....	60,806	2,144	62,950
	1905.....	165,455	2,551	168,006
	1906.....	240,503	3,167	243,670
	1907.....	284,188	5,457	289,645
	1908.....	76,556	1,716	78,271
	1909.....	93,570	2,849	96,419

Locomotive building followed closely along the same lines as car building. The number ordered in 1909 was 3350 as compared with 1182 in 1908, and 3482 in 1907. The number of locomotives built by 11 manufacturing companies in the United States and Canada, not including those built by railway companies in their own shops, is shown in the table below for each year from 1904 to 1909:

1904.....	3,441	1907.....	7,362
1905.....	5,491	1908.....	2,342
1906.....	6,952	1909.....	2,887

BLOCK SIGNALS. The mileage of railway track protected by some form of block signals at the end of 1909 was 63,324, an increase of 3775 miles during the year. Automatic block signals were installed on 2228 miles of track, and manual block signals on 1558 miles.

RAILWAY ACCIDENTS. The accompanying table compiled from the reports of the Interstate Commerce Commission shows the number of passengers and employees killed and injured on railways in the United States for the years ending June 30, 1908-9. The number of casualties in 1908-9 showed a marked falling off from the low figures of the previous year, due perhaps in part to the decrease in the volume of traffic handled. The number killed dropped from 3784 to 2791, a decrease of 26 per cent. A marked reduction during the year in the number of fatal and non-fatal accidents to trainmen in coupling cars is evidence of the greater care taken by the railways in keeping the couplers in good repair and perfect operative condition. The annual report of the Commission to Congress states that "inspectors of the Commission have gone over the equipment of our large railway systems without finding any defective couplers." The Interstate Commerce Commission, State Railroad Commissions and the railway companies have been making earnest but as yet ineffectual efforts to reduce the enormous annual loss of life to "other persons," which includes grade crossing accidents and injuries to trespassers in the railway right-of-way. In the year ending June 30, 1908, 6402 persons were killed and 10,187 injured in accidents classified under this head. The deaths in 1907 were 6695 and the injuries 10,331.

Passengers	1909		1908	
	Killed	Injured	Killed	Injured
In train accidents.....	131	3,865	165	7,430
Other causes.....	204	6,251	241	5,215
Total	335	10,116	406	12,645
Employees				
In train accidents....	520	4,877	642	6,818
In coupling accidents, 161	2,353	239	8,121	
Overhead obstructions, etc.	76	1,229	110	1,353
Falling from cars, etc. 451	10,259	669	11,735	
Other causes.....	1,218	33,086	1,699	33,317
Total	2,456	51,804	3,359	56,344
Total passengers and employees	2,791	61,920	3,765	68,989

RAINES, JOHN. An American politician, died December 16, 1909. He was born at Geneva, N. Y., in 1840, and was educated in the common schools of that city. He graduated from the Albany Law School in 1861. For a short time he taught and then took up

the practice of law in his native town, later removing to the town of Canandaigua. He early became interested in politics, and joining the Republican party threw himself with enthusiasm into the campaigns that followed the war. He was elected a member of the State Assembly in 1881, 1882 and 1885. In 1886 he was elected State Senator and remained a member of the upper house in the State Legislature until 1890. In 1894 he was again elected to the Senate to fill a vacancy and was re-elected the following year. He served in the State Senate until the time of his death. In 1903 he was elected President *pro tempore* of the Senate, an office which carried with it the Republican leadership. He served in this capacity in every term thereafter. He served as a member of Congress in the Fifty-first and Fifty-second Congresses. Senator Raines was the originator of the famous Raines law which regulates the selling of liquor in the State. He was one of the most skillful politicians in the State. He supported Senator Platt as Republican leader of the State until the latter broke with Governor Odell and was obliged to resign the leadership. He was a supporter of Governor Odell, and after the election of Governor Hughes became a leader of the party organization in the State and the strongest opponent of many of the measures advocated by Governor Hughes. He formed an alliance with Senators McCarran and Grady, Democrats, by which he prevented the removal on charges of Otto Kelsey, Superintendent of Insurance, which had been recommended by Governor Hughes to the Senate. He also vigorously opposed the public service bill which was, however, passed in spite of his opposition. At the legislative session of 1909 he strongly opposed the direct primaries plan of Governor Hughes and nearly all other reforms which that official recommended, and by combining with the Democrats under Grady and McCarran, he was able to prevent the passage of these measures.

RAUM, GREEN BERRY. An American soldier and public official, died December 18, 1909. He was born at Golconda, Ill., in 1829, and was admitted to the bar of Illinois in 1853. He was a member of the National Democratic Convention which supported Douglass for President in 1860. In 1861 he entered the Union army as leader of the Forty-sixth Illinois Volunteers and was promoted through successive grades to be brigadier-general. He served under Grant and Sherman and was severely wounded at Missionary Ridge. He did important service in the Atlanta campaign, and the campaign following the March to the Sea. From 1876 to 1883 he served in Congress, and from 1889 to 1893 he was Commissioner of Pensions. He was the author of many magazine articles and two books, *The Existing Conflict* and the *History of Illinois Republicanism*.

RECLAMATION SERVICE. See LANDS PUBLIC, AND IRRIGATION.

RED CLOUD. A chief of the Sioux tribe of Indians, died December 10, 1909. He was born about ninety years ago and was the head of a long line of famous chiefs who were heads of the Sioux nation, which once comprised more than 20,000 persons. He first came into prominence as the leader in the Fetterman massacre in Wyoming, which occurred near Ft. Kearny

on December 22, 1866, when about 2000 Indians under the command of Red Cloud surrounded 100 men commanded by Captain Fetterman and killed every one. The massacre made Red Cloud famous among his own people, and he was made leader of the Sioux warriors by common consent. In a short time he had established a military dictatorship and became a terror to the whites in the region where he ruled. Following a council in 1874, the Indians left the North Platte country and went to the Red Cloud agency, where they continued, under Red Cloud, to make frequent raids. The capture of his ponies by General Crook prevented his taking part in the Indian war of which the Custer massacre was a part. About thirty years ago he signed a peace treaty, and at the time of the battle of Wounded Knee in 1890 he was one of the supposed friendly Indians at the Pine Ridge agency. When news of the battle arrived many of the Indians, including Red Cloud, stampeded to the hills. The band attacked the Drexel Mission and almost ambushed Colonel Forsythe before the Ninth Cavalry came to his rescue. It was claimed by army officers that Red Cloud had charge of these operations, which showed wonderful strategic skill. After the close of the campaign against Sitting Bull General Crook formally deposed Red Cloud from the chieftainship of the Sioux, and he was kept at the Pine Ridge agency. He fought civilization almost to the last and declined his allotment of land, saying that he would starve before he would work like a squaw, and he was so bitter against the whites that he refused to learn a word of English. In 1905, however, he was persuaded to abandon in a measure his hostile attitude and went to work.

RED CROSS, THE AMERICAN NATIONAL. The American Association of the Red Cross was founded in 1882 under the leadership of Miss Clara Barton. This was a voluntary reserve emergency organization and was practically a private society. It continued in this form until 1904, when it was reorganized and reincorporated by an act of Congress January 5, 1905. By this act it was transformed into an organization of national scope on an equality with European Red Cross associations. It has affiliation with the government, which assures harmony and coöperation between the two. William H. Taft was its president in 1908, and continued in this capacity after his election to the Presidency. The chairman and five members of the Central Committee are appointed by the President of the United States and represent the Federal departments of State, Treasury, Army, Navy and Justice. There is also a Board of Consultation, which includes the Surgeon-Generals of the Army, the Navy and the Public Health and Marine Hospital Service. Other government officials and ex-officials are also members of the Red Cross. In the United States there are more than thirty State branches and there are branches also in Porto Rico and Hawaii. From the time of its reincorporation in 1905 the Red Cross has rendered assistance to sufferers from the Philippine typhoon, Japanese famine, the eruption of Vesuvius, the Italian earthquake, Gulf storm, Chinese famine, Russian famine, Mississippi cyclone and Southern floods, the Monongah mine disaster, the Chelsea fire, Michigan forest fires and Canadian forest fires. The principal activities during 1909 were in aid of sufferers from the Italian

earthquake, Mexican floods, the Armenian massacres and the Key West cyclone. For the Italian earthquake relief fund the Red Cross received contributions aggregating over \$1,000,000. There was expended \$29,500 by the American Red Cross for relief work in Armenia; about \$8000 and a large amount of clothing and supplies for sufferers in Mexico; \$1000 for sufferers in Key West. The officers in 1909 were: President, William H. Taft; Vice-President, Robert W. de Forest; Treasurer, Charles D. Morton; Counselor, Lloyd W. Bowers; Secretary, Charles L. Magee; National Director, Ernest P. Bicknell; Chairman of the Central Committee, Major-General George W. Davis, U. S. A., retired.

REFERENDUM. See ELECTORAL REFORM.

REFORM BUREAU, INTERNATIONAL. An organization for general and specific betterment of mankind, inaugurated by Rev. Wilbur F. Crafts, Ph. D., in a course of lectures on Sociology at Princeton University. The Bureau was incorporated at Washington in 1896. The special evils which the Bureau was formed to combat are intemperance, impurity, Sabbath breaking and gambling. Its methods are by legislation, by letters, by lectures and by literature. It has four fields of work, local, State, national and international. Its specialties at the present time in its local work are the investigation of low class theatres, efforts to suppress sensational and obscene literature, and the general enforcement of the Sabbath law. In the State work the Bureau gives special attention to the race track gambling trust. In its national work it has drafted twelve laws which have passed Congress. Among these are laws which prevent the selling of liquor to immigrants at immigrant stations; legislation closing the liquor bars in the House and Senate basements; laws prohibiting the sale of liquor, opium and fire-arms by American traders in the islands of the Pacific having no civilized government; and the Gillett divorce reform act, which broke up the "divorce colonies" in the Territories. Important work in the international field has been carried on in relation to measures to restrict liquor selling in Africa, and against the sale and use of opium in China and elsewhere. Among the bills presented by the Bureau in Congress in 1908-9 was the bill to forbid liquor selling in all soldiers' homes, and in ships, buildings and premises used by the United States government; a bill to protect no-license territory against "original packages"; a bill to prohibit opium traffic in all territories under United States jurisdiction; a District of Columbia Sunday law; a national anti-gambling law; a national interstate anti-cigarette law; an anti-polygamy amendment to the constitution; a bill to forfeit a periodical's second class mail privileges when once ruled out as immoral; a bill to suppress liquor selling in all the "Indian country" of Alaska; a bill to prohibit the issuing of money orders or the registering of letters on Sunday; a uniform marriage and divorce law by an amendment to the United States Constitution, and child labor laws, restricting the age of children working in mills, mines and stores. The most important event in the history of the Bureau during 1909 was the sending of Rev. E. W. Thwing to China and Japan as Oriental Secretary to assist in the anti-opium fight which China is making.

Dr. Crafts visited England during the year as official delegate of the United States to the twelfth International Congress on Alcoholism. As chairman of the United States delegates, he prepared an important report. The Bureau took part, through its Superintendent, in local option fights in Canada and some States of the United States. The Bureau took an important part in the opposition of bills in the New York Legislature for weakening the Sunday laws. In April a harmony banquet was held, at which the leaders of many reform movements were brought together for fellowship and co-operation. On December 12-17 a conference of all the national temperance societies of the United States was held. The Bureau occupies a building of its own in Washington. The officers of the Bureau in 1909 were: President of the Board of Trustees, Henry W. Blair; Secretary, Rev. F. D. Power, D. D.; Superintendent and Treasurer, Rev. Wilbur F. Crafts, Ph. D.

REFORMED CHURCH IN AMERICA

(DUTCH). A Protestant religious denomination, composed originally of settlers from Holland and largely intermixed with elements from many other sources. Up to 1807 it was known as the Reformed Protestant Dutch Church in North America. The first church organization was established in 1628. The total enrollment in the Church in 1909 was 116,174. There were 684 churches and 727 ministers. The families in the denomination numbered 63,364. The number of Sunday schools was 777, with a total enrollment of 118,513. The contributions received during the year for denominational objects was \$355,945 and for other objects \$93,371. For congregational purposes there were received \$1,506,331, making a total of all contributions of \$1,955,647. The church is active in foreign missions, sustaining missionaries in China, India, Japan and Arabia. The Church Building Fund has charge of the aid for the erection of the new churches. Other funds of the church are the Disabled Ministers' Fund and the Widows' Fund. Under the denominational auspices are three theological seminaries: The New Brunswick Seminary at New Brunswick, N. J.; the Western Seminary at Holland, Mich., and the Arcot Theological Seminary at Palmener, India. Two colleges, Rutgers College, at New Brunswick, N. J., and Hope College at Holland, Mich., are controlled by the denomination. The official organs of the denomination are the *Christian Intelligencer*, published in New York City, and *The Leader*, published at Holland, Mich. There are besides many missionary and departmental publications. The church has a Board of Education which furnishes aid to educational institutions and to young men studying for the ministry. The headquarters of the denomination are 25 East Twenty-second street, New York City.

REFORMED CHURCH IN THE UNITED STATES (GERMAN). A Protestant religious denomination, founded by immigrants from the Palatinate and other districts of Germany. The denomination was established in the United States at Germantown, Pa., in 1714. In 1793 it became independent, having previously been under the supervision of the church in Holland. The church in 1909 numbered 389,328 communicants, 1753 churches and 1179 ministers. There are eight district synods and 59 classes corresponding to the presbyteries in Presbyter-

ian bodies. There were 1716 Sunday schools, with 232,746 scholars and 25,333 teachers. The denomination carries on home mission work, and its fields cover practically the entire United States and a portion of Canada. There are 189 missions, of which 71 are under the two German boards, the Eastern and the Western, and the remaining 118 are under the General Board. The home mission work consists of the support of the missionaries and church building. Missions are maintained among the Hungarians and Bohemians. Foreign mission work is also carried on in Japan and China. Under the control of the church are the Eastern Theological Seminary at Lancaster, Pa.; the Central Theological Seminary of the Reformed Church in the United States at Dayton, O., and a mission house for training German missionaries at Sheboygan, Wis. Franklin and Marshall College at Lancaster, Pa., is the leading collegiate institution under the denominational auspices. Other colleges are Heidelberg College at Tiffin, O., and Ursinus College at Collegeville, Pa. Colleges for women are maintained at Frederick, Ind., and Allentown, Pa. The annual session of the Eastern Synod was held October 20, 1909, in the First Reformed Church at Easton, Pa.

REFORMED CHURCHES THROUGHOUT THE WORLD HOLDING THE PRESBYTERIAN SYSTEM, THE ALLIANCE OF. An organization formed in London in 1875. The churches connected with the Alliance number more than ninety and are located in all of the five continents. The adherents of the Presbyterian and Reformed Churches of the world number about 25,000,000. The Alliance includes in the United States the Presbyterian Church of the United States of America, the Presbyterian Church in the United States, the United Presbyterian Church of North America, the Reformed (Dutch) Church in America, the Christian Reformed Church in North America, the Reformed (German) Church in the United States, the Reformed Presbyterian Church Synod, the Associate Reformed Synod of the South, the Reformed Presbyterian Church, General Synod, the Welsh Calvinistic or Presbyterian Church in the United States of America. The communicants of the various churches in the United States numbered in 1909 2,238,880. The officers of the Alliance in the United States are: President, Rev. David J. Burrell; General Secretary, Rev. G. D. Matthews; American Secretary, Rev. W. H. Roberts.

REFORMED EPISCOPAL CHURCH. An Episcopal Church of historic orders organized in New York in 1873 by members of the Protestant Episcopal Church who were opposed to the growth of sacramentalism and sacerdotalism in that church, and who made the separation in order that they might continue to worship after the historic orders of the English Reformation and in order to provide a place for any others who might desire to have membership in a church, evangelical in its teaching, liturgical in its worship, episcopal in its government and dignified and conservative in its methods. In 1909 the church numbered 9419 communicants, 74 churches and 82 ministers. There were eight bishops, seven of whom presided over synods and missionary jurisdiction in the United States and Canada and one in British Columbia. The nineteenth annual

council was held in St. Paul's Church, Philadelphia, in May, 1909. The church conducts large missionary work, including between thirty and forty churches among the colored freedmen of the South. Foreign missions are carried on in India. The theological seminary of the denomination is in Philadelphia. The official organs are *The Episcopal Recorder*, published in Philadelphia, and *The Evangelical Episcopalian*, published in Chicago.

REFORMED PRESBYTERIANS. The general name of several religious bodies of Presbyterian doctrine, founded by members of the Covenanting or Reformed Presbyterian Church of Scotland. They include the Synod of the Reformed Presbyterian Church of North America, which has about 900 communicants; the Reformed Presbyterian Church in North America, General Synod, which in 1909 had about 3500 members, 19 churches and 19 ministers, and the Reformed Presbyterian Church in the United States and Canada, which has a membership of about 450, and the Reformed Presbyterian Church, Covenanted, which had in 1906, according to the reports of the United States census, a membership of 17. The General Synod maintains a theological seminary at Philadelphia. It held its annual meeting in Philadelphia on May 19, 1909. The next annual meeting will be held in Cincinnati on the third Wednesday of May, 1910.

REID, SIR JOHN WATT. An English physician, died February 25, 1909. He was born in 1823 at Edinburgh and was educated at Edinburgh University. He entered the Royal Navy in 1845 as surgeon. From 1880 to 1888 he was medical director-general. At the latter date he retired from active service. In 1881 he was appointed honorary physician to Queen Victoria. He served in the Russian War in the Black Sea, 1854-56; in the China War, 1857-59, and in the Ashanti campaign in 1874.

RE-INFORCED CONCRETE. See CONCRETE.

REMINGTON, FREDERIC. An American artist, died December 26, 1909. He was born at Canton, St. Lawrence county, New York, in 1861. At the age of 18 he began a course at the Yale Art School, but the death of his father interrupted his art studies, and he returned to his home and worked as clerk in a country store, afterwards acting as confidential clerk to Governor Cornell. After having received a share of his father's estate he went West, and for four years led the life of a cowboy. He established a sheep ranch and afterwards went to Kansas, and spent the next few years in wandering about the Southwest, serving as a scout and a ranchman. He traveled through the interior of the country from Mexico to Hudson Bay. During this time he was developing his ability as an artist, especially in the sketching of animals and Indians. He obtained a commission from the editor of the *Century Magazine* to make drawings of Indians, together with a series of sketches. He also illustrated editions of *Iowatha* and *The Oregon Trail* and other tales dealing chiefly with Western life. He came to be recognized for his knowledge of the life of the Great West, of the Indian and the fur trader, and the United States soldier of those days, all before he was thirty years of age. Then turned to more serious work in oils, which he made rapid development. The

brilliancy of his color sense was particularly remarkable. He exhibited at the Paris Exhibition a large canvas entitled, "The Last Stand," and in 1892 showed in New York an exhibition of a hundred works in oil and water color, and pen and ink and pencil. He had in the meantime made a trip to Europe, and he exhibited also some of the results of his work there, among these "A German Infantry Officer" and "An Old Trooper." He also visited Russia, but was obliged to leave that country. In 1894 he practically ceased making paintings and sketches of the West, declaring that the romantic aspects of that part of the country had vanished. In 1895 he published many of his stories and sketches under the title *Pony Tracks*. He wrote also two other books of sketches entitled *Crooked Trails* and *Frontier Sketches*, and a novel, *John Ermine of the Yellowstone*. In the last years of his life he turned to sculpture, in this as in his illustrations and paintings and writings giving himself to the expression of action. Two of his sculptures, "The Broncho Buster" and "The Wounded Bunkie," attracted particular attention.

REPUBLICS, AMERICAN, INTERNATIONAL BUREAU OF. An official institution under the support of the republics of North, South and Central America, devoted to the encouragement of Pan-American commerce, friendship and peace. It was established in 1890 in accordance with the resolutions passed at the first International Conference of American Republics, held in Washington in 1889-90. It was continued by resolutions at other conferences in 1901 and 1906. The real purpose of the Bureau is to develop commerce and trade, to promote better political relations, closer acquaintance and more intimate association among the American republics. In order to bring about these results the Bureau keeps in close touch with the commercial affairs of the republics and publishes numerous handbooks, pamphlets and maps relating to them, as well as a monthly bulletin. The work of the Bureau has expanded greatly in the last two or three years, largely as a result of the visit of Secretary Root to the countries of South America and Mexico in 1906 and 1907. A gift of \$750,000 from Mr. Andrew Carnegie, together with additional sums from the governments of the various republics, enabled the Bureau to construct a handsome building for its uses. In April, 1909, the president of the Bureau, Mr. John Barrett, gave a dinner in honor of Secretary Knox, as the new chairman of the governing board of the Pan-American Bureau, and also in honor of the representatives in Washington and of the republics participating in that undertaking. Secretary Knox made an important address, in which he placed himself upon record in the administration as continuing the policies of Secretary Root in relation to the Western Hemisphere. Señor Joaquim Nabuco, the Brazilian Ambassador, replied in behalf of the American republics and cordially reciprocated the sentiments of Secretary Knox. Other speakers were Vice-President Sherman, Speaker Cannon and Senator Root. The director of the Bureau was John Barrett, and the secretary, Francesco J. Yáñez.

RESERVOIRS. See DAMS; IRRIGATION.

RÉUNION, or BOURBON. An island in the

Indian Ocean about 420 miles east of Madagascar; a French colony. Area, 965 square miles; population (1907), 177,677 (including 6514 British Indians, 1941 natives of Madagascar, 3237 Africans, 810 Chinese, 377 Arabians). The towns are under French municipal law. St. Denis, the capital, had (1907) 25,689 inhabitants; St. Pierre, 31,927; St. Paul, 20,091; St. Louis, 12,846. There were (1907) 163 schools, with 306 teachers and 13,524 pupils. The products are sugar, rum, coffee, tapioca, vanilla, spices. The live-stock in 1898 numbered 2345 horses, 2950 mules, 3495 oxen, 13,750 sheep and goats. Imports (1907) were valued at 14,490,988 francs, chiefly rice and grain; exports, 13,976,891 francs (sugar, 9,386,432 francs). Of rum 2,497,950 litres were exported; coffee, 49,805 kilos; tapioca, 2,420,447 kilos; vanilla, 37,970 kilos. Imports and exports to the value of 12,562,010 and 13,535,377 francs respectively came from and were sent to France and French colonies. There were in 1908 seventy-eight miles of railway. The Tamatave-Réunion-Mauritius telegraph cable was opened October 13, 1906. Revenue and expenses (local budget, 1909) balanced at 4,508,450 francs; expenditure of France (1909), including a subvention of 2,215,000 francs for railway and harbor, 2,388,480 francs. The colony as such has no debt. The debt of the eighteen communes, incurred for public works, amounted, January, 1907, to 8,990,981 francs. The Bank of Réunion is capitalized at 3,000,000 francs and has a reserve fund of 1,015,234. The colony is administered by a governor, assisted by a privy council and an elective council general, and is represented in French Parliament by one senator and two deputies. St. Paul and Amsterdam, small islands in the Indian Ocean, and Keraguén, a desolate island about 50 S. lat. and 70 E. long., belong to France.

REYER, ERNEST. A French composer, died on January 15, 1900. He was born at Toulon, December 1, 1823. His first opera, *Maitre Wolfram*, was produced in 1854. In 1861 appeared *La Statue*, a grand opera in three acts, and in 1877 *Sigurd*. Reyer composed but one more opera, *Salammbo*, which was produced with success in Paris in 1890.

REYES, RAFAEL. A Colombian soldier and public official, until July 26, 1909, president of the Republic of Colombia. He was born in 1852 at Santa Rosa de Viterbo, Boyaca, Colombia. From early manhood he was identified with the politics of his country, but he gained distinction also as an explorer, having traveled 25,000 miles from Panama to Patagonia through heretofore unvisited territory. In 1885 he supported the government against the revolutionists, and at the beginning of the revolution of 1895, as the head of the national army, he suppressed the insurrection. In 1891 he represented Colombia at the Pan-American Congress. He was elected President in 1904. His advocacy of the separation of church and state, and of the abolition of capital punishment made him unpopular with many prominent politicians. In 1906 an attempt was made on his life. His administration was progressive and enlightened, for he was a man of wide culture and attainments. In May, 1909, he left Colombia and this was taken as foreshadowing his resignation, which was sent to the Colombian Senate from Hamburg. See COLOMBIA.

RHODE ISLAND. One of the North Atlantic States of the United States. Its area is 1248 square miles. The population in 1900, according to a Federal estimate made in that year, was 521,302.

MINERAL PRODUCTION. The mineral resources of the State are not large and consist chiefly of stone and its products. The value of the stone product in 1908 was \$556,474, which was almost entirely granite. The value of the granite produced in 1907 was \$674,148. There were produced in 1908 594,208 gallons of mineral water valued at \$39,405, as compared with a product of 245,307 gallons, valued at \$17,108, in 1907. Among other mineral products produced in small quantities are coal products, graphite and talc. The value of the mineral products of the State in the year 1908 was \$708,694, as compared with \$937,384, the value of the products in 1907.

AGRICULTURE AND STOCK RAISING. The area devoted to agriculture in Rhode Island is comparatively small. The acreage, production and value of the principal farm crops of the State in 1909, according to figures of the United States Department of Agriculture, were as follows: Corn, 365,000 bushels, valued at \$354,000, from 11,000 acres; oats, 50,000 bushels, valued at \$26,000, from 2000 acres; potatoes, 750,000 bushels, valued at \$600,000, from 6000 acres; hay, 68,000 tons, valued at \$1,265,000, from 62,000 acres. The number of farm animals in the State on January 1, 1910, was as follows: Horses, 14,000; dairy cows, 26,000; other cattle, 10,000; sheep, 9000; swine, 13,000. The wool clipped in the State in 1909 was estimated at 34,560 pounds.

FISHERIES. The value of the product of the fisheries of the State for the year ending December 31, 1908, was \$1,685,680. The most important of these products in point of value was oysters, of which 1,228,900 bushels, valued at \$969,490, were taken. In addition to these 719,934 bushels, valued at \$584,298, were taken up by Connecticut oystermen. Next in point of value were lobsters, of which 1,424,800 pounds, valued at \$152,460, were taken. Following in the order of rank of the value of the production were scup, \$123,110; butterfish, \$40,100; cod, \$40,700; hard clams, \$39,140; soft clams, \$37,710. Other fish taken in considerable quantities were haddock, mackerel, swordfish and sea bass. There were 565 independent fishermen engaged in the fisheries of the State and 895 wage-earning fishermen employed. The number of vessels engaged was 131, valued at \$406,205.

EDUCATION. The school attendance for 1908, the latest year for which figures are available, was 94,875. The teachers employed numbered 2260, of whom 194 were men and 2066 women. The average annual salary of the teachers was \$630.98. The total expenditure for education in that year was \$2,646,940, of which the State expended \$506,422, and cities and towns \$2,140,517. There have been no radical changes in school policy and administration in recent years, but several new measures in law and practice have been put in force. Among these are the minimum salary law, requiring that every teacher in the State shall receive at least \$400 as annual salary. Another important measure is that enforcing compulsory secondary education, which means that every municipality must furnish free high school education. The

State pension system for retiring teachers has been put in force. This is supported exclusively by State appropriations. State certification of school superintendents to secure competent qualifications is required. There were in 1908 sixty pensions in force in accordance with the above mentioned measure. The highest pension in force was \$500 and the lowest \$150. The average pension was \$320.48. The complete amount of yearly pensions in force was \$19,228.89.

POLITICS AND GOVERNMENT. The Democratic State Convention for the nomination of State officers convened in Providence October 7. Olney Arnold, of Providence, was nominated for Governor, Thomas A. Carroll, Providence, for Lieutenant-Governor. Mr. Arnold was the leader of the Democratic forces in 1908, but was defeated with the rest of the ticket. The Republican State Convention was held in Providence October 13. Aram J. Pothier, of Woonsocket, was renominated for Governor, Zenas W. Bliss, of Cranston, was nominated for Lieutenant-Governor. The Prohibition party on September 6 nominated Willis H. White, of Providence, for Governor, and N. C. Green, of Warwick, Lieutenant-Governor. The principal issues of the campaign were three proposed amendments to the State constitution. These were passed by two legislatures and were submitted to the people. A three-fifths vote of the entire voting population was necessary. One amendment provided for redistricting the State so that the House of Representatives might have 100 members instead of 72. The second amendment provided that the Lieutenant-Governor shall preside over the Senate, and the third gave to the Governor the veto power. The Democrats opposed the first two, and the Republicans wished to pass all three amendments or none. The result of the election of November 3 was a Republican landslide. Though 1908 was the Presidential year and the vote was several thousands heavier than in 1900, the pluralities of the Republicans in the latter year were thousands greater than in 1908. Governor Pothier's plurality was the greatest ever given to a Governor of Rhode Island, or 11,769. The entire State ticket had pluralities above 11,000. The necessary three-fifths vote was cast for all three constitutional amendments, and as a consequence the Governor now for the first time has the veto power. The General Assembly, as was the case last year, is overwhelmingly Republican.

LEGISLATION. Among the measures enacted at the legislative session of 1909 are those noted below. Measures were passed limiting the hours of labor for women and children in manufacturing and mechanical establishments to fifty-six hours in any one week. Provision is made for commissioners on uniformity of legislation and conservation of natural resources, a survey of the natural resources of the State authorized. Measures were enacted underaking to prevent hazing, and the proposed amendment to the constitution, giving to the governor the power to veto, was enacted.

OFFICERS: Governor, Aram J. Pothier, Rep.; Lieutenant-Governor, Zenas W. Bliss, Rep.; Secretary of State, J. Frederick Parker; Attorney-General, William B. Greenough; Treasurer, Walter A. Read; Adjutant-General, Frederick Sackett; Auditor, Charles C. Gray; Commissioner of Public Schools, Walter E. Ranger;

Commissioner of Insurance, Charles C. Gray—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Edward C. Dubois; Associate Justices, Clark H. Johnson, C. Frank Parkhurst, John T. Blodgett, William H. Sweetland. Clerk of the Court, B. S. Blaisdell—all Republicans.

The State Legislature of 1909 was composed of 31 Republicans and 6 Democrats in the Senate, and 64 Republicans and 6 Democrats in the House. The State representatives in Congress will be found in the section *Congress* of the article UNITED STATES.

RHODESIA. An inland South African territory under British protection. The Zambesi River makes the natural division into Northern and Southern Rhodesia, and the entire territory is administered by the British South Africa Company.

SOUTHERN RHODESIA includes the two provinces of Matabeleland (capital, Bulawayo) and Mashonaland (capital, Salisbury), with a total area of 143,830 square miles; European population (1907), 14,018; native, 662,786. Bulawayo had (1907) 3491 white inhabitants; Salisbury, 1684. Cereals, vegetables and European fruits are grown, and tobacco, rubber, cotton, etc., are indigenous. Extensive mineral deposits are found, and several mining companies have been formed. The gold output to the end of 1908 was valued at £13,762,954; the output for the year 1908 at £2,526,007, an increase of £347,121 over the returns for 1907; the output for the first nine months of 1909 at £1,931,431. Silver, copper, coal, diamonds, lead, chrome, iron, asbestos and other minerals exist in considerable quantities. Tin is found, associated with iron and copper, on what experts declare to be the site of an ancient tin working. The imports and exports in 1907 were valued at £1,450,174 and £2,819,250 (gold at £2,132,740; gold concentrates, etc., £83,101; hides and skins, £10,632). Bulawayo is the commercial centre. Southern Rhodesia is a member of the South African Customs Union. There are over 2000 miles of railway in operation. The principal lines are the Mashonaland and the Rhodesia Railways, the former running from Salisbury east to Umtali (158 miles), and thence to Biera (Portuguese); the latter from Vryburg to Bulawayo (588 miles) is a continuation of the Cape Town (Cape-to-Cairo) line (distance from Cape Town to Bulawayo, 1362 miles). The line connecting Salisbury with Bulawayo is 300 miles. The section from Bulawayo through the Wankie coal fields to Victoria Falls (281 miles) has been extended to Broken Hill in Northwestern Rhodesia (374 miles from the Falls), and was to be completed to the Congo border (132 miles) by the beginning of 1910. (See CAPE-TO-CAIRO RAILWAY.) A light railway from Salisbury to the Ayrshire Mine (84 miles), with a branch (12 miles) to the Eldorado Mine, has been completed. A line connects Gwelo with Selukwe (about 23 miles); a line runs from Bulawayo to West Nicholson (119 miles), with a branch to the Matopos (9 miles), where Cecil Rhodes is buried. There are about 3000 miles of highways; 4018 miles of telegraph lines; 98 telegraph offices; 70 post-offices. An extensive telephone system is in operation. The revenue and expenditure in 1907 and 1908 amounted to £554,029 and £543,597 respectively. Southern Rhodesia is administered by the Company through an Administrator (1909, Sir W. H. Milton),

aided by an executive council. The Legislative Council has 14 members, seven appointed and seven elected by popular vote.

NORTHERN RHODESIA is divided into Northeastern Rhodesia (area, 109,000 square miles; population, 1907, 250 Europeans and about 398,000 natives) and Northwestern Rhodesia, or Barotseland (area, 182,000 square miles; population, 700 Europeans and 350,000 natives). The Administrator of Northeastern Rhodesia (1909) was Judge Leicester P. Beaufort (acting), with headquarters at Fort Jameson. The Administrator of Northwestern Rhodesia, or Barotseland, was (1909) L. A. Wallace (acting), with headquarters at Livingstone. Lealui is the chief kraal of Lewanika, the native King. The imports and exports (1907) of Northwestern Rhodesia amounted to £106,949 and £89,200 respectively.

RICE. The rice crop of the United States in 1909, according to statistics published by the United States Department of Agriculture, amounted to 24,368,000 bushels, grown on 720,225 acres, the average yield per acre being 33.8 bushels. The average price per bushel December 1 was 79.4 cents, and on this basis the crop represents a value of \$19,341,000. The average yield of rice by States was as follows: Louisiana produced 12,075,000 bushels on 375,000 acres; Texas, 9,894,000 bushels, on 291,000 acres; Arkansas, 1,120,000 bushels on 28,800 acres; South Carolina 476,000 bushels on 18,600 acres; Georgia, 100,000 bushels on 4200 acres; Alabama, 35,000 bushels on 1000 acres; Mississippi, 30,000 bushels on 1000 acres; Florida, 25,000 bushels on 1000 acres; and North Carolina, 13,000 bushels on 425 acres. The average yield per acre ranged from 23.9 bushels in Georgia to 40 bushels in Arkansas. Louisiana yielded 33.8 bushels and Texas 34 bushels per acre. The value of the crop in Louisiana amounted to \$10,013,000 and in Texas to \$7,717,000. While the rice crop was good, the prices shortly after harvest were from 75 to 80 cents per barrel lower than they were last year during the same period. During the eleven months ending with November, 1909, rice and rice flour to the amount of \$4,100,000 were imported. This amount was smaller by \$400,000 than the importations for the same period of 1908. The interests of the rice industry of the country are furthered mainly by the Rice Association of America, by some experiment stations, in particular by the Louisiana Rice Experiment Station, established during the past year, and by the Department of Agriculture.

RICHARDS, JOHN KELVEY. An American jurist, died March 1, 1909. He was born at Ironton, O., in 1856, and graduated from Swarthmore College in 1875. He was admitted to the bar, and from 1880 to 1882 was Prosecuting Attorney of Lawrence county, O.; from 1885 to 1889 City Solicitor of Ironton; from 1890 to 1892 State Senator; from 1892 to 1896 Attorney-General of Ohio. From 1897 to 1903 he was Solicitor-General of the United States, and in the latter year was appointed Judge of the United States Circuit Court, Sixth District. Judge Richards was a member of many important commissions, and as Solicitor-General argued successfully many important cases, including the Anti-Trust, Federal Legacy Tax, and several famous insular cases.

RICHARDSON, HENRY BROWN. An Ameri-

can engineer, died August 21, 1909. He was born in Winthrop, Maine, in 1837, and was educated in public and private schools in Portland. He was engaged as civil engineer in 1857 and 1859. He served throughout the Civil War in the Confederate army, chiefly in engineering capacities. From 1877 to 1904 he was a member of the Louisiana Board of State Engineers, and from 1880 to 1904 was chief engineer of the State. He was appointed by President Roosevelt a member of the United States Mississippi River Commission, which has charge of improvements in the channel of the Mississippi River.

RICHMOND, CHARLES ALEXANDER. An American clergyman and educator, inaugurated in June, 1909, president of Union College. He was born in New York City in 1863, and graduated from Princeton University in 1883, and from the Princeton Theological Seminary in 1888. After two years spent in teaching he became a pastor of the Presbyterian Church in East Aurora, N. Y. He remained here until 1894, when he was called to the Madison Avenue Presbyterian Church in Albany, N. Y. He continued in this pastorate until he was chosen president of Union College in 1908.

RIGG, JAMES HARRISON. An English Wesleyan clergyman, died in April, 1909. He was born in 1821, and was educated at Old Kingswood School. He entered the Wesleyan ministry in 1845. He was twice president of the Wesleyan Conference; an original member of the London School Board, and principal of Westminster Training College, 1868-1903. His writings were numerous, including *Principles of Wesleyan Methodism* (1850); *Modern Anglican Theology* (1857); *Discourses and Addresses* (1880); *Reminiscences of Sixty years Ago* (1904). Dr. Rigg was for fifteen years editor of the *London Quarterly Review*, and he contributed to many other periodicals.

RIPON, GEORGE FREDERICK SAMUEL ROBINSON, Marquis of. An English nobleman and public official, died July 9, 1909. He was born in London in 1827. In 1852 he became member of Parliament for Hull, and sat for various constituencies until 1859. In that year he was appointed Under Secretary for War, serving until 1861, when he became Under Secretary to India. In 1863 he was made Secretary of State for War and served until 1866. In the latter year he was appointed Secretary of State for India, and in 1868 was made Lord President of the Council, serving until 1873. He was appointed chairman of the joint commission for drawing up the Treaty of Washington in 1871, and in the same year became Grand Master of the Free Masons of England. From 1880 to 1884 he was Governor-General of India, and in 1886 First Lord of the Admiralty. He was Secretary for the Colonies from 1892 to 1895. In 1905 he was made Lord Privy Seal in the Campbell-Bannerman Cabinet. He became a Roman Catholic in 1874, and withdrew from the Cabinet in 1908 as the result of the government's opposition to the Eucharistic procession at the Church Congress in London.

RIVER IMPROVEMENT. See WATERWAYS, INTERNAL.

ROADS. See PAVEMENTS AND ROADS.

ROCHESTER, WILLIAM BEATTY. An American army officer, died November 11, 1909. He

was born at Angelica, N. Y., in 1826. In his early youth he was engaged in business, but upon the discovery of gold in California he went there by way of the Isthmus of Panama in 1850 and became the agent of the Wells Fargo Express Company at Sacramento in California. He returned to New York in 1860 and in the following year, on the outbreak of the Civil War, was appointed an additional paymaster for volunteers with the rank of major. He served until 1867, when he was transferred to the regular army as paymaster with the same rank. After serving in several stations until 1882 he became paymaster-general of the army with headquarters at Washington. He was retired from active service in 1890 having reached the age limit.

ROGERS, HENRY HUTTLESTON. An American financier, died May 19, 1909. He was born in Fairhaven, Mass., January 29, 1840. His formal education ended when he was 16 years of age, when he graduated from the Fairhaven High School. He began his business career by selling newspapers, but soon left this for a position in his father's grocery store, at a wage of three dollars a week. Here he remained for five years. For a short time he was employed on the Fairhaven branch railroad, but, having married, he went to the Pennsylvania oil wells, then recently discovered, in search of a fortune. He settled at McClinton's Wells, and for five or six years made a careful study of the oil business in all its branches. At the end of that time he was recommended to Charles Pratt of Brooklyn, who then practically controlled the retail oil trade of New York and vicinity, as a young man of ability and enterprise, and Mr. Rogers came to New York and was placed in charge of the further development of the business. He had previously made a business connection with the Pennsylvania Salt Co., which operated a large refinery on the Allegheny River. Mr. Rogers speedily became an important factor in the Pratt oil business, and when, in 1874, the union of the chief refineries in New York, Philadelphia, Pittsburgh and Cleveland, which formed the Standard Oil Co., was made, Mr. Rogers and Mr. Pratt became trustees of the new company, and the relations then begun were maintained by the former until his death. He was one of the controlling forces of the great organization, for many years undoubtedly the greatest force. In the early '90's he was president of the corporation, but later resigned this office, and became one of its vice-presidents.

Mr. Rogers's ventures were not confined to the Standard Oil Co. and its allied interests. He invested heavily in mining companies, especially those mining copper. He came into control of the Amalgamated Copper Co., the Boston and Montana, and the Butte and Montana, which were consolidated in 1901, and Mr. Rogers became president and principal shareholder. The methods employed in this consolidation furnished much of the material for the famous "exposures" in "frenzied finance," made by T. W. Lawson. Another of Mr. Rogers's famous ventures was in the gas field in Boston. He bought control of the Brookline Gas Co. and built it into a powerful company about the time the lease of the Bay State Gas Co., controlled by J. Edward Addicks, expired. By lower bids the Brookline Gas Co. obtained the contracts for lighting the city. This precipitated

one of the most spectacular stock market wars in the financial history of the country, and resulted in the wrecking of the Bay State Gas Co. In 1894 Mr. Rogers was charged, in a suit brought by the receiver, with conspiring with a bank and a trust company to effect a fraudulent foreclosure for their personal profit, but the suit was dismissed. The last, and in many ways the most notable, of Mr. Rogers's great undertakings, was the building of the Tide-water Railway from Norfolk, Va., to Deepwater, W. Va., a distance of 442 miles. The road was built by Mr. Rogers entirely at his own expense, and it was finally opened the April before he died. It was said that in the panic of 1907, Mr. Rogers sacrificed many valuable securities in order that the completion of this road might not be delayed.

Mr. Rogers appeared many times as a witness in cases against the Standard Oil Co. His last appearance in this capacity was in the spring of 1909 in the case of the United States against the Standard Oil Co. for a dissolution of the "trust." At this time Mr. Rogers gave a detailed history of the methods of the company and its development from the time when he became prominent in the conduct of its affairs.

Mr. Rogers was probably less in the public eye than any other of the great financiers. He was an indefatigable worker, and this undoubtedly hastened his end. On being asked near the end of his career to account for his success he replied, "By working as hard as anybody I ever saw, or read about." His personality was described by his friends as charming, and by his enemies as little short of terrible. Among his most intimate friends were S. L. Clemens, and Helen Keller, and to both he rendered material assistance.

Aside from his business and family interests, Mr. Rogers took the greatest delight in the improvement of his native town, Fairhaven. Here he built himself a fine country place. His gifts to the town amounted to over \$3,000,000. They include a memorial church to his mother, a high school building, a library, a group of buildings valued at \$1,000,000 to the Unitarian church as a memorial to his first wife, and a Masonic Hall. He spent large sums in improving the streets and sewers, and served for several years as Superintendent of Streets. Mr. Rogers's other benefactions were large, but were made so unostentatiously that little was known of them. His estate, at his death, was valued at considerably over \$100,000,000.

ROMAN CATHOLIC CHURCH. There were no events in the history of the Roman Catholic Church in 1909 comparable in general interest to the centenary celebration of the founding of the arch-dioceses of New York, Philadelphia and Boston; the celebration of the Pope's jubilee; and the Eucharistic Congress in London, in 1908. Preparations were carried on during the year for the great Eucharistic Conference which is to be held in Montreal in November, 1910. At this conference several cardinals will be present. Preparations were also made for the commemoration in New York of the one-hundredth anniversary of the birth of Cardinal McCloskey, the first American cardinal. At this celebration, also, several cardinals are expected to be present. During this occasion St. Patrick's Cathedral will be consecrated, a ceremony which can be performed only when the entire debt has been paid off. It

is expected that this celebration will surpass even the centenary celebration of 1908.

The total membership of the Roman Catholic Church in 1908 was estimated at 230,860,533. Of this number 160,165,000 were in Europe; 58,393,882 in America; 6,574,481 in Oceanica; 2,655,920 in Africa, 3,007,250 in Asia. In Europe, the largest number of Roman Catholics is found in France, where there are 35,387,000. Austria-Hungary follows with 31,100,100 and Italy is third with 29,850,000. In Germany there are 17,100,000 and in the United Kingdom 6,500,000.

UNITED STATES. The total Catholic population of the United States is estimated by the official Catholic directory at 14,347,027 in 1909. This estimate includes the entire membership of families professing the Roman Catholic faith. The hierarchy of the church is composed of 13 archbishops, of whom one is a cardinal, and 88 bishops. The secular clergy numbered in 1909, 12,274 and the religious clergy 4276, or a total of 16,550. There were 8849 churches with resident priests, and 4355 missions with churches. The total number of churches was 13,204. Under the direction of the church there were 82 seminaries with 6182 students, 217 colleges for boys, 700 academies for girls, 4845 parishes with schools, with 1,237,251 children in attendance, 289 orphan asylums, in which were 51,541 orphans, and 1125 charitable institutions. The total number of children in the Catholic institutions was 1,450,448.

During the year the church in the United States and its possessions lost by death three of its prominent prelates, Rt. Rev. William G. McCloskey, D. D., Bishop of Louisville, who died September 17, 1908; Rt. Rev. James B. Cotter, D. D., Bishop of Winona, who died June 28, 1909, and Rt. Rev. Thomas A. Hendrick, late Bishop of Cebu, Philippine Islands, who died November 29, 1909. Obituary notices of these will be found in their alphabetical order in this work.

Among the new members of the hierarchy consecrated during the year were the following: Most Reverend John D. Piterval, promoted to be Archbishop of Santa Fé, January 3, 1909; Rt. Rev. John P. Farrelly, consecrated Bishop of Cleveland, May 1, 1909; Rt. Rev. Thomas F. Hickey, D. D., succeeded to the See of Rochester, N. Y., January 18, 1909; Rt. Rev. James J. Carroll, D. D., consecrated Bishop of Nueva Segovia, Philippine Islands, February 14, 1909; and Rt. Rev. George W. Mundelein, D. D., consecrated auxiliary Bishop of Brooklyn, September 21, 1909.

The census of the religious bodies of the country for the year 1906, the results of which were published in 1909 by the United States Bureau of the Census, reveals much important information relative to the growth of the Roman Catholic Church in the United States in the period 1890 to 1906. During that time the church grew from a membership of 6,241,708 to 12,079,142, or an increase of 5,837,434, which is equivalent to 93.5 per cent. While this is a higher rate of growth than is shown by any of the Protestant bodies, it must be considered that the Roman Catholic Church includes as members all persons baptized into the church, and requires that all children of members shall be baptized as soon as possible, thereby themselves becoming members, while the Protestant bodies, as a rule, admit as mem-

bers only those who, after reaching a fairly mature age, declare their desire to join the church. The great increase in the membership of the Roman Catholic Church during this period is largely due to the volume of immigration during that time, a great proportion of these immigrants belonging to the Roman Catholic faith. The value of the property under the control of the Church in 1906 was given at \$292,038,787, as compared with a value of \$118,123,340 in 1890, or a growth of 147 per cent. This percentage of increase is surpassed only by the Latter Day Saints and several independent denominations. The clergy of the church increased in the period under discussion from 9166 in 1890 to 15,179 in 1906 or 65.6 per cent.

FOREIGN COUNTRIES. In France considerable criticism was caused by the appointment of Abbé Loisy, who has been one of the most prominent exponents of Modernism, to the Chair of Religions at the Collège de France, which was formerly occupied by M. Raville. For an account of this and other events dealing with the relation of the church and state in France, see the article *FRANCE*, paragraphs on *History*. In Italy there was considerable criticism in Parliament of the government's policy of non-interference with the Vatican. This called forth a statement from the Minister of Public Worship to the effect that intolerance was considered by the government to be foreign to the modern idea of liberty. He declared that while the government would not enter into any alliance with the Roman Catholic Church it had no intention of interfering with the exercise of its legitimate functions. There were anti-clerical demonstrations in various parts of the country during the year, and on October 3 it was reported that the Pope pronounced personal and general excommunication against all the inhabitants of the city of Adria and its suburbs, for severely injuring Bishop Bogiani of that Diocese during an anti-clerical demonstration. This was the first general excommunication of a city during the present Pontificate.

There were no particular developments in Great Britain in which the church was concerned. One of the most important events was the death of Father Tyrrell noted below.

MODERNISM. Modernism remained in the same quiescent condition which marked it in 1907 and 1908. The death of Father Tyrrell (q. v.) removed the ablest and best known exponent of the movement. The Roman Catholic Bishop of Southwark, who had the support of Archbishop Bourne, refused to grant Father Tyrrell Catholic burial, but the prayers of the church were said "unofficially" at his funeral by Abbé Bremond, a well known French Catholic and author. The report of the Vatican Biblical Commission on the historical character of the first three chapters of Genesis dealt another blow at Modernism. Two of its eight declarations allow that the Fathers may be followed by superimposing an allegorical interpretation on the literal and historical sense, and also that it is lawful to discuss whether the word "day" means twenty-four hours or an indefinite period of time. The other declarations, however, declare that it is not lawful to discuss the truth of the literal and historical sense of the narratives. The words must be received in their plain and obvious meaning and the

exercise of private judgment upon them is absolutely forbidden. While these declarations do not possess Papal authority, they are published with the knowledge and consent of the Pope.

RÖNTGEN RAYS. See PHYSICS.

ROOT, ELIHU. United States Senator from New York. He was born in Clinton, N. Y., in 1845 and graduated from Hamilton College in 1864. His father was for many years professor of mathematics in this institution. He taught at the Rome Academy in 1865 and in 1867 graduated from the Law School of the University of the City of New York. In the same year he was admitted to the bar. He at once took a prominent position in his profession and in 1883 was appointed by President Arthur United States Attorney for the Southern District of New York. He was a delegate at large to the State Constitutional Convention of 1894 and Chairman of the Judiciary Committee. He was a member of the Commission on the Alaskan Boundary and in 1899 was appointed by President McKinley, Secretary of War. He retired from this office on January 31, 1904, and on July 7, 1904, he was appointed Secretary of State. He resigned that office on January 22, 1909, upon his election to the United States Senate to succeed Thomas C. Platt (see NEW YORK). The achievements of Senator Root while he held the portfolios of the War and State Departments form an important part of the history of the country during that period. Among the most memorable incidents was his journey through Central and South America while he was Secretary of State, for the avowed purpose of bringing about more friendly relations between the Republics of Central and South America and the United States. In this he was eminently successful. As Secretary of State he negotiated about forty treaties or conventions, many of them of great importance. He is considered to rank among the greatest of those who have held the portfolio of Secretary of State.

ROWING. The intercollegiate races were held on the Hudson River, near Poughkeepsie, on July 2, Cornell, Pennsylvania, Syracuse, Wisconsin and Columbia entering crews in the regatta. Cornell made a clean sweep in the three events and at the same time established two records. In the 'Varsity eight-oars (four miles) all five crews covered the distance in less than 20 minutes, a feat unaccomplished before since 1903. Columbia made a good showing in this event, the difference in time between her crew and Cornell's being only a little more than two seconds. Syracuse, the winner of the 1908 race, also made a good fight. The time of the several events as taken at the finish was: Cornell, 19 minutes 2 seconds; Columbia, 19 minutes 43 seconds; Syracuse, 19 minutes 15 $\frac{1}{2}$ seconds; Wisconsin, 19 minutes 24 $\frac{1}{2}$ seconds, and Pennsylvania, 19 minutes 32 $\frac{1}{2}$ seconds. In the 'Varsity four-oared event (two miles) Cornell made the record time of 10 minutes 1 second. The order of finish and time of the other crews were: Syracuse, 10 minutes 10 seconds; Columbia, 10 minutes 12 seconds, and Pennsylvania, 10 minutes 27 $\frac{1}{2}$ seconds. The crew to finish last in 1908, Pennsylvania, made much better time than the winner of this race in 1908, Syracuse. Cornell's third victory, that of the freshman eight-oars, also established a new record, the crew covering the two miles in 9 minutes 11 $\frac{1}{2}$

seconds. Syracuse finished second in 9 minutes 14 $\frac{1}{2}$ seconds, Pennsylvania third in 9 minutes 21 seconds, Wisconsin fourth in 9 minutes 22 $\frac{1}{2}$ seconds and Columbia last in 9 minutes 26 seconds.

The annual races between the Harvard and Yale crews took place on the Thames River, near New London, Conn., on June 26. Harvard was successful in each of the three events, a feat never accomplished by either college before. The time made by the Harvard crews, however, was much slower than that made by Cornell on the Hudson. In the 'Varsity eight-oars Harvard covered the four miles in 21 minutes 50 seconds and Yale in 22 minutes 10 seconds. The 'Varsity four-oared event was the closest of the three races, the difference in time between the two crews being only 9 seconds. Harvard's time for the two miles was 13 minutes 14 seconds and Yale's 13 minutes 23 seconds.

The Harvard freshman eight had more trouble winning than did the 'Varsity, but still the victory was a fairly easy one. The time of the winning crew, 11 minutes 32 seconds, was over two minutes slower than the Cornell youngsters made on the Hudson. Yale's time in this event was 12 minutes 9 seconds.

Several dual college regattas were held during 1909, of which the one held on Lake Cayuga with Harvard and Cornell as contenders was the most important. The Cornell eight defeated the Harvard crew in a two-mile race by 1 $\frac{1}{2}$ lengths, Cornell's time being 10 minutes 41 seconds and Harvard's 10 minutes and 47 seconds. Harvard was more successful in the race with the Columbia 'Varsity, defeating the latter by 5 $\frac{1}{2}$ lengths over a 1 $\frac{1}{2}$ mile course on the Charles River. Other dual races and their results were: Pennsylvania eight defeated Yale eight over a 1 $\frac{1}{2}$ -mile course on the Schuylkill River by 1 length; U. S. Naval Academy eight defeated New York University eight over a 1 $\frac{1}{2}$ mile course at Annapolis by 10 lengths, and Syracuse University eight defeated U. S. Naval Academy eight over a 2-mile course at Annapolis by 3 lengths. Two dual college regattas were held on the Pacific Coast in 1909, Stanford University defeating the University of California over a 3-mile course in Oakland Estuary, and Stanford University defeating the University of Washington over a 3-mile course on Washington Lake, Seattle.
